### Behavioral Health Discharge Management Program

#### Year 2 (10/1/2012 – 9/30/2013)

Data Source: Project Documentation, Interview notes

**Metric 2 [P-2.2]:** Review interview data conducted by multidisciplinary team

Baseline/Goal: Interview Summary Report

Data Source: Project Documentation, Interview Notes

---

#### Year 3 (10/1/2013 – 9/30/2014)

Data Source: Evidence of how pilot test results were used in rapid-improvement to inform the scaled-up plans for a hospital care transition process or community-based program for high-risk patients

**Metric 1 [I-40]:** Expected Increase in target inpatient population members who have been discharged and have received clinician follow-up calls to review treatment plans and assess compliance.

Goal: 75% of patients discharged to home will receive at least 3 attempted follow-up calls to review treatment plans and assess compliance.

Data Source: Medical Records; Project Data; Clinician Logs, Discharge Call Manager

Milestone 21 Estimated Incentive Payment: $720,581

**Milestone 22 [I-40]:** Assessment and Follow-up

---

#### Year 4 (10/1/2014 – 9/30/2015)

Milestone 15 Estimated Incentive Payment: $449,058

**Milestone 23 [I-42]:** Follow-up After Hospitalization

---

#### Year 5 (10/1/2015 – 9/30/2016)

Milestone 25 Estimated Incentive Payment: $595,263

**Milestone 27 [I-42]:** Follow-up

---

### Behavioral Health/Substance Abuse 30-day readmission rate (Stand-alone measure)

Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons

ED appropriate utilization
### Behavioral Health Discharge Management Program

**Region 10 RHP Plan**

Project Summary

Project Option 2.9.1– Establish/Expand a Patient Care Navigation Program– MedStar Patient Navigation

**Unique Project ID:** 126675104.2.8

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** This project will navigate patients at risk for potentially preventable emergency department (ED) visits and hospital admissions to more safe and effective settings for their healthcare needs. This project dramatically expands a short-cycle tested, limited-enrollment, pilot project that has resulted in exceptional results for the target population.

**Need for the project:** The pilot Patient Navigation project has only been able to reach 528 patients at risk for potentially preventable ED visits. Not only have the enrollee’s experienced dramatic improvement in health status, but the program has saved nearly $1.7 million in healthcare expenditures (over $3,000 per patient enrolled).

**Target population:** Medically underserved Medicaid indigent patients and uninsured that are at risk for potentially preventable ED visits and hospital admissions. We anticipate enrolling a total of 6,525 patients in this program over the reporting period.

**Expected patient benefit:** Improved health status through navigation away from uncoordinated/episodic ED use to their patient-centered medical home and reduced expenditures by Medicaid through reduced ED visits and hospital admissions.

**Category 1 or 2 expected patient benefit:**

- I-8.1: Reduction in ED use by identified ED frequent users receiving navigation services. This project is anticipated to reduce ED usage by 2,082 visits for the 911 Nurse Triage and High Utilization Group programs.
  - ED visits for the 911 Nurse Triage program will be reduced by 1,920 visits (by 30% in DY3-450 pt. visits, reduced by 35% in DY4-630 pt. visits, and reduced by 40% in DY5-840 pt visits).
  - ED visits for the High Utilization Group (HUG) program will be reduced by 162 visits (by 30% in DY3-30 pt. visits, reduced by 35% in DY4-52 pt. visits, and 40% in DY5-80 pt. visits).
  - Four programs will be served under this model: 911 Nurse Triage will enroll 5,400 pts (DY 3 – 1500 pts, DY 4 – 1800 pts and DY5 – 2100 pts); Observation Admission Avoidance will enroll 450 pts (DY 3-100 pts, DY 4-150 pts and DY5-200 pts); CHF Program – will enroll 225 (DY 3-50 pts, DY 4–75 pts, and DY5-100 pts); and the High Utilization Group (HUG) will enroll 450 pts (DY 3 – 100 pts, DY 4 – 150 pts, and DY5 – 200 pts).
Category 3 outcomes:
IT 3.2: CHF 30 Day Readmission Rate-113 CHF program patients will experience no PPR during the 30-day post-discharge time frame throughout the reporting period (DY 3 – 25 pts, DY 4 – 38 pts, and DY5 – 50 pts-

IT 2.11: Ambulatory Care Sensitive Conditions Admission Rate

  o This program will reduce the number of PPA by 5% from established baseline in DY3, will reduce the number of PPA by 10% from established baseline in DY4, and reduce the number of PPA by 15% from established baseline in DY5. This is estimated to be an impact of 50 patients during the reporting period.
  o Observation Avoidance Program will enroll 450 patients (DY3-100pts, DY4-150 pts, and DY5 200pts).

Project Option 2.9.1– Establish/Expand a Patient Care Navigation Program– MedStar Patient Navigation
Regional Healthcare Partnership

Unique Project ID: 126675104.2.8
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
In the past three years MedStar\textsuperscript{xxvi} initiated four pilot patient navigation projects on a limited basis. These programs have significantly reduced the incidence of ED visits and PPRs for congestive heart failure (CHF) and ambulatory care sensitive conditions (ACSC). JPS Health Network and MedStar plan on expanding these programs to allow more patients to be served and result in more dramatic improvement in patient outcomes, ED utilization and potentially preventable readmissions.

The MedStar Patient Navigation program has four components:

911 Nurse Triage Program:
The 911 Nurse Triage components will screen low-acuity 911 calls and send the callers to a specially trained RN in the 911 call center. The RN who works with these low-acuity callers to find them resources other than an ambulance transport to the ED. To date, the limited scope, pilot 911 Nurse Triage project has been successful in referring 38% of patients enrolled in the program to dispositions other than an ambulance trip to the emergency department.

An analysis of current 911 calls reveals that 5-10% of all 911 calls are calls with very low-acuity patient complaints. Typically, these calls have resulted in an ambulance response and subsequent transport to a local emergency department. This leads to uncoordinated care for the patient and high cost to the system. The average Patient Charge (APC) for an ambulance transport is $1,500 and the APC for an ED visit is $2,400 for a cost per episode of care of $3,900.

A very limited pilot program launched by JPS Health Network and MedStar in June 2012 with a 911 Triage Nurse on duty M-F, 9a – 5p. Of the 200 patients referred to this program since June, of low acuity calls referred to a specially trained RN in the MedStar Call Center 76 patients have been effectively navigated to resources other than an ambulance response and subsequent transport to an emergency department. In many cases, these patients have been navigated to a PCMH for coordinated care at reduced costs. Expanding this program to 24/7 will have significant impact on up to 24 patients per day, versus the current 6 patients per day.

The High Utilization Group (HUG) Program:
The High Utilization Group (HUG) component targets patients with four or more ED visits/admissions in the past year and provides program enrollees with in-home education; medication reconciliation, environmental assessment and mitigation, and connection to other resources to help them better manage their medical conditions in settings other than the ED. To date, the limited pilot project has reduced PPA to EDs by 56% for enrolled patients.

MedStar has been conducting a Community Health Program for 3 years to address frequent 911 users. To date, the program has enrolled over 150 patients with a 46% reduction in 911 and ED use during the patient’s enrollment and 85% sustained reduction in 911 and ED use up to 12 months post-graduation from the program.
JPS Health Network has identified 778 patients who have used the ED 4 or more times in 12 months in FY11. Under this DSRIP project, we plan to enroll these 450 patients into the HUG program in an attempt to achieve similar results as the frequent 911 users.

**CHF Program:**
In-Home Congestive Heart Failure (CHF) Management component provides in-home education, medication reconciliation, environmental assessment and mitigation, and medical intervention (in-home diuresis) in coordination with the patient’s PCP for patients at risk for potentially preventable admissions (PPRs) for CHF. To date, the limited scope pilot project has demonstrated a 46% reduction in PPR for CHF for enrolled patients.

**Observation Admission Avoidance Program:**
The Observational Admission Avoidance component targets patients who are at risk for an observation only admission until they can be seen by their PCP or a specialist, and provides them with in-home assessment, evaluation and any necessary treatments to assure they are safe at home and help assure they attend their follow-up PCP/specialist appointment. To date, no patients enrolled in this limited scope, pilot project have experienced a PPR to the ED prior to their PCP/specialist appointment for enrolled patients.

Under the pilot, only 528 patients in the past 24 months were enrolled due to limited funding. This DSRIP project will significantly expand these 4 programs. Under the Waiver, MedStar will expand the Patient Navigation program and enroll an estimated 6,525 patients, which will have a greater impact on patient outcomes and system costs.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The primary goal of this program is to reduce unnecessary ED visits and PPRs by providing patients accessing the emergency care system for reduction of ED visits and PPR with coordinated, timely, and site-appropriate health care services.

Secondary goals include improving individual health status, improving community health and reducing health care costs.

This project meets the following Regional goals:
This project meets a number of Regional goals which are aligned with the goals of the Waiver and the Institute for Healthcare Improvement’s (IHI) triple aim. Specifically, this program will improve care by navigating patients to PCPs and other medical homes for more coordinated, safer medical care which will improve the patient’s overall health and quality of life. In addition, navigating patients away from high cost ED settings to more appropriate, less expensive settings will reduce the cost of caring for these patients.
Challenges:
Like most U.S. hospitals JPS Health Network has a high volume of patients entering the ED for primary care issues. While patients’ immediate health care needs may be dealt with in the ED, the ED is not set up to provide the longitudinal care and care coordination important for overall patient health. Under this project, patients seeking primary care services in the ED would be navigated to their patient-centered medical home (PCMH), which can provide care that is safer, more effective and efficient, provided in the right setting and timely, based on the patients presentation. Limited funding has prevented JPS Health Network and MedStar from expanding the program to benefit the entire cohort of patients who require it.

5-Year Expected Outcome for Provider and Patients:
During the Waiver period, JPS Health Network and MedStar will participate in four admission/readmission avoidance programs. The 911 Nurse Triage program will reduce potentially preventable ED visits - by - 1,920 visits. The Observation Admission Avoidance program will reduce ACSC inpatient admissions by 15% from established baseline. We estimate 162 potentially preventable ED visits -will be avoided through the high-utilization group (HUG) program. The CHF target population program will prevent 113 ED visits and potentially preventable readmissions.

Starting Point/Baseline:
Over the past 12 months, 528 unduplicated patients have been enrolled in various components of the Patient Navigation program. MedStar utilizes 4.5 community health paramedic FTEs (4.9% of the full-time paramedic workforce) and one 911 Triage Nurse (2.7% of the call center workforce) for the program. There have been approximately 1,084 encounters with these patients over the past 12 months.

In the JPS Health Network system, 778 patient patients have been identified as having four or more JPS Health Network ED or inpatient admissions during FY11, equating to 1,423 potentially avoidable ED encounters and 161 potentially avoidable inpatient admissions.

Rationale:
In Fort Worth, nearly 12,000 people call 911 each year with very low-acuity medical complaints. Up to 38% of these patients can be navigated to a specially trained RN in the 911 call center to assist them with finding the right care in the right setting without an ambulance response and transport to an ED. Numerous studies and published data from CMS and other sources indicate that frequent ED and EMS system users suffer added health issues due to lack of care coordination and a PCMH. Further, a 70,000 patient population in a peer hospital system in Ft. Worth experienced 3,000 observational admissions until they could be seen by their PCMH or
PCP. This type of utilization leads to uncoordinated care, unnecessary procedures and an overall risk to patient safety. Readmissions for CHF-related illnesses are another major cost driver for the health care system. Using mobile CHPs, the program aims to respond proactively to patients who may normally access the emergency care system to provide in-home education, assessments and interventions and build patients’ ability to better manage their own care.

As a Region, there were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1,000 persons. The 2007 national ED visit rate was 390.5 per 1,000 persons, increasing 23% since 1997, but lower than the ED visit rate of Region 10. Under this program, we will reduce 911 calls resulting in an ambulance response and transport to an ED by 40%, reduce PPA for Ambulatory Sensitive Conditions by 15% in enrolled patients, reduce CHF PPRs by 50% in enrolled patients and reduce ED visits for PPA-HUG patients by 40%.

**Project Components:**

Project components include:

- Identifying target populations for program enrollment and using patient navigators in the 911 and the field to reduce ED visits and PPRs.
- Training health care navigators in cultural competency.
- Deploying community health paramedics (CHPs) as innovative health care personnel to provide the right care in the right setting to prevent unnecessary ambulance transport to ED.
- Navigating patients to established PCMHs or PCPs in the community.
- Focusing on care coordination by conducting monthly meetings of a Care Coordination Council. All case managers participating in the patient’s care will come together to review the care provided and the patient’s health care resource use to improve care coordination. Care is also coordinated with the patient’s PCP as needed by the community health paramedics on scene with patients during home visits.
- Educating healthcare teams in chronic disease self-management.
- Conducting Plan-Do-Cycle-Act (PDSA) rapid cycle testing to evaluate results for processes used and make adjustments as necessary based on this analysis.

**Unique community need identification numbers the project addresses:**

- CN. – 10 Overuse of ED services
- CN. – 11 Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This initiative significantly enhances a program that has already demonstrated significant improvement in health care, and reduced costs to the system. Funding has limited the program to only 528 eligible patients over the past three years. We expect additional funding will allow us to impact more than 6,525 patients during the Waiver period.

The MedStar Community Health Program was recently profiled by AHRQ as a best-practice innovation on their Innovation Exchange\textsuperscript{xviii}. The RAND Corporation just completed a review of the program and will be recommending to CMS that this is a best practice for community care coordination. (Their report will be published in December 2012). The Institute of Medicine (IOM) published a Consensus document in 2006 called “EMS at the Crossroads” which encouraged partners and governments to utilize EMS providers in new roles in an effort to improve individual health status and reduce costs\textsuperscript{xxix}.

There is no other HHS funding provided for these programs.

**Related Category 3Outcome Measures:**

**Outcome Measure 1: Observation Admission Avoidance Program**

*IT-2.11 Ambulatory Care Sensitive Admission Rate:*

Reduce the number of acute care hospitalization for ambulatory care sensitive conditions under age 75 years by 15% from established baseline.

In our community, one hospital and payer group have identified that 3,000 patients are admitted to 23-hour observation at a cost of $5,000 per admission. In some cases, these observational admissions are simply because the ED physician is uncomfortable sending the patient home to an unknown and medically unsupervised setting. Under this program, MedStar will receive these patients into their community health program; conduct any necessary follow-up visits until the patient can be scheduled for follow-up with his or her primary care provider. It is anticipated that for each observation admission avoided, there will be a $3,000 to $5,000 cost-savings to the community.

**Outcome Measure 3: CHF Readmission Avoidance Program**

*IT-3.2 Congestive Heart Failure 30-day readmission rate*

113 PPR for CHF patients (50% of the 225 enrollees) will be avoided during the project term.

All counties identified it as a system cap and need. Barriers include complexity of coordination, lack of staff, and lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists.

**Relationship to Other Projects:**

This project will operate in tandem with other related JPS Health Network projects: JPS Health Network’s Patient-centered Medical Home Project (126675104.2.2), Care Connections for the Homeless (126675104.2.3) and Community Connect (126675104.2.10)
**RD-1-1. Potentially Preventable Admissions**
The 911 Nurse Triage, HUG and Observation Admit components of the Patient Navigation project will reduce PPA for ACSC, with specific focus on diabetes and COPD.

**RD-2-1. CHF 30-Day Readmission**
The CHF program will specifically target the patients at risk for PPA and PPR for CHF conditions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

JPS Health Network defined the population that will be directly impacted by the project as patients who dial 911 for medical assistance. The percentage of the population expected to be positively impacted by the project is 41%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, their potential to spend time in the ED or Observation is reduced.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, the system costs are greatly reduced and access to care to the ED for other members of the community is increased as well.

#### JPS Health Network

**Baseline/Goal:**

**For 911 Nurse Triage** – Review 911 call volume records to identify protocol/call types most appropriate for transfer to MedStar Triage Nurse. **Data Source:** MedStar 911 call records, JPS Health Network and MedStar EMR records.

**Baseline/Goal:**

**For Observation Avoidance**

Review EMR to establish number and most frequent Dx of patients admitted

**Milestone 2 Estimated Incentive Payment (maximum amount):**

$612,306

**Milestone 3:**

**High Utilization Group**—Enroll 100 of the patients identified by JPS as having used the ED for ACSC services 4 or more times in the past 12 months.

**Data Source:** JPS EMRs.

**Milestone 4 Estimated Incentive Payment (maximum amount):**

$1,310,049

**Milestone 5 Estimated Incentive Payment (maximum amount):**

$1,082,215

**MedStar Patient Navigation**

- Congestive Heart Failure 30-day readmission rate (Stand-alone measure)
- Ambulatory Care Sensitive Condition Admission rate (Stand-alone measure)

**Baseline/Goal:**

100 observational admission patients referred for navigation to a PCMH instead of observational admission

**Data Source:** JPS EMRs.

**Milestone 3:**

- CHF In-Home Management – Enroll 50 patients at risk for PPR for CHF are referred to the MedStar program.

**Data Source:** JPS and MedStar EMRs.

**High Utilization Group**—Enroll 100 of the patients identified by JPS as having used the ED for ACSC services 4 or more times in the past 12 months.

**Patient Count**

**Data Source:** JPS EMRs.

**Milestone 4 Estimated Incentive Payment (maximum amount):**

$1,310,049

**Milestone 5 Estimated Incentive Payment (maximum amount):**

$1,082,215

- Available site, state, county and clinical data including flow patients, cases in a given year by race and ethnicity, number of cases lost to follow-up that required medical treatment, percentage of monolingual patients.

- **Baseline/Goal:**

**For 911 Nurse Triage** – Review 911 call volume records to identify protocol/call types most appropriate for transfer to MedStar Triage Nurse. **Data Source:** MedStar 911 call records, JPS Health Network and MedStar EMR records.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.16.1 – Design, implement, and evaluate a program to provide remote psychiatric consultative services to all participating primary care providers delivering services to patients with mental illness or substance abuse disorders

Unique Project ID: 126675104.2.9
Performing Provider Name/TPI: JPS Health Network / 126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The project will create a virtual psychiatric and clinical guidance service to 1,802 primary care providers in Region 10. The virtual psychiatric and clinical guidance service will allow medical professionals in primary care settings to access - behavioral health professionals (psychiatrists, psychiatric nurses, psychiatric social workers) - via - telephone, - facsimile, and e-mail - who will support PCPs delivering services regionally with the necessary resources and guidance to adequately treat patients who present with a wide variety of behavioral health conditions. This project is a new initiative.

Need for the project: This project addresses the following community needs: a) CN.1 - Lack of provider capacity, b) CN.4 - Lack of access to mental health services, c) CN.5 - Insufficient integration of mental health care in the primary care medical care system, d) CN.7 - Need to address geographic barriers that impede access to care, e) CN.8 - Lack of access to healthcare due to financial barriers, f) CN.10 - Overuse of emergency department (ED) services, and g) CN.11 - Need for more care coordination.

Target population: Primary care physicians in Region 10 who will address behavioral health issues in primary care settings for 9,047 patients (DY2 = 452, DY3 = 1810, DY4 = 2940, DY5 = 3845) and with target population of 1,759 to reach experience identified improvements. Medicaid and the uninsured of our service area will benefit from increased access to behavioral health services within the patient’s medical home setting, increase coordination between primary and behavioral health care providers and increase teamwork and consultations so the patient’s physical and behavioral health issues are treated synergistically.

Category 1 or 2 expected patient benefits:
Milestones P-1.1, P-2.1, P-2.2, P-4.1, P-5.1, P-X1.1, P-X1.2, P-X2.1, PX2.2, P-X2.3, I-7.1, and I-9.1 were selected. Each milestone selected was due to their natural progression to project implementation or a natural result of implementing integrated care components.

Category 3 outcomes: Outcomes IT-1.8 and IT-1.9 were selected. There is an evidence base to suggest that a virtual consultation service will have positive impact on each of those outcome areas.
Project Option 2.16.1 – Design, implement, and evaluate a program to provide remote psychiatric consultative services to all participating primary care providers delivering services to patients with mental illness or substance abuse disorders

Unique Project ID: 126675104.2.9
Performing Provider Name/TPI: JPS Health Network / 126675104

Project Description:
This intervention creates a virtual psychiatric and clinical guidance service available to 1,802 primary care providers in Region 10. The virtual psychiatric and clinical guidance service will provide support to primary care providers delivering services regionally with the necessary resources and guidance to adequately treat patients who present with a wide variety of behavioral health conditions. The support will include, but is not limited to, 1) information and referral assistance, 2) general information about various mental illnesses and tools to assist with determining an appropriate diagnosis, 3) an evidence based center with current research based literature and best practices from multiple sources on behavioral health disorders and topics to be available to medical professionals including guidelines for psychotropic medication indications, diagnosis and symptomology, psychotropic medication administration and monitoring, and appropriate screening, prevention, and interventions in community settings, 4) webinar types of education and training for primary care providers focused on improved identification, diagnosis, and treatment of common behavioral health conditions, and 5) virtual behavioral health guidance consisting of an interdisciplinary consultative team comprised by a psychiatrist, a master’s level psychiatric social worker and a psychiatry nurse who will ensure virtual psychiatric guidance services are available within 30 minutes on a 24-hour basis to primary care providers. The medical professionals in primary care settings - will access professional behavioral health expertise - via telephone, facsimile, and email.

This service will rely heavily upon evidence-based treatment protocols to promote better adherence to evidence-based guidelines for specific behavioral health conditions by primary care physicians. Access to services will allow the medical treatment team to utilize behavioral health expertise in areas including but not limited to: diagnostic impressions, psychiatric medication administration, trajectory and outcomes of mental health diagnoses, cultural considerations relevant to behavioral health treatment, and referral recommendations for ongoing treatment, and behavioral health self-management resources. Interventions for this project include primary care physician, nursing, and case worker support in treatment through education and virtual clinical guidance for behavioral health issues with recommendations from evidence and research based literature and best practices, complicated case reviews, referral recommendations for ongoing treatment, patient and family resource education and suggestions, psychotropic titration, administration, monitoring and ongoing management recommendations. Other interventions will be developed and identified based on primary care provider stated needs and requests.

Goals and Relationship to Regional Goals:
Project Goals:
This project will increase patient access to behavioral health services within the patient’s medical home setting, increase coordination between primary and behavioral health care providers and increase teamwork and consultations between primary and behavioral health care providers so that the patient’s physical and behavioral health issues are treated synergistically. JPS Health Network will Integrate Behavioral Health Capacity into the PCMH Model by assisting primary care providers in delivering high quality, evidence-based psychiatric medication management as appropriate in primary care settings throughout Region 10. Additionally, this project will directly impact multiple community health needs identified below.

This project meets the following Regional goals:
This project addresses the Regional need for more access to behavioral health services and increased coordination between primary care and behavioral health.

Challenges:
Fewer than one-third of patients with a diagnosable mental disorder receive treatment in the mental health system\(^{242}\) and primary care physicians (i.e., family physicians, general internists, and obstetrician-gynecologists) serve as the initial health care provider for between 40% and 60% of individuals with depressive disorders. These statistics explain why 77% of all antidepressant medications are prescribed by primary care providers.\(^{243}\) Additionally, Region 10’s Stakeholder Needs Assessment found that 69% of respondents believed the effectiveness of primary care physician co-managing patients who have both mental health and medical conditions with mental health patients was either somewhat ineffective or very ineffective. In many circumstances, the clear solution is to implement broader care integration across primary care and behavioral health. However, eight of Region 10’s nine counties are federally designated Mental Health Provider Shortage Areas.\(^{244}\) Due to the shortage of mental health providers, traditional integrated care is not an option. This combination of a lack of mental health providers in Region 10 and the common practice for patients with mental health issues to seek treatment in primary care settings requires an innovative intervention.

5-Year Expected Outcome for Provider and Patients:
By the end of the Waiver period, there will be an increase over baseline in adherence to evidence-based guidelines for specific behavioral health conditions and an increase (baseline and target to be established in DY3) in improved provider satisfaction.

Starting Point/Baseline:
JPS Health Network has extensive experience in providing emergency psychiatric services, inpatient psychiatry, and ambulatory behavioral health services. Our partner for this project is UNTHSC Department of Psychiatry, which maintains a core competency in education and

\(^{243}\) Integrated Behavioral Health Project, 2009. “Partners in Health: Primary Care/County Mental Health Collaboration Tool Kit”
\(^{244}\) Professional Shortage Areas (http://hpsafind.hrsa.gov/)
information sharing. Also, JPS Health Network operates a hospital-based consultation/liaison service and an Integrated Medical Unit that provide co-management by an internal medicine physician and psychiatrist for patients with serious medical and psychiatric issues requiring hospitalization. There is no current virtual psychiatric and clinical guidance program throughout Region 10.

**Rationale:**
Despite the high prevalence and substantial impact of depression, detection and treatment in the primary care setting are frequently suboptimal. Studies have shown that usual care by primary care physicians fails to recognize 30% to 50% of depressed patients. Because patients in whom depression goes unrecognized cannot be appropriately treated, systematic screening has been advocated as a means of improving detection, treatment, and outcomes of depression. Compared with usual care, screening for depression can improve outcomes, particularly when screening is coupled with system changes that help ensure adequate treatment and follow-up. This project was selected to address these challenges because of the clear need for additional resources to primary care providers attempting to manage behavioral health issues in their offices. JPS Health Network proposes an innovative approach for more effectively integrating behavioral health capacity into primary care settings in spite of mental health provider shortages throughout our Region.

The category 3 outcomes selected for this project are focused on depression as these were the only options provided in the outcome menu. This project will not be limited to providing support to providers for depressive disorder only but will be available to offer expertise and guidance with multiple symptoms and diagnoses including, but not limited to, Major Depression, Anxiety, Schizophrenia, Schizoaffective Disorder, Bipolar Disorder and others.

**Project Components:**
The proposed intervention is a virtual psychiatric and clinical guidance service to 1,802 primary care providers in Region 10. The virtual psychiatric and clinical guidance service will allow medical professionals in primary care settings to access professional behavioral health expertise (via telephone, facsimile, and email). We have included in our project’s design all core and optional project components because they will serve as basic guideposts and steps to completion for our project implementation plan. Each of these items builds on the previous step to ensure a well-developed project plan. -Required core project components:
Core Component A: We will establish the infrastructure and clinical expertise to provide remote psychiatric consultative services. This will include the expertise and consultative services from an interdisciplinary team with behavioral health experience. The team and infrastructure will be developed during the planning phase of this project and will incorporate the community needs assessment and collaboration from primary care providers to identify their needed and lacking areas of expertise.
Core Component B: We will determine the location of primary care settings with a high number of individuals with behavioral health disorders (mental health and substance abuse) presenting for services, and where ready access to behavioral health expertise is lacking. Identify what expertise primary care providers lack and what they identify as their greatest needs for psychiatric and/or substance abuse treatment consultation via survey or other means.

The project will develop a survey to assess needs in primary care settings as well as utilize the community needs assessment to identify appropriate locations lacking behavioral health expertise and what are their greatest needs.

Core Component C: We will assess applicable models for deployment of virtual psychiatric consultative and clinical guidance models.

During the development and planning of this project models for deployment and clinical guidelines will be evaluated for appropriateness to meet community needs and seek out best practices to adopt.

Core Component D: We will build the infrastructure needed to connect providers to virtual behavioral health consultation. This will consist of an interdisciplinary consultative team by procuring a Psychiatrist, a master’s level psychiatric social worker and a psychiatry nurse.

Core Component E: We will ensure staff administering virtual psychiatric consultative services is available to field communication from medical staff on a 24-hour basis to ensure primary care providers are able to communicate and contact the team and have a response within 30 minutes of a request anytime.

Core Component F: We will identify which medical disciplines within primary care settings (nursing, nursing assistants, pharmacists, primary care physicians, etc.) could benefit from remote psychiatric consultation. We are beginning with an assumption that psychiatric consultation can benefit the primary care physicians, case workers, nursing, and nursing assistants. Other disciplines may be identified throughout the implementation of the project.

Core Component G: We will provide outreach to medical disciplines in primary care settings that are in need of telephonic behavioral health expertise and communicate a clear protocol on how to access these services. This will occur in the pre-operational phase where a specific protocol will with contact information and guidelines will be created with contact information to ensure efficient access to services is achieved.

Core Component H: We will identify clinical code modifiers and/or modify electronic health record data systems to allow for documenting the use of telephonic behavioral health consultation. In doing so, we will evaluate multiple opportunities and methods of documentation and electronic record keeping ensuring occurrences of consultation are captured and documented appropriately. We will also seek out best practices from similarly established and existing services in the nation to develop a documentation practice for this program.

Core Component I: We will develop and implement data collection and reporting standards for remotely delivered behavioral health consultative services. In doing so, we will evaluate
multiple methods of data collection and develop and implement a reporting system to accurately reflect unique and significant data from consultation services and occurrences.

Core Component J: We will review the intervention(s) impact on access to telephonic psychiatric consults and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. Review of interventions, lessons learned, and expansion will be ongoing through our CQI activity managed with milestone P-5.1. We will also assess progress, further community and provider needs, constraints and limitations, and challenges to expansion.

Core Component K: We will develop a database or information resource center for behavioral health professionals to ensure appropriate research based interventions are being communicated to providers. There will be a resource database or information resource center for behavioral health professionals to ensure appropriate and current research based interventions and best practices from multiple sources are available and communicated to providers.

Core Component L: We will develop or adapt best practice resources and research based literature to medical professions on a range of behavioral health topics that frequently occur in primary care settings (including guidelines for best practices for administration of psychotropic medications for all of the most common mental health conditions and monitoring of these medications).

Additionally, we will create a database or center with current research based literature and best practices from multiple sources on behavioral health disorders and topics to be available to medical professionals including guidelines for psychotropic medication indications, diagnosis and symptomology, psychotropic medication administration and monitoring, and appropriate screening, prevention, and interventions in community settings.

- **Unique community need identification numbers the project addresses:**
  - **CN.1** – Lack of provider capacity. Patients find difficulty in navigating the system and have noted the difficulty in finding a provider, particularly Medicaid providers. Five counties recognized as medically underserved areas.
  - **CN.4** – Lack of access to mental health services. All but one county in Region 10 are recognized as Health Professional Shortage Areas for mental health providers.
  - **CN.5** – Insufficient integration of mental health care in the primary care medical care system. Community stakeholders cite a need to achieve better integration of primary care and mental health care services in the primary care setting through heightened awareness of medical models for mental health integration.
  - **CN.7** – Need to address geographic barriers that impede access to care. There is a skewed distribution of providers in Region 10, with most located in the major urban centers,
particularly Fort Worth, Tarrant County. Individuals from rural counties have difficulty with access to care, especially specialty care.

- CN.8 – Lack of access to health care due to financial barriers (i.e., lack of affordable care). Providers overwhelmingly list lack of coverage/financial hardship as a major barrier for low-income patients.
- CN.10 – Overuse of emergency department (ED) services. Demand for ED visits is on the rise and EDs are becoming overcrowded due to reduced inpatient capacity and impaired patient flow. As a Region, there were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1,000 persons. The 2007 national ED visit rate was 390.5 per 1,000 persons, increasing 23% since 1997, but lower than the ED visit rate of Region 10.
- CN.11 – Need for more care coordination. All Region 10 counties identified it as a need. Barriers include complexity of coordination, lack of staff, lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: This is a new initiative for Regional 10 and we have received no other funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:

IT-1.8 Depression management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134) was selected because CMS has stated the evidence is adequate to conclude that screening for depression in adults, which is recommended with a grade of B by the U.S. Preventive Services Task Force (USPSTF), is reasonable and necessary for the prevention or early detection of illness or disability, and is appropriate for individuals entitled to benefits under Part A or enrolled under Part B.245 Despite the high prevalence and substantial impact of depression, detection and treatment in the primary care setting have been suboptimal. Studies have shown that during usual care by primary care, depression goes unrecognized and cannot be appropriately treated. Systematic screening has been advocated as a means of improving detection, treatment, and outcomes of depression. Compared with usual care, screening for depression can improve outcomes, particularly when screening is coupled with system changes that help ensure adequate treatment and follow-up. The virtual psychiatric and clinical guidance

245 Centers for Medicare and Medicaid Services (CMS) http://www.cms.gov/medicare-coverage-database/details/nca-proposed-decision-memo.aspx?&NcaName=Screening%2520for%2520Depression%2520in%2520Adults&bc=ACAAAAAAIAAA A&NCAId=251.
service should improve on the depression screening and the effectiveness of follow-up plans as well as treatment.

(NEW) IT-1.9 Depression management: Depression Remission at 12 Months (NQF# 0710) was selected because CMS has stated the evidence is adequate to conclude that screening for depression in adults, which is recommended with a grade of B by the U.S. Preventive Services Task Force (USPSTF), is reasonable and necessary for the prevention or early detection of illness or disability, and is appropriate for individuals entitled to benefits under Part A or enrolled under Part B. Primary care providers (PCPs) tend to be the first (and often last) stop for services for individuals with mental illness and substance use disorders. Indeed, more than one-third of all patients rely solely on PCPs to treat psychiatric disorders. These individuals may have medical conditions that are created or exacerbated by untreated or undertreated mental illness and substance abuse. This trend means PCPs should have adequate resources and expertise to treat behavioral health conditions. Treating behavioral health conditions during a PCP visit reduces the chances of losing the patient during the referral process. The goal of this project is to provide PCPs delivering services Regionally with the necessary resources and guidance to adequately treat patients who present with behavioral health conditions. Clinical guidance will be provided remotely via the following communication methods: telephone, instant message, videoconference, facsimile, and email. Access to these services will allow the medical treatment team to utilize behavioral health expertise in areas including, but not limited to: diagnostic impressions, psychiatric medication administration, trajectory and outcomes of mental health diagnoses, cultural considerations relevant to behavioral health treatment, and referral recommendations for ongoing treatment, and behavioral health self-management resources. PCPs will increase their knowledge base about behavioral health conditions while also having quick access to cutting edge and research based behavioral health interventions over several communication methods. This effort will bridge the often disparate disciplines of behavioral and physical health, providing better outcomes for patients who increasingly rely on primary care settings for treatment of their behavioral health conditions. As such we will utilize the Patient Health Questionnaire (PHQ-9) tool because it is a widely accepted, standardized tool that is completed by the patient, ideally at each visit, and utilized by the provider to monitor treatment progress. This measure additionally promotes ongoing contact between the patient and provider as patients who do not have a follow-up PHQ-9 score at 12.

The PHQ-9 will be used to assist with integrated behavioral health as well as in remote settings to assist primary care providers in early detection, prevention, symptomology, and rating severity of depression. It will used to assist primary care providers in delivering care and will be used in conjunction with consultative services to educate primary care providers and increase their base knowledge and expertise in the treatment of depression.

---

Relationship to Other Projects:  
This project will work in tandem with, and be a resource for, the JPS Health Network project 126675104.2.6 – Design, implement, and evaluate projects that provide integrated primary and behavioral health care services

This project is related to RD-1.3 Potentially preventable admissions Behavioral Health and Substance Abuse Admission rate (based on other selected PPA primary diagnoses). This reporting measure was selected because it is anticipated this project will reduce potentially preventable admissions by behavioral health patients for medical conditions by improving the care and adherence to treatment recommendations through virtual psychiatric and clinical guidance.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:  
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:  
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

JPS Health Network defined the population that will be directly impacted by the project as primary care physicians in Region 10 who will potentially address behavioral health issue in primary care settings. The percentage of the population expected to be positively impacted by the project is 26%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her quality of care is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number
because when a person is positively impacted, the coordination of care in the community is greatly increased.

Specifically, 9,047 patients (DY2 = 452, DY3 = 1810, DY4 = 2940, DY5 = 3845) receiving care from primary care providers will be positively impacted in the following quantifiable ways:

- Increase use of evidence-based treatment protocols and adherence to evidence-based guidelines for specific behavioral health conditions (these conditions could include schizophrenia, autism, bipolar depression, etc.) by primary care physicians by 10% over life of project.
- Percentage of Primary Care Providers reporting improved satisfaction with virtual psychiatric consultative services by 10% over life of project.
- Increase in patient’s screened for clinical depression using a standardized tool AND follow-up plan is documented by a percentage to be determined in DY3.
- Improved percentage of patients who have depression remission at 12 months by a percentage to be determined in DY3.

Project Option 2.12.1 – Implement/Expand Care Transitions Programs: Community Connect-
Transitioning Care/Continuity of Care with non- JPS Health Network Clinics

Unique Project ID: 126675104.2.10

Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and
primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a
population of approximately 1.8 million residents. As one of Texas’ major urban public
hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant
County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals
make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering
a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only
acute psychiatric care facility.

Intervention: This project will increase access to primary and specialty care services, and
improve quality outcomes for the residually uninsured Tarrant County residents through care
coordinators, expanded primary care and specialty services, and improved information sharing
with JPS Health Network collaborative partners. The project will also improve care transitions
to identify and navigate patients at risk for reducing potentially preventable emergency
department (ED) visits and hospital re-admissions to more appropriate and effective settings.
This project is a new initiative. Currently care for the residually uninsured in Tarrant County is
provided in the ED, Federally Qualified Health Care (FQHC), charitable clinics, and urgent care
centers are fragmented and not shared across the continuum, or this target population does not
currently have access to primary care and specialty services.

Need for the project: Tarrant County has 36,000 residually uninsured residents. Further, the
state’s population is growing rapidly placing additional demands on a system that is already
underserving the residually uninsured due to shortages of primary and specialty care providers.

Target population: This project will serve 5,000 unduplicated patients during the reporting
period. The target population includes the residually uninsured patients that are currently
utilizing the ED or urgent care for their primary care needs or do not currently have access to
primary care providers.

Expected patient benefits: Coordinating care and increasing access to primary and specialty
care services will improve health care outcomes; and in return reduce expenditures by Medicaid
through reduced ED visits and hospital re-admissions.

Category 1 or 2 expected patient benefits: This project will serve 5,000 unduplicated patients
during the reporting period (DY3-1,000, DY4-2,000, and DY5-2,000).

Category 3 outcomes: IT1-10: Diabetes Care (HbA1c Poor Control) and IT-9.2: ED
appropriate Utilization: Our goal is to improve the overall health of the residually underinsured
patients identified as having HbA1c in poor control by 10% in DY4 and 15% in DY5; and
reducing ED visits by 10% in DY4 and 15% in DY5.
**Project Option 2.12.1 – Implement/Expand Care Transitions Programs: Community Connecting Care/Continuity of Care with non-JPS Health Network Clinics**

**Unique Project ID:** 126675104.2.10

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Project Description:**
The Transition Care/Continuity of Care Program will transform health care delivery for some of our area’s most disadvantaged residents by better coordinating care and creating more health services resources for those who will remain residually uninsured even after possible future reform-related coverage expansions. To meet the needs of this population, JPS Health Network will strengthen its existing collaborative relationships with North Texas Area Community Health Center Inc. (NTACHC), MedStar, and Project Access of Tarrant County (PACT) (an all volunteer physician program founded by the Tarrant County Medical Society and with grant funding from The Amon G. Carter Foundation, The Sid W. Richardson Foundation and The Martha Sue Parr Trust. We propose to develop a multisystem approach to providing needed care for the residually uninsured that incorporates JPS Health Network resources (including a project manager, patient navigators, and care coordinators) works to strengthen our safety net provider partners (NTACHC), identified charitable clinic partners and/or PACT. -This project will focus to develop and maintain IT systems information processes across the - identified entities to facilitate better patient tracking and outcomes monitoring. This project will also provide for additional primary care services, maintain effective recruitment efforts for generating adequate staffing of volunteer specialists, and improved data sharing capabilities across the continuum. This program will enable us to educate the residually uninsured residents of our county about their non-emergency care options (such as MedStar Patient Navigators) and to help them receive a referral to NTACHC Patient-centered Medical Home; and/or Project Access of Tarrant County for coordination of specialty care, transportation, or translation services. The program will link patients and their families with the appropriate resources and ensure better access to primary and specialty care and other needed services for this population within the Tarrant County Community Collaborative partnership. This project will offer assistance in navigating the health care system, educate residually uninsured residents about their care options, and encourage continuity of care and better outcomes monitoring through a shared information system, and reduce inappropriate reliance on the ED as the primary care provider of last resort.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
During the Waiver period, JPS Health Network will build on its existing collaborative partnership within the Tarrant County health care community to assist the low-income individuals who don’t qualify for health insurance by facilitating access to appropriate services. The partnership will focus on placing these patients into a medical home at NTACHC and/or PACT and providing additional resources to NTACHC and PACT to improve access to
preventive care, self education, and chronic disease management for residually uninsured residents of Tarrant County. We propose to develop an information sharing system among all collaborative partners to ensure providers receive discharge information on our mutual patients and create continuity of care beyond JPS Health Network. Working with our collaborative partners to assist them in placing the patients into a Patient-Centered Medical Home to care for their chronic conditions such as hypertension (HTN) and hemoglobin A1c (HbA1c) (listed as top contributors for frequent emergency department visits and admissions which can be preventable when managed by a primary care physician on a regular basis) will lead to improved quality outcomes, and reduced emergency department visits and preventable admissions to the hospital, therefore, reducing the overall health care costs to the community for this very underserved population.

This project meets the following Regional goals:
This project meets a number of Regional goals, all of which are aligned with the goals of the Waiver and The Institute for Healthcare Improvement’s triple aim. Specifically, through better care coordination along with increased access to primary and specialty care, we will improve quality outcomes for low-income and uninsured Tarrant County residents. In addition, the project will contribute to reducing frequent ED visits, and readmissions for preventable conditions.

Challenges:
Low-income individuals who don’t qualify for public health insurance programs and without other affordable coverage options struggle to access outpatient services in our community and will continue to do so even with public program expansions. This problem is growing because of our Region’s steady and rapid population growth and a chronic Regional shortage of primary and specialty care for low-income individuals.

JPS Health Network and its partners throughout Tarrant County recognize that they provide fragmented care for low-income residents who don’t qualify for health insurance and that only expanded resource sharing, newly strengthened collaboration efforts, and an increased focus on data sharing and data measurement will improve this underserved population’s access to appropriate care. JPS Health Network and its collaborative partners are dedicated to serving Tarrant County’s uninsured population. This project will overcome the fragmented information problem by developing a JPS Health Network -based team to develop a shared information system and data monitoring approach. This collaborative approach under JPS Health Network project leadership will improve our Regional health care system for those individuals who receive hospitalization through JPS Health Network and other services through NTACHC and PATC.

5-Year Expected Outcome for Provider and Patients:
This project will serve 5,000 unduplicated patients by the end of the Waiver period. The project will reduce the number of ED admissions by 15% from established baseline and will reduce the number of patients with HbA1c in poor control by 15% from established baseline in year five. It will also promote improved outcomes for patients with chronic conditions (to be measured through Patient-Centered Medical Home and meaningful use guidelines).

**Starting Point/Baseline:**
Our two safety net provider partners—NTACHC and PATC—both report useful starting points for developing accurate baseline. Since beginning to provide primary care services in September 2005, NTACHC reports a total of 23,293 primary care encounters. Project Access (PATC), which started in September 2011, has provided 700 volunteer hours of specialty care services. We anticipate using information from these two providers as baseline and we expect to refine our project numbers after implementation.

**Rationale:**
Texas has among the nation’s highest rates of low-income residents who don’t qualify for public health care coverage. Further, the state’s population is growing twice as fast as the national average, placing additional demands on a system that is already shortchanging the uninsured. JPS Health Network is committed to developing a Regional solution to better meeting the health care needs of residents who don’t qualify for public programs by helping to reduce system information fragmentation and improving its existing partnerships with other county safety net providers. Only a carefully designed and shared approach will enable us to ensure the right care for every uninsured low-income person every time, including those with chronic conditions. Further, identifying and facilitating care for our low-income residents who will remain residually uninsured, combined with developing a system to share information among stakeholders, is the best way for us to work to reduce repeat visits to the ED and/or admissions to the hospital and improve longer term patient outcomes. *(See JPS Health Network, Transforming Health Care Together, [http://www.transforminghealthcare.com](http://www.transforminghealthcare.com); The Tarrant County BRFSS, 2009/2010, [www.unitedwaytarrantcounty.org](http://www.unitedwaytarrantcounty.org)).*

**Rationale Outcomes Selected and Why:**

“Texas is the uninsured capital of the United States. More than 6.3 million Texans—including 1.2 million children—lack health insurance. Texas’ uninsured rates, 1.5 to 2 times the national average, create significant problems in the financing and delivery of health care to all Texans. Those who lack insurance coverage typically enjoy far-worse health status than their uninsured counterparts. *(See Texas Medical Society: The Uninsured in Texas, [http://www.texmed.org](http://www.texmed.org)).*

With the current uninsured population in Tarrant County at 480,951, and the lack of care coordination for those seeking services outside of JPS, and/or increased utilization of the emergency room for avoidable conditions the following outcomes were selected:
IT 9.2 ED appropriate utilization:

As a Region, there were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1,000 persons. Data from July 2011 through June 2012 reveals that 59.27% of current ED admissions to JPS were potentially unnecessary visits. Under this program we will reduce the number of unnecessary ED visits through care coordination and increased access to primary care and specialty care (utilizing a physician recruiter to increase volunteer service hours) with the projects collaborative partners.

IT-1.10 Diabetes care: HbA1c-poor control:

In 2007, an estimated 7.8 percent of the United States population suffered from diabetes with 1.6 million new cases of diabetes diagnosed that year. Additionally, diabetes-related complications rank as the seventh leading cause of death in the United States as well as Tarrant County.”

“When untreated or under-treated, diabetes can contribute to increases in heart disease and stroke, high blood pressure, vision problems, kidney and nervous system diseases, amputation, and periodontal diseases. Experts approximate that diabetes cost the United States population more than $170 billion in 2007 due to medical expenditures, days of lost hospitalizations involving diabetes short-term and long-term complications cost residents over $240 million.”  

Under this program we will work to reduce HbA1c in poor control using current HEDIS measures. The impact to these patients can result in a reduction of preventable disease, and ED visits. Currently with programs goal to increase diabetic services to 500 patients by DY5 with at starting base line at the 50th percentile of diabetic patients whose HbA1c is >9% a reduction 10% from established baseline by DY4 (Anticipated impact 22 patients); and a reduction in baseline by 15% in DY5 (Anticipated impact 32 patients).

Project Components:

- Project components were selected based on evidence linking poor or inadequate care transitions for low-income patients unable to qualify for health insurance with increased ED visits and preventable admission. Specifically, our approach includes:
  - Utilization of HEDIS best practices for reducing recurrent ED visits.
  - Analysis of key drivers of 30-day hospital readmissions using a chart review tool and patient interviews.
  - Integrating information systems to facilitate continuity of care.
  - Developing a system to identify patients being discharged who are at risk of needing acute care services within 30-60 days.
  - Implementing discharge planning and support.
  - Developing a cross-continuum team which may include but is not limited to clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers, and home care providers.
• Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

In DY2, the Transition Care/Continuity of Care program will engage community resources, determine/refine baseline rates, and develop and test data systems. In DY3, we will develop staffing and an implementation plan to provide primary care and support services for the residually uninsured who frequent the emergency department. A PDSA cycle will be performed to test changes. In DYs 4-5, milestones will identify reductions in ED usage, and will focus to identify patients with top chronic conditions and other patient characteristics of socioeconomic factors that are common causes of avoidable ED use from the baseline. Taken together, these milestones represent how care coordinators and patient navigators will help manage transitions to improve health and decrease costs.

Unique community need identification numbers the project addresses:
- CN.1 – Lack of provider capacity
- CN.3 – Shortage of specialty care
- CN.8 – Lack of access to health care due to financial barriers
- CN.10 – Overuse of ED services
- CN.11 – Need more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This is a new initiative and we are not receiving any other federal funding.

Related Category 3 Outcome Measures:
IT-1.10- Diabetes Care: HbA1c Poor Control
IT-9.2: ED appropriate Utilization

Relationship to Other Projects:
The MedStar Navigator program (126675104.2.-8) enters the patient into a system which monitors their calls to 911. The patient is triaged based on protocols to determine whether a visit from a paramedic or transportation to the ED is indicated. These new initiatives will focus on navigating care to appropriate facilities, while reducing ED visits, and preventable admission to JPS Health Network.

RD-1(2.ii) Uncontrolled Diabetes- Diabetes is the seventh leading cause of death in the U.S. and Tarrant County; and contributes to several diabetes-related conditions at the top of the list of
preventable hospitalizations in Tarrant County.247 Placing these patients into an FQHC-based medical home to improve their quality outcomes will decrease frequent ED visits, and readmissions at JPS Health Network.

**RD-2.7 All-Cause: 30-day Readmission**– Almost 80,000 potentially preventable hospitalizations in Tarrant County over the five-year period in 2006-2010 cost an estimated $2.2

By increasing access to primary care providers for this residually uninsured low-income population, we anticipate a measurable reduction in preventable readmissions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaborative along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as the underserved population in Tarrant County, specifically the diabetic unduplicated patients who are low-income, uninsured, and ineligible for public programs. The percentage of the population expected to be positively impacted by the project is 15%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or her quality of life is not significantly improved. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, - increased access to emergent care will be available for other members of the community through a reduced ED utilization of the specific target population for this project.

#### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1 [P-4]**: Conduct an assessment and establish linkages between community-based organizations to create a support network for targeted patients postdischarge: Conduct an assessment and establish linkages between community-based organizations to create a support network for targeted patients postdischarge.  

**Metric 1 [P-4.1]**: Care transition assessment: Submission of care transitions assessment and resource planning documents: Review each organizations role supporting low income population who don’t qualify for health insurance patients postdischarge:  

- Baseline/Goal: Conduct an assessment and establish linkages within Tarrant County to create a support net work for the low income uninsured population within Tarrant  

**Milestone 3 [P-2]**: Implement standardized care transition processes: Create and Implement a standardized transition processes for all organizations listed above-JPS, FQHC, PACT, MedStar, and Catholic Charities.  

**Metric 1 [P-2.1]**: Care Transitions policies and procedures: Develop policies and procedures  

- Submission of protocols: Develop protocols for care coordinators and patient navigators for the low income population without insurance  

- Baseline/Goal: Develop policies and procedures for care transitions program.  

- Data Source: Policies and procedures of care transitions program materials: Develop policies and procedures for each organization listed above  

**Milestone 3 Estimated Incentive Payment:** $1,093,251  

#### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 5 [I-10]**: Identify the top chronic conditions and other patient characteristics or socioeconomic factors that are common cause of avoidable readmissions.  

**Metric 1 [I-10.1]**: Identification and report of those conditions, socioeconomic factors, or other patient characteristics resulting in the highest readmission rates.  

- Goal: Enroll 2,000 new unduplicated patients of low income population into the program (3,000 patients in total by end of DY4).  

- Data Source: EPIC (EMR), NextGen (EMR), and DyaWeb (Diabetic Management System)  

**Milestone 5 Estimated Incentive Payment:** $1,093,251  

#### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 6 [I-10]**: Identify the top chronic conditions and other patient characteristics or socioeconomic factors that are common cause of avoidable readmissions.  

**Metric 1 [I-10.1]**: Identification and report of those conditions, socioeconomic factors, or other patient characteristics resulting in the highest readmission rates.  

- Goal: Enroll 2,000 new unduplicated patients of low income population into the program (5,000 patients in total by end of DY5).  

- Data Source: EPIC (EMR), NextGen (EMR), and DyaWeb (Diabetic Management System)  

**Milestone 6 Estimated Incentive Payment:** $903,121

Regional Healthcare Partnership

Project Option 2.4.1 – Redesign to Improve the Patient Experience 126675104 – Program Innovation and Redesign

Unique Project ID: 126675104.2.11
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: This project will develop a patient experience focus within JPS Health Network. This project represents a new initiative.

Need for the project: Patient perception scores are especially low for the Network and a focused effort will be needed to make more than incremental movement.

Target population: Patients and their families accessing care in the JPS Health Network. Estimated - 124,000 patients and their family members will be served over each year - of waiver period. There were 124,000 unique patients seen in the specialty and primary care clinics in FY2011. Currently between 25-50 patients per week are newly enrolled in the Connection program and have access to the JPS network adding an additional 2500 new patients per year to the program. Each of these patients and members of their family will potentially be impacted by this program. In addition, the network provided care for 100,000 additional unique patients via the Emergency Department, Urgent Care, our psychiatry programs or inpatient admissions.

Expected patient benefits: The project will improve quality of care received by those members of our community that have little choice in their healthcare provider. Improvement efforts will be determined by survey results but will likely focus largely on access to the right care at the right time. Current survey results are especially low in the domain of “moving through the visit”. This domain measures delays and information about delays in the coordination of care. With focused improvement efforts, patients and families visiting the network will experience improvement in communication, efficiency and quality. The targeted domains are access to timely care, appointment, and information, provider communication, access to specialty care, patient’s involvement in shared decision making and patient’s overall health status. While the outcomes of this project are primarily targeted to patients visiting our outpatient clinics, there will be benefits for all patients as the project requires an overall strategy for patient experience improvement.

Category 1 or 2 expected patient benefits: Milestones include aligning the patient experience under the oversight of one executive with the establishment of a steering committee, enhanced employee training and integration of patient experience into performance measurement. A strategic plan will be developed.
**Category 3 outcomes:** Category 3 IT-6.1 measures are related to improving patient experience scores on a nationally recognized tool. In year DY4 the planned activities are expected to increase topbox scores by 5%. In DY5, the planned activities are expected to increase topbox scores by 10%.

**Project Option 2.4.- 1– Redesign to Improve the Patient Experience 126675104 – Program Innovation and Redesign**

**Unique Project ID: 126675104.2.11**

**Performing Provider Name/TPI: JPS Health Network/126675104**

**Project Description:**
JPS Health Network will develop a patient experience focus within the organization, starting at the top by appointing an executive dedicated to improving the patient experience throughout the organization with a multipronged strategy:

**Shared organizational vision –** A dedicated leader, steering committee and development and adoption of a strategic patient experience plan will allow for a single shared vision. A patient experience team will be commissioned. Staffing in the Office of the Patient and Family Experience will be increased.

**Increased staff training –** The patient experience team will provide more focused patient experience training by building competency in patient and family centered principles and culturally competent care. Using both external and internal resources, the Patient Experience Team will provide on-site, unit-based coaching directed toward improving the patient experience. Internal change agents will be identified, trained and allocated to target areas to lead patient experience training and focused projects at each site. Team members will be trained using LEAN tools, methods and approaches. Expertise will be developed in reducing operational waste and improving efficiency by focusing on value-added activities that improve patient satisfaction and quality of care across the health care system.

**Site Specific Leadership and Surveying –** The CAHPS tools will be utilized to survey patient experience. Physician/staff/administration and community partnerships will be developed at each target area/site to focus on needed improvement domains. Patient experience leadership competency will be developed, recognized and rewarded.

248 http://www.ipfcc.org
249 http://www.lean.org
Shared Lessons Learned – The Patient Experience Team will catalog and share lessons learned from each project as well as coordinate action planning to corroborate and implement best practice across the network.

Listen to the Patient’s Voice – The Patient and Family Advisory Council (currently in its infancy) will be expanded to ensure that the voice of the patient is represented in all process improvement initiatives across the network.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to improve patient experience of care by developing organizational competency in patient and family centered care as defined by the Patient and Family Centered Care Collaborative. A successful project will improve coordination of care across the district thereby improving health and patient/family satisfaction. By better focusing on and understanding how patient experience could be improved, JPS Health Network will be better able to implement community-based delivery system improvement actions.

As noted above, the organization will appoint an executive responsible for the patient experience, assess and recruit both internal and external talent to build a Patient Experience Team. At least 4.0 FTEs with LEAN training and health care experience will be hired to provide immediate expertise while competency is developed across the organization. Additionally, patient and family centered education will be incorporated in the New Employee Orientation experience, expanded to existing employees as a component of annual required training and reinforced as part of daily huddles. The patient experience outcomes as measured by CAHPS survey tools will be added to management performance to ensure accountability with cultural change. Outcomes will be displayed and transparent across the organization to ensure a continued focus on improvement. All improvement teams will include patients and their family members. The end goal will be to develop a sustainable model of process improvement that will continue to increase patient satisfaction and improve coordination of care across the continuum.

This project meets the following Regional goals:
A major goal of the Region is to pursue the triple aim of health care by improving patient experience of care, improve health of populations and reduce the cost of health care. Redesigning the patient experience at the largest safety net hospital in the Region will impact the health of our community by keeping patients engaged in the health care system.

Challenges:
JPS Health Network patient experience scores need significant improvement. Overall perception of care averaged across all ambulatory practice sites has remained below the 10th percentile for the current fiscal year as measured by Press Ganey patient satisfaction surveys. Areas with
lowest mean scores include: ease of getting clinic on the phone, ease of scheduling appointments, wait times and sensitivity to patient needs. Incremental progress has not been sustainable pointing to a need for improving operational efficiency and customer service competency across the network. There is great variability in processes which causes great difficulty for our patients trying to navigate a network of 47 clinic sites. In reviewing the year’s focused activities related to patient satisfaction, JPS Health Network believes that part of the reason for its inability to improve patient experience scores is the lack of a dedicated, organization-wide patient experience focus.

In looking around the organization, there is very little experience or expertise in LEAN principles. The organization has been teaching the Model for Improvement (Plan-Do-Study-Act, or PDSA) to willing volunteers for about the past two years. This training has resulted in some small improvements within units or departments but there has been little organization-wide momentum. Under the direction of the Patient Experience Steering Committee resources will be prioritized and efforts directed toward improving the patient experience. The Steering Committee will provide a governance structure for directing and implementing change such that efforts are not duplicated or wasted and are aligned with other strategic priorities for the organization.

The selection of the project was precipitated by the need for transformative change in the delivery system that will impact the health of our patients. Programs intended to improve patient health outcomes and not perceived as meaningful by those directly impacted will fail to produce the intended results. Patient, provider and employee engagement is key to the success of all of the improvement projects.

5-Year Expected Outcome for Provider and Patients:
Our five year goal is to increase patient satisfaction scores in the selected domains. Using the top box score as the baseline, JPS Health Network expects to increase our patient satisfaction scores by 10% over the Waiver period specifically for the ambulatory survey.

Starting Point/Baseline:
In hospital fiscal year 2011, there were 224,000 unique patients that visited our hospital system. A sample of these patients received a survey of patient experience in that same year. A subset of the population with an inpatient visit received the HCAHPS tool. The CGCAHPS tool has only been used in a pilot form in the outpatient primary care and specialty clinics. The organization plans to implement a recognized CGCAHPS tool in FY 2013.

Rationale:

Patient experience scores are pulled from Press Ganey and shared transparently throughout the organization at various committees with little coordination. Without a specific leadership focus, all efforts to improve are diluted by the many other operational priorities of a large health care organization. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization’s resolve to get better and stay better. Improvement targets like those selected for our project have been very successful at other institutions such as Virginia Mason and Denver Health.\textsuperscript{252,253}

Our milestones measure the development and integration of a patient experience plan into all areas of the organization including employee training, performance measurement and policy changes. The milestones also measure the ongoing communication of all patient experience improvement projects ensuring that patient experience data is transparent to the organization and the community. The combination of these improvement milestones will impact the overall patient perception of care in the organization and increase patient satisfaction using the CAHPS tool.

**Project Components:**

Our project contains all of the core components with one noted exception:

- We will not develop a process to certify independent survey vendors to administer the patient experience survey. We will be using a nationally recognized vendor, Press Ganey (we may change our survey vendor).

The project does include the following core elements:

- Organizational integration and prioritization of patient experience
- Data and performance measurement will be collected by utilizing patient experience of care measures from the HCAHPS in addition to CAHPS
- Process improvement to improve patient’s experience in getting through to the clinical practice

**Unique community need identification numbers the project addresses:**

- CN.1 – Lack of provider capacity
- CN.10 – Overuse of the emergency department services
- CN.11 – Need for more care coordination
- CN.12 – Need for more culturally competent care to address unmet needs

\textsuperscript{252} Kenney C. Transforming Health Care: Virginia Mason Medical Center’s Pursuit of the Perfect Patient Relationship, Productivity Press, 2011

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:
Outcome Measure 1: IT-6.1: Increase patient satisfaction scores
By the end of the Waiver, our goal is to increase patient satisfaction for CGCAHPS identified domain targets by 10% of the top box percentage points over baseline.

Relationship to Other Projects:
This project is aligned with other projects that improve the patient experience by providing high-quality health care at every touch. The projects that are most closely aligned are: 126675104.2.2 (Enhance/expand medical homes), 126675104.1.3 (Expand/enhance specialty care) 126675104.1.2 (Enhancing urgent medical advice) and 126675104.2.5 (Enhancing care transitions). There is a small overlap in population outcomes for Category 3 with the following projects: 126675104.2.4 (CHF). Each of the two projects measure patient satisfaction IT 6.1. There are 263 patients targeted in the CHF project and a subset of patients with asthma and obesity/diabetes in the school-based project.
This project is aligned with RD 4 which is designed to improve patient satisfaction in the inpatient setting. While the call center is directed toward the outpatient population, those patients transitioning from inpatient care to outpatient primary or specialty care will be directed to the call center for 24/7 nurse advice.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
JPS Health Network defined the population that will be directly impacted by the project as all patients and family members who utilize JPS Health Network hospital system. The percentage of the population expected to be positively impacted by the project is 10%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.8.11 – Sepsis

Unique Project ID: 126675104.2.12
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The purpose of the project is to implement an evidence-based early detection and treatment plan for patients presenting in the ED with sepsis; the intended outcome of the project is to reduce the mortality rate associated with sepsis. JPS’ goal is to improve the reliability with the identification and application of the Sepsis Management and Resuscitation Bundles for patients who meet the specified criteria in the ED. A 24 hour – 7 days/week “Sepsis Response” team comprised of an intensivist, critical care nurse and other clinicians will increase consistency in initiating and complying with the bundle, decrease - variation in diagnosis and management, the complications and mortality rates and result in better overall outcomes for our patients.

Continuous quality improvement e.g. Rapid Cycle PDSA, Six Sigma, Lean will be utilized to drive improvement and sustain the gains. This is a new initiative.

Need for the project: During the baseline period 2011, 192 ED patients were diagnosed with Sepsis- The compliance with Sepsis Identification and Management Bundle was less than 35% (67 patients received perfect sepsis care) and the mortality rate was 20% (37 patients expired). The average ICU LOS for patients with a primary diagnosis of sepsis was 5.33 days and all other patients was 4.27 days.

Target population: The target population for this projects includes patients with a diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl). In 2011, 192 patients met criteria for goal directed therapy, estimated to be one third of the target population (patients presenting to the ED with infection related conditions). The target population estimated at 576 annually (1728 target population spanning waiver period) will be screened on entry to the ED, of those 60%/345 is estimated will meet criteria for goal directed therapy.

Expected patient benefits: Early recognition and activation of the Sepsis Bundle is effective in arrestsing the development of complications, such as end organ failure and death. JPS anticipates reducing mortality from 20% to 12%, this represents 15(192/2011 goal directed therapy candidates) or 28 (345 goal directed therapy candidates projected with improved sepsis identification and response)saved lives over the waiver period.

Category 1 or 2 expected patient benefits: The Sepsis Resuscitation and Management milestones includes the formation of an improvement plan with key stakeholders (ED, ICU,
Regional Healthcare Partnership

The plan addresses engagement of stakeholders, gaining an understanding the current state, areas of the variation, resources, baselines, roles and responsibilities, expectations, process and outcome measure definitions, etc. Continuous quality improvement e.g. Rapid Cycle PDSA, Six Sigma, Lean will be utilized to drive improvement and sustain the gains.

**Category 3 outcome:** IT-4.9 ICU Length of stay

**Project Option 2.8.11 – Sepsis**

**Unique Project ID:** 126675104.2.12  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Project Description:**
When sepsis remains undetected for any period of time, the likelihood of complications and increased mortality rises rapidly. This project will implement an evidence-based early detection and treatment plan for patients presenting in the ED with sepsis. In order for JPS Health Network to effectively improve the health outcomes of this population, this project will:

- Fully develop the multidisciplinary Code Sepsis Team and provide the team with a common knowledge base to identify early on and treat patients who present with sepsis in order to achieve a greater than 95% compliance with the sepsis resuscitation and management bundles to improve patient outcomes. By Y5, based on the estimated 345 patients, we will correctly diagnose and manage 293/85% using the six hour sepsis bundle. Goal directed therapy will enable us to move from a 20% (69 deaths) to 12%(41 deaths). This represents 28 saved lives.
- Standardize the process and outcome definitions;
- Effectively and fully implement the measurement and reporting system supporting compliance with sepsis resuscitation and management bundles, including establishing baseline data, initiating process improvement, and developing and implementing evidence-based order sets;
- Hire a Sepsis Coordinator and clinical analyst to hardwire the coordination of continuous improvement (and we are considering adding biomarkers within the ED; and
- Partner with and expand Emergency Medical Services’ Medical Emergency Team (MET) that provides coverage for sepsis alerts to improve the delivery of care to patients with suspected infection; 24-hour -7 day per week coverage sepsis response will require 2.5 critical care nurses.

The target population for this projects includes patients with a diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl).

**Goals and Relationship to Regional Goals:**
Project Goals:
JPS Health Network’s goal is to improve reliability of the identification and application of the sepsis management and resuscitation bundles for patients who meet the specified criteria in the ED. By decreasing variation in diagnosis and management, the complications and mortality rates will be reduced and result in better overall outcomes for our patients. Thus, the goals of implementing early detection and treatment of patients with sepsis are to reduce the risk of mortality, minimize complications and decrease the patient’s intensive care unit (ICU) length of stay (LOS).

This project meets the following Regional goals: This project focuses on reducing potentially preventable morbidity and mortality.

Challenges:
The National Critical Care Medicine has identified Sepsis as a major improvement opportunity as evidenced by the following:

- 750,000 severe cases of sepsis in the U.S.;
- Severe sepsis mortality is greater than breast cancer and AIDS mortality; and
- Severe sepsis causes an undue burden on the health care system with annual cost exceeding $16 billion.

Sepsis is difficult to detect, both from a clinical judgment perspective and through diagnostic coding, because the symptoms of sepsis and the International Classification of Diseases (ICD) codes could indicate a number of other conditions. In fact, JPS Health Network has used varying definitions for sepsis (e.g., baseline mortality rate currently includes non-septic patients for whom the bundle was implemented), so it is currently difficult to measure and analyze data on sepsis. JPS Health Network does not have standardized processes for early detection of and treating patients with sepsis who present to the ED. As a result, patients going undetected may not receive the needed treatment, resulting in complications and even mortality from sepsis.

5-Year Expected outcome for Provider and Patients:
At the end of the Waiver, this project will:

1. Achieve 85% compliance with identification of early goal directed therapy candidates on arrival to the ED (estimated targeted population of 345 patients) 293 patients will be appropriately diagnosed.

2. Achieve 95% compliance with the sepsis six hour bundles in patients admitted to the Medical ICU (MICU) from the ED; 327 patients will receive perfect sepsis bundle care.

3. Reduce the mortality rate for septic patients admitted through ED to MICU from the current 20% to 12% (28 lives saved based on 345 goal directed candidates).
Starting Point/Baseline:
During the baseline period 2011, 192 ED patients were diagnosed with sepsis, and 37 of those patients expired. The compliance with sepsis identification and management bundle was 32% and the mortality rate was 20%. The average ICU LOS for patients with a primary diagnosis of sepsis was 5.33 days and all other patients was 4.27 days.

Rationale:
By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment, decrease complications, mortality, length of stay and health care costs.254 The reason for choosing the Category 3 outcomes, mortality and cost is because identifying the presence of sepsis along with early intervention will prevent complications and decrease length of stay, reduce health care cost and mortality.

The Sepsis resuscitation and management milestones include the formation of an improvement plan with key stakeholders (ED, ICU, EMS, METs). The plan addresses engagement of stakeholders, gaining an understanding the current state, areas of the variation, resources, baselines, roles and responsibilities, expectations, process and outcome measure definitions. In order to have an impact on reducing mortality and average LOS, compliance with sepsis diagnosis and protocols for sepsis bundles are critical. The implementation plan is necessary to examine the plan as it is implemented and understand what is working, what needs continued improvement, barriers and make corrective actions.

Project Components:
In 2008, the Surviving Sepsis Campaign was initiated by the Institute for Healthcare Improvement (IHI): the focus of the campaign was and still is early recognition and improving reliability in managing sepsis. Consistent with best practices identified by IHI, the JPS Health Network project consists of four components: 1) sepsis recognition; 2) sepsis response, 3) sepsis management in the ED and ICU; and 4) immediate feedback to the providers regarding response times and compliance with evidence-based protocols. 5) Continuous quality improvement e.g., rapid cycle PDSA, Six Sigma, and Lean will be utilized to drive improvement and sustain the gains. By DY3 the team infrastructure will include EPIC redesign, and a functioning sepsis response team will have been put into place so that PDSA cycles aim to eliminate variation and the team’s metrics will be focused on progress to goals.

Unique community need identification numbers the project addresses: CN 11: Need for more care coordination.

254 The Institute for Health care Improvement ‘ Surviving Sepsis Campaign, The Society of Critical Care Medicine,; IDSA Guidelines for appropriate antibiotic selection
CN 11 – Need for more care coordination. All counties identified CN11 as a need. Barriers include complexity of coordination, lack of staff, lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists. Care coordination is a challenge for the sepsis patients presenting in the ED. The absence of a system to identify these patients and implement the bundle increases the incidence of complications, costs and mortality. Due to the lack of access to health care resources, a large number of patients treated in our hospital will benefit from earlier detection of sepsis. The benefit of this program will ultimately extend housewide to include all patient care units.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: This is a new project and JPS Health Network is not receiving any other federal funds for this work.

Related Category 3 Outcome Measures:

Outcome Measure 1: Mortality IT-4.8 Sepsis Mortality: The reason for choosing the Category 3 outcomes, mortality and cost is because identifying the presence of sepsis along with early intervention will prevent complications and decrease length of stay, reduce health care cost and mortality.

National Critical Care Medicine has identified Sepsis as a major improvement opportunity as evidenced by the following:

- 750,000 severe cases of sepsis in the U.S.
- Severe sepsis mortality is greater than breast cancer and AIDS mortality
- Severe sepsis causes an undue burden on the health care system with annual costs exceeding $16 billion

By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease length of stay, reduce health care cost and mortality. Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection.

Outcome Measure 2: Average ICU LOS IT-4.9: By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease complications with resulting ICU length of stay reduction.

Relationship to Other Projects:
JPS Health Network is submitting the Transformation of Care at the Bedside project which is aimed at harm reduction by reducing health care acquired conditions. The five conditions included under the TCAB initiative are reduction of CAUTIs, CLABSIs, SSIs, VTE, Falls. The sepsis rate will be impacted by interventions planned for the HAIs.
Sepsis recognition and management is aimed at reducing the complications associated with Category 4, #35, Septicemia and Severe Infections.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as JPS Health Network Emergency Department population. The percentage of the population expected to be positively impacted by the project is 30%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her chance to survive sepsis-related life-threatening conditions is significantly improved in addition ICU - length of stay is reduced.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because reducing ICU length of stay opens up more ICU beds for other acute patients.-

**Year 2** (10/1/2012 – 9/30/2013)

**Milestone 1** [P-2]: Establish baseline, in order to measure improvement over self (for correct diagnosis of sepsis)

**Metric 1** [P-2.1]: Establish baseline for correct diagnosis of sepsis (Target population of 576)

Baseline (32%)/Goal (50% / 288): Percent compliance with correct diagnosis of sepsis.

Data source: EPIC

**Metric 2** [P-2.2]: Establish baseline for bundle compliance

Baseline/Goal: 32% / Goal 50% (288) early goal directed therapy candidates

Data source: Surviving Sepsis Campaign (SSC) Database

Milestone 1 Estimated Incentive Payment (maximum amount): $2,650,815

**Year 3** (10/1/2013 – 9/30/2014)

**Milestone 4** [P-2]: Establish baseline to measure improvement over self (for ICU LOS for Septic patients admitted from ED)

**Metric 1** [P-2.3]: Reduce the current LOS for patients admitted to the ICU from the ED

Baseline/Goal: 5.12 / 4.7

Source Data: EPIC

Milestone 4 Estimated Incentive Payment (maximum amount): $4,066,730

**Year 4** (10/1/2014 – 9/30/2015)

**Milestone 6** [I-13]: Progress toward target/goal

**Metric 1** [I-13.1.1]: Percent of all clinical cases that meet target/goal (correct diagnosis of sepsis)

Goal: Achieve 75% compliance (259 of 345 patients) with correct diagnosis of sepsis

Data source: EPIC

**Metric 2** [I-13.1.2]: Percent of all clinical cases that meet target/goal

Numerator (2011): Number of diagnoses of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl) where at least 1 Sepsis Resuscitation bundle was used in its entirety.

Denominator: Total number of diagnoses of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl) where at least 1 Sepsis Resuscitation bundle was used in its entirety.

Goal: Compliance with sepsis resuscitation and management bundles and assess improvements in delivery reliability through the assessment of process measures

Data source: EPIC

**Year 5** (10/1/2015 – 9/30/2016)

**Milestone 7** [I-13]: Progress toward target/goal

**Metric 1** [I-13.1.1]: Percent of all clinical cases that meet target/goal (correct diagnosis of sepsis)

Goal: Achieve 85% (293 patients) compliance with correct diagnosis of sepsis

Data source: EPIC

**Metric 2** [I-13.1.2]: Percent of all clinical cases that meet target/goal

Numerator (2011): Number of diagnoses of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl) where at least 1 Sepsis Resuscitation bundle was used in its entirety.

Denominator: Total number of diagnoses of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl)

Goal: Compliance with sepsis resuscitation and management bundles and assess improvements in delivery reliability through the assessment of process measures

Data source: EPIC

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project

**Project Option 2.10.1** – Implement a Palliative Care Program to address patients with end-of-life decisions and care needs

**Unique Project ID:** 126675104.2.13 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** The project will create a comprehensive palliative care consultation program for patients with serious or life-threatening illnesses. This project is a new initiative.

**Need for this project:** This project addresses the following community needs: a) CN. 9. - Need for increased geriatric, long-term, and home care resources (e.g. beds, Medicare providers) and b) CN.11 - Need for more care coordination.

**Target population:** Patients who are terminally or chronically ill as approximated by the CAPC research of over 500 hospitals based on number of staffed beds - DY3 = 269, DY4 = 403, DY5 = 537 (1208 total for DY3, DY4, and DY5). Medicaid and the uninsured of our service area with serious illnesses will benefit from (1) better symptom management; (2) relief from pain and suffering; (3) more psychosocial and spiritual support; (4) an alternative to aggressive treatment and time in intensive care units. As a result, patients will experience improved quality of life, medical care based on the patient’s goals for care and increased patient and family satisfaction with the care received.

**Category 1 or 2 expected patient benefit:** Milestones P-3.1, P-4.1, P-5.1, P-7.1, P-X1.1, P-X1.2, I-9.1, and I-10.1 were selected. Each milestone selected was due to their natural progression to project implementation or a natural result of implementing integrated care components.

**Category 3 outcomes:**
Outcomes IT-5.1, IT-13.1, and IT-13.2 were selected. There is an evidence base to suggest that a palliative care service will have positive impact on each of those outcome areas.
Project Option 2.10.1 – Implement a Palliative Care Program to address patients with end-of-life decisions and care needs

Unique Project ID: 126675104.2.13 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
We will implement a comprehensive palliative care consultation program for patients with serious or life-threatening illnesses. The program will focus on optimizing patients’ quality of life through symptom management and the alleviation of pain and suffering. This project is targeting 1,208 patients (DY3 = 269, DY4 = 403, DY5 = 537) who are terminally or chronically ill who will receive inpatient palliative care consultation services. Beginning as an inpatient consultation service, the palliative care program will initially be comprised of an RN palliative care program coordinator, a social worker, a chaplain and a physician from the JPS Physician Group who is experienced in providing palliative care services. The inpatient consultation program model will be based on the Clinical Practice Guidelines for Quality Palliative Care (see evidence-based citation). The model contains 21 guidelines with associated criteria that are organized around eight core domains of all quality palliative care programs. These domains were established by the National Consensus Project and the National Quality Forum. Where possible, the palliative care program will implement the 38 preferred practices also identified in the evidence-based model.

Goals and Relationship to Regional Goals:
Project Goals:
The goals of this project are to provide chronically and seriously ill patients (and their families where appropriate): (1) better symptom management; (2) relief from pain and suffering; (3) more psychosocial and spiritual support; (4) an alternative to aggressive treatment and time in intensive care units. As a result, patients will experience improved quality of life, medical care

255 The central focus of the palliative care model is comprehensive, interdisciplinary care that provides medical, emotional, spiritual and practical support. It is provided simultaneously with all other appropriate medical treatments, and is coordinated among all caregivers and specialists. Studies show that palliative care improves quality of life for seriously ill patients and consistently reduces symptom distress and improves patient and family satisfaction. Palliative care programs can also alleviate inpatient overcrowding, bed shortages and inappropriate use of intensive care unit beds. Palliative care, when done right, improves the communication of all parties involved in the patient’s care. Much of this evidence has been synthesized and made available by the Center to Advance Palliative Care (CAPC). A list of specific studies would include:
b. Hospital-Based Palliative Care Consultation: Effects on Hospital Cost – *Journal of Palliative Medicine*, 2010. Volume 13, Number 8
c. Cost Savings Associated with U.S. Hospital Palliative Care Consultation Programs – *Archives of Internal Medicine*, 2008. 168 (16): 1783-1790
based on the patient’s goals for care and increased patient and family satisfaction with the care received.

This project meets the following Regional goals:

Challenges:
Nationally, over 80% of hospitals with more than 300 beds have palliative care services within their system. JPS currently has no organized inpatient palliative care program. With the aging of the American population, and the steady growth in the number of people living with chronic illness, palliative care approaches have emerged in recent years to ease the prolonged pain and suffering associated with being severely ill. It is estimated that 70% of people who experience chronic pain do so without adequate treatment: Symptoms such as anxiety, depression, shortness of breath, and fatigue are sometimes overlooked or ignored by health care professionals. In addition, caregivers of people with chronic or life-threatening illnesses often feel alone in their struggle to provide good care. Palliative care strives to deal with the many issues surrounding people who deal with life-threatening illnesses, and provide them with the tools to make critical decisions about end-of-life care.

5-Year Expected Outcome for Provider and Patients:
JPS will develop palliative care competencies and capacity across the continuum to meet population health needs. By the end of the waiver period, a significant portion of total in-hospital deaths will have had a palliative care consult. Additionally, a large percentage of hospice or palliative care patients will have been screened for pain to ensure proper pain management.

Starting Point/Baseline:
JPS does not currently have a palliative care program. In 2011 there were at least 600 patients who died in the hospital who would have benefitted from palliative care. By DY5, it is expected JPS will have a fully operational consultative palliative care program to meet the palliative care needs of patients with specific chronic conditions that is utilized by the hospitalists as appropriate.

Rationale:
JPS has selected this project because of the documentation that palliative care programs routinely improve patient outcomes, expedite communication and decision making for patients and family members, increase coordination among health care providers, ease patient transitions between care settings, boost patient and family satisfaction, reduce the burden of time-intensive and complex cases to improve staff satisfaction, apply a more systematic approach to outlier patients, and promote beneficial care resulting in more appropriate hospital resources/cost avoidance/improved bed capacity. In addition, palliative care centers treatment around the goals of the patient and family to include increased family presence and interaction, very intentional
management of pain and suffering and allows the patient to maintain dignity during the dying process.

This region has a need for increased geriatric, long-term, and home care resources (CN.9) (e.g., beds, Medicare providers). Region 10’s population is projected to grow 9% by 2016, with a 26% increase in the senior population (ages 65+). Palliative care services will be increasingly needed as the population ages and develops chronic or terminal conditions. These services have often not been available or integrated with community, emergency or intensive care services. This project will make available this much-needed approach to care especially to the geriatric population and enhance integration of palliative care with other approaches to care.

**P-3** was selected because all primary care specialties are involved with chronic diseases and the associated chronic symptoms and management of these symptoms, but may not have specific expertise in palliative care programs and planning. As the goal of this palliative program is to provide resources to patients and families to improve patient experiences, the education programs will also consider the use of palliative care medicine for health care personnel (including ancillary staff).

**P-4** was selected because measures all the metrics (e.g. percentage clinic visits documented in the EHR, the amount of lab values accurately placed in the patient chart, or even the number of e-prescriptions sent over an established timeframe) document the palliative care program effectiveness. A study of 2021 hospitals showed that the quality of care provided improved among all types of hospitals that implemented a form of EHR²⁵⁷

**P-5** was selected because there is widespread evidence that palliative care can improve the quality of care while reducing cost.²⁵⁸

**P-7** was selected to assess the effectiveness of this consult service in large numbers of patients and families, and how it improve their health care experience. Not all patients with a chronic condition are candidates for palliative care.

**I-10** was selected to ensure the ideal of palliative consults for most patients who died in the hospital so that the patient and the family have the choice of how the patient spends his/her end of life.

**Project Components:**

This project has not adopted the project component related to developing a business case for palliative care because this step has already been completed. While there is not a milestone associated with it, our program will strive to transition palliative care patients from acute hospital care into home care, hospice or a skilled nursing facility. The idea of a survey was explored. However, currently all patient satisfaction surveys are managed through a third party vendor and extensive efforts would be required to ensure surveys did not conflict with existing efforts or HCAPS surveys. Existing survey results can be monitored at the patient level, and results will be

---
tabulated for those who receive palliative care consults with a comparison to normal care. We will conduct quality improvement for project using methods such as rapid-cycle improvement. These efforts will be included in annual report to the hospital Quality Committee and the Board of Managers Quality Committee.

**Unique community need identification numbers the project addresses:**
CN. 9. Need for increased geriatric, long-term, and home care resources (e.g., beds, Medicare providers). Region 10’s population is projected to grow 9% by 2016, with a 26% increase in the senior population (ages 65+).
CN. 11. Need for more care coordination. All counties identified it as a system cap and need. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This is a new initiative and is not receiving any other federal funding.

**Related Category 3 Outcome Measures:**
2. **Outcome Measure 1: IT-13.1 Pain Assessment (non-stand-alone)** was selected because the NQF Report states, “The Hospice and Palliative Care – Pain Assessment measure addresses pain for patients with high severity of illness and risk of death, including seriously and incurably ill patients enrolled in hospice or hospital-based palliative care. Research on care of patients with serious incurable illness and those nearing the end of life shows they experience high rates of pain (40%-70% prevalence) and other physical, emotional, and spiritual causes of distress.” The National Priorities Partnership has identified palliative care and end-of-life care as one of its national priorities. A goal of this priority is to ensure that all patients with life-limiting illness have access to effective treatment for symptoms such as pain and shortness of breath. The affected populations are large; in 2009, 1.56 million people with life-limiting illness received hospice care. In 2008, 58.5% of U.S. hospitals with 50 or more beds had some form of palliative care service, and national trends

---

show steady expansion of these services. \(^{263}\) Patients and family caregivers rate pain management as a high priority when living with serious and life-threatening illnesses. \(^{264}\)

3. **Outcome Measure 2: IT-13.2 Treatment Preferences (non-stand-alone)** was selected because the NQF Report states “Hospice and Palliative Care – Treatment Preferences measure addresses patient autonomy for patients with high severity of illness and risk of death, including seriously and incurably ill patients enrolled in hospice or hospital-based palliative care. The National Priorities Partnership has identified palliative and end-of-life care as one of its national priorities. A goal of this priority is to ensure that all patients with life-limiting illness have the right to express preferences that guide use of invasive or life-sustaining forms of treatment. \(^{265}\) The affected populations are large; in 2009, 1.56 million people with life-limiting illness received hospice care. \(^{266}\) In 2008, 58.5% of U.S. hospitals with 50 or more beds had some form of palliative care service, and national trends show steady expansion of these services. \(^{267}\) From a recent systematic review of clinical trials, moderate evidence supports multicomponent interventions to increase advance directives, and ‘care planning through engaging values, involving skilled facilitators, and focusing on key decision makers.’ These studies found improved outcomes of patient-physician communication, improved satisfaction with care, and increased hospice enrollment. \(^{268}\) The more recently published Coping with Cancer Study, a prospective observational study of over 300 patients with advanced cancer, found that communication of patient treatment preferences was associated with use of treatments honoring those preferences and wishes for lesser use of aggressive, high-cost treatments.\(^{269,270}\)

**Outcome Measure 3: 5.1 Improve cost savings:** This outcome measure was selected due to the wide body of evidence that suggests implementation of palliative care services reduces hospital costs. \(^ {271}\) The process milestone selected for DY2 is a required building block to accurately identify the baseline costs of specific diagnoses that commonly warrant palliative care but have not had access to the service. The DY3 process measure related to identifying the baseline costs

is a critical step that must be accomplished to compare improvement targets for palliative care patients. Outcome improvement targets for DY4 and DY5 will be established in DY3.

**Relationship to Other Projects:**
This project is related to RD-4.1 patient satisfaction. It is widely asserted that palliative care programs have positive impacts on patients’ perception of care because of the coordinated nature of the services.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted by this intervention, his or her comfort, peace of mind and coordination of care, and reduction in unnecessary procedures increases. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, there is a resulting reduction of utilization, increased comfort of family members and more appropriate allocation of health care resources.

Specifically, 941 (DY3=180, DY4=314, DY5=448) patients who are terminally or chronically ill will be positively impacted in the following quantifiable ways:

- Increase percent of total in-hospital deaths that had a palliative care consult to ensure 30% of those dying in the hospital have a palliative care consult over the life of the project.
• Increase Palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility (SNF) with and without hospice services to ensure 25% of those with a palliative care consult are transitioned over the life of the project.
• Increase percent of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening by a percentage to be determined in DY3
• Increase percent of palliative care patients with chart documentation of preferences for life-sustaining treatments
• Reduce costs of patients who receive palliative care services by a percentage to be determined in DY3
### Implement a Palliative Care Program to address patients with end-of-life decisions and care needs

| Milestone 3 [P-5]: Determine how many consults are submitted per number of patients admitted with chronic conditions or MCC (e.g. COPD exacerbation, heart failure exacerbation, fluid overload in an ESRD patient, etc.) that are candidates for palliative care services.  
**Metric 3 [P-5.1]:** Palliative care consults for patients with chronic conditions.  
- **Baseline/Goal:** Chronic Condition Palliative Care Consult Report  
- **Data Source:** EMR  
**Milestone 3 Estimated Incentive Payment (maximum amount):** $2,578,557

| Milestone 4 [P-X]: Establish benchmark and improvement target for measure I-10 for DY4 and DY5  
**Metric 4 [P-X.1]:** Benchmark for total in-hospital deaths who had a palliative care consult  
- **Baseline/Goal:** 15%  
- **Data Source:** EMR  
**Milestone 4 Estimated Incentive Payment (maximum amount):** $2,762,996

| Milestone 5 [I-10]: Among patients who died in the hospital, increase the proportion of those who received a palliative care consult  
**Metric 1 [I-10.1]:** Percent of total in-hospital deaths who had a palliative care consult  
- **Goal:** 20%  
- **Data Source:** EMR  
**Milestone 5 Estimated Incentive Payment:** $2,762,996

| Milestone 6 [I-9]: Palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility (SNF) with and without hospice services.  
**Metric 1 [I-9.1]:** Transitions accomplished  
- **Baseline/Goal:** 25%  
- **Data Source:** EMR  
**Milestone 6 Estimated Incentive Payment:** $2,762,996

| Milestone 7 [I-10]: Among patients who died in the hospital, increase the proportion of those who received a palliative care consult  
**Metric 1 [I-10.1]:** Percent of total in-hospital deaths who had a palliative care consult  
- **Goal:** 30%  
- **Data Source:** EMR  
**Milestone 7 Estimated Incentive Payment:** $2,282,475

| Milestone 8 [I-9]: Palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility (SNF) with and without hospice services.  
**Metric 1 [I-9.1]:** Transitions accomplished  
- **Baseline/Goal:** 25%  
- **Data Source:** EMR  
**Milestone 8 Estimated Incentive Payment:** $2,282,475

| Milestone 9 [I-10]: Among patients who died in the hospital, increase the proportion of those who received a palliative care consult  
**Metric 1 [I-10.1]:** Percent of total in-hospital deaths who had a palliative care consult  
- **Goal:** 30%  
- **Data Source:** EMR  
**Milestone 9 Estimated Incentive Payment:** $2,282,475

| Milestone 10 [I-9]: Palliative care patients transitioned from acute hospital care into hospice, home care, or a skilled nursing facility (SNF) with and without hospice services.  
**Metric 1 [I-9.1]:** Transitions accomplished  
- **Baseline/Goal:** 25%  
- **Data Source:** EMR  
**Milestone 10 Estimated Incentive Payment:** $2,282,475

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.5.1: Integrated care model with outcome-based payments

Unique Project ID: 126675104.2.14 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility. JPS Health Network has a program called the Connections Program that is a managed care like program for the population of Tarrant County below 200% of the FPL. This program offers insurance for medical services at JPS Health Network locations. The benefit to the indigent population will be reduced wait times by increased access to primary care and specialty care, reduction in duplication of services, reduction in emergency room utilization because they cannot see a provider.

Intervention: To develop a payment model that is based on outcomes instead of Fee for Service for approximately 46,000 Connection enrolled patients. The project is a new intervention that will reduce medical costs. The providers that participate in the Connections program are reimbursed on a Fee for Service basis. This program allows itself a perfect opportunity to transition to an outcome based program. JPS Health Network can work with the providers to transform the care and payment options for both the patients and providers. This will allow for an improvement in access, quality, cost, and improve outcomes.

Need for the project: The project addresses the following community needs CN.10, 11, and 22. This project will fund payments based on outcomes and not fee for service in an underserved population, the JPS Health Network Connections population, of Region 10 that is similar to Medicaid.

Target population: The target population is 37,500 Connections members. JPS Health Network needs to realign the payment structure from a fee for service model to an access, outcome and performance based system. This will align providers, patients (Connection enrollees) and JPS Health Network and begin the journey on the development of an integrated care model.

Category 1 or 2 expected patient benefits: Milestones P-1, P-2, P-3, P-4, P-9, I-7, I-8, and I-9.1 were selected. Each milestone selected was due to their natural progression to project implementation or a natural result of implementing integrated care components.

Category 3 outcomes: Outcomes IT-5.1 was selected. There is an evidence base to suggest that Integrated Care with Outcome based payments will have positive impact.
Project Option 2.5.1: Integrated care model with outcome-based payments

Unique Project ID: 126675104.2.14 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
JPS Health Network has a program that is similar to an insurance program for the indigent population of Tarrant County. A person below 200% of the FPL can apply for a program funded by the taxpayers of Tarrant County. There are certain asset and income tests similar to the Texas Medicaid program that is applied during the application process. If the person qualifies they will be enrolled for a 12 month period and receive medical care at the JPS Health Network locations and prescription drug benefits at JPS Health Network pharmacies with small individual responsibility such as copays for medical and pharmacy care. The current program reimburses physicians on a fee for service basis and does not tie access or outcomes to a payment method. The program currently has approximately 45,000 individuals enrolled in the program but during a year 75,000 individuals are covered under the program. The current wait time for an appointment for a new patient with a primary care physician is 189 days in some areas, the average wait time for a surgical consult is over 45 days, and the average wait time for a medical specialty consult is over 55 days. Due to the wait in the specialty clinics many tests need to be performed a second time causing additional costs and waste of resources, along with unnecessary strain on the patients, and increased utilization of the emergency room.

JPS Health Network will develop an integrated care model with outcome-based payments. This new payment model will integrate the providers into the development of the model so that the access issues, duplication of tests, and scheduling issues can be addressed. The individuals in the Connections program will receive care in a more timely and concise manner. The Connections members will have a medical home (primary care physician) that can coordinate their care reducing unnecessary emergency utilization and duplication of tests. The patient will be become a partner in the care treatment plan. The benefit to the indigent population is an increase in access at primary care locations and specialty offices with more concise structured care and less wait time for tests, appointments, and results.

An executive will be appointed to implement the integrated care model with outcome-based payments. The new model will be developed and implemented using a multistage process.

Organizational integrated outcome-based payments – a dedicated leader, steering committee, and development of an integrated outcome-based payment strategy will allow for a single shared payment plan. An integrated outcome-based payment team will be created.

Physicians, executives, and financial staff will be trained to track and report outcomes using clinical and financial measures. Payments will be made based on outcomes instead of the
traditional fee-for-service methodology. Expertise will be developed to track and report the outcomes and the impact on the delivery of health care.

Outcomes will be determined and payment structures identified for the providers. These outcomes will be shared with the Region.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to provide better care with a focus on access, quality and outcomes with the lowest cost. A successful project for JPS Health Network will transition from a fee-for-service payment to a quality-based payment system that is driven by outcomes and funded by the savings from better health in the community.

This project meets the following Regional goals:
A major goal of the Region is to pursue the triple aim of health care by improving patient experience of care, improve health of populations and reduce the cost of health care. Developing an integrated care model with outcome-based payments will impact the cost of health care in the Region and improve the health of the population due to the focus on outcomes.

**Challenges:**
JPS Health Network needs to realign the payment structure from a fee-for-service model to an access, outcome and performance-based system. This will align providers and JPS Health Network and begin the journey toward the development of an integrated care model.

**5-Year Expected Outcome for Provider and Patients:**
At the end of the Waiver this project will:

These Core Components are reflected in the Milestones.

1. Implement a cost accounting system – JPS Health Network will evaluate the overall costs that are associated with providing services to the Connections patients. JPS Health Network will research and decide upon a cost accounting system that measures how wisely medical services are being utilized, cost accounting helps to provide the data relevant to the current situation. By identifying medical costs and further defining the cost of by three or more successive business cycles, it is possible to note any trends that indicate a rise in costs without any appreciable changes or increase in utilization of services.. This system will be implemented so that cost information regarding services for the Connection patients can be reported. This new system will be implemented.

2. Provide data-based cost and quality measures – By using the cost accounting system that is implemented JPS Health Network will obtain cost information for all types and levels of care provided to Connection patients. The cost of Primary Care, Specialty Care, Emergency Care, Inpatient and Outpatient Care, and Ancillary care will be reviewed and
analyzed. The cost will be reviewed with quality measures around access measures for Primary Care and Specialty Care, number of tests (utilization per 1000 patients) performed, Emergency Utilization, Readmission, and Prescription drugs prescribed.

3. Identify cost efficiencies – A Team of Physicians, Executives, and Financial staff will review the data provided by the cost accounting system to identify the costs and compare them with benchmarks for similar populations. These comparisons will help determine costs that need to be improved and the team will drive the efficiencies among the Network.

4. Increase access – An increase access to Primary Care and Specialty Care will be the result. JPS Health Network expects to decrease wait times for Specialty Surgery below the 45 days, for Medicine Specialty below the 55 days and to have new members able to see a primary care physician within 21 days.

**Starting Point/Baseline:**
As of October 2012, approximately 46,000 individuals were enrolled in the Connections program at JPS Health Network. Each of these had a medical encounter of some kind with JPS Health Network. The cost of these encounters are not captured and tracked accurately.

**Rationale:**
Cost, quality data, and access data are pulled from disparate systems and a team of individuals calculate measures. In order to reduce costs JPS Health Network must have reliable data that is easily accessible by clinicians, financial analysts, operational experts, and others. The cost for the Connections program is a combination of price, program needs, acuity of the population, ability to access the services, and volume of services provided. In order to provide better care at the correct setting, data needs to be analyzed to determine the correct proportion of the variables.

**Project Components:**
Project contains all of the core components,

**Unique community need identification number the project addresses:**
CN .10 Overuse of emergency department services
CN.11 need for more care coordination
CN.22 inadequate health IT infrastructure

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** This is a new project and JPS Health Network is not receiving any other federal funds for this work.

**Related Category 3 Outcome Measures:**

**Outcome Measure #1:** IT 5.1 Improved cost savings: Demonstrate cost savings in care delivery

**Relationship to Other Projects:**
Regional Healthcare Partnership

JPS Health Network projects are designed to provide better care, improve health, and lower costs.

**Relationship to Other Projects:**
This project is aligned with other projects that improve health and provide better care. The goal of all projects is to lower costs.

**Relationship to Other Performing Providers Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as all JPS Connections patients. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
### Integrated care model with outcome-based payments

- **Milestone 1 [P-1]**: Develop/identify a cost-accounting methodology to quantify the financial impact of quality and efficiency improvement interventions. To identify areas for cost improvements and movement from Fee for service to outcome based payments.
  - **Metric 1 [P-1.1]**: Metric: Cost-accounting methodology/metric
    - Baseline: Average Annual Cost of selected measures for chosen diagnoses and provider panels for a 9 month period 1/12-9/12
    - Goal: Documentation of the methodology and metric.
    - Data Source: Cost-accounting system or another administrative, financial or clinical data set

  Milestone 1 Estimated Incentive Payment *(maximum amount)*: $2,769,073

- **Milestone 2 [P-2]**: Establish a baseline for cost
  - **Metric 1 [P-2.1]**: Metric: Establish a baseline for cost.
    - Baseline: Establish a baseline data.
    - Goal: Submission of baseline data.

- **Milestone 3 [P-3]**: Implement the cost-accounting methodology and related systems to measure intervention impacts and movement from a fee for service to an outcome based payment,
  - **Metric 1 [P-3.1]**: Cost-accounting system.
    - Baseline/Goal: Methodology and or system not installed
    - Goal: Adoption, installation, upgrade, and/or interface of technology, and/or implementation of system using existing technology
    - Data Source: System installed

  Milestone 3 Estimated Incentive Payment: $1,888,297

  **Milestone 4 [P-4]**: Conduct cost analysis
  - **Metric 1 [P-4.1]**: Cost analysis plan or results
    - Baseline/Goal: Comparative report from DY3 to baseline DY2.
    - Goal: Submission of cost analysis plan for targeted improvement in cost and quality.
    - Data Source: Reports from data systems.

  Milestone 4 Estimated Incentive Payment: $6,070,091

- **Milestone 6 [I-7]**: Measure cost containment by re-measuring health care costs of first set of interventions and compare to baseline to gauge improvements in cost and transition from fee for service to outcome based payment.
  - **Metric 1 [I-7.1]**: Measure health care costs of intervention and gauge improvement and transition from fee for service to outcome based payment.
    - Goal: Improve cost against baseline
    - Data Source: Cost accounting system

  Milestone 6 Estimated Incentive Payment: $6,070,091

- **Milestone 8 [I-7]**: Measure cost containment by re-measuring health care costs of second set of interventions and compare to baseline to gauge improvements in cost and transition from fee for service to outcome based payment.
  - **Metric 1 [I-7.1]**: Measure health care costs of intervention and gauge improvement and transition from fee for service to outcome based payment.
    - Goal: Improve cost against baseline
    - Data Source: Cost accounting system

  Milestone 8 Estimated Incentive Payment: $5,014,423

Project Option 2.7.3 – Implement Evidence-based Disease Prevention Programs: Implement innovative evidence-based strategies to increase early enrollment in prenatal care – Journey to Life: Prenatal Care and Healthy Babies Initiative.

**Unique Project ID:** 126675104.2.15 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** CenteringPregnancy and the Maternity Medical Home, will provide patients with comprehensive care in innovative settings with the goals of increasing the number of women seen early in care; increasing compliance and frequency of prenatal care; increasing compliance of postnatal care; and reducing inappropriate emergency department utilization. JPS Health Network adopted CenteringPregnancy in 2011 with limited trained staff at Health Center for Women–Main. JPS Health Network proposes to expand services to increase the number of trained staff at HCW–Main, and expand to 3 additional clinics. The Maternity Medical Home is a new initiative that will be at 4 additional JPS Health Network Clinics that will utilize the principles of the Patient Centered Medical Home.

**Need for the project:** The Tarrant County Fetal Infant Mortality Review reported that 42% of the cases reviewed in 2008 reported having access to care issues. 48% of women giving birth in Tarrant County received late or no prenatal care. In Texas, only 48.0% of women received a postpartum visit on or before 21 days and 56 days after delivery. The postpartum care rate at JPS is estimated to be 40%, and the national average is 64.1%.

**Target population:** JPS Health Network will deliver services to the medically underserved, Medicaid, indigent, and underinsured prenatal patients in Tarrant County. The number of patients to be served over the waiver period is 6,959 women. The population was calculated based on the number of women receiving JPS prenatal care and delivered at JPS in FY11.

**Expected patient benefit:** Journey to Life will enhance access by providing pre-appointed dates and times for visits to help patients plan for child care, transportation, and other needed services. This will increase early enrollment into care and improve compliance with prenatal and postnatal care. It also increases patient satisfaction and engagement by providing the opportunity to enhance learning, build relationships and be linked to community resources through established agencies. Outreach through these programs will allow the team to more closely monitor the patient’s needs, provide continuity of care, and decrease the inappropriate utilization of the emergency department.

**Category 1 or 2 expected patient benefit/Category 3 outcomes:** The Category 2 milestone selected will enroll 3,084 patients in Journey to Life in DY4 and 3,875 patients in DY5. Each patient will be seen 11 times during their pregnancy which makes the volume of visits 33,924 for DY4 and 42,625 for DY5. For category 3, IT 8.1 will increase in the timeliness of prenatal and postnatal care in DY4 and DY5; and IT 9.2 will decrease emergency department use by 162 visits in DY4 and 323 visits in DY5.
Project Option 2.7.3 – Implement Evidence-based Disease Prevention Programs: Implement Innovative evidence-based strategies to increase early enrollment in prenatal care – Journey to Life: Prenatal Care and Healthy Babies Initiative.

Unique Project ID: 126675104.2.15 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
Develop and implement an innovative, comprehensive Perinatal Services Program that includes preconception, prenatal and interconception care for low-income women of childbearing age in Tarrant County. The program will include implementing and expanding two evidence-based proven models of prenatal care that contribute to healthier mothers and babies:

CenteringPregnancy\(^{272}\) (to provide Comprehensive Perinatal Services Program and Group visits in clinics with high numbers of pregnant women) Maternity Medical Home\(^{273}\) (to provide pregnant women enhanced services through health care coordination and navigation in those clinics with small numbers of pregnant women). These models will be utilized to effectively address birth outcomes and disparities by implementing preconception and interconception interventions.

By providing women the opportunity to participate in the CenteringPregnancy and Maternity Medical Home models of care, women are empowered to choose health-promoting behaviors such as attending all their scheduled appointments. Through recruiting and retaining women in the program throughout their prenatal and postpartum care, birth outcomes will be better. Staff will communicate with patients via phone, mail, and/or other available method to encourage attendance and participation in the group sessions. Incentives such as baby supplies will be offered at each visit to further encourage participants to complete the program.

Goals and Relationship to Regional Goals:

Project Goals:
JPS will deliver prenatal services through the evidence-based CenteringPregnancy and Maternity Medical Home models to at least 75% of patients served by JPS outpatient clinics for prenatal care. JPS will have four clinics participating in CenteringPregnancy and four clinics with the Maternity Medical Home.
JPS proposes to serve low-income women of childbearing years in Tarrant County that are in need of preconception, prenatal and interconception care. The JPS Outpatient service provides prenatal care to over 5,140 women annually throughout Tarrant County. JPS proposes to have four clinics participating in CenteringPregnancy and four clinics with the Maternity Medical Home. JPS’ 537-bed hospital setting and outpatient clinics are well-positioned to provide these services.

\(^{272}\) CenteringPregnancy is a multifaceted model of group care that integrates the three major components of care: health assessment, education and support, into a unified program within a group setting. The CenteringPregnancy model is based on the Centering Healthcare Institute model. This results-driven model repeatedly demonstrates better fetal outcomes in evidence-based clinical studies. The Centering Healthcare Institute assists clinical sites with education, consultation, guidance, and materials to start CenteringPregnancy groups. [https://www.centeringhealthcare.org/pages/centerin-model/pregnancy-overview.php](https://www.centeringhealthcare.org/pages/centerin-model/pregnancy-overview.php).

\(^{273}\) The Maternity Medical Home will provide linkages to services in the community and will offer follow-up to patients. This will help increase prenatal and postnatal care that will affect birth outcomes.
This project meets the following Regional goals:

This project meets a number of Regional goals, which are aligned with the goals of the Waiver and IHI’s triple aim. Specifically, low-income pregnant Medicaid/CHIP recipients residing in Tarrant County are the targeted designated population for this proposal. Tarrant County, located in North Texas, is the third most populous county in the state and includes the cities of Fort Worth and Arlington.

Challenges:

Low-income women in Tarrant County face significant risks to their health and the health of their babies during pregnancy. Preterm birth is one of the three leading causes of infant death in Tarrant County, and the number one cause for African-American women. Tarrant County has the second highest infant mortality rate among Texas counties with 10,000 or more live births per year. The clinical staff will work directly with the women to form ongoing relationships that will keep them coming back to the same clinic for care. The population is fairly transient which, without the relationships, may cause them to transfer from clinic to clinic, or utilize the emergency department inappropriately for care.

5-Year Expected Outcome for Provider and Patients:

CenteringPregnancy and Maternity Medical Home outcomes at the end of the Waiver will be that the number of infants born to the program will have - more timely prenatal and postnatal care, decreased emergency department utilization, and additional collateral benefits. The desired outcome for this patient population is to - increase the timeliness of prenatal and postnatal visits, and decrease the utilization of the emergency department for prenatal care.

Starting Point/Baseline:

The JPS outpatient service provides prenatal care to over 5,140 women annually throughout Tarrant County. Currently 92% of the women who deliver their babies at JPS receive their prenatal care at one of our JPS outpatient health centers. JPS Health Network adopted CenteringPregnancy in December 2011. Currently, JPS has four mid-level providers who were trained by the CenteringHealthcare Institute (CHI) and see patients for CenteringPregnancy. This represents only 16% of the providers who provide prenatal care and less than 5% of JPS’ patient visits. To date, 52 women have enrolled and 21 have delivered. The UNT Women’s Health Nurse Practitioners facilitate the group with support from JPS Health Network staff. With this proposed model, JPS will expand services from four providers at one clinic to 24 providers at four clinics and will have groups in both English and Spanish.

Maternity Medical Home: Currently we are providing prenatal care through the traditional OB visit model at several of our Community Health Centers. In several of these clinics, JPS has one nurse practitioner who provides obstetric care. In these sites there are fewer prenatal patients and
the CenteringPregnancy model is not recommended. In order to bring innovative services in these clinics, JPS plans to expand services to include a Maternity Medical Home service to provide patient navigation and health care coaching. Through this support staff, patients will be more readily linked to available community resources and health care.

**Rationale:**
Currently, there is an identified need to improve services in Tarrant County with Tarrant County having the second highest infant mortality rate among Texas counties with 10,000 or more live births each year and preterm birth ranking as one of the three leading causes of infant death. By providing enhanced services through innovative care, JPS will be able to work with partnering organization and groups to provide more timely care. Outreach will be incorporated into each model, so that JPS can reach out to patients and get them into care earlier in their pregnancy.

**DY2:** JPS timeliness to prenatal care is below the national average and is the primary, if not only source of preconception and interconception care for low-income women in Tarrant County. By providing innovative opportunities for care, JPS will increase timeliness to prenatal and postnatal care, and decrease the inappropriate utilization of the emergency department. JPS will develop a staffing plan to expand the Journey to Life team roles, including outreach into the community. This will include redefining the roles and responsibilities of the team and training the team for their new roles. While engaging the staff and preparing them for Journey to Life, a team will establish the criteria for Journey to Life assignment. An assessment tool will need to be utilized to establish eligibility. This tool can be used during OB intake where all their OB appointments will be made for better patient compliance. Journey to Life will be an opt-out program; however, there are some patients who would be better served with traditional care. JPS will also utilize this time to establish a baseline using current and past data on utilization rates of Journey to Life. JPS will implement and document a process to increase utilization through outreach and partnering with community organizations.

**DY3:** JPS will implement Journey to Life in a total of eight JPS Health Centers for Women and Community Clinics in DY3. By rolling the project out over this time frame, JPS can ensure a quality sustainable program. JPS will also develop a plan of disseminating the findings and best practices to the stakeholders through a Community Stakeholder Committee. Disseminating this information will demonstrate improvement opportunities for the program across the clinics and in the community.

**DY4 and DY5:** The number of patients enrolled in Journey to Life prenatal and postnatal outcomes, and emergency department utilization will be measured. By establishing and validating the data baselines in DY2 and implementation, and best practices implemented from feedback given by the Community Stakeholder Committee in DY3, outcomes will be measured to show the increase in timeliness of prenatal and postnatal care, utilization of the emergency department and participation in Journey to Life.
Project Components: CQI Core Components

Ongoing engagement and support of community stakeholders is essential to the successful recruitment of women into the program and providing a continuum of care through integrated referrals. JPS will bring together an oversight board consisting of the members of JPS and other pertinent agencies or individuals quarterly. The project will include a focus on continuous quality improvement by:

- Completing a rapid cycle improvement on early enrollment/access to care
- Identifying project impacts through the measurement of prenatal patients seen inappropriately in the emergency department
- “Lessons learned” will be utilized to identify barriers to care with special considerations for safety-net populations
- Key challenges associated with expansion of the project from one site to eight sites throughout the network, and these challenges will be communicated to the internal and external stakeholders.

Unique community need identification numbers the project addresses:

CN.11 Need for more care coordination
CN.19 Need for more and earlier onset of prenatal care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

In choosing option 2.7.3, implement innovative evidence-based strategies to increase early enrollment in prenatal care, CenteringPregnancy will enhance access by providing group care with preappointed dates and times to help patients plan for child care, transportation, and other needed services. It also increases patient satisfaction and engagement by providing the opportunity to learn from other patients and build relationships. Clinicians who have delivered care through CenteringPregnancy report higher satisfaction with their practice. The Maternity Medical Home will expand services to provide care navigation, health care coordination as well as expanding education/prenatal care and enhancing the delivery of maternity services by utilizing community resources through established agencies. Although this is not a new initiative, JPS is not receiving federal funding for this project.

Related Category 3 Outcome Measures:

a. Outcome Measure 2: IT-8.1: Timeliness of Prenatal/Postpartum Care The Fetal Infant Mortality Review reported that 42% of the cases reviewed in 2008 reporting having access to care issues. Forty-eight percent of women giving birth in Tarrant County received late or no prenatal care. In Texas, even among women with commercial HMO insurance, only 48% of women received a postpartum visit on or before 21 days and 56 days after delivery. The postpartum care rate at JPS is
estimated to be 40%, and the national average is 64.1%. For low-income women, the postpartum visit may be the source of medical care until they become pregnant again.

b. **Outcome Measure 1: IT-9.2 ED Appropriate Utilization:** During prenatal care, patients will utilize the emergency department as a secondary source of care to treat acute non-pregnancy-related issues. In fiscal year 2011, the emergency department provided 3,230 ED visits to pregnant women. During DY2, baseline data will be established to identify the percentage of ED visits that are potentially preventable. Through patient education and enhancing services in the outpatient setting, the number of prenatal patient seeking services in the ED can be decreased, and the patients can be seen in the most appropriate setting.

**Relationship to Other Projects:**
The Patient-Centered Medical Home (PCMH - 126675104.2.2) at JPS is related to the Maternity Medical Home. The Maternity Medical Home will utilize the principles of the PCMH model to develop and implement the program. The goals of the PCMH project are to decrease potentially avoidable ED admissions, reduce inpatient admissions, increase compliance with prevention cancer screening, and increase patient satisfaction. This project will not duplicate services provided under the PCMH project.

- **RD3(59) – Medical and Anesthesia Obstetric Complications** – Obstetric anesthesia is generally considered to be one of the higher-risk areas of anesthetic pregnancy. Both regional and general anesthesia carries with them the potential for complications. Improving these outcomes will improve the lives of both the mother and the baby.
- **RD3(60) – Major Puerperal Infection and Other Major Obstetric Complications**
Puerperal infection is a bacterial infection following childbirth. A small number of women who deliver vaginally suffer from a puerperal infection; however, for caesarean sections it is five to 10 times higher. Decreasing the number of elective caesarean sections will help reduce the number of infections.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
JPS will work collaboratively with the University of North Texas Health Science Center (UNTHSC) project team to improve the timeliness of prenatal and postnatal care, and reduce infant mortality. The UNTHSC Category 2 project is titled Implement innovative evidence-based strategies to reduce low birth weight and preterm births – Tarrant County Preconception and Perinatal Health Promotion Initiative. Both organizations will be a referral source for the other, and will work together to influence positive birth outcomes for the whole county.

Through the Centering Healthcare Institute (CHI), JPS will work with Texas Health Arlington Memorial to share ideas and experiences with CenteringPregnancy. CHI provides support by holding local and national meetings for providers and their teams. This will give both programs
the opportunity to work together to provide innovative methods of care. CHI will focus on a
distinct target prenatal population not receiving prenatal services at JPS. The outcomes for Texas
Health Arlington Memorial’s project are different from those of JPS; however, they are not in
conflict with each other. Journey to Life will not duplicate services provided by either of these
projects.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along
with a list of participating provider projects for each.) Though this project does not fit into the
two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and
learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that
CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and
outcomes by computing the total value of the Category 3 outcomes connected to each project.
JPS Health Network has computed the value of this project using the model developed at the
Regional level. That model computes separate values for impacts on the health care system, the
individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as
women receiving care through JPS Health Network. We used the pricing matrix developed by
Regional providers to determine the value to the health care system for each positive outcome
realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1
to 5, the value of this project is a 3. We believe this to be the correct number because when a
person is positively impacted, the health of the mother and baby is improved through proper
prenatal care and education. To determine the value to the community of each individual
positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We
believe this to be the correct number because when a person is positively their chances of having
a high-risk pregnancy and delivery, resulting in a complicated hospital admission is decreased.
### Region 10

#### Implement Evidence-based Disease Prevention Programs:
**Implement Innovative evidence-based strategies to increase early enrollment in prenatal care – “Journey to Life: Prenatal Care and Healthy Babies Initiative”**

Project Option 2.2.1 – Expand Chronic Care Management Models-School Based Collaborative Chronic Disease Care Model

Unique Project ID: 126675104.2.16 (Pass 2)

Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The multidisciplinary Wagner Chronic Care Model will be utilized to effectively approach the care and management of childhood and adolescent asthma and obesity/diabetes in our community with the goal of improving outcomes, preventing complications and reducing potentially preventable ED visits and inpatient readmissions. This project is a new initiative based on the Wagner Chronic Care Model.

Need for the project: 18.6% of children in Tarrant County have asthma and 32% are overweight or obese. Asthma is the most common chronic disease in childhood and children in low-income families are more than twice as likely to have been diagnosed with asthma as those that are not low-income. Among Medicaid-enrolled children with persistent asthma, the underuse of controller medications is widespread, reaching as high as 73 percent. Currently, patients seen in the 19 JPS Health Network School Based Health Centers with diagnoses of asthma and obesity/diabetes receive individual medical management and are provided with written education. There is no care coordination or multidisciplinary component to care, such as a focus on exercise, nutrition, social and psychological well-being, and no formalized self-management.

Target population: The project aims to serve 1,584 patients in DY4 and 1,980 patients in DY5 (a 10% increase from DY4). The target population is children and young adults with a diagnosis of asthma and/or obesity/diabetes who are currently accessing primary care services within our school based health centers as well as our community health centers.

Expected patient population: Improved health status through multidisciplinary care coordination and improved self-management tools as well as reduced expenditures by Medicaid through reduced ED visits and hospital readmissions.

Category 2 expected patient population: I-17: by DY5, 50% of identified target population will receive care under the chronic care model; I-18: Improve percentage of patients with self-management goals 60% from baseline by DY5.

Category 3 outcomes: IT-3.11-Reduce the percentage of pediatric and young adult patients with asthma who are readmitted to the hospital for any cause within 30 days of discharge from initial admission by 15% from established baseline by DY5; IT-9.3-Reduce the percentage of pediatric and young adult patients with asthma who have greater than or equal to one visit to the emergency room by 15% by DY5; IT-10.1: Improve quality of life score over established baseline by 10% for identified target population by DY5.
Achieving these outcomes will improve effective management of pediatric and adolescent asthma and obesity/diabetes, improve outcomes and reduce potentially preventable ED visits and inpatient readmissions.

**Project Option 2.2.1 – Expand Chronic Care Management Models-School Based Collaborative Chronic Disease Care Model**

**Unique Project ID:** 126675104.2.16 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Project Description:**
JPS Health Network has expanded access to primary care for underserved children and adolescents through its 19 regionally dispersed School-Based Health Centers. However, this population has very limited access to coordinated, proactive chronic care management for obesity, asthma, diabetes and other chronic conditions. This project will utilize the multidisciplinary Wagner Chronic Care Model\(^1\) and its six essential elements to improve care and management of these childhood and adolescent conditions in our community.

1. **Community:** JPS Health Network will expand current partnerships with local school districts as well as local children’s hospitals (Cook Children’s Fort Worth and Children’s Medical Center Dallas). During planning and development, JPS will create new alliances with local non-profits that support efforts to prevent chronic childhood diseases such as the North Texas Asthma Consortium and the FitWorth Healthy City Initiative. Forming such partnerships will create a community network to provide coordinated care with available resources at the local level.

2. **Health System Organization of Health Care:** JPS Health Network currently operates 19 School-Based Health Centers through partnerships with 12 of Tarrant County’s 20 independent school districts. Located in low-income areas with poor health care access, these SBHCs are already expanding access to primary care in our community and treating children with chronic conditions. This well-developed system, along with its strong partnerships with local independent school districts, is poised to create a formalized regional model for children and teens with limited to no access to chronic care management services/programs.

3. **Delivery System Design:** The multidisciplinary care delivery system design will include clearly defined roles and stress efficient resource use. Multidisciplinary care teams will be hired to cover four distinct regions inclusive of the 19 SBHCs. In DY2, the project will develop a multidisciplinary team model likely to include the following disciplines: mid-level provider, RN educator/certified asthma educator, social work/case management, nutritionist/dietitian and bilingual outreach worker. Other program design elements are medical management clinics, group sessions, summer programs and self/family medical management classes/tools to encourage a proactive approach that improves health outcomes and reduces urgent care and emergency department visits. Patients will see the same clinicians at each visit to improve communication and continuity of care. Patients will receive an average of four clinical visits over the course of the program resulting in a volume of services of 6336 visits in DY4 and 7920 visits in DY5. Home visits will be made to the
most vulnerable patients to address behavioral and environmental problems. Patients will come to the program through multiple avenues, including referrals from SBHCs, school nurses and Family Resource Centers. The program will also include pediatric and adolescent referrals originating from other JPS Community Health Centers.

4. Decision Support: JPS Health Network and its partners will develop and implement recommendations for chronic childhood disease prevention/self-management and use evidence-based practice to create educational curriculums for patients, parents, school staff and community stakeholders.

5. Clinical Information Systems: JPS Health Network will optimize its electronic medical record to capture accurate and complete data to populate a registry for targeted childhood chronic diseases: asthma and obesity/diabetes. Program leaders will develop and implement processes to measure baseline/ongoing data pertaining to prevalence of chronic childhood diseases within the SBHC service delivery area.

6. Self-Management Support: Efforts will focus on raising student and parental awareness and parent-driven medical monitoring through educational offerings and home visits. Innovative, Internet-based, interactive self-management tools will be created to engage students and parents in care management.

Goals and Relationship to Regional Goals:

Project Goals:
The School-Based Collaborative Chronic Disease Care Model will expand chronic disease management services to underserved children and adolescents. Objectives achieved by DY5 will include: 50% of identified target population receive care under the chronic care model; A 15% reduction from baseline in the percentage of pediatric and young adult patients with asthma and one or more ED visits; 15% reduction in the percentage of pediatric and young adult patients with asthma readmitted to the hospital for any reason within 30 days of discharge; 10% improvement in the target population’s quality of life score from baseline.

This project meets the following Regional goals:
Project goals are aligned with the goals of the Waiver and -Institute of Healthcare Improvement’s triple aim, and will improve the health of underserved asthmatic and/or obese/diabetic children in our community. Through better management of chronic conditions, we will improve health outcomes and quality of life, while lowering health care costs.

Challenges:
At this time chronic disease care is fragmented, and chronic disease prevention, management and education is not widely available for underserved children in our community.

5-Year Expected Outcome for Provider and Patients:
At the conclusion of the Waiver, we expect an innovative chronic care model focusing on care coordination, education and self-management to address the needs of children and adolescents with asthma and obesity/diabetes. Currently, children and adolescents with diagnoses of asthma and obesity/diabetes receive individual medical management treatment and are provided with written education at JPS SBHCs. They do not receive care coordination or other multidisciplinary care components such as a focus on exercise, nutrition, social and psychological well-being, and no formalized self-management tool or plan.

**Starting Point/Baseline:**

Our target population will be 3,960 children/young adults with a diagnosis of asthma and/or obesity/diabetes. In FY 2011, JPS SBHCs treated 3,960 children with the targeted diagnoses:

<table>
<thead>

</tr>
<tr>
<td>TOTAL UNDUPLICATED</td>
<td>3,960</td>
</tr>
</tbody>
</table>

**Rationale:**

Tarrant County is home to 401,322 children ages 0-14. About 19% (18.6%) of those children have asthma and 32% are overweight or obese based on body mass index. Asthma is the most common childhood chronic disease; children in low-income families are more than twice as likely to be diagnosed with asthma as children in higher-income families. Asthma is the leading cause of ED visits and hospitalizations for children in the United States as well as a major cause of school absenteeism. Asthma-related illnesses lead to almost 13 million school days missed per year. Three time more children are obese now than two decades ago, leading to increases in type 2 diabetes and other comorbidities. FitFuture of Tarrant County reported three ZIP codes where 44% to 57% of the children are obese: 76104 (south of downtown Fort Worth); 76013 (west Arlington); and 76014 (southeast Arlington). Our program implementation efforts will focus on incorporating the Wagner Chronic Care Model in all 19 School Based Health Centers, thereby benefiting children and adolescents throughout Tarrant County.

Both asthma and obesity have a high cost. The estimated annual cost of treating childhood asthma is $8 billion with inpatient hospital services the largest single direct medical expense. Among Medicaid-enrolled children with persistent asthma, fully 73% may not be using recommended and prescribed controller medications. As a result, they account for many more emergency department visits, hospitalizations, and high preventable treatment costs. According to the Centers for Disease Control and Prevention, hospital costs associated with childhood obesity rose from $35 million in 1979 to $127 million in 1999. Additionally, overweight and obese children are more likely to become obese adults, leading to an increased risk for many devastating and costly diseases over their lifetime including type 2 diabetes, heart disease, some
forms of arthritis, and several cancers.\textsuperscript{10} Research suggests that among children 5 or older, asthma and overweight/obesity are significantly associated.\textsuperscript{11} Obese children with asthma have 29\% higher hospitalization costs than non-obese children hospitalized for asthma.\textsuperscript{12}

**Project Components:**
This project creates a collaborative and innovative chronic disease management model within School-Based Health Centers (SBHCs) to target the most common chronic childhood diseases: asthma and obesity/diabetes. The project’s design includes all core components including tailoring care teams to target population’s needs; ensuring that patients have easy access to their care teams; increasing patient and parent engagement; offering components to empower children to make lifestyle changes and better manage their conditions; and conducting quality improvement efforts during the project to build on lessons learned and identify key challenges to address.

**Unique community need identification numbers the project addresses:**
CN.8 – Lack of access to healthcare due to financial barriers
CN.10 – Overuse of emergency department (ED) services-CN.11 – Need for more care coordination
CN.15 – Need for more education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This is a new initiative. We are receiving no other federal funding for this project. In 2011, JPS Health Network was awarded a HRSA grant in the amount of $500,000 for equipment and renovation to benefit existing School Based Health Centers.

**Related Category 3 Outcome Measures:**
- **Outcome Measure 1:** IT-9.3 Pediatric/Young Adult Emergency Department Visits
- **Outcome Measure 2:** IT-3.11 Pediatric Asthma 30-Day Readmission Rate

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
We will measure pediatric/young adult ED visits and pediatric asthma 30-day readmission rates because asthma is the leading cause of emergency department visits in the U.S., and reducing those visits through a proactive and coordinated approach to care is a key outcome.

**Relationship to Other Projects:**
RD-1(6) – Potentially Preventable Admissions-Pediatric Asthma, RD-2 (6) – 30-Day Readmissions-Pediatric Asthma, RD-4 (1) – Patient-Centered Healthcare. With this DSRIP project, JPS intends to make a positive impact by decreasing the number of pediatric admissions and readmissions related to the diagnosis of asthma. The focus on chronic disease management...
and care coordination is a key component of JPS’ strive for patient-centered health care and goal to increase patient satisfaction.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
Efforts have been made to collaborate and link the School-Based Collaborative Chronic Care model with UNT’s ASTHMA 411 – A Sustainable School-Based Asthma Program project. Examples include increased access to primary care and a written provider-driven asthma action plan through the JPS School-Based Health Clinics for students identified in the ASTHMA 411 program without a primary care provider. There is also a strong potential for collaboration on educational curriculums and data sharing through the mutual partnership with Fort Worth Independent School District. Although these projects share a similar focus, there will be no overlap in target populations.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as children with asthma seen at our school-based clinics. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a child’s asthma is addressed, the child is able to participate in a classroom and social setting more effectively.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number
because when a child is positively impacted, access to emergent care is available for other members in the community.

Project Summary

Project Option 2.12.1 – Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions – Develop rehab transition process for JPS Connections patients

Unique Project ID: 126675104.2.17 (Pass 3)
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: This project will create new and badly needed specialized inpatient rehabilitation purposes for uninsured individuals of Tarrant County. An estimated 420 vulnerable uninsured low-income Tarrant County residents requiring inpatient rehabilitation after stroke, hip replacement or hip fracture will receive specialty inpatient rehabilitation services through this intervention. For those who receive the intervention, we anticipate significantly shortened recovery times, higher functional status, and fewer re-admissions and ED visits compared with pre-intervention. This project is a new initiative.

Need for the project: The project will greatly increase access to specialty rehabilitation services for uninsured Tarrant County residents. The project specifically addresses three identified community health needs for Medicaid and Uninsured Region 10 residents: shortage of specialty care; overuse of ED services; and, need for more care coordination.

Target population: The target population is JPS Health Network patients who do not qualify for Medicaid in Texas and lack private coverage enrolled in JPS’ patient coverage program called JPS Connections.

Expected patient benefits. This intervention will result in new specialty care access to inpatient rehabilitation services for approximately 420 uninsured JPS Connections patients recovering from stroke, hip replacement or hip fracture in need of inpatient specialty rehabilitation over the course of the waiver period. This project was designed to improve specialty care access for low and moderate income uninsured Tarrant County residents with specific diagnoses requiring specialty inpatient rehabilitation. This project will result in reduced overall lengths of stay for patients, improved patient satisfaction with care, improved long term functioning and reduced re-admission rates. The project’s impact will be assessed through a CG-CAHPS pre- and post-intervention survey, achievement of milestones related to development and implementation timeline, as well as measurement of patient’s overall length of stay and quality of life.
Project Option 2.12.1 – Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions – Develop rehab transition process for JPS Connections patients

Unique Project ID: 126675104.2.17 (Pass 3)
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
JPS Health Network will establish a preferred partnership with a leading private provider of rehabilitation services (“Rehab Provider”) that creates new and badly needed specialized inpatient rehabilitation access for JPS Connections patients. By establishing a formal relationship with Rehab Provider, one of the Region’s most highly regarded inpatient rehabilitation providers, this project will achieve both regional and JPS-specific objectives to improve regional system care transitions and increase access to appropriate, high quality, specialty care for some of Region 10’s most vulnerable underserved and uninsured residents.

JPS Connections patients admitted to Rehab Provider will benefit significantly from an intensive, evidence-based rehabilitation therapy program with the potential for increased rates of clinical improvement resulting in earlier and safer home or community discharge. For individuals with qualifying conditions and presentations, inpatient rehabilitation hospitals promote the fastest and most comprehensive recovery opportunities. This partnership offers significant clinical benefits to patients as well as system-level cost reductions. JPS and Rehab Provider anticipate this partnership will reduce costs and improve functional independence and related outcomes for inpatient rehabilitation-eligible individuals. We expect our collaboration with Rehab Provider to reduce the target population’s average inpatient length of stay at JPS Health Network to seven to 14 days from the current average of more than 20 days.

Goals and Relationship to Regional Goals:
Project Goals:
JPS Connections patients admitted to Rehab Provider will: 1) receive an active and ongoing therapeutic intervention under the supervision of a rehabilitation physician that incorporates multiple therapy disciplines; 2) require an intensive and targeted rehabilitation therapy program; 3) actively participate in a customized intensive rehabilitation therapy program; and, 4) make measurable timely improvements.

---

274 JPS Connections patients do not qualify for Medicaid in Texas at this time and lack private coverage. There are three tiers of Connections patient coverage, depending on their income level: Tier 1 coverage levels and benefits are available to uninsured adults who do not qualify for Medicaid with incomes under 200% of the FPL; Tier 2 coverage levels and benefits are available to uninsured adults with incomes between 200% and 250% of the FPL. Additionally, JPS Connections is offered as a discounted fees program for uninsured adults with incomes above 250% of the FPL unable to secure affordable private coverage.
This project meets the following regional goals:
This project addresses Region 10’s goals of 1) improving access for the uninsured and underserved to needed primary care and specialty care and 2) better coordination of care across the region’s health care providers with an emphasis on more efficient care provided in clinically appropriate settings.

Challenges:
At this time Region 10 offers minimal and poorly coordinated access for the uninsured and underserved to specialty providers and specialized inpatient settings, including specialized rehabilitation inpatient services and other rehabilitation programs.

5-Year Expected outcome for Provider and Patients:
JPS Health Network will partner with Rehab Provider to transfer patients with three specific inpatient admission diagnoses (stroke, hip fracture and hip replacement) requiring ongoing therapy and targeted inpatient rehabilitation services to Rehab Provider. By the end of the Waiver period, JPS expects to have referred approximately 400 unique patients to Rehab Provider and a JPS PCP and reduced these patients’ readmissions through the JPS Health Network Emergency Department by at least 25%. Additionally, this project will result in faster recovery periods for JPS patients admitted to the Rehab Provider. We anticipate the JPS inpatient length of stay to decrease by seven to 10 days for the transferred patients and total recovery periods for these patients to be shorter.

Starting Point/Baseline:
Until now there has been no formal relationship between JPS Health Network and Rehab Provider and no inpatient referral agreement between the two systems. Therefore the baseline for this project is zero.

Rationale:
This project option was selected because of the benefit it will provide to a particularly vulnerable set of JPS Connections patients at great risk of care transition errors and potentially preventable readmissions and the efficiency and improved rehabilitative outcome opportunity it presents.

Project Components:
This project encompasses all seven required core components. JPS Health Network will: work with Rehab Provider to identify/verify the most appropriate therapy and related protocols for each of three clinical diagnoses; conduct a chart review analysis of the 30-day hospital readmissions for similar JPS Connections patients who have not benefited from access to Rehab Provider and share that with Rehab Provider; integrate information system exchange between JPS Health Network and Rehab Provider; work with Rehab Provider after the project is
implemented to identify which patients are most likely to need acute care services in the 30-60 days after discharge; collaborate with Rehab Provider on a discharge planning and post-discharge support program; develop a cross-system, cross-continuum multidisciplinary team to support patient recovery; and engage throughout the project in ongoing activities with Rehab Provider to continuously learn from the collaborative implementation experience and transfer that knowledge both to other inpatient JPS populations as well as care transitions with other partner providers. Rehab Provider will focus on developing greater understanding of best practice approaches and specific challenges associated with providing therapeutic services to this underserved population.

JPS and Rehab Provider will work in good faith to establish a formal contractual relationship that will include such provisions as term and termination; payment provisions including claims submission and payment guidelines; performance categories; measurement period(s); incentive payment potential and general responsibilities of both parties. Additionally, the two parties will develop an agreement to share data and information about their shared patients and to work together on continuous care transitions quality improvement.

**Unique community need identification numbers the project addresses:**

CN.3: Shortage of specialty care  
CN.10: Overuse of ED services  
CN.11: Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project represents a new initiative as there is no such formal relationship established between the two parties. This project does not duplicate any federal funds.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**Outcome Measure #1:** IT-6.1 (5) Percent improvement over baseline of patient satisfaction score – (5) Patient’s overall health status/functional status (Standalone measure)

**Outcome Measure #2:** IT-4.9 Average Length of Stay

**Relationship to Other Projects:**

There are no related Category 1 and 2 projects.

**Related Category 4 Population-focused improvements**

This project will impact RD-2: Potentially Preventable Readmissions. Specifically, this project will reduce RD-2.5 (Stroke readmissions) for the JPS Health Network ED.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

This intervention will result in new specialty care access to inpatient rehabilitation services for approximately 420 uninsured JPS Connections patients over the course of the waiver period, or 15% of the JPS Connections Patients with 3 specific diagnoses requiring inpatient rehabilitative therapy: stroke, hip replacement and hip fracture. This population number was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. JPS Health Network is anticipating both a reduction in length of stay, causing fewer costs to the hospital district and the Medicaid program, and thus an increase in patient satisfaction. The average length of stay for these types of patients at JPS costs $5,576 per day; decreasing the average length of stay, currently nearly 20 days, for patients by 15% over baseline by DY5 will result in a significant savings and an increase in patient satisfaction.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe this to be the correct number because, when a person is positively impacted, clinical outcomes will be improved by the ability to access care in the proper setting and have a positively impacted patient experience through a reduced length of stay in an acute care setting.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, there will be increased capacity for acute care patients in need of inpatient and rehabilitation beds.

Project Option 2.2.1 – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases – Healthy Education and Lifestyles Program (HELP) Chronic Disease Management Program

Unique Project ID: 127304703.2.1
Performing Provider Name/TPI: Texas Health Harris Methodist Azle / 127304703
Provider: Texas Health Harris Methodist Hospital Azle’s mission is to improve the health of the people in the communities we serve. The mission is the foundation for all of the facilities activities. Texas Health Harris Methodist Hospital Azle, a 36-bed hospital, is located on the border of Tarrant and Parker County, resulting in Texas Health Azle being the major source of primary health care to the area’s 30,000 citizens since 1954.
Provider’s Role in Region: The Tarrant County side has many resources, such as public health services; however, there is no public transportation from Azle to access these services. Parker County does not have a county hospital and only one clinic in Weatherford, which is approximately 20 miles from Azle. Again, there are no transportation options to Weatherford. Access for Medicaid patients is an equal concern. Although there are physicians in the large cities who accept Medicaid, there is not adequate transportation to these facilities.
Regional Need: The rural parts of Parker County provide an economic challenge. In fact, 18.7 percent of households in North Parker make less than $25,000 a year. In Parker County, the uninsured rate has jumped from 14.1 percent in 2007 to 24.8 percent in 2010xxx. The percent of children without insurance is 11.8† percent. Lack of insurance increases their dependence on Medicaid. As a result, 56% of the patients seen in the emergency room at Texas Health Azle were either unfunded or Medicaid. This translates into approximately 13,154 patients.
Project Intervention: Unfunded or Medicaid patients, who have an uncontrolled chronic disease, do not have access to primary care. They wait until their chronic disease is at an emergent level, then they seek treatment at the Emergency department (ED). After receiving treatment, the cycle begins again. This is not a good way to manage a chronic disease; and it is extremely costly to both the patient and the provider. The HELP clinic provides a primary care home for these patients, where they will receive, not only a clinic visit, but education and a support group as well. The HELP clinic is in the design phase and is only seeing ten patients as a pilot project. The DSRIP funds will expand this much needed program to include a multi-disciplinary team to provide a coordinated effort, and to ultimately redesigns the delivery of care.
Target Population and Benefit: Approximately 2,000 patients are seen in Texas Health Azle’s ED at an average cost of $1,322.00 per patient per visit. In a recent focus group held at Texas Health Azle for patients with a chronic disease, ninety percent said they would utilize a medical home instead of the emergency department.
Category 2 Expected Patient Benefits: The project seeks to provide a medical home for approximately 900 patients, who have a chronic disease by DY5, resulting in higher quality of care in a more cost effective setting.
Category 3 Outcomes: One outcome of the HELP program is to reduce by 50% the number of unfunded/Medicaid visits treated in the emergency department for uncontrolled chronic disease
Project Option 2.2.1 – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases – Healthy Education and Lifestyles Program (HELP) Chronic Disease Management Program

Unique Project ID: 127304703.2.1
Performing Provider Name/TPI: Texas Health Harris Methodist Azle / 127304703

Project Description:
Our HELP team of clinical and support staff will provide program participants monthly clinical office visits with a practitioner along with ongoing health coaching and education resources to support patients learning to effectively manage their chronic disease and to encourage them to take an active role in reducing the negative toll that their chronic conditions will otherwise take on their lives. The monthly office visits will ensure those who are uninsured gain access to lab testing, results and medications necessary to help them effectively self-manage their disease.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to develop and implement a community-based innovative chronic disease management program to help low-income and unfunded residents of Tarrant and North Parker County better self-manage their chronic conditions with a particular clinical support focus on reducing the rates of uncontrolled diabetes and hypertension among project participants.

Relying on an empirically validated, evidence-based self-management educational and clinical support approach, our goal is to improve the health outcomes and self-management competency of community residents in Tarrant and North Parker Counties living with chronic disease who in the absence of this program will continue to experience (1) unnecessarily reduced quality of life and (2) inappropriately high reliance on acute and emergent care community resources.

At this time, there are no programs like the one being proposed for this population, many of which are living with chronic disease in northwest Tarrant and Parker Counties. A community-based primary care model designed to reach out to disadvantaged adults living with a chronic illness is a much needed program for RHP 10 to improve the primary care access and chronic condition management needs of this population.

Our proposed intervention will help low-income and uninsured residents of northwest Tarrant and Parker Counties with chronic conditions to better self-manage their disease through disease education and peer support and provide them with appropriate access to chronic care management support resources, including lab and medications in an outpatient community-based setting. HELP care teams will be assigned based on individuals' health care needs and will include non-physician health professionals, such as pharmacists doing medication management;
case managers providing care outside of the clinic setting via phone, email and other electronic support, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system. Program participants will receive an individual assessment by a nurse practitioner under the direction of a Medical Director. They will participate in tailored self-care activities, including a health care and lifestyle self-assessment form, and have staff-facilitated peer to peer conversations with other participants about their disease management concerns. Participants will also be included in facilitated discussion by a registered nurse or nutritionist about a relevant health topic. In addition, high risk program participants will be given a tablet and other necessary medical equipment to monitor their chronic disease. These tablets will be electronically linked to the HELP care team to provide them with the ability to monitor participants’ conditions beyond the clinic setting. Program participants will be encouraged to access their care teams in person, by phone or email.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing a community-based, innovative chronic disease management program to help low-income senior and near senior residents of Tarrant and North Parker Counties better self-manage their chronic conditions, with a particular clinical support focus on reducing the rates of uncontrolled diabetes among project participants.

Challenges:
Higher than the national average of around 8%, 9.7% adults 18 years and older in Texas are diagnosed with diabetes. (i.e. about 1.8 million adults) Among the elderly population (older than 65 years), the rate is 23%, and among adults between 45-64 years of age, the rate is 14%. While chronic conditions are a growing concern for all U.S. populations, the uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable hospitalizations. Those who are uninsured or without access to appropriate care have been widely reported in clinical research literature as having the greatest difficulty in managing chronic conditions due to lack of a medical home, minimal or no primary care access, limited or no access to medications necessary for disease management, and limited or no access to regular lab work.276

We serve the Northwest Tarrant and the North Parker County areas. According to the Dallas Fort Worth Hospital Councils 2008 Community Needs Assessment, although the rate for uncontrolled

diabetes for Northwest Tarrant County is lower than state and national levels, diabetes-related death rates have exceeded county rates for five of the past six years. Similarly, North Parker County death rates exceed county rates for the past six years with diabetes identified as a major health concern. In 2011, Texas Health Azle’s ED treated 1,902 unfunded/Medicaid patients for an uncontrolled chronic disease.

This project was specifically selected because of its relevancy to providing improved cost-effective, competent care to help manage hypertension, high cholesterol and diabetes in the low income and uninsured population. We know this program is needed because, in August 2011, we conducted focus groups for uninsured patients living in our community with chronic disease. Findings from those focus groups indicated while chronic disease patients recognized their need for primary care and assistance with disease management, most felt they didn’t have sufficient support and primary care access to do so.\(^{277}\) Most focus group participants said they knew what they needed to do in order to be compliant: exercise, take proper medication, and improve their nutrition. Unfortunately, the same participants pinpointed their inability to pay as a critical barrier to following through with these needed management techniques and supports. Most respondents admitted to taking their medicine every other day to stretch out the medicine. Respondents also said they didn’t want to use hospital ERs as their source of care when their disease flared, but lacked any alternative.

**5-Year Expected outcome for Provider and Patients:**
In the focus group held at Texas Health Azle, 90% of the participants said they did not want to use the emergency department as a primary care facility, but there was no alternative. HELP provides the alternative. By the end of the Waiver, the goal is a 50% improvement in the number of patients seen in the HELP clinic over the baseline.

**Starting Point/Baseline:**
In 2011 the emergency department at Texas Health Azle, 56% of the patients were either unfunded or Medicaid. This translates into approximately 13,154 patients. A review of patient records indicates 1,902 of these patients were treated for an uncontrolled chronic disease. Ninety percent of the focus group said they would utilize a medical home instead of the emergency department. One outcome of the HELP program is to reduce by 50% the number of unfunded/Medicaid patients treated in the emergency department for uncontrolled chronic disease.

**Rationale:**
In the past, our system has focused on providing high-quality inpatient and emergency services. However, technological advances and recognition of the inadequacies of a reactive inpatient-

\(^{277}\) Our focus group findings were compiled in a June 2011 report, “What the Disadvantaged of Tarrant and Parker County Need to Improve Their Chronic Disease Self-Management Efforts.”
centered system of care, particularly for those living with chronic illness, requires a system “make-over” in which primary care access is the basis for ensuring ongoing, coordinated care for patients. So patients can stay healthy and out of the hospital, we have selected this project to expand our primary care capacity. Additionally, we have focused this project on a population disproportionately affected by the lack of primary care: economically disadvantaged and underserved adults living with a chronic disease. The Community Needs Assessment clearly identifies; (1) geographical barriers to care; (2) the lack of health care due to financial inability to pay; and (3) inappropriate emergency department utilization as concerns for this area. This clinic will provide low-cost access to primary care close to home for low-income or unfunded patients to prevent costly emergency department visits.

**Project Components:**
The HELP project meets all (A-E) of the required core components in Category 2.2.1, including:

- Design and implement a care team tailored to the patient’s health care needs through disease-specific patient education and self-management support;
- Increase patient engagement, through group visits and peer support opportunities as well as opportunities for participants to become auxiliary support resources for other participants as well as more broadly within their communities and families;
- Implement chronic disease self-management to empower patients to make lifestyle changes;
- Clinically-led and mission-driven team that communicates and stays in touch with program participants;
- All participants will have access to the Care Team via phone or email;
- Electronic tablet distribution to highest-risk participants to facilitate daily monitoring by team;
- Monthly clinical visits for participants with lab work and medications provided, and;
- Conduct quality improvement using the Plan, Do, Study and Act (PDSA) cycle for improvement, including studying the opportunity to scale part of the project to a broader patient population.

Our milestones measure an increased population receiving chronic care management through a proven, effective model of care: (1) by establishing a multidisciplinary team and (2) increasing the number of patients served under this model, as measured by patient touches recorded in the registry. These milestones and metrics will measure how many patients are receiving ongoing chronic care management through this effective, coordinated model (rather than not receiving care, or receiving fragmented care).

**Unique community need identification numbers the project addresses:**
- CN.7 – Need to address geographic barriers that impede access to care
- CN.8 – Lack of access to health care due to financial barriers
- CN.10 – Overuse of emergency department services
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
HELP is a new approach to offering outpatient care by implementing a team approach. Instead of just a clinic visit, each patient will receive education and support and lifestyle-changing techniques.

Related Category 3 Outcome Measures:
Outcome Measures:
IT-9.2 ED Appropriate Utilization (stand-alone)

Reasons/rationale for selecting the outcome measures:
This project was specifically selected because of its relevancy to providing improved cost-effective, competent care to help manage hypertension, high cholesterol and diabetes in the uninsured population. We know this program is needed because, in August 2011, we conducted focus groups for uninsured patients living in our community with chronic disease. Findings from those focus groups indicated that while chronic disease patients recognized their need for primary care and assistance with disease management, most felt they didn’t have sufficient support and primary care access to do so. Most focus group participants said they knew what they needed to do in order to be compliant – exercise, take proper medication, and improve their nutrition. Unfortunately, the same participants pinpointed their inability to pay as a critical barrier to following through with these needed management techniques and supports. Most respondents admitted to taking their medicine every other day to stretch out the medicine. Respondents also said they didn’t want to use hospital ERs as their only source of care when their disease flared, but lacked any alternative.

Related Category 4 Population-focused improvements:
RD-1.2 Diabetes Admission Rates: Implementing our HELP CDSMP-based intervention for uninsured and disadvantaged adults with a serious chronic condition will have a positive impact on this reporting measure for HELP program participants.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $1,322 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., with either hypertension or diabetes), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Project Summary Template to be completed for each Category 1 and 2 project  
Project Option 2.18.1– Implement whole health peer support (Peer Support).

**Unique Project ID:** 127373205.2.1  
**Performing Provider Name/TPI:** Helen Farabee Centers / 127373205

**Provider:** The Helen Farabee Center consists of 9 clinics in north-central Texas serving 19 counties across 16,705 square miles and a population of 318,665. The Helen Farabee Center is a Community Mental Health/Intellectual & Developmental Disability authority/provider. The Center serves primarily indigent clients and roughly 30% of them have Medicaid.  
**Intervention:** The goal is to expand the Peer Provider staffing to better meet the needs of the patient population in Wise County. The project is an expansion of services occurring within the service area and it is new to Wise County.  
**Need for the project:** The project meets the following needs identified through a regional needs assessment: CN.4 Lack of access to mental health services; CN.7 Need to address geographic barriers that impede access to care.  
**Target population:** The target population for this project is Adults/Children who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (Adults with Major Depression, Bipolar Disorder, Schizophrenia and Children with a diagnosis of mental illness who exhibit serious emotional, behavioral, or mental health disorders. The estimated target impact is 60 clients a year receiving a health assessment and 30 a year qualifying for full Whole Health treatment. Milestones in years 4 and 5 target improved health measures in 50% and 60% of recipients, respectively. The project represents a needed service that is currently absent in the identified service area and one that can be provided at low or no cost to Medicaid/indigent recipients.  
**Category 1 or 2 expected patient benefits:** The benefit is the assessment of clients for health risks and treating them with a Whole Health approach by trained Peer Providers. This benefit meets the purpose of implementing Whole Health Peer Support in the identified service area.  
**Category 3 outcomes:** How does this tie back to the project’s purpose? The benefit of the project is a 5% and 10% improvement in quality of life as measured by assessments in DY’s 4 and 5, respectively. This meets the project purpose of improving quality of life through Whole Health Peer Support for people in the identified service area.
Project Option 2.18.1– Implement whole health peer support (Peer Support).

Unique Project ID: 127373205.2.1  
Performing Provider Name/TPI: Helen Farabee Centers / 127373205

Project Description:  
Currently, Peer Provider services are provided by one Peer Provider staff member located in Wichita County who also attempts to provide the services in eighteen additional counties. The goal is to expand the Peer Provider staffing to better meet the needs of the patient population in Wise County (ZIP codes 76431, 76225, 76234, and 76073). The target population for this project is Adults who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (Major Depression, Bipolar Disorder, and Schizophrenia). The project fits within the Project Area in that it involves recruiting and training potential peer providers. The project fits within the Intervention in that the new staff will be implementing peer support services.

Goals and Relationship to Regional Goals:

Project Goals:  
The goal is to expand the Peer Provider staffing by hiring two Peer Providers in Wise County to better meet the needs of the patient population in that county. These Peer Providers will use Whole Health Planning and health risk assessment tools in order to improve standardized health measures. The purpose of performing the project within this project area is that recruiting and training are integral to completing the goal.

This project meets the following Regional goals:  
The project is related to Area of Focus Two: Care Coordination. The majority of respondents did not believe that low-income patients could access behavioral/mental health providers. The project is related to Area of Focus Three: Community Health. Respondents felt that behavioral health, substance abuse and insufficient access to care were the top issues affecting population health. In addition, they listed friends and family, the Internet and their doctor as the main places where patients were getting health education.

The Helen Farabee Center primarily serves low-income individuals seeking mental/behavioral health care. The Peer Support model adds an additional layer of care coordination by providing peers as access points for clients in care. The Peer Model also serves as an important education source for patients.

Challenges:
According to the National Alliance on Mental Illness (NAMI), one in four people will experience some sort of diagnosable mental illness. One in 17 people in the United States suffers from a severe persistent mental illness. Mental health interventions for these individuals have evolved over the years to include more evidence-based practices such as Peer Service Provision. Peer provision is a new shift in the way mental health centers can provide skills training and rehabilitative services to individuals with mental health needs. For the past few years this service has been provided in a limited capacity by a single peer provider employed by the Helen Farabee Center. More peer providers are needed to serve more of the Helen Farabee Service area. This project addresses these challenges by hiring and training the staff required to provide Peer Services in an area with limited Peer service.

5-Year Expected outcome for Provider and Patients:
The five-year outcome is to have hired two peer providers for Wise County and implement whole health planning for identified consumers resulting in improved standardized health measures for those consumers.

Starting Point/Baseline:
There is currently one peer provider centerwide. There are no consumers receiving Whole Health Planning interventions at any location. The goal is to provide services initially to 20 people.

Rationale:
On August 15, 2007 the Center for Medicare & Medicaid Services (CMS) issued a statement as part of a letter to state Medicaid offices encouraging the use of State certified peer specialists. Currently, the Texas Department of State Health Services includes Peer Support among other best practices as part of the Texas Resilience and Recovery treatment model. The corresponding milestones and metrics track the changes necessary to place, train, and equip peer providers in a location that currently lacks the service.

Project Components:
Core Component a) “Train administrators and key clinical staff in the use of peer specialists as an essential component of a comprehensive health system” was not included since the administrators and key clinical staff at the mental health center include certified Peer Specialists and already acknowledged peer specialists as a key component of the Texas Recover and Resiliency mental health system. Core component b) “Conduct readiness assessments of organization that will integrate peer specialists into their network.” was not included because the organization has already integrated peer specialist services into its network. This project is an expansion of those services.

---

278 The High Costs of Cutting Mental Health (www.nami.org)
280 http://www.dshs.state.tx.us/mhprograms/RDM.shtm
Projects c) “Identify peer specialists interested in this type of work”, d) “Train identified peer specialists in whole health interventions, including conducting health risk assessments, setting SMART goals, providing educational and supportive services to targeted individuals with specific disorders…”, e) “Implement health risk assessments to identify existing and potential health risks for behavioral health consumers.”, f) “Identify patients with serious mental illness who have health risk factors that can be modified.”, g) “Implement whole health peer support.”, h) “Connect patients to primary care and preventive services.”, and i) “Track patient outcomes.” were selected since they are integral to the whole health system of care and are areas that have not yet been fulfilled. They will require recruiting of additional peer specialists, training, implementing health risk assessments, identifying patients who have health risk factors, implementing the whole health peer support model, connecting patients to primary care or preventive services, and tracking outcomes.

The milestones and metrics were chosen based on the elements required to be in place in order to provide peer-provided whole health services at a new location where none had been provided before. The process requires the recruitment and training of peer specialists, implementing health risk assessments, identifying consumers with modifiable health risks, developing person-centered wellness plans, and tracking improvements in standardized health measures.

**Unique community need identification numbers the project addresses:**
- CN.4 Lack of access to mental health services
- CN.7 Need to address geographic barriers that impede access to care

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Using Peer Service Provision in our service area an initiative started through the Texas Department of State Health Services and continues within its Texas Resiliency and Recovery model of care. Since specific funding for peer initiatives is absent in the DSHS model, this project enhances the Peer Services model by specifically funding additional peer positions to more effectively meet consumer needs across the service area.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

*IT-10.1 Quality of Life.*

This outcome is important to the RHP since improvements in this measure correlate to increased time in a regular community setting versus seeking help through the emergency department or
state hospital. When patients with behavioral health issues cannot get timely evaluations and care through a Local Mental Health Authority, they will likely visit a local emergency department. AHRQ reports that one in eight of 95 million emergency department visits involved people with a mental health disorder. A quarter of these mental health disorders involved a substance abuse problem. Nearly 41% of these mental disorder and/or substance abuse-related visits resulted in hospitalization.²⁸¹ Many patients reporting improved QOL ratings may also be diverted from emergency departments if an immediate peer support intervention were available. The outcome also reflects any impact peer support services will have in ensuring patients remain in the community. Expansion of the peer provider program can foster recovery having a subsequent improvement on an individual’s health overall well-being. Peer Service Provision is identified as a clinical best practice by the Texas Department of State Health services. Certified Peer Specialists are trained using a curriculum developed by the Appalachian Consulting Group, the leading provider of Peer Specialist training in the United States. Non-degreed, certified Peer Specialists can provide engagement and rehabilitative services which were previously limited only to degreed professionals. The resulting impact is that a peer provider network represents valuable clinical interventions at a lower cost to mental health authorities. In a 2004 research review, the Psychiatric Rehabilitation Journal noted studies showing little difference in outcomes resulting from professional versus nonprofessional (peer) providers. Other studies reviewed in this journal showed a decrease in hospitalizations and shorter hospital stays for clients connected to peer interventions.²⁸² Given the consistent findings of decreased hospitalization and shortened length of stay combined with the low cost of utilizing paraprofessionals and self-help groups, peer provided services are likely to result in cost savings. A 2008 policy briefing at the National Conference of State Legislatures described an expansion of the health care system through using Community Health Workers (including peer service provision). This briefing described current research which found the Community Health Worker model to be cost-effective, resulting in improved health, more preventive and primary care visits as opposed to urgent care, and fewer hospitalizations.²⁸³ The expected improvement milestone for DY4 is to see improvement in quality of life, comparing assessments at three months with assessments at six months, as measured by the ANSA for 5% of adults receiving peer support services in Wise County. The milestone increases to 10% for DY5.

**Relationship to Other Projects:**

This Peer Support implementation project is related to project 127373205.1.2 Improve access to specialty care (psychiatric open access), in that it provides access to a service that would otherwise require a long wait or not be available in Wise County.

The Project relates to 127373205.1.1 Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (substance abuse expansion), in that it also provides a behavioral health service in an area that currently has very limited access to the service.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Texas Health Harris Methodist Hospital Azle (127304703.2.1)

The target population for this project is Adults who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (adults with major depression, bipolar disorder, schizophrenia). Part of this eligibility includes geographic location limited to Wise County. The services provided by the mental health authority are specific to DSHS’s Texas Recovery and Resiliency model of care. We do not believe the project duplicates another provider’s intervention for the same target population.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

We applied a benefit-cost ratio of $3.71 per dollar invested. The closest studies relating to valuation of peer support programs came from Sari et al. (2008) who found the benefit-cost ratio for a peer support program related to preventing adolescent suicide was $3.71 for each dollar invested. Kuyken et al., (2008) in another peer-support program for prevention of adolescent suicide, found a benefit cost ratio of $43 for each dollar invested for Native American Youth. The average benefit cost ratio between these two studies is $23.36; however, since our target population contains little or no Native American representation, we chose the conservative amount of $3.71.

Year 2 Estimated Milestone Bundle Amount: *(add incentive payments amounts from each milestone): $152,651*

Year 3 Estimated Milestone Bundle Amount: $163,847

Year 4 Estimated Milestone Bundle Amount: $175,248

Year 5 Estimated Milestone Bundle Amount: $169,293

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $661,039*
**Project Option 2.16.1** – Provide virtual psychiatric and clinical guidance to all participating primary care providers delivering services to behavioral patients Regionally (Virtual Psychiatric Consultation)

**Unique Project ID:** 127373205.2.2 (Pass 2)

**Performing Provider Name/TPI:** Helen Farabee Centers/127373205

**Provider:** The Helen Farabee Center consists of 9 clinics in north-central Texas serving 19 counties across 16,705 square miles and a population of 318,665. The Helen Farabee Center is a Community Mental Health/Intellectual & Developmental Disability authority/provider. The Center serves primarily indigent clients and roughly 30% of them have Medicaid.

**Intervention:** The project expands our current contract for telemedicine services in Wise County by providing psychiatric telephone consultation to physicians seeing patients in primary care settings. This is a new initiative.

**Need for the project:** The projects address regional needs identified through a needs assessment. Those needs are: CN.4 Lack of access to mental health services; CN.5 Insufficient integration of mental health care in the primary care medical care system; CN.7 Need to address geographic barriers that impede access to care and; CN.11 Need for more care coordination.

**Target population:** The target population are patients presenting at primary care facilities with mild to moderate psychiatric symptoms or conditions for which the primary physician desires consultation via psychiatrist to inform diagnosis, treatment, and/or referral options. The estimated number of patient served will be determined during DY2 per Milestone 1. The project represents a needed service that is currently absent in the identified service area and one that can be provided at low or no cost to Medicaid/ Indigent recipients.

**Category 1 or 2 expected patient benefits:** The benefit of Milestones 1-6 are the implementation of a psychiatric consultation model available to enrolled primary care physicians who report satisfaction with the service. The benefit fulfills the project’s purpose by providing psychiatric guidance to participating primary care providers. A very rough estimate of patient impact would be 128 per year. There is no past utilization of telemedical psychiatric consultations upon which one can accurately base utilization. The analyses conducted in DY2 are designed to determine the number of primary care settings, potential number of patients served, and the estimated number of psychiatric consults to be performed.

**Category 3 outcomes:** The benefit of Category 3 milestones 1 and 2 is having local stakeholders inform the planning of the project and review the findings, lessons learned and best practices. This is related to the purpose of the project which is to ensure that local providers find the service relevant and useful. The benefit of Category 3 Improvement Targets 1 and 2 is that they set goals for having the majority of enrolled providers actually using the service.
**Project Option 2.16.1** – Provide virtual psychiatric and clinical guidance to all participating primary care providers delivering services to behavioral patients Regionally (Virtual Psychiatric Consultation)

**Unique Project ID:** 127373205.2.2 (Pass 2)

**Performing Provider Name/TPI:** Helen Farabee Centers/127373205

**Project Description:**
The project expands our current contract for telemedicine services in Wise County (ZIP codes 76431, 76225, 76234, and 76073) by providing psychiatric telephone consultation to physicians seeing patients in primary care settings. The target population is patients presenting at primary care facilities with mild to moderate psychiatric symptoms or conditions for which the primary physician desires consultation via psychiatrist to inform diagnosis, treatment, and/or referral options. A rough estimate of the number of patients to potentially benefit from consultation would be 128 per year. The project fits within the project area since it provides for immediate access to psychiatric consultation in primary care to enhance and improve treatment for individuals with behavioral health conditions.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The project goals include establishing an infrastructure and the clinical expertise to provide remote psychiatric consultation; determining the location of primary settings with a high number of individuals with behavioral health disorders; assessing applicable models of deploying virtual psychiatric consultation; building the infrastructure needed to connect providers to the virtual psychiatric consultant; ensuring psychiatric consultation services are available 24 hours a day; identifying disciplines within primary care settings that could benefit from remote psychiatric consultation; providing outreach and communicating protocols to medical personnel in primary care settings who need telephonic behavioral health expertise; developing and implementing data collection and reporting standards; and finally, reviewing the impact on access to telephonic psychiatric consults and identifying how the model can improve. The project represents an innovative way to provide psychiatric resources to a primary care setting that has historically lacked them.

**This project meets the following Regional goals:**
Regional goals are in accordance with CMS’ triple aim of right service, right setting, right time. This project provides virtual psychiatric consultation for primary care physicians who conduct routine mental health inquiries as opposed to delaying psychiatric interventions or possibly resulting in crisis-oriented services (right service). The services are available at any primary care
access point, eliminating the need for patients to travel to other clinics (right setting). Finally, the services are provided at the right time, which is immediately when the primary physician requests the consultation in order for that physician to begin treatments quickly if indicated (right time). This project improves patient experience by providing their primary care physicians with timely access to psychiatric consultation. It improves health by creating a system that is able to begin treatment sooner. It is designed to reduce costs by using alternative and efficient routes of access to psychiatric consultation and by providing care designed to integrate primary and psychiatric interventions.

**Challenges:**
The performing provider as well as primary care physicians in the Region face the challenge of meeting the growing demand for psychiatric specialty services in an efficient, cost-effective, and consumer-friendly way. This project addresses those challenges by providing an efficient means of accessing psychiatric guidance that allows the primary physician to provide more comprehensive care without unnecessary referrals. The cost associated with telephonic psychiatric consultation is less than those associated with full referrals for psychiatric evaluations. Additionally, this consultation model is consumer-friendly in that it allows a patient to be treated in one setting or by preferred providers rather than receive care in multiple and potentially disconnected settings.

**5-Year Expected Outcome for Provider and Patients:**
The five-year goal is to have an established and effective virtual psychiatric consultation system with enrolled primary care physicians who regularly use the system and report being satisfied with it.

**Starting Point/Baseline:**
There are currently no virtual psychiatric consultation systems available to primary care physicians in Wise County.

**Rationale:**
A significant proportion of emergency department visits include patients who have either primary or concurrent behavioral health issues. AHRQ reports that one in eight of 95 million emergency department visits involved people with a mental health disorder. A quarter of these mental health disorders involved a substance Abuse problem. Nearly 41% of these mental disorder and/or substance abuse-related visits resulted in hospitalization. The prevalence of behavioral health issues is not limited to emergency department presentation. The American

Psychological Association reports data compiled by an independent actuarial firm showing that up to two-thirds of people who need behavioral health treatment are first seen in primary care settings, yet only 12.7% receive even minimally adequate treatment there.\(^{288}\) A number of primary care physicians report perceiving the need for addressing behavioral health conditions in a primary care setting, and collaborative models of care are considered helpful in that treatment.\(^{289}\) Due to the shortage of psychiatrists in many rural areas, this form of collaboration requires new and innovative consultation systems. Studies have shown that collaborative care models can be successfully adapted for primary care clinics without on-site psychiatrists by using virtual technology.\(^{290}\) This project was selected to meet that need in local primary care settings by providing virtual psychiatric consultation services.

**Project Components:**

All required components have been selected. Components (a) “Establish the infrastructure and clinical expertise to provide remote psychiatric consultative services.”, (b) “Determine the location of primary care settings with a high number of individuals with behavioral health disorders (mental health and substance abuse) presenting for services, and where ready access to behavioral health expertise is lacking. Identify what expertise primary care providers lack and what they identify as their greatest needs for psychiatric and/or substance abuse treatment consultation via survey or other means.”, (c) “Assess applicable models for deployment of virtual psychiatric consultative”, (d) “Build the infrastructure needed to connect providers to virtual behavioral health consultation.”, (e) “Ensuring staff administering virtual psychiatric consultative services are available to field communication from medical staff on a 24-hour basis.”, (f) “Identify which medical disciplines within primary care settings (nursing, nursing assistants, pharmacists, primary care physicians, etc.) could benefit from remote psychiatric consultation.”, (g) “Provide outreach to medical disciplines in primary care settings that are in need of telephonic behavioral health expertise and communicate a clear protocol on how to access these services.”, and (h) “Identify clinical code modifiers and/or modify electronic health record data systems to allow for documenting the use of telephonic behavioral health consultation.” are considered critical steps in identifying the settings that would benefit from the psychiatric consultation and what infrastructure would be required to meet those needs. Components (i) “Develop and implement data collection and reporting standards for remotely delivered behavioral health consultative services.” and (j) “Review the intervention(s) impact on access to telephonic psychiatric consults and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges.

associated with expansion of the intervention(s), including special considerations for safety-net populations” represent the necessary data collection, evaluation, and reporting activities that will ensure the consultation system is having the intended effect.

Four process milestones were selected to track progress in creating a consultation service based on existing needs in the primary care setting. An initial needs assessment will be conducted to assess the demand on primary care providers from patients with behavioral health issues, and whether they would benefit from telephonic psychiatric consultations (P-1.1). Next, psychiatric consultation services will be designed to allow primary care physicians to access behavioral health expertise (P-2.1). Interested primary care settings will then be enrolled as eligible participants to receive consultative services (P-3.1). Finally, the consultative services will be continuously evaluated for improvement purposes (P-5.1). Improvement milestone I-9 was chosen to capture primary care provider satisfaction with virtual psychiatric consultative services. Improvement milestone I-8 was chosen to capture patient satisfaction with primary care providers who had access to psychiatric consultations.

**Unique community need identification numbers the project addresses:**
- CN.4 Lack of access to mental health services,
- CN.5 Insufficient integration of mental health care in the primary care medical care system
- CN.7 Need to address geographic barriers that impede access to care
- CN.11 Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The project represents a less costly, more efficient method of obtaining a psychiatric consultation while allowing the primary physician to initiate psychiatric treatment concurrently with treatments for a presenting physical issue. This is a significant enhancement to primary care and represents a new way of integrating physical and behavioral health care in Wise County.

**Related Category 3 Outcome Measures:**
1. **IT-9.4 Other Outcome Improvement Target** which was modified to track the percentage of enrolled primary care settings that utilize the telephonic psychiatric consultation service

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
The related Category 2 project (telephonic psychiatric consultation) helps achieve this outcome by first designing a consultation model to meet the needs of the Region as determined by primary care provider survey. Providers are enrolled, utilize the consultation service, and are asked to provide feedback. The feedback is used to improve the system by increasing efficiency and usefulness. These Category 2 activities are designed to increase the percentage of enrolled providers who regularly use the consultation service. Having providers regularly use this consultation service is important, due to the rates at which patients present to primary care
settings with behavioral health disorders291. The Center served approximately 1000 unduplicated clients in Wise County in 2012. The APA estimates that as many as 2/3 of patients with a behavioral health issue will present first for care at a primary care clinic292. Based on the 1000 patients served, 660 (2/3) of them may have presented initially in a primary care setting. Ensuring primary care sites use available psychiatric consultation will have a direct impact on these patients.

**Relationship to Other Projects:**

N/A

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s Learning Collaborative activities. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative.

**Project Valuation:**

The valuation methodology is based on an assumed gain of 0.335 Quality Life Years gained by using the proposed project. One quality life year is commonly estimated at $50,000. Assuming 15 clients were served in the program, the annual valuation is $251,250 ($50,000 x 0.335 = $16,750. $16,750 x 15 = $251,250). We used cost-utility analysis (CUA), which measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses Quality-adjusted life years (QALY) analysis combines health quality (utility) with the length of time in a particular health state. The benefits of the proposed program are valued based on assigning a value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard. One study examined collaborative care intervention for multisymptom patients including depression, diabetes, and coronary heart disease (Keaton, 2012).293 In this study, the effect of the intervention was 0.335 incremental life years gained. This can be considered a conservative gain given that the study focused on depression, which is likely to be the most prevalent and least intense behavioral health condition presented in primary care settings.

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.13.1 – Design, implement, and evaluate research-supported and evidence-based interventions tailored toward individuals in the target population (WRHS NTCH BH/SA Collaboration Project)

Unique Project ID: 130606006.2.1
Performing Provider Name/TPI: Wise Regional Health System / 130606006

Provider: WRHS is a health system licensed for 148 beds and NTCH is licensed at 38 beds. The service area is Wise, Montague, Jack, and parts of Tarrant County. This service area holds 64,000 residents and is expected to grow to 74,000 by 2017. In DY1 our health system’s charges for providing care to our indigent population was $118.3M. These two hospitals are the only two in the county.

Intervention: This project will implement an intensive outpatient program for dual diagnosis of behavioral health and substance abuse. It is a new intervention.

Need for the project: This project is designed to fulfill the community need CN.4 Lack of access to mental health services. Currently there is a very high ratio of population to mental health specialists in Wise County, 19,495:1, so the need is very strong.

Collaboration: This project will be a collaborative project involving Wise Regional Health System and North Texas Community Hospital in Bridgeport. Wise Regional will be the main provider of resources (case managers, behaviorists) and thus will be the Performing Provider. Interventions and education will take place in the ER of both facilities. This will be transformative because there will be communication and coordination of care from both units. The IOP program will be available to all eligible residents of Wise County. Being the first of its kind of program, this project is also transformative by providing dually diagnosed residents a way to seek treatment.

Target Population: The target population is the Wise County residents with BH/SA, uninsured and Medicaid. -The number of patients exposed to education and intervention will be in DY1 3281, DY2 3300, DY3 3400, DY 3264, DY5 3145.

Expected patient benefits: Most of the patients coming through this program will be Medicaid eligible or uninsured.

Category 1 or 2 expected patient benefits: The selected milestones will walk WRHS through the implementation process by providing employees, methods for the design, plan, implementation and measure of community-based specialized interventions. They meet the need of adding mental health specialists and ensuring improvement in the target population.

Category 3 outcomes: IT-2.4 Behavioral Health/Substance Abuse (BH/SA) Admission Rate, the goal of the project is to reduce this rate through the implementation of an IOP model using a proven evidence-based treatment approach. OD-10, IT-10.1 Quality of Life, with patient survey utilizing SF-36 to determine positive outcomes of symptom improvement and increased functioning that will ultimately promote wellness and resiliency due to adherence to treatment and improve overall community recovery. Both of these measures will illustrate the effectiveness of the project’s implementation and reduce cost to the health care delivery system.
Project Option 2.13.1 – Design, implement, and evaluate research-supported and evidence-based interventions tailored toward individuals in the target population (WRHS NTCH BH/SA Collaboration Project)

**Unique Project ID:** 130606006.2.1  
**Performing Provider Name/TPI:** Wise Regional Health System / 130606006

**Project Description:**
**Project Area:** Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specified setting  
**Project Intervention:** Design, implement, and evaluate research-supported and evidence-based interventions tailored toward individuals in the target population.  
Wise Regional Health System (WRHS) and North Texas Community Hospital (NTCH) propose to collaborate to design and implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse (BH/SA) utilizing a disease model with evidence-based therapies and services. The major causes for disability in the U.S. are changing from medical to social and behaviorally related conditions, increasingly involving complications such as substance abuse, violence, and poor mental health. Implementing a community-based IOP will provide better outcomes for patient care to address the increasing percentages of abuse and dependency on alcohol, illicit drugs, and prescription drugs and address co-occurring mental health issues. These outcomes will be documented and meet the goals of the project. The program will also focus on hiring and retention of qualified mental health professionals to address the Health Professional Shortage Area in Wise County as reported by the U.S. Department of Health and Human Services. Outpatient services will impact the use of higher level of care services in the ED, BH/SA Inpatient Facilities, and decrease the need for legal interventions. A reduction of use in these facilities will be county-wide and will impact both WRHS and NTCH. There will be better patient outcomes in least restrictive appropriate setting, while patients remain a productive part of the workforce in their home community. A formal network with other providers will be established to provide care coordination. The number of patients exposed to education and intervention will be in DY1 3281, DY2 3300, DY3 3400, DY 3264, DY5 3145.

**Goals and Relationship to Regional Goals:**
**Project Goals:**  
The goal of this project is to reduce admission rates for substance abuse and behavioral health-related diagnosis into area hospitals acute care and Emergency Departments while improving the quality of life of the patients as exhibited by results of evidence-based surveys (i.e. SF-36). This project will develop, redesign and expand an IOP that meets the needs of persons with mental illness, substance abuse, poly substance abuse and dual diagnosis. The target population will have abroad based continuum of evidence-based services including Cognitive Behavioral Therapy, psychiatric and medication services, and nutritional counseling that addresses their needs in one location. Services will also focus on co-occurring issues (i.e., use of medications,
self-medicating, symptom management) that is not addressed in self-help or traditional outpatient settings. More costly medical and legal services should be impacted when this target population has access to community-based services that are more appropriate and provide a holistic approach to treatment. Data will be collected and analyzed from both hospitals to look for trends, unduplicated and duplicated services, and opportunities for policy and intervention changes. An inquiry and referral system will be developed through the EDs and existing social workers at both hospitals and by the new case management position that will coordinate services between the facilities and within the community.

Currently, no programs provide IOP to the target population in this county. Our proposed intervention will focus on people who are high users of more costly services, are disabled, and are usually from a lower socioeconomic level. Our target population is residents of Wise County, 18 and older, who are covered under Medicaid, Medicare, dually eligible, insured and uninsured with co-occurring behavioral health and substance abuse illnesses. Treatment will include early intervention, relapse prevention, crisis and symptom management, and patient/family education.

Program participants will receive an initial evaluation and monthly follow-ups by the psychiatrist, individualized treatment planning, and therapeutic interventions by masters and specialty level staff. They will receive a minimum of three groups a day for three days a week for a period of 90 days to six months, based on treatment team recommendations and authorization by the psychiatrist in evidence-based therapy. Another goal is to increase the overall quality of life for patients and their families with treatment in their home community which allows them to continue employment and be productive citizens in their community. The service(s) will provide a continuum of care that will have an impact across medical, psychiatric, and substance abuse arenas.

This project meets the following Regional goals:
The goal is to prevent unnecessary use of services in settings such as the ED, urgent care, and the judicial system and reduce the overall admission rate for persons with BH/SA, which this project contributes to.

Challenges:
A challenge will be to coordinate services between the two hospitals and develop outreach services within the community in non-clinical settings. Outreach will be conducted by WRSH staff that focuses on education and advocacy for this target population in order to reduce stigma, and improve fragmented, episodic care. This project was selected due to the relevancy in our Region and Texas for BH/SA services with the increasing percentages of substance abuse/dependency and co-occurring mental health issues. The Community Health Needs Assessment identified BH/SA and insufficient access as issues affecting population health. If services for this population are not diverted to least restrictive and less costly services, the outcome is negatively characterized by additional services and costs in acute care settings, law enforcement, and the judicial system. To address Wise County as a Health Professional Shortage
Area, WRHS will focus on hiring and retention of qualified mental health and substance abuse staff. A treatment challenge will be to provide Suboxone treatment in IOP while ensuring patients’ adherence to intensive therapy protocol and random drug screens. Other treatment challenges associated with the high-risk population, including relapse and recidivism, will be addressed with individualized treatment plans, crisis plans, family outreach, coordination with other service providers, and case management to address medication costs and other barriers to treatment. Data will be critical in tracking trends in order to have appropriate planning, effective interventions and forming policy decisions.

5-Year Expected Outcome for Provider and Patients:
This project will provide support for the patients, hospitals, physicians and the community by providing outpatient treatment for persons with BH/SA as an alternative to inpatient medical and psychiatric services, state hospital admissions, and incarceration in city and county jail within Wise County for single and dually diagnosed persons. It will improve a referral system that allows treatment recommendations and ongoing consultations with a psychiatrist and clinical staff to ensure continuity of care, care coordination and improved provider communications. A partnership could also be developed with MHMR and the judicial system for sliding scale services based on the fees established by DSHS. The projected impact over five-year period includes ongoing evaluations for quality improvements to ensure enhancement of outcomes and core measures in order to reduce admissions and the use of unnecessary services by 7.5% at the end of DY5 and increase IOP census from 23-40 by DY5. Functional status will increase in DY4 by 33% and in DY5 by 50% as the improvement milestone. This will result in a significant savings to the local health care system because of the impact of this project from both hospitals.

Starting Point/Baseline:
In the development of this program additional evidence-based services for substance abuse will be implemented. Baseline data will be developed from October 1, 2013 to September 30, 2014 in DY3 on admissions, quality of life, and functional status using evidence-based strategies. In DY2, two licensed professional counselors, one licensed chemical dependency counselor, and one tech will be hired and trained by WRHS. They will begin implementing evidence-based interventions including cognitive behavioral therapy and relapse prevention. One case manager will be hired and trained by WRHS to coordinate referrals between the two hospitals and within the community at large. Patients will also have access to a psychiatrist for initial psychiatric evaluation and monthly follow-ups including medication services, and earlier interventions for substance abuse, behavioral and medical health needs. We will begin to assess need, size and characteristics to expand services to include nutritional counseling and healthy lifestyle(s) in order to address behavioral and medical health.

Rationale:
Currently, there is a lack of intensive outpatient BH/SA services that also have access to psychiatric services. Discharge data from both hospitals within Wise County show diagnosis of BH/SA-related disorders from acute medical and psychiatric services from October 2011 to September 2012 to be 3,281. In 2011 the judicial system had 252 cases and to date in 2012 106 cases disposed that were substance abuse-related including drug sale and manufacturing, drug possession, and felony DWI. This data reflects state and national statistics on BH/SA. As reported by the U.S. Department of Health and Human Services, mental health services, Wise County is considered a Health Professional Shortage Area (HPSA). The Community Health Needs Assessment reported the need for additional mental health professionals for Wise County with a benchmark ratio of 19,495:1 and Texas ratio at 3,609:1. The Community Health Needs Assessment Stakeholder survey Regional Summary respondents reported that behavioral health, substance abuse, and insufficient access to care were top issues affecting population health. Overall, the goal is to increase access to services, provide evidence-based treatment for this specialized patient population and provide case coordination and continuity of care in the medical and judicial sector for this population.

**Project Components:**

All five required core components in 2.1.3.1 (a-e) will be addressed. Assessing size, characteristics, and needs of the population based on evaluation of data from discharges from acute care, prevalence of diagnosis, forensic encounters, number of patients enrolled in IOP, and compliance with treatment and related services. The community-based program will be designed with a range of supports. There will be ongoing review of literature/experience throughout the project to assess negative and positive outcomes and relevancy of evidence-based interventions. A project evaluation plan will be developed with qualitative metrics, design and implementation of program, and assessing impact of interventions. The functional status of the patients will be assessed utilizing standardized assessments such as the GAF, ANSA, patient surveys and encounter records.

Milestone P-2 was chosen to design a broad community-based program, hire four staff to provide specialized interventions including cognitive behavioral therapy, substance abuse services, and nutritional counseling and psychiatric and medication services for the BH/SA population. There will be flexibility to add interventions as needs are identified through an ongoing program CQI process. P-2.1 Design of this project will be based on evidence/experience (e.g., citations throughout project) that meet the project goals and will be documented for this metric. The improvement milestone I-5 will be implemented in order to have an outcome including functional and symptom improvement utilizing standardized assessments (e.g., ANSA). These were chosen to meet the goals of the project by improving access, and implementing care coordination and continuity of care in the medical and judicial sector. It will also support Category 3 as BH/SA persons represent 24% of the potentially preventable admissions.
Unique community need identification numbers the project addresses:
- CN.4 – Lack of access to mental health services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This is a new initiative to address substance abuse and co-occurring illnesses in an expanded IOP model using a proven evidence-based treatment approach. We have not received any other federal funding for this program.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

**Outcome Measure 1:** IT-2.4 Behavioral Health/Substance Abuse (BH/SA) Admission Rate (Stand-alone measure) is based on data from EMR at WRHS and NTCH. Performing provider should report on both categories below:
1. One for BH/SA as the principal diagnosis; The ranges/intervals/brackets of BH/SA codes as principal secondary diagnosis as outlined in the project definitions for specific ICD-9 CM categories.
A second category in which a significant BH/SA secondary diagnosis is present. A list of the ranges/intervals/brackets of BH/SA codes as secondary diagnosis as outlined in the project definitions for specific ICD-9 CM categories.

The project priority is to reduce unnecessary services in specific settings, reduce costs, and provide services in the least restrictive most appropriate setting. The goal is a 7.5% reduction in BH/SA admission rates to WRHS and NTCH in Wise County by the end of DY5. When compared to the residents over the age of 18 in Wise County this equates to .55% of the population. This outcome was chosen because the project will reduce admissions into the acute care setting for patients across Wise County with both primary and secondary diagnoses related to behavioral health or substance abuse.

**Outcome Measure 2:** OD-10, IT-10.1 Quality of life with patient survey utilizing SF-36 to determine positive outcomes of symptom improvement and increased functioning that will ultimately promote wellness and resiliency due to adherence to treatment and improve overall community recovery. The goal is to show an improvement in quality of life scores in at least 50% of patients.

Relationship to Other Projects:
This project relates to the Category 4 reporting requirement: RD-1.3Behavioral Health and Substance Abuse Admission Rate.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Our valuation approach is consistent with the method within our RHP. We have taken the values of both outcomes from this project and used those to determine an overall value for all four categories on this project. We have estimated our reduction of BH/SA admissions with either primary or secondary diagnosis at 7.5%, or 246, from both hospitals by the end of the Waiver period. We take 246 and apply a value of $7,100 per admission to give us an annual value of $1,721,718 in cost savings. We then apply this for five-years to get a total outcome value of $8,733,000. The value is then distributed proportionately across the categories and demonstration years according to the allocation described in the Funding and Mechanics Protocol. The value of $7,100 per BH/SA admission was chosen by our RHP using data from AHRQ documented in the Healthcare Cost and Utilization Project.

The additional value comes from the second outcome, improvement in Quality of Life. The second value was provided by our RHP which suggests a quality-adjusted life year for patients with co-occurring mental health and substance abuse to be a factor of 0.335 X $50,000 for each patient. This results in a value of $16,750 per patient who completes the IOP. This value comes from a factor that used research to place a value on the benefit from improved quality of life. This calculation takes into consideration current and future societal economic impacts of this proven improvement in quality of life. We used this QALY factor and multiplied it by our anticipated DY5 number of patients showing an improvement in quality of life measures then multiplied times five-years. This results in 0.335 X $50,000 X 36 patients times five-years = $3,015,000.

When combining these figures together we get a total value of $8,510,409.95 for this project.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option - 2.12.1 - Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions

Unique Project ID: 130606006.2.2 (Pass 3)
Performing Provider Name/TPI: Wise Regional Health System / 130606006

Provider: WRHS is a health system that serves Wise, Montague, Jack, Parker and parts of Tarrant County. This service area holds 64,000 residents and is expected to grow to 74,000 by 2017. WRHS is the only source for health care for specific services for Medicaid in the County. In DY1 our health system’s charges for providing care to our indigent population was $118.3M.

Intervention: This project is designed to reduce 30 Day All Cause Readmissions and lower CHF admissions through coordinated care models involving transition coordinators, CHF nurses, cardiac rehab, and local cardiologists. This is a new initiative.

Need for the project: This project is designed to fulfill two unique community needs, CN.11 Need for more care coordination and CN.10 Overuse of emergency department (ED) services. All patients will be eligible to participate regardless of payor status.

Target Population: All WRHS inpatients and those with a diagnosis of CHF are the target population. It is estimated 32,265 patients will be served by the program over five years. This number comes from the program targeting every inpatient discharge for follow up on the Care Transitions program. This number of patients impacted per year will be estimated at the following DY1 5285, DY2 5814, DY3 6395, DY 7034, DY5 7738.

Expected patient benefits: The goal of this project is capture patients who may susceptible to PPAs and PPRs, many Medicaid and uninsured patients are included in this population, and coordinate their care with consideration to patient’s individual barriers to access care, such as transportation and financial issues.

Category 1 or 2 expected patient benefits: The milestones and metrics selected for this project will initially develop a baseline, while assessing gaps in the current process. Then, these measures will allow for the expansion of the program through the addition of staff, training, networking with other providers, and the addition of software to increase the ability of WRHS to capture inpatient admissions and coordinate those patients’ care accordingly.

Category 3 outcomes: The Category 3 measures selected are IT-3.1 All cause 30 day readmission rates and IT-2.1 Congestive Heart Failure rate (CHF). Through the implementation of a care coordination program both measures should decrease by 10% at the end of DY5, resulting in a reduction of health care costs (for the patient and the facilities) and an increase in quality of care.
Project Option - 2.12.1 - Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions

Unique Project ID: 130606006.2.2 (Pass 3)
Performing Provider Name/TPI: Wise Regional Health System / 130606006

Project Description:
Our Care Transitions project will involve changing the current concept of the hospital admission and discharge process. The current transition process provides an opportunity for both human and system errors. Such errors can be a contributing factor in the re-hospitalization of patients. We also will work with local cardiologist to reduce the number of CHF admissions into the hospital. Our transition program will address the issues surrounding these potential problems (Jack & Bickmore, 2011).

Our plan will address the patient’s issues upon admission. We will use a CHF trained nurse and a social services staff member for this process. Our cardiac nursing staff will initiate discharge education and conduct CVD inflammation profile and risk on admission. Cardiac rehab, PT, and dietary services will also be involved in the process. The social services staff will consult with cardiac staff prior to discharge, discuss transportation needs, and evaluate patient’s need for an assistance program including the use of medication and follow-up care. We plan for at least two full time nurse employees initially to act as Transition Coordinators (TCs) who will round on each patient. Discussions will focus on patient diagnoses and treatments during inpatient admission. TCs will coordinate with physicians regarding integration of patient concerns, post discharge plans and medications. TCs will discuss with patient and family questions regarding discharge diagnoses and education, and answer questions from patient and family pertinent to anticipated discharge. Post discharge TCs will contact patient at home and review discharge guidelines and assess the patient’s understanding of diagnosis and medications through return verbalization. This will allow for nurse assessment of possible discrepancies and misunderstanding prior to an issue becoming a problem. Nurses will assess telephonically patient understanding of possible problems post discharge and what to do if problem arises. TCs will verify post discharge appointments have been made, or they will make appointments for the patient with consideration to the patient’s individual barriers to access care, such as transportation and financial issues, through use of Wise County Community Health Clinic. This facility uses sliding scale fees for patients who lack available financial resources for follow up visits with general practitioners. The number of patients impacted per year will be estimated at the following DY1 5285, DY2 5814, DY3 6395, DY 7034, DY5 7738.

Goals and Relationship to Regional Goals:

Project Goals:
The project goals are to identify the most frequent adverse events that occur after a hospitalization and their causes. We wish to reduce 30 Day All Cause Readmissions by 10% at the end of the waiver period and lower CHF admissions by 10% over baseline. It has been determined that 20% of discharges result in adverse patient events (Bond, 2011).

This project meets the following regional goals:
This project addresses a problem that occurs in healthcare facilities nationwide. The lack of communication between providers as well as between patient, physician and family contributes to confusion and misunderstanding.

Challenges:
Most of the challenges faced by TCs revolve around interdisciplinary issues. For instance, in the Emergency Department (ED), patients may be readmitted as inpatients without meeting inpatient criteria. In addition, patients who are already inpatient have issues related to inappropriate or early discharge, additional contributors to readmissions and admissions beyond 30 days. Patients who experienced discharge difficulties related to physician or case management services were six times more likely to be re-hospitalized (Bond, 2010).

The project would address these challenges through training and designating ED case managers to address criteria of the inpatient admission which would help decrease the readmission rate. The TCs would also positively affect the lack of communication between physicians by acting as a liaison between the parties. The ED case manager may also serve as a reference for physician to address difficulties related to discharge.

5-Year Expected outcome for Provider and Patients:
The five-year expected outcome is to improve the percentage of patients receiving TC services to 90% through early identification of possible needs as evidenced by historical information in the TC registry and database. In addition, WRHS anticipates that the implementation of a care transitions program will reduce our 30 Day All Cause Readmission rate by 10% over baseline. We also wish to reduce our CHF related admission rate by 10% through the coordination of care beginning with admission and continuing through the post discharge phase.

Starting Point/Baseline:
Our admissions in 2011 were 5285 with 295 30 day all-cause readmissions for a total readmission rate of 5.6%. However, with the increase in population and the addition of new services, that rate may increase to as much as 6000.

We currently have one transition coordinator, who started this position June 2012. Her focus has been on the 4th Floor Medical unit and the 5th floor Surgical unit. Starting in June, our TC saw 63.5% or 228 of the inpatients, 71.4% or 302 in July, 61.7% or 245 in August The number of CHF related admissions from October 1, 2011 through September 30, 2012 was 138.

Rationale:
Projects should be data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance and/or disparity that is important to the population (i.e., a provider selecting a project to implement a chronic care model for diabetes should discuss local data such as prevalence of diabetes in the community and rates of preventable admissions for diabetes and describe why diabetes is an important health challenge for the community). With this in mind, please develop narratives that address the following:

The RED program has shown effectiveness in reducing certain admissions (Jack & Bickmore, 2011). For instance, if patients don’t understand their disease, the importance of follow-up visits to the primary care physician and why they should follow their treatment plan, then they are destined to suffer a decline in status and subject to be readmitted with the same diagnosis. An expanded care transitions program with staff to support the project will help close these gaps in follow-up care.

Project Components:

c. Describe the reason(s) for selecting these project components (if the selected project option includes required core project components, all required core components must included in the project, addressed as fulfilled, or the provider must otherwise justify in the narrative why all required core components were not included)

All core components will be included through the processes implemented in this project. Below are the ways in which we will achieve the Core Components:

- All core components will be included through the processes implemented in this project.
  
a) Review best practices from a range of models (e.g., RED, BOOST, STAAR, INTERACT, Coleman, Naylor, GRACE, BRIDGE, etc.). – The Director of Case Management along with the CNO will review the models and choose the best one to implement. Milestone 1 will fall within this component.

b) Conduct an analysis of the key drivers of 30-day hospital readmissions using a chart review tool (e.g., the Institute for Healthcare Improvement’s (IHI) State Action on Avoidable Re-hospitalizations (STAAR) tool) and patient interviews. - Part of the follow-up phone call process will include patient interviews and key drivers will be documented. Milestone 1 will fall within this component.

c) Integrate information systems so that continuity of care for patients is enabled – Software from Siemens called Mobile MD will be utilized. This software allows physicians access to hospital patient information to follow up appropriately with patients. Milestone 2 will fall within this component.

d) Develop a system to identify patients being discharged potentially at risk of needing acute care services within 30-60 days – An evidence-based model around CHF patients will be utilized and additional models will be added to identify patients potentially needing care post-discharge. Milestone 2 will fall within this component.
e) Implement discharge planning program and post discharge support program –
Discharge protocols and medicine reconciliation will be used to support better patient
care post discharge. Milestone 1 and 2 will fall within this component.

f) Develop a cross-continuum team comprised of clinical and administrative
representatives from acute care, skilled nursing, ambulatory care, health centers, and
home care providers. This team will be assembled and meet regularly to assess the
project and find ways to improve and expand what works Milestone 1, 2, and 4 will
fall within this component.

g) Conduct quality improvement for project using methods such as rapid cycle
improvement. Activities may include, but are not limited to, identifying project
impacts, identifying “lessons learned,” opportunities to scale all or part of the project
to a broader patient population, and identifying key challenges associated with
expansion of the project, including special considerations for safety-net populations. –
Lessons learned will be regularly discussed and documented for ongoing analysis.
Milestone 5, 9, and 12 will fall within this component.

d. **Reasons for selecting the milestones and metrics** based on relevancy to the RHP’s
population and circumstances, community need, and RHP priority and starting point
(new).
The metrics and milestones have been chosen with the goal of the project in mind.
The implementation of these measures will prove logical steps in the achieving the
goals that have been set forth. DY2 focuses on developing the baseline of the
program and protocols for action. During the development stage, structure will be
given to the concept and necessary implementation steps will be identified with
specific consideration given to the population and demographics of the area. The
project must be first implemented through evidence-based practices as a baseline then
expanded to meet the needs of the population. This will include the addition of
personnel, including TCs and case managers, and a CHF nurse, program guidelines
and collaboration with local cardiologists. DY3 focuses on expanding the program
through the integration and interaction of networking with other providers. This
helps expand the knowledge base and adds credence to changes that may need to be
made to the program. This stage may also include the addition or modification of
software applications.

DY4 should show an improvement in the ability to capture a percent to be
determined of all inpatient admissions, including CHF. This projected increased
ability is based on training and the implementation of protocols introduced in project
years DY2-3. Software should be concise with implementation protocols. In DY5 it
is anticipated that 75% of the inpatient admissions and 80% of CHF admissions will
be eligible for and participate in the transitions care program. Again, software should
be concise with implementation protocols.
Unique community need identification numbers the project addresses:

- CN.11 - Need for more care coordination.
- CN.10 - Overuse of emergency department (ED) services.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This is a new initiative and has not received any federal funding.

Related Category 3 Outcome Measures:

Outcome Measures and reasons/rationale for selecting the outcome measures:

**IT-3.1 All cause 30 day readmission rates (>17%) – NQF**

The all cause 30 day readmission rate outcome is a priority for several reasons. First, it shows a relationship between patient health and treatment. Hospital readmissions and some admissions are considered avoidable and indicators of poor care or missed opportunities to better coordinate care. This is a reflection on the total care system and should be addressed systemically. Secondly, readmissions adversely impact payer and provider costs and patient morale. Patients are sometimes discharged earlier which theoretically increases the risk of readmissions. Finally, reducing all cause 30 day readmission rates may reduce health care costs (for the patient and the facilities) and increase the quality of care.

**IT-2.1 Congestive Heart Failure rate (CHF)**

Focusing on the outcomes of this project will help improve the health of low-income populations in several ways. The initiative to avoid CHF admissions leads to the presumption of improved health. This is evidenced by affordable medications, affordable physician office visits, and improved patient knowledge of the need for healthy environment, healthy nutrition, exercise and avoidance of disease. These can be accomplished through a transition care program which makes this information available to populations at risk.

Relationship to Other Projects:

**2.1.1 PCMH**

Care transition is dependent upon care after inpatient stays. Likewise, care coordination through a PCMH will rely on communication from local hospitals. Both have shown a reduction on admissions and readmissions. Although both are unique, both projects benefit through increased communication between patient, clinic, and hospital.

**RD-1.1 Congestive Heart Failure Admission Rate**

**RD-2.7 All Cause 30 Day Readmission Rates**

As the care transitions program takes shape improved communication and care coordination will positively impact many Category 4 measures. Specifically, RD-1.1 Congestive Heart Failure Admission Rate and RD-2.7 All Cause 30 Day Readmission Rates will be directly affected by
the implementation of a care transitions program, whose goal is to reduce said admissions and readmissions by 10%.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Describe the approach for valuing each project and rationale/justification (e.g. size factor, project scope, populations served, community benefit, cost avoidance, addressing priority community need, estimated local funding). Supporting information may be included in the addendums.

*Please let us know what information should be included in the addendum.*

In order to value this project we used the combination of the values provided by our RHP for the two measures, all cause 30-day readmissions and CHF admissions. The value of $7,491 per all cause 30 day readmission was chosen by our RHP using data from the Texas Department of State Health Services. The value of $8,252 per CHF admission was chosen by our RHP using data from the Texas Department of State Health Services. Based upon 2011, data our total all cause 30 day readmissions were 295 over 5,285 total inpatient admissions, giving us a readmission rate of 5.6%. Our goal is to reduce our readmissions by 10% over baseline, or 30 total readmissions by the end of the waiver in DY5.

In addition, we wish to reduce CHF admissions by 10% or 14, with regard to the DY1 CHF admission total of 138. The total value of this project is $3,917,887.

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Regional Health System has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

Wise Regional Health System defined the population that will be directly impacted by the project as All Cause 30 day Readmissions. The percentage of the population expected to be positively impacted by the project is 10%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their quality of life is moderately impacted.
To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their dependence on the community is moderately.
### Region 10

#### Milestone 1 [P-1]: Develop or implement best practices or evidence-based protocols (such as Partnership for Patients) for effectively communicating with patients and families during and post-discharge to improve adherence to discharge and follow-up care instructions

**Metric 1 [P-1.1]: Care transitions protocols**
- **Baseline/Goal:** Establish protocols
- **Data Source:** Documentation

**Milestone 5 [P-11]: Review project data and respond to it every week with tests of new ideas, practices, tools, or solutions. This data should be collected with simple, interim measurement systems, and should be based on self-reported data and sampling that is sufficient for the purposes of improvement.**

**Metric 1 [P-11.1]: Number of new ideas, practices, tools, or solutions tested by each provider.**
- **Baseline/Goal:** 1 new idea per quarter
- **Data Source:** Documentation of ideas

**Milestone Estimated Incentive Payment (maximum amount): $175,386**

#### Milestone 2 [P-3]: Establish a process for hospital-based case managers to follow up with identified patients hospitalized related to the top chronic conditions to provide standardized discharge instructions and patient education, which address activity, diet, medications, follow-up care, weight, and worsening symptoms; and, where appropriate, additional patient education and/or coaching as identified during discharge

**Metric 1 [P-3.1]: Care transition protocols**
- **Baseline/Goal:** Care Transition Protocols
- **Data Source:** Documentation

**Milestone 6 Estimated Incentive Payment: $382,674**

#### Milestone 3 [P-6]: Train/designate more ED case managers

**Metric 1 [P-6.1]: Number of trained and/or designated ED case managers over baseline**
- **Baseline/Goal:** Train at least 1 ED Case Manager
- **Data Source:** HR Documentations

**Milestone 6 Estimated Incentive Payment: $382,674**

#### Milestone 4 [I-11]: Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies

**Metric 1 [I-11.1]: Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines**
- **Goal:** Capture 70% of inpatient admissions eligible for care transition
- **Data Source:** Patient Census, Records

**Milestone Estimated Incentive Payment: $255,857**

#### Milestone 5 [I-14]: Implement standard care transition processes in specified patient populations (CHF specific).

**Metric 1 [I-14.1]: Measure adherence to processes.**
- **Goal:** Capture “75%” of CHF inpatient admissions eligible for program
- **Data Source:** Program records

**Milestone Estimated Incentive Payment: $255,857**

#### Milestone 6 [I-11]: Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies

**Metric 1 [I-11.1]: Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines**
- **Goal:** Capture 75% of inpatient admissions eligible for care transition
- **Data Source:** Patient Census

**Milestone Estimated Incentive Payment: $211,360**

#### Milestone 7 [I-14]: Implement standard care transition processes in specified patient populations (CHF specific).

**Metric 1 [I-14.1]: Measure adherence to processes.**
- **Goal:** Capture “85%” of CHF inpatient admissions eligible for program
- **Data Source:** Program records

**Milestone Estimated Incentive Payment: $211,360**

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.1 – Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)

**Unique Project ID:** 130614405.2.1

**Performing Provider Name/TPI:** Texas Health Resources Arlington Memorial / 130614405

**Provider:** Texas Health Arlington Memorial Hospital is a full-service acute-care medical center with 369 beds, serving Arlington and its surrounding communities. THAM provides emergency and acute inpatient care to the community.

**Intervention:** The purpose is to help individuals with diabetes who are traditionally underserved and give them access to diabetes education and regular clinical care so they can take ownership and better manage their diabetes. This project intervention is an expansion of the current diabetes education program at THAM to include a nurse practitioner run outpatient clinic for patients with diabetes.

**Need of the project:** According to THAM data, Medicaid and uninsured patients make up about 40% of our payer mix from the ED, and 30% from the inpatient population. Diabetes is the 4th leading cause of hospital readmissions at THAM.

**Target population:** The target population is the Medicaid and underserved and undocumented population in the Arlington and surrounding areas. As the Hispanic community continues to grow and makes up 31% of the service area, and since diabetes is 1.5 times more likely to develop in someone of Hispanic heritage, there is an increased opportunity to serve this group. We estimate that 2000 patients will be served over the course of the waiver period. We anticipate a growth of 5% each year beginning DY 4, with each additional year an increase in volume by 5%. More specifically, DY2 and DY3 include 500 patients each year, anticipated growth for DY4 525 patients, DY5 551 patients, (a total increase of 51 patients enrolled across waiver period). Each additional patient will be seen by the clinic practitioners at least 5 times each year. We will expand visits to the clinic by an additional 125 in DY 4, 256 additional visits in DY5, for an additional total volume of 381 patient visits during the waiver period. Of the 25 new patients in DY4, we expect 80% (20 patients) to set self-management goals. In DY5 the expectation is for 90% of the 51 participants to set self-management goals (46 patients).

**Expected patient benefits:** We have selected this project so that complications will be prevented, quality of life for our community members will improve, patients can stay healthy, and costly hospital readmissions are prevented. Ultimately we believe in serving the community, and with the increasing number of people who are uninsured and economically disadvantaged, this will be an effective program for those who do not otherwise have access to coordinated diabetes care. Increasing the number of people served by 10% over baseline with a focus on impacting those unfunded or Medicaid patients with limited access to healthcare.

**Category 1 or 2 expected patient benefits:** The project seeks to establish and advance the development of a comprehensive, multi-disciplinary Chronic Disease Management program utilizing Wagner’s Chronic Care model to help an increasingly underserved population of patients with diabetes in our community.

**Category 3 outcomes:** Key metrics and goals were selected that would demonstrate improved patient outcomes as a result of the project including (1) a 15% reduction from baseline in the
number of individuals served who decrease their Hemoglobin A1C to less than 9% showing better control of their diabetes and (2) a 15% reduction from baseline in the number of diabetes related readmissions within 30 days.

**Project Option 2.2.1 – Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)**

**Unique Project ID:** 130614405.2.1

**Performing Provider Name/TPI:** Texas Health Resources Arlington Memorial / 130614405

**Project Description:**
Historically underserved patients have not been effectively educated on how to manage their diabetes. Moreover, they have not been followed to measure their outcomes and long term goals. This program will be implemented to help those who need education on managing diabetes by providing a patient-centered medical home where they have access to exceptional and coordinated care. Through implementation of a more comprehensive diabetes education center/medical home using a Wagner’s Chronic Care model, we hope to reduce the rates of uncontrolled diabetes among project participants. A multidisciplinary team, including nurse practitioners, will be formed to develop protocols, processes, procedures and policies, using evidence-based practices, to improve the care and monitoring of the disadvantaged community members with diabetes. Patients will be identified by: first, partnering with primary care clinicians to utilize protocols: A1C>9, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education. Second, ED case managers and inpatient diabetes educator will identify patients with the same criteria as above, and/or those individuals who do not currently have a patient-centered medical home, have not received diabetes education within the last five years, and all others appropriate for education due to difficulty managing their disease or understanding the care requirements.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
According to THAM data, diabetes was the fourth highest readmission diagnosis. Additionally, 10% of the THAM service area has been diagnosed with diabetes. Based on THAM outpatient diabetes education data, the program is underutilized in comparison with the service area diabetic population. Our proposed intervention will help individuals who are traditionally underserved and give them access to diabetes education and regular clinical care so they can better manage their diabetes. The program staff will consist of non-physician health professionals such as certified diabetes educators, registered dietitians, nurses, clinical social workers, and support staff. Physicians and mid-level providers will be a key part of the team to provide clinical visits and medication adjustments and prescriptions.

This project meets the following Regional goals:
Regional Healthcare Partnership

A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by improving the access to chronic care for individuals in Tarrant County who are underserved and who need diabetes education, training and clinical interventions.

**Challenges:**

THAM data indicates that Medicaid and uninsured patients make up about 40% of our payer mix of those treated and released from the ED and approximately 30% of inpatient population. In our service area the Hispanic community makes up approximately 31% of the population and is the fastest growing ethnicity in Arlington. Hispanic people are about 1.5 times more likely to develop diabetes than non-Hispanic white people. In the current THAM Outpatient Diabetes Education Program, approximately 75% of those served are Caucasian, thus indicating a need for innovation and creativity to reach this population. Another area of opportunity is the cost of managing diabetes. Since a large percentage of THAM patients have limited access to insurance and other resources, it is paramount that we intervene by educating and treating the people in the community we serve.

**5-Year Expected Outcome for Provider and Patients:**

We anticipate an increased number of referrals of the identified patient population by 5% above baseline beginning DY4. Patients participating in the clinic will have the HbA1c maintained below 9.0 and a decrease in readmissions within 30 days.

**Starting Point/Baseline:**

The THAM outpatient Diabetes Education Program currently provides services for about 500 individuals each year. The expectation is an increased growth rate of 5% each year of the program beginning in DY4.

**Rationale:**

Currently our organization provides excellent emergency and inpatient services, but in order to be more proactive in the prevention of diabetes complications, patients need an alternative to using the emergency department for primary care. It is well known that the current inpatient health care system is reactive, and we believe being proactive by preventing complications will improve the quality of life and save money. We have selected this project so that complications can be prevented, quality of life can be improved, and patients can stay healthy and out of the hospital. Additionally, we have selected this project so that the increasing number of people who are uninsured and economically disadvantaged can have access to coordinated diabetes care.

**Project Components:**

Our project contains all of the required core components including:
1. Design and implement care teams that are tailored to the patient’s health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system

2. Ensure that patients can access their care teams in person, by phone or email

3. Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources

4. Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions

5. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Additional components include:

- Disease-specific patient education and self-management support
- Clinically led and mission-driven team that communicates and stays in touch with program participants
- Increase access to care through coordination of efforts through the emergency department and inpatient staff.
- Conduct quality improvement for project using rapid cycle improvement. Activities may include but are not limited to, identifying project impacts, identifying “lessons learned”, and identifying key challenges.

Our milestones and metrics advance development of our program to help an increasingly underserved population receive diabetes management through the Wagner Chronic Care Model and include: (1) Establishing a multidisciplinary team including physicians, nurse practitioners, diabetes educators, registered dietitians, clinical social workers, registered nurses, pharmacists, and support staff, (2) Increasing the number of patients served under this model by 10% over baseline as recorded in the database and (3) Developing policies, procedures, and data collection tools to effectively run the coordinated program and monitor effectiveness, reducing fragmented care.

**Unique community need identification numbers the project addresses:**

- CN.8 – Lack of access to health care due to financial barriers
- CN.11 – Need for more care coordination
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Linking diabetes patients who present to the ED or inpatients to a primary care physician is a new initiative. All of the current diabetic educators are trained in the Stanford model of Diabetes Management and have led a number of community workshops free to the public funded by the Area Agency on Aging of Tarrant County. This project could significantly enhance the number of patients who have accessibility to diabetic education. This project has not received any other federal funding.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
1.10 Diabetes care: HbA1c poor control (>9.0%)
- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or 2) who had hemoglobin Ac (HbA1c) control > 9.0%
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and 2)
3.3 Diabetes 30-day readmission rate
- Numerator: number of readmissions (for patients 18 years and older), for any cause, within 300 days of discharge from the index diabetes admission. If an index admission has more than 1 readmission, only first is counted as a readmission.
- Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of diabetes and with a complete claims history for the 12 months prior to admission.

Relationship to Other Projects:
- Related Category 1 and 2 projects: This project relates to project 2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Clinic for management of their disease.
- Related Category 4 Population-focused improvements: RD.1: Potentially Preventable Admissions RD.1.2: Diabetes Admission Rate should improve for at-risk patients who would not otherwise be able to access care to manage their diabetes. Diabetics whose disease is managed will decrease their risk of developing complications from their disease that would result in hospital admissions. RD 2: 30 Readmission Rate: RD 2.2 Diabetes 30-day Readmissions should improve by providing access to care and assistance in self-management of their disease, risk of admission and readmission are reduced.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

- **Approach/Methodology:** For every inpatient admission avoided, $9,832 in cost is saved by the health care system. Health care costs are calculated by multiplying $9,832 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
Project Components: 2.2.1 (a-e)

Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases

**Milestone 1** [P-3]: Develop a comprehensive care management program
Metric 1 [P-3.1]: Documentation of care management program using the Wagner Chronic Care Model
Goal: Complete implementation of outpatient clinic for heart failure patients to receive ongoing care. Includes procurement of equipment and supplies to run clinic,
Data Source: Program description

Milestone 1 Estimated Incentive Payment (maximum amount): $40,441

**Milestone 2** [P-2]: Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease care
Numerator: Number of care navigation encounters
Metric 1 [P-2.1]: Increase percent of staff trained
a) Numerator: number of relevant staff trained in the Chronic Care Model

Milestone 4 Estimated Incentive Payment: $58,734

**Milestone 4** [P-4]: Formalize multidisciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
Metric 1 [P-4.1]: Increase the number of multidisciplinary teams (e.g., teams may include physicians, mid-level practitioners, dieticians, licensed clinical social workers, psychiatrists, and other providers) or number of clinic sites with formalized teams
a) Number of teams or sites with formalized teams
Baseline/Goal: Develop at least 2 multidisciplinary teams
Data source: Team rosters

Milestone 5 Estimated Incentive Payment: $61,946

**Milestone 6** [I-17]: Apply the Care Model to targeted chronic disease, which are prevalent locally
Metric 1 [I-17.1]: Additional patients receive care under the Care Model for diabetes (Chronic disease Diabetes)
Goal: 5% increase over baseline (25 additional or a total of 525 patients)
Data source: registry

Milestone 8 [I-17]: Apply the Care Model to targeted chronic disease, which are prevalent locally
Metric 1 [I-17.1]: Additional patients receive care under the Care Model for diabetes (Chronic disease Diabetes)
Goal: 5% increase over DY4 (51 additional or a total of 551 patients)
Data Source: registry

Milestone 7 Estimated Incentive Payment: $50,019

**Milestone 7** [I-18]: Improve the percentage of patients with self-management goals
Metric 1 [I-18.1]: Patient with self-management goals
a) Numerator: The number of patients with diabetes who have at least one self-management goal
b) Denominator: Total number of patients with type 1 or 2 diabetes in the registry
Goal: 80% (20 participants)
Data Source: registry

Milestone 9 [I-18]: Improve the percentage of patients with self-management goals
Metric 1 [I-18.1]: Patient with self-management goals
a) Numerator: The number of patients with diabetes who have at least one self-management goal
b) Denominator: Total number of patients with type 1 or 2 diabetes in the registry
Goal: 90% (46 participants)
Data Source: registry

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $462,721*
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.1– Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases (Improving Management of Heart Failure (HF))

Unique Project ID: 130614405.2.2

Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Provider: THAM is a 369 bed acute care hospital located in Arlington, Texas. Our hospital serves the city of Arlington and surrounding communities, a 100 square mile area and a population of more than 365,000 residents. THAM provides emergency and acute inpatient care to the community.

Intervention: The primary objective of the project is to improve the HF patient’s ability to effectively manage their disease and decrease the rate of HF patient hospitalizations and readmissions to the hospital. Because nearly 40% of patients seen at the hospital have no insurance or Medicaid, it is expected that a large portion these patients will be impacted by this project. Initial work has begun to implement the project on a limited scope. The HF clinic currently has one part time nurse practitioner working 16-24 hours per week. Full implementation of the project would require additional FTEs and development of an outpatient clinic space.

Need of the project: Heart failure is one of Texas Health Arlington Memorial Hospital's most common reasons for admission with 320 patients admitted with a primary diagnosis of heart failure and 1,947 patients admitted with primary/secondary diagnosis of heart failure between June 2011 and May 2012.\(^{295}\) For this population, 90% were government funded or unfunded (80% Medicare/Managed Medicare; 10% Medicaid or unfunded).

Target population: The target population is indigent or government-funded patients with a diagnosis of heart failure in the community who do not have access to receive care. Over the course of the waiver, we anticipate impacting approximately 6,000 patients by assisting in management of their disease through the HF clinic and/or RN case manager intervention/telephonic support.

Expected patient benefits: An analysis of THAM data for 127 HF patients that required readmission within 30 days of discharge between October 2010 and May 2012 revealed that a majority of these patients were unfunded or had government funded insurance (88.5%). Through this project, the hospital and post acute care providers will develop protocols to more effectively identify and implement patient needs. Root causes for readmission of the low-income and underserved HF patient often related to lack of financial resources will be addressed.

Category 1 or 2 expected patient benefits: Milestones selected include hiring a multidisciplinary team of nurse practitioners, RNs, case managers, dietitians, and social workers and training them in Wagner’s Chronic Care model; developing a comprehensive care management program, including the implementation of an outpatient nurse-practitioner run HF clinic and development of case manager program to navigate patients to appropriate resources and continue to support patient telephonically post hospital discharge.

Category 3 outcomes: Our project goal is to implement programs that will improve the health of patients with heart failure as evidenced by a reduction in HF patient hospital admission rates (Cat

---

\(^{295}\) Internal hospital admissions data obtained from Premier Quality Advisor
3.2.1) by 10.5% and reduction in HF patient 30 day, all cause hospital readmission rate (Cat 3.3.2) by 15% at the conclusion of the 5 year time period.

**Project Option 2.2.1**– Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases (Improving Management of Heart Failure (HF))

**Unique Project ID:** 130614405.2.2

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Project Description:**
Disadvantaged, low-income patients with heart failure (HF) are often challenged to effectively manage their disease due to lack of resources to obtain necessary medications and supplies or inability to access health care. Failure to manage this chronic condition adversely impacts the patient’s health, often resulting in hospitalizations. This project is based on the Institute for Healthcare Improvement (IHI)’s publications and:

1. Develops a screening process to identify barriers to effective management of the HF patient’s disease (e.g., lack of ongoing monitoring by a health care professional, inability to obtain medications or inadequate understanding of their disease and self-management interventions).
2. Utilizes a RN case manager to lead a multidisciplinary team in the coordination of appropriate resources based on identified, patient-specific needs.
3. Coordinates post-acute care support through telephonic monitoring by an RN case manager, home visits provided by hospital partners including, United Way “Healthy at Home” Care Transitions coaches, PrimeMedic program paramedics, Transitions House Calls nurse practitioner or other health care providers.
4. Coordinates timely follow-up care with the patient’s primary care providers (PCP), (obtain PCP for patient as needed) or with the hospital’s outpatient nurse practitioner run Heart Failure Clinic, developed using the Chronic Care Model to supplement physician's care through more frequent evaluation/monitoring of high risk patients.
5. Collaborates with area health care providers including providers at nursing homes, skilled nursing facilities, and inpatient rehabilitation hospitals to develop protocols designed to effectively manage HF patients to avoid hospitalization.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
Approximately one of every five HF patients (21%) at Texas Health Arlington Memorial hospital (THAM) requires readmission within 30 days of discharge. The primary goal of the project is to improve the health of low-income, underserved HF patients through more effective disease management along the continuum of care with particular emphasis on transitions through the post-acute phase. Goals are to 1) reduce overall need for HF patient hospital admission and 2) reduce HF patient hospital readmissions within 30 days of discharge.
This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing a community-based innovative chronic disease management program to help low-income, disadvantaged community members of Tarrant County better manage their heart failure conditions, with a particular clinical support focus on reducing the readmission rate among project participants.

Challenges:
An analysis of THAM data for 127 HF patients who required readmission within 30 days of discharge between October 2010 and May 2012 revealed that a majority of these patients were unfunded (2.5%) or had government funded insurance (86%). Almost half (46.4%) of these patients had been discharged from the hospital to continue care through another provider (17% skilled nursing or nursing home, 9.4% inpatient rehabilitation hospital or long term acute care hospital, and 20.5% to home health care). Through this project, the hospital and post-acute care providers will develop protocols to more effectively identify patient needs and implement interventions to assist the patient in managing their illness outside the hospital. Root causes for readmission of the low-income and underserved HF patient often related to lack of financial resources (e.g., inability to purchase medications, healthy food or bathroom scales to monitor weight, lack of transportation to appointments, inability to obtain PCP, etc). Through this program, trained RNs screen at-risk HF patients presenting to the emergency department or admitted to the hospital and identify barriers to maintaining their health. Interventions are then implemented to reduce admission or readmission risks. The expansion of the HF Clinic would be key to providing disadvantaged HF patients with timely access to a health care provider, education and resources.

5-Year Expected Outcome for Provider and Patients:
Our project goal is to improve the health of patients with heart failure as evidenced by a reduction in HF patient hospital admission rates by 10.5% and reduction in HF patient 30-day, all-cause hospital readmission rate by 15% at the conclusion of the five-year time period.

Starting Point/Baseline:
In 2011, HF was the number one cause of readmissions in North Texas (22.6%), impacting 13,272 patients. Heart failure is one of Texas Health Arlington Memorial Hospital's most common reasons for admission with 320 patients admitted with a primary diagnosis of heart failure and 1,947 patients admitted with primary/secondary diagnosis of heart failure between June 2011 and May 2012. For this population, 90% were government funded or unfunded (80% Medicare/Managed Medicare; 10% Medicaid or unfunded). Baseline readmission rate for THAM HF patients is approximately 21%.
Currently, one part-time acute care nurse practitioner is developing protocols for management of HF patients in an outpatient clinic and beginning to assist with management of a small (~14) number of these patients in an outpatient setting. The clinic has been successful in preventing hospital admission for these disadvantaged, high-risk patients over the 3 months (July – September 2012) the nurse practitioner has been operating the clinic. Partnerships with community members have been established. There is one United Way "Healthy at Home" coach trained in the Coleman Care Transitions model available to make home visits to Medicare HF patients. The hospital also has two PrimeMedic paramedics available through the city ambulance service to make home visits to Arlington residents and provide telemonitoring through the ambulance service's central dispatch station. PrimeMedic responds when a patient's weight or vital signs fall outside the established parameters and then coordinates with the hospital community case manager or HF Clinic nurse practitioner in conjunction with the PCP. Early intervention can prevent decompensation and avert hospital admission.

Initial work has been started with area health care providers. Three primary care physicians (PCPs) that also care for patients in area nursing homes and skilled nursing facilities are working with the hospital to develop protocols at their facilities that will assist in intervention outside of the hospital when a patient develops of early signs of HF exacerbation.

**Rationale:**

In 2011, HF was the number one cause of readmissions in north Texas (22.6%), impacting 13,272 patients. Heart failure is one of Texas Health Arlington Memorial hospital's most common reasons for admission with 320 patients admitted having a primary diagnosis of heart failure and 1,947 patients admitted with a secondary diagnosis of heart failure between June 2011 and May 2012. For this population, 90% were government funded or unfunded (80% Medicare/Managed Medicare; 10% Medicaid or unfunded). Baseline readmission rates for these patients are near 21%. The Arlington/Southeast Tarrant County area has had an increase of 42% over the last year in community member identified as unable to pay for their health care. Our project is designed to target the HF population within our Region and intervene to prevent hospitalization with those low-income, disadvantaged HF patients.

**Project Components:**

Our project contains all of the required core components including:

- Design and implement care teams that are tailored to the patient’s health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system
- Ensure that patients can access their care teams in person, by phone or email
• Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources
• Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions
• Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Additional key components of the project based on IHI recommendations include:
1. Development of a screening process and enhanced multidisciplinary team approach to discharge process to address potential barriers to effective post-acute management
2. Early post-discharge follow-up. High risk patient evaluation will be completed by a provider within three days of hospital discharge.
3. Working with home health agencies that front-load home care visits for at-risk patients to include care transitions coaches, paramedics, and/or nurse practitioners
4. Ability to provide telemonitoring in conjunction with PrimeMedic program.
5. Care Transitions coaches to engage patients in their own care as well as clarify and/or follow-up on post-discharge instructions.
7. Ongoing post-discharge follow-up monitoring through telephonic assessments by RN case manager to respond to questions and evaluate for emerging needs.
8. Collaboration with post-acute facilities to more effectively manage HF patients throughout the continuum of care.

Our milestones were selected to advance the development of the chronic care management program designed to assist our target population. Milestones include (1) identifying/hiring and training a multidisciplinary team, (2) developing and implementing a plan for the HF clinic based on the Wagner’s Chronic Care Model, (3) establishing a multi-disciplinary team approach to the identification of and intervention with patients at risk for ineffective management of their HF, (4) collaborating with area health care providers to assure effective management of the high-risk HF patient along the health care continuum, (5) increasing the number of at-risk patients in the program, and (6) implementing interventions key to improving the patient’s health (weight monitoring, medication management, self-management), thus reducing their risk for hospital admission or readmission. These milestones and metrics will measure the number of patients receiving ongoing chronic care management through an evidence-based, coordinated model (rather than not receiving care, or receiving fragmented care).
Unique community need identification numbers the project addresses:

- CN.1
- CN.3
- CN.8

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative for THAM. No funding from the U.S Department of Health and Human Services is used to fund project initiatives or related activities.

**Related Category 3 Outcome Measures:**

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

- **Outcome Measure 1:** IT-3.2 Congestive Heart Failure 30-day readmission rate (Stand-alone measure)
- **Outcome Measure 2:** IT-2.1 Congestive Heart Failure Admission rate (CHF) - PQI #8 (Stand-alone measure)

Data discussed in Section 4 (a) provides evidence supporting the need to improve our management of heart failure patients. Studies cited throughout the narrative support the effectiveness of a multidisciplinary team approach to providing support and post-acute care monitoring of HF patients to reduce readmissions. By focusing on readmission rates and overall hospital admission rates as outcomes, we will be able to determine whether or not our project has been successful in improving the health of our target population.

**Relationship to Other Projects:**
This project relates to project 2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who might benefit from closer monitoring. The navigator would refer the patient to the HF Clinic for management of their disease.

**Related Category 4 population-focused improvements** with the unique RHP project identification number based on the requirements above:
RD.1: Potentially Preventable Admissions RD.1.1: Congestive Heart Failure Admission rate and RD 2: 30 Readmission Rate: RD 2.1 Congestive Heart Failure (HF) 30-day Readmissions are Category 3 Outcome Measures selected to evaluate the effectiveness of this project. This project also impacts RD.4 Patient-centered Health Care: RD.4.2 Medication Management as enhanced inpatient screening and discharge processes will verify completion of medication reconciliation and assist patient in understanding and/or obtaining necessary medications prior to discharge.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

- **Individual benefits** were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Milestone 1** [P-2]: Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease care
- Metric 1 [P-2.1]: Multidisciplinary team including nurse practitioners, RN, dietitians, and social workers hired and trained in chronic care model
- Baseline/Goal: Increase percent of staff trained to 100%
- Data Source: Training records

**Milestone 5** [P-9]: Develop program to identify and manage chronic care HF patients needing further clinical intervention
- Metric 1 [P-9.1]: Increase the number of HF patients identified as needing screening test, preventive tests, or other clinical services
  - Goal: Develop screening process to identify HF patients at high risk for readmission and process to engage them in program/provide necessary services
  - Data source: Patient registry

**Milestone 8** [I-17]: Apply the Chronic Care Model to targeted chronic diseases (Heart failure), which are prevalent locally
- Metric 1 [I-17.1]: X additional patients receive care under the Chronic Care Model for a chronic disease or for MCC (Heart Failure)
  - Goal: 50 additional patients
  - Data Source: Registry

**Milestone 12** [I-17]: Apply the Chronic Care Model to targeted chronic diseases (Heart failure), which are prevalent locally
- Metric 1 [I-17.1]: X additional patients receive care under the Chronic Care Model for a chronic disease or for MCC (Heart Failure)
  - Goal: 75 additional patients
  - Data Source: Registry

**Milestone 13** [I-18]: Improve the percentage of patients with self-management goals
- Metric 1 [I-18.1]: Patients with self-management goals
  - Goal: 75% of patients will have documented self-management goal
  - Data Source: Registry

**Milestone 10** [I-19]: Implement

**Year 2 (10/1/2012 – 9/30/2013)**
- and obtain/design a dedicated space to see patient in an outpatient clinic setting.
- Data Source: Program description

**Milestone 2 Estimated Incentive Payment:** $49,889

**Milestone 3 [P-4]:** Formalize multidisciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
- Metric 1 [P-4.1]: Increase the number of multidisciplinary teams (e.g., teams may include physicians, mid-level practitioners, dieticians, licensed clinical social workers, psychiatrists, and other providers) or number of clinic sites with formalized teams
- Baseline/Goal: Establish a team
- Data Source: Clinic records

**Milestone 4 [P-16]:** Participate in face-to-face learning (i.e. meetings or initiatives that all providers can do to “raise the floor” for performance).
- Each participating provider should publicly commit to implementing these improvements.
- Metric 1 [P-16.1]: semi-annual face-to-face meetings or seminars organized by the RHP
  - Goal: Participate in 2 meeting annually
  - Data Source: Documentation of semiannual meetings including meeting agendas, slides from presentations, and/or meeting notes.

**Milestone 6 Estimated Incentive Payment:** $64,405

**Milestone 7 [P-X]:** Customizable Process Milestone: Establish baseline processes for DY4 and DY5 metrics
- a) volume of patients receive care under the Chronic Care Model for a chronic disease or for MCC (Heart Failure), b) percent of patients with self-management goals, c) percent of patients on medication specific for disease-specific or MCC Medical Home

**Milestone 10 Estimated Incentive Payment:** $50,946

**Milestone 11 [I-21]:** Improvements in access to care of patients receiving chronic care management services using innovative project option
- Metric 1 [I-21.4]: Improved compliance with recommended care regimens (Heart Failure: weight monitoring).
  - a. Numerator: Number of individuals with heart failure that have documentation of weight monitoring
  - b. Denominator: Number of Heart Failure patients appropriate to receive an ACEI or ARB
  - Goal: 80%
  - Data Source: Clinic records

**Milestone 13 Estimated Incentive Payment:** $41,136

**Milestone 14 [I-19]:** Implement disease-specific or MCC Medical Home
- Metric 1 [I-19.1]: Use of appropriate medication for specific disease (Heart Failure use of ACEI or ARB)
  - a. Numerator: Number of individuals with heart failure and EF <40% who receive ACEI or ARB
  - b. Denominator: Number of Heart Failure patients appropriate to receive an ACEI or ARB
  - Goal: 95%
  - Data Source: Clinic records

**Milestone 15 [I-21]:** Improvements in access to care of patients receiving chronic care management services using innovative project option
- Metric 1 [I-21.4]: Improved compliance with recommended care regimens (Heart Failure: weight monitoring).
  - a. Numerator: Number of individuals with heart failure that have documentation of weight monitoring

**Total Estimated Incentive Payments for 4-Year Period:**

$761,102
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.7.4 – Implement innovative evidence-based strategies to reduce low birth weight and preterm birth

**Unique Project ID:** 130614405.2.3

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Provider:** THAM is a 369 bed acute care hospital located in Arlington, Texas. Our hospital serves the city of Arlington and surrounding communities, a 100 square mile area and a population of more than 365,000 residents. THAM provides emergency and acute inpatient care to the community.

**Intervention:** The goal of this project is to provide prenatal care to women in the community without access to this care. This is a new project.

**Need of the project:** In Arlington, the infant mortality rate is the highest in zip codes 76010, which is adjacent to the hospital and less than 75% of pregnant women in this East Arlington area receive prenatal care.296

**Target population:** The target population is pregnant women with Medicaid or no insurance in need of prenatal care. Over the course of the waiver, we anticipate the potential to intervene with approximately 900 patients per year (based on annualized 2012 figures for unfunded and Medicaid women delivering infants) through the provision of ongoing prenatal care or education.

**Expected patient benefits:** Between January and August 2012, there were 1,382 (2,073 patients annualized) infant deliveries performed at THAM. 45.2% (937 annualized) of these women were unfunded or Medicaid funded patients. There are increasing numbers of at-risk, disadvantaged women in our geographic area with a limited number of physicians willing to care for these patients and the current county funded clinic located in our community is scheduled for relocation to another part of the city.

**Category 1 or 2 expected patient benefits:** Milestones selected include implementation of an evidence-based prenatal clinic, using the CenteringPregnancy model. A process for tracking the volume of patients, monitoring interventions and evaluating outcomes will be developed.

**Category 3 outcomes:** By providing prenatal care and education to those who would otherwise receive no care, we expect to decrease the number of low birth weight babies by 10% and reduce early elective deliveries by 95% from baseline.

---

296 Community Health Report 2008 for the City of Arlington; Tarrant County Public Health; M.A.P.II Monitoring and Assessment Project 2002-2004
Project Option 2.7.4 – Implement innovative evidence-based strategies to reduce low birth weight and preterm birth

**Unique Project ID:** 130614405.2.3

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Project Description:**

Babies born to mothers who received no prenatal care are three times more likely to be born at low birth weight, and five times more likely to die, than those whose mothers received prenatal care. This project includes the development of an advanced practice nurse run prenatal clinic located in the area within our community which has the highest rate of women that do not receive prenatal care. The clinic plans to incorporate elements of the Centering Pregnancy model that was designed to reduce racial disparities in birth outcomes and was successful in decreasing preterm infants to rates as low as 1 in 28 births (compared to a national rate of 1 in 8 births).

Centering Pregnancy is a multifaceted model of group care that integrates three major components of care: 1) health assessment, 2) education and 3) support into a unified program within a group setting. Using this unique model, women are empowered to choose health promoting behaviors. Outcomes from this approach resulted in increased birth weights of infants and high satisfaction of patients. Pregnant teenagers are often among the population without access to health care due to lack of funding. Tarrant County has a high teen pregnancy rate and would provide these young women with access to health care at no or reduced cost in a unique environment where they could learn and receive support.

**Goals and Relationship to Regional Goals:**

**Project Goals:**

The purpose of the project is to implement an advanced practice nurse managed prenatal clinic at a location in the community that is geographically convenient for the women in the community who do not have access to prenatal care. The project incorporates innovative elements of the Centering Pregnancy model which has demonstrated success in improving health outcomes for women/infants with racial disparities in infant outcomes will be developed. The ultimate goal of the program is to increase the number of disadvantaged pregnant women who receive prenatal care and decrease the rate of low birth weight and preterm births in our community.

This project meets the following Regional goals:

A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing a prenatal clinic to help low income, disadvantaged pregnant women in the community obtain the care they need to improve their health and the health of their unborn child, with a goal of reducing low birth weight and preterm babies.

**Challenges:**
The most significant challenge to the success of the project is the ability to entice the target population of disadvantaged pregnant women to obtain prenatal care. Outreach programs at area schools, churches, community centers and through other venues would be initiated to communicate the availability of the clinic to those in need. A second challenge is to retain the women in the program to continue to receive prenatal care throughout their pregnancy. The dynamic environment created using the Centering Pregnancy program has demonstrated success in improving compliance with women maintaining their prenatal care. Group members provide support to other members while motivating individuals to learn and make positive changes.

5-Year Expected Outcome for Provider and Patients:
At the conclusion of the 5-year project, we expect a 10% reduction in the number of low birth weight infants delivered at our hospital.

Starting Point/Baseline:
There is currently no prenatal clinic available at Texas Health Arlington Memorial to serve these patients. Between January and August 2012, there were 1,382 (2,073 patients annualized) infant deliveries performed. 45.2% (937 annualized) of these women were unfunded or Medicaid funded patients. There is an increase in numbers of at-risk, disadvantaged women in our geographic area with a limited number of physicians willing to care for these patients. This results in many women being unable to obtain prenatal care. Conversations with area obstetricians have been initiated and there is support from the physician community for the clinic, including a willingness of the physicians to assume care of the women at 36 weeks gestation in order to transition them for delivery of the infant.

Rationale:
Between 2000 and 2009, infant mortality rates were on the rise in Tarrant County. The national infant mortality rate is 7.6 deaths/1,000 births. In Tarrant County there were 15.3 deaths per 1,000 live births in African-Americans, 6.7 deaths per 1,000 live births in whites and 5.9 deaths per 1,000 live births in Hispanics. The Centering Pregnancy model has demonstrated effectiveness in reducing racial disparities in birth outcomes.

Healthy People 2020 reports that in 2009, only 52.1% of mothers in Tarrant County received prenatal care and that 8.4% of infants born were low birth weight babies. In Arlington, the infant mortality rate is the highest in ZIP code 76010 (8.9 of 1,000 live births) and less than 75% of pregnant women in this East Arlington area receive prenatal care.

Evidence supports that women receiving early and regular prenatal care have healthier outcomes for both mother and baby. The development of a prenatal clinic would provide an option for patients in our community who do not have financial resources to receive prenatal care. Texas Health Arlington Memorial Hospital is close in proximity to an area where a large percentage of
expectant mothers have been identified as not receiving prenatal care. The county hospital system is moving the clinic currently available to these women to an area of the city not as easily accessible to the at-risk population with the highest infant mortality. A hospital-based prenatal clinic would be geographically convenient for the population needing the service.

### Prenatal Care and Infant Outcomes

</tbody>
</table>

**Project Components:**
This model allows for better cost effectiveness, while providing practitioners that can handle the array of obstetrics and non-obstetric issues during pregnancy. Patients are encouraged to become engaged in their care, learn to manage their health and supported throughout the process. Ongoing evaluation for opportunities to improve the care and service provided utilizing the Plan Do Study Act (PDSA) continuous improvement methodology will assist in progressing the program and achieving better patient outcomes.

Our milestones provide a structure for project improvement and implementing a prenatal clinic program in order to address an identified need within our community. By increasing the number of low-income pregnant women who receive prenatal care, studies show we can positively impact the number of low birth weight babies and preterm infants being born.

Milestones and metrics support:
1. developing and implementing a prenatal clinic that uses the Centering Pregnancy model,
2. engaging and enrolling patients in the program to increase numbers of at-risk patients receiving prenatal care, and
3. improving quality of life while decreasing overall cost of care as evidenced by decreasing the number of patients who deliver low birth weight or preterm infants.

**Unique community need identification numbers the project addresses:**
- CN.1
- CN.3
- CN.8
- CN.10
- CN.13
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any federal funding.

**Related Category 3 Outcome Measures:**

**Outcome Measures:**
- IT-8.2 Percentage of Low Birth-weight births (CHIPRA/NQF # 1382) (Stand-alone measure)
- IT-8.3 Early Elective Delivery (Medicaid Adult Core Measure/NQF #469) (Stand-alone measure)

**Reasons/rationale for selecting the outcome measures:**
Data discussed as outlined above supports the need to improve the delivery of prenatal care to women in our community. Two of the most significant benefits of early and ongoing prenatal care are the decrease in risk of low birth weight babies and preterm deliveries. According to the March of Dimes, the average cost of medical care for a premature or low birth weight baby is approximately $49,000 during the first year of life, compared to $4,550 for a normal newborn.

Because approximately 45% of women delivering babies at our hospital are unfunded or government-funded and a very limited number of physicians in the area will accept these patients for prenatal care, implementation of a low-cost/no-cost prenatal clinic in the area would provide access to the timely, quality care in order to optimize health outcomes for the women in our community who cannot afford health care for themselves and their unborn baby. The Centering Pregnancy model used to develop the program should draw disadvantaged women to continued prenatal care at the clinic.

**Relationship to Other Projects:**
- **Related Category 1 and 2 projects:** This project is related to the Establish/Expand Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care 2.9.1. The patient navigation program will assist with the identification of at risk patients who might benefit from closer monitoring/support and refer them to use the resources available in the prenatal clinic.

- **Related Category 4 Population-focused improvements:** This project is related to RD-3 Potentially Preventable Complications (PPCs): Risk adjusted PPC rates. The Prenatal Clinic provides an avenue for those who might not otherwise obtain prenatal care to receive this care. Complications associated with obstetrics can be reduced through the provision of prenatal care and early identification of/intervention with patients at risk for obstetrical complications.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

- **Approach/Methodology:** For every low birth-weight birth avoided, $29,000 in cost is saved by the health care system. Health care costs are calculated by multiplying $29,000 by the total individuals affected.

- **Rationale/Justification:** Low birth-weight birth outcome improvement targets are dependent on the target population, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place. There are no individual and community savings for this outcome.
### Implement Evidence-based Disease Prevention Program: Implement innovative evidence-based strategies to reduce low birth weight and preterm birth.

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.9.1– Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

**Unique Project ID:** 130614405.2.4

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Provider:** THAM is a 369 bed acute care hospital located in Arlington, Texas. Our hospital serves the city of Arlington and surrounding communities, a 100 square mile area and a population of more than 365,000 residents. THAM provides emergency and acute inpatient care to the community.

**Intervention:** Goals for the project include improved management of patient health care needs resulting in a reduction of inappropriate ED utilization for non-emergent conditions and increased navigation of patients to appropriate health care resources, including establishing a PCP. Initial work has begun to implement the project on a limited scope. One full time RN case manager has recently been hired to assist in navigation and telephonic follow-up with at risk patients. Additional FTEs would be needed for full implementation of the project.

**Need of the project:** The volume of patients cared for in the emergency department has increased by 20% since 2010, with a 27.9% increase in indigent and Medicaid patients. An analysis of the 4,936 June 2012 THAM ED patients indicated that 53% of the patients presenting for care in the ED were unfunded or Medicaid. Over half of these patients (55%) had diagnoses that did not require emergency care, but came to the ED because they felt they had no other healthcare options. During January through June 2012, over 61% of the patients who came to the emergency department for care indicated they had no PCP.297

**Target population:** The target population is patients, primarily those patients without insurance or with government funded insurance, who present to the ED for care that could be provided at a lower level or those with frequent utilization of the ED routine healthcare. Over the course of the waiver, we anticipate being able to intervene with over 3,000 patients. (DY2: 200 patients; DY3: 400 patients; DY4: 1,400 patients; DY5: 1,500 patients)

**Expected patient benefits:** The ED case manager will navigate patients to appropriate healthcare facilities or community programs, refer to area resources or assist in establishing a medical home. The ED case manager may continue to follow the patient post discharge as appropriate to provide necessary education, re-enforce discharge plans and monitor patient compliance with follow-up care to improve their health.

**Category 1 or 2 expected patient benefits:** Milestones selected include expansion of the ED health care navigation program to include hiring, training and providing ongoing education to RN case managers acting as navigators with the support of social workers and other health care team members. A process for tracking and reporting on the patients enrolled, interventions implemented would be developed. Tracking outcomes of the programs including PCP referrals for patients without a medical home and decrease in avoidable patient use of the ED would be monitored.

**Category 3 outcomes:** Our project goal is to implement programs that will improve the health of patients who are most at risk of receiving disconnected and fragmented care by improving appropriate use of the ED by 18% over the course of the project.

---

297 Internal organizational data from EPSI database
**Project Option 2.9.1– Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)**

**Unique Project ID:** 130614405.2.4

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Project Description:**
The project implements an emergency department- (ED-) based case management program to identify high-frequency ED patients and navigate them to more appropriate care settings, particularly primary care. The project uses highly-skilled nurse case managers to lead a collaborative process of assessment, planning, facilitation and advocacy for options. The project promotes quality cost-effective outcomes by providing services to meet an individual’s health needs through enhanced communication and increased access to available resources. The ED RN case manager will work with a multidisciplinary health care team to assist disadvantaged patients without primary care access to:

1) Navigate patients to obtain necessary community resources to meet identified patient needs.
2) Facilitate finding and obtaining a primary care provider (PCP) or enroll in a nurse practitioner -run chronic disease management clinic to more effectively manage their disease on an ongoing basis.
3) Intervene as necessary to provide education, monitor identified patients post-discharge to encourage compliance with their follow-up plan, and provide ongoing care/support for their health care needs.
4) Facilitate arrangements for care, as clinically appropriate, at a less resource intense level, such as an outpatient clinic or skilled nursing facility to avoid hospital admission and reduce risk of ongoing utilization of ED for non-emergent care needs.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
Goals for the project include a reduction in inappropriate ED utilization for non-emergent conditions and increased navigation of patients to appropriate health care resources, including establishing a PCP. We anticipate that improved management of health needs through navigation of at-risk patients to appropriate resources and to establishing the patient’s relationship with a PCP who can monitor and manage their health on an ongoing basis will reduce the number of potentially avoidable hospitalizations and ED visits as well as lower overall health care costs for this target population.

**This project meets the following Regional goals:**
Regional goals are aligned with the triple aim of health care reform, namely, to improve clinical outcomes and the patient experience while lowering per capita health care costs. Additionally, a major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing a RN
navigator based in the ED to help at risk, disadvantaged community members obtain access to preventive, primary and chronic health care services in order to more effectively manage their health.

**Challenges:**
During January through June 2012, over 61% of the patients living in the North Arlington area who came to the emergency department for care indicated they had no PCP. The ED case manager will provide these patients with a resource to facilitate enrollment in appropriate community programs or establish a medical home. The ED case manager will continue to follow the patient post-discharge to provide necessary education, re-enforce discharge plan and monitor patient compliance with follow-up care to improve their health.

Challenges include the availability of PCPs in the area that accept new unfunded or government-funded patients. The hospital has recently aligned with the county health care system, JPS Health Network (JPS), to have a representative appointed to our hospital. The JPS Health Network Representative will work with the ED case manager to enroll patients in the JPS Health Network system, establish a PCP, and expedite appointments. In addition, PCPs accepting disadvantaged patients are being recruited to align with the hospital. One physician has been recruited and will be housed in a new medical office building scheduled to open in spring 2013. THAM nurse-practitioner run outpatient clinics for chronic disease management and follow-up care are being developed. The implementation of an ED case manager to navigate disadvantaged patients to these and other resources in the area will assist in more appropriately managing the health care needs of disadvantaged patients in a cost-effective manner, while relieving the emergency department.

**5-Year Expected Outcome for Provider and Patients:**
Goal is to reduce inappropriate utilization of the emergency department or hospitalization by 18% over the five-year time period.

**Starting Point/Baseline:**
Utilization of the Texas Health Arlington Memorial hospital emergency department has been steadily increasing over the last several years with an 11% increase in ED patient volume between 2010 (57,400 visits) and 2011 (64,600 visits). Estimates for 2012 (72,000 visits) indicate an additional 12.5% increase in volume will be noted from 2011 to 2012. Approximately 50% of the patients currently utilizing our ED are unfunded or government patients, many of whom routinely use the ED for management of their chronic condition or episodic care.

The new JPS Health Network liaison, working only Monday through Friday, 9 a.m. until 5 p.m., has made contact with 667 disadvantaged patients over the last two months. She has only been successful in enrolling 17 of these patients in the JPS Health Network system for care. The
addition of ED case managers with expanded hours (24/7 coverage) and the availability of additional PCPs or nurse practitioner run clinics will provide new options to assist patients in obtaining care and avoid emergency department visits or hospitalizations.

**Rationale:**

An analysis of the 4,936 June 2012 Texas Health Arlington Memorial ED patient visits indicated that 53% of the patients presenting for care in the ED were unfunded or Medicaid. Of this disadvantaged low income target population, over half (55%) had diagnoses that did not require emergency care, including conditions such as chronic back pain, prescription refills, follow-up exams or dental disorder. Additional diagnoses, such as limb pain or urinary tract infection might have been managed at a lower level of care or prevented with appropriate primary care. This program will guide the disenfranchised medically complex patient more appropriately through and across our system, from provider to provider, ensuring they can get to and make multiple appointments, get prescriptions filled, access community services for people with special needs (such as getting cancer patients access to support groups), etc. The patient navigator represents the liaison between primary, secondary, tertiary and quaternary health care.

**Project Components:**

All required core project components, which are listed below, are included in the project:

a) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

b) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.

c) Connect patients to primary and preventive care.

d) Increase access to care management and/or chronic care management, including education in chronic disease self-management.

e) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety net populations.

Our process milestones and metrics will facilitate our project to moving chronically ill, low income patients at risk of receiving fragmented care into a program that will allow them to more effectively manage their disease and obtain timely and appropriate level of care. We are committed to participating with other RHP providers to continually evaluate and improve our program effectiveness. Milestones and metrics measure navigator assistance provided through the program to our high need population and include:

1) Hiring and training staff including RN case managers to cover the ED seven days a week who will coordinate a multidisciplinary team including social workers, RNs and
physicians/nurse practitioners to more effectively address anticipated needs (social and clinical)

2) Developing policies, procedures, data collection tools and equipment to effectively run the program and monitor effectiveness

3) Increasing the number of patients served under this model by 20% over the five-year period. These milestones and metrics will measure the volume of at-risk patients receiving navigation services through an effective, coordinated model, and thus be able to access care at the appropriate level for ongoing management of their health (rather than receiving fragmented care).

**Unique community need identification numbers the project addresses:**

- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

**IT-9.2 Right Care, Right Setting – ED appropriate utilization (Stand-alone measure)**

This project will reduce inappropriate ED visits for the following target conditions CHF, diabetes, ESRD, CV/hypertension, behavioral health/substance abuse, COPD, asthma.

This project provides navigation services so the patient gets the right care, in the right setting and in a timely fashion, avoiding unnecessary ED visits and avoidable hospital admissions. (See data discussed in Section 4.a). Many studies have demonstrated the effectiveness of case management/navigation program to improve management of patient health, reduce risk of avoidable readmissions and provide better primary care access. RN Navigators will assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health. Patients with effectively managed disease and access to a dedicated health care provider will be less likely to utilize the ED for non-emergent conditions and will manage their health through primary and non-emergency health care providers. The program also assists in avoiding inpatient hospitalizations by providing patients with more appropriate alternatives to receive care and coordinating the necessary services from the ED.

**Relationship to Other Projects:**

**Related Category 1 and 2 projects:** This project is related to project 2.2 Expand Chronic Care Management Models. The ED case manager will utilize the chronic care clinics as a resource to refer patients needing assistance with management of their chronic condition.

**Related Category 4 population-focused improvements**

Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate

- RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)

The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:

- **Approach/Methodology:** For every inappropriate inpatient admission avoided, $9,302 in cost is saved by the health care system. The average length of stay per inpatient admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inappropriate inpatient admissions outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent inappropriate inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
### Project Components: 2.9.1 (a-e)

**Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)**

<table>

<th>Year 3</th>
<th>Year 4</th>
<th>Year 5</th>
</tr>
</thead>
</table>

#### Milestone 1 [P-2]:
- Establish/expand a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigator education.
- Metric 1 [P-2.3]: Frequency of contact with care navigators for high risk patients.
- Baseline/Goal: 200 encounters
- Data Source: Patient navigation program materials and database, EHR

- Milestone 1 Estimated Incentive Payment: $328,503

#### Milestone 2 [P-5]:
- Provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. The

#### Milestone 5 [P-8]:
- Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance).
- Each participating provider should publicly commit to implementing these improvements.
- Metric 1 [P-8.1]: Participate in semi-annual face-to-face meetings or seminars organized by the RHP.
- Baseline/Goal: Attend 2 programs/year
- Data Source: Documentation of semiannual meetings including meeting agendas slides from presentations, and/or meeting notes.

#### Milestone 7 [I-6]:
- Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.
- Metric 1 [I-6.2]: Percent of patients without a primary care provider (PCP) who received education about a primary care provider in the ED
- Goal: 85% of identified patients
- Data source: Administrative data on patient encounters and scheduling records from patient navigator program

- Milestone 7 Estimated Incentive Payment: $670,919

#### Milestone 8 [I-8]:
- Reduction in ED use by identified ED frequent users receiving navigation services
- Metric 1 [I-8.1]: ED visits pre- and post-navigation services by individuals identified as ED frequent users (based on program enrollment).
- Goal: 18% reduction from baseline

Project Summary

**Project Option 2.15.1– Integrate Primary and Behavioral Health Care Services- Collaboration with indigent clinics and site-based primary care**

**Unique Project ID:** 130724106.2.1  
**Performing Provider Name/TPI:** Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106  

**Provider:** Pecan Valley Centers is the Local Authority for mental health and developmental disability services for a six county region (5 of which are included in RHP 10). The total area covers 4267 sq miles and has a total population of 442,719. In the last 12 months, provider has served an average of 2173 individuals (adults and youth). Pecan Valley Centers, as the local authority for the service area, is the safety net for mental health services for individuals without Medicaid or other funding source. Although we serve individuals with Medicaid, Medicare and other funding sources more than half of our population served do not have a funding source and would go without mental health services without the local authority.  

**Intervention:** Project will aim to integrate primary health care with behavioral health care by co-locating primary care services in existing behavioral health clinics as well as placing mental health staff in community indigent clinics. The project is new to Pecan Valley as currently no integration of primary and behavioral healthcare is present.  

**Need for the project:** Insufficient integration of mental health care in the primary care medical system was identified as a need in the community needs assessment for Region 10. The lack of integration adversely affects both the medical system and behavioral health system and treatment becomes fragmented. By increasing access to primary care services and expanding the system of care, early detection of chronic health conditions and mental health conditions will diminish the disconnect between services. Individuals with behavioral health issues experience higher risk of mortality and poor health outcomes, largely due to a lack of preventive health services and poorly controlled co-morbid medical disease. The risk increases with the severity of the behavioral health diagnoses. Since more than half of the 2100 individuals receiving services at Pecan Valley do not have Medicaid or other funding sources, these same number of people most likely do not have a primary care physician, due to the inability to pay for such services. They may utilize the indigent clinics or just lack healthcare services. Collaboration between primary and behavioral healthcare providers is important to ensure adequate monitoring.  

**Target population:** The target population is adults and youth with severe mental illness. Estimated number of patients to be served over course of waiver period: 720. Approximately 55% (1210) of our population has no funding source or are indigent and 25% (500) of adults and 75% (150) of youth have Medicaid, so this project will impact a large portion on uninsured individuals by providing primary care access.  

**Category 1 or 2 expected patient benefit:** Our goal is to provide;  

1) DY 2-Discussion with community providers to identify three potential sites for integration in the community  
2) DY 3- 25% or estimated 300 referrals will occur between providers; two providers in the community will be identified as potential sites for Level 4 interaction
3) DY 4-50% or estimated 600 individuals will receive coordination of care; and 
15% or estimated 180 individuals will receive integrated services.

4) DY 5-30% or estimated 360 will receive integrated services from a site; 30% or 
estimated 360 will show an increase in health metrics as evidenced by the CANS 
or ANSA assessments

The goals identify the effectiveness of the healthcare integration.

**Category 3 outcomes:** IT-6.1 Percent improvement over baseline of patient satisfaction scores-
By the end of the waiver the expected results is to see 70% of individuals receiving integrated 
services reporting satisfaction with their overall health and functional status. Patient satisfaction 
is a critical component in the success of integration in order to keep the client engaged in both 
behavioral and physical healthcare. Studies show that patients with high satisfaction scores are 
more likely to remain engaged in services as opposed to those with low satisfaction scores in 
which tend to drop out of services. By achieving high patient satisfaction, patients will continue 
to utilize lower costing services available in the community to manage and improve their 
ilnesses, saving tax payers an estimated $3.04 million over the life of the grant. In addition, 
clients receiving integrated services will create a benefit for primary care patients with non-
behavioral health issues valued at $1.2 million, by allowing more time available for primary care 
physicians to see additional patients due to the lower intensity service needed by behavioral 
health clients for primary care. The integration of care will be reflected in the overall health of 
individuals by providing access to services and assessments. Integrating care between primary 
and behavioral health care can impact patient satisfaction because individuals will receive a 
holistic approach and receive the right service at the right time. By removing barriers to primary 
care, for individuals with behavioral health issues, an expected overall improvement in health care status and functioning can be expected. The valuation of this project is aimed at assessing 
patient satisfaction as it relates to patient experiences with integrated health care.
Project Option 2.15.1– Integrate Primary and Behavioral Health Care Services- Collaboration with indigent clinics and site-based primary care

**Unique Project ID:** 130724106.2.1  
**Performing Provider Name/TPI:** Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106

**Project Description:**
Integrated care project will be a combination of co-location of primary care services in existing behavioral health clinics as well as locating mental health staff in existing primary care and indigent care clinics. Currently an indigent care clinic and behavioral health clinic exists in four counties. By increasing access to primary care services and expanded system of care, early detection of chronic health conditions and mental health conditions will diminish the silo model of disconnected services.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to link individuals with primary care services, while also receiving services to address their behavioral health needs. Currently services for both primary and behavioral health care are not integrated. This is complicated by multiple providers, as well as lack of continuity of elements such as medication monitoring, health records and screenings. By integrating services, individuals will be able to receive their services in one location. This will provide continuity of services and result in early detection of conditions that are detrimental to their well being. The five year goals are 1) to integrate primary and behavioral health care services in three community sites, and 2) close collaboration in a partly integrated system in one site.

**Challenges:**
People with chronic medical conditions have high rates of behavioral health problems. Individuals in Texas with psychiatric illnesses die 29 years earlier than the normal population. Nearly two-thirds of these deaths are caused by treatable physical illness including diabetes, cardiovascular disease and cancer. In behavioral health settings, more than half of medical conditions go unrecognized. Many individuals who experience mental illness experience challenges in accessing primary care. As a result, many tend to seek medical care through the ED and have little continuity of care. By integrating health care with behavioral health will result in increased access to primary care. By embedding mental health professionals into existing community-based settings, better care coordination will occur for both behavioral and medical health needs.
5-Year Expected outcome for Provider and Patients:
The five year goals are 1) to integrate primary and behavioral health care services in three community sites, and 2) close collaboration in a partly integrated system in one site. Multidisciplinary treatment by both primary and behavioral health professionals, providing needed continuity of treatment to ensure adequate follow up so the full benefit of health care treatment is achieved.

Starting Point/Baseline:
Currently no integrated services exist for Pecan Valley. Fifty percent (1,200) of the current behavioral health population of individuals with severe mental illness served by Pecan Valley does not have Medicaid, Medicare or private insurance. This population will be the target for this project. This baseline will assist in making the determination as to which site represents the most need for co-location.

According to the 2009 Texas County statistics, 24.46% of individuals in five counties Pecan Valley serves do not have insurance and unlikely to have a primary care provider. A baseline will be determined as to how many individuals currently in behavioral health services do not have a primary care provider.

Rationale:
Behavioral health conditions, including mental illness and substance abuse, are frequent with Medicaid-eligible individuals with chronic medical conditions. These individuals with common chronic conditions and mental illness makeup approximately 75% of health care costs. Recent studies show that integration of behavioral health and physical health services should be standard for advanced health care systems resulting in more cost-effective and comprehensive patient care. Patients with behavioral health issues experience higher risk of mortality and poor health outcomes, largely due to a lack of preventive health services and poorly controlled co-morbid medical disease. Risk increases with the severity of the behavioral health diagnoses. The measures chosen for this project would identify the level of need for primary care services, develop relationships with providers and community setting for co-location and integrating mental health professionals into the primary care setting. Mental health professionals can play a key role in assisting individuals in developing self-management goals, managing chronic conditions, promoting wellness. Complex medical and social issues including multiple chronic health conditions, low income, housing, insecurity, social isolation, and lack of natural supports systems severely impact health and social functioning for persons with more severe behavioral health diagnoses such as schizophrenia, bipolar disorder and major depressive disorder. Substance use disorders, alone or in combination with mental health conditions, have significant physical consequences, leading to disability and increased acute and long term service expenditures.
Project Components:
Our project contains all the core elements, including:

- Sites for potential integrated sites will be in the individual’s community to provide ease of access. These sites are currently being used by either indigent care clinics or behavioral health services. Discussions have occurred with community providers and are agreeable to shared space and staff.
- Provider agreements and legal arrangements will define scheduling and information sharing processes as well as contracts defining locations, cost sharing of building usage and utilities.
- Protocols and processes for sharing information for scheduling, data sharing, communication and electronic health information will be established. An anticipated upgrade of an electronic health record in FY13 will result in more efficient information sharing.
- Ten additional providers will be recruited to provide and support of integrated services. These staff will be located in multiple locations.
- Training will be integral for the success of this project. Both primary and behavioral health care providers will be trained together to create a shared vision of service delivery and continuum of care. Team consultations will be implemented in order for all team members to communicate and co-develop care plans.
- The upgrade of an electronic health record in FY13 will result in more efficient information sharing in order to track utilization of services and outcomes. The quality and utilization management departments will be active in tracking expanded data collection, including primary care integration.
- Minimally of quarterly quality improvement reviews to include project impact, penetration of patient population, and challenges with program expansion.

The Community Needs Assessment identified a need to better achieve integration of primary care and mental health care services in the primary care setting through heightened awareness of medical models for mental health integration. The measures chosen for this project will 1) identify level of need for primary care services 2) develop relationships with providers and community settings for co-location and integrating mental health professionals into the primary care setting 3) co-located primary care services in behavioral health setting. These measures will measure the number of individuals who receive both primary and behavioral health care in integrated settings.

Unique community need identification numbers the project addresses:

- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.11 – Need for more care coordination
- CN.10-Overuse of emergency department (ED) services.
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:
*Outcome Measure 1: IT-6.1 Percent improvement over baseline of patient satisfaction scores*

According to the Integrated Behavioral Health Project integrating primary and behavioral health care allows for a more “cohesive service delivery system and better continuity of care”. The document goes on to state that integrated care has the ability to produce significant positive results due to both physical and behavioral health needs are addressed. Data also shows that those suffering with behavioral health issues are more likely to have co-occurring physical ailments as well. In order to retain patients with both physical and behavior health needs, patient satisfaction must be maintained. By the end of the Waiver project, our goal is to show 70% of individuals reporting satisfaction with their overall health and functional status.

Relationship to Other Projects:
Integration of primary and behavioral health care will support the expanding access project (1.9.2 Expand specialty care access) by providing a link to necessary health care.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Integrating care between primary and behavioral health care can impact patient satisfaction because individuals will receive a holistic approach and receive the right service at the right time. By removing barriers to primary care, for individuals with behavioral health issues, an expected overall improvement in health care status and functioning can be expected. The valuation of this project is aimed at assessing patient satisfaction as it relates to patient experiences with integrated health care. The population of this project will be those individuals in the identified sites for integration. Only those individuals enrolled in this program will be included in the project scope of the project. According to Integrated Behavioral Health Project integrating primary and behavioral health care allows for a more “cohesive service delivery system and better continuity of care.” The document goes on to state that integrated care has the ability to produce significant positive results due to both physical and behavioral health needs are
addressed. Data also shows that those suffering with behavioral health issues are more likely to have co-occurring physical ailments as well. In order to retain patients with both physical and behavior health needs, patient satisfaction must be maintained. Utilizing the Region 10 Pricing Model, Pecan Valley Centers’ places a value of customer satisfaction to equal $87,427. This calculation is based on a 70% favorable rating of the population at a value of 2% of billing over the five-year period of the Waiver. In addition, Pecan Valley Center’s recognizes that integrated health will lead to lower level intervention needed to address the patients’ on-going physical needs. By reducing the CPT billing codes from a level 5 to a level 2, a cost savings value of $2,956,200 can be achieved. With both physical and behavioral health needs being achieved on a routine bases and a lower physical intervention being required to maximizing the patients’ health care needs, greater access to additional patients in the community with needs can be addressed, resulting in a community benefit of $1,200,572 over the life of the grant and a total project value of $4,244,200.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option – 2.2.2 – Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program

Unique Project ID: 135036506.2.1

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Provider: Baylor All Saints Medical Center at Fort Worth, located near downtown Fort Worth, is a full-service hospital dedicated to providing for the health care needs of the community. Baylor Fort Worth is among Tarrant County’s oldest not-for-profit hospitals and celebrated 100 years of service in 2006. The medical center has 525 licensed beds and offers a broad range of medical services including programs of excellence in cardiology, transplantation, neurosciences, oncology and women’s services. Baylor Fort Worth’s service area represents a population of 1.2 million.

Intervention: The project purpose is to provide focused education and point of care testing for underserved patients who have diabetes, CVD and/or Respiratory disease that are in need of education, clinical management and training within a primary care setting. We will co-locate primary care and chronic disease management services to improve clinical outcomes. This will be a new project for the Medicaid and Uninsured populations in Fort Worth.

Need for the project: Underserved patients experience multiple barriers to effectively manage their chronic illnesses. Two of the needs identified by the Community Health Needs Assessment for Region 10 included components of patient education and helping patients to understand their illness, how to better manage it and how to coordinate their lifestyle choices to achieve optimal health outcomes.

Target population: The target population is PCMH patients with diabetes, CVD and Respiratory disease in Fort Worth. 570 new patients from DY3-DY5 will receive chronic disease education and point of care services. The Community Health Needs Assessment identified the top 5 most prevalent conditions as: diabetes, obesity, hypertension, heart failure and COPD. This project addresses 3 of these illnesses directly and 2 indirectly, it aligns exactly with the needs of the Region by increasing the availability of chronic care services and self-management training/education.

Category 1 or 2 expected patient benefits: Develop Chronic Care model; increase number of patients seen by Chronic Disease program; and improved patient compliance with care regimens. These milestones and metrics tie into the project purpose through identifying patients with chronic diseases and providing comprehensive education for Diabetes, CVD and Asthma/COPD.

Category 3 outcomes: (all baselines will be reevaluated and reestablished in DY2)

- IT-1.10: Diabetes Care: HbA1c Poor Control. Our goal is to decrease the number of patients with uncontrolled HbA1cs (> 9.0%) from 25% currently to 21.4% in DY5.
- IT-11.1: Diabetes Care: BP Control (< 140/80 mmHg). Our goal is to increase the number of diabetic patients in good BP control from 50.9% currently to 57.9% in DY5.
- IT-1.13 Diabetes care foot exam: Our goal is to increase the number of patients with diabetes receiving foot exams/screenings from 96% currently to 97.2% in DY5.
Project Option – 2.2.2 – Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program

Unique Project ID: 135036506.2.1
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Project Description:
The Baylor Clinic on the Baylor All Saints Medical Center at Fort Worth campus will house a carved out chronic disease management program to provide focused and dedicated education and care for patients (including uninsured and Medicaid) with diabetes, cardiovascular diseases (CVD) (i.e., congestive heart failure) and respiratory diseases (asthma/chronic obstructive pulmonary disease) within a primary care setting. Community health workers and nurse care managers will address the complex clinical and prevention needs of these patients and spend time specifically on management of these diseases—providing both clinical counseling and a focus on lifestyle issues and self-management. Patients will also receive point of care testing for diabetes (HbA1c testing and glucose testing using test strips) and asthma (peak flow meter assessments). We believe this program will reduce patients’ noncompliance with completing lab orders and address their financial and transportation barriers to access. We will leverage the expertise and experience of both the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) and Baylor Clinics to provide the staff education, develop competencies and create protocols that will result in a complete and robust program tailored for multiple community settings. The Diabetes Health and Wellness Institute will house this staff and appropriately triage and manage providers to see patients at Baylor Clinics based on volume and demand parameters. Baylor Clinics have had previous success in managing patients with chronic disease through the creation and development of a community health worker model. These successes and competencies will be leveraged to create programs around CVD and respiratory illnesses.

Goals and Relationship to Regional Goals:
Project Goals:
Project goals for this program include: (1) increase health literacy around chronic illnesses for patients in the community, (2) educate and teach self-management techniques for patients with chronic diseases, (3) augment RN care managers with CHWs to serve a greater number of patient through a carved out, focused care model, (4) increase the number of patients screened and monitored for their chronic diseases using point of care testing and (5) increase education for patients with CHF and asthma/COPD. The project will identify patients with chronic diseases and provide them with treatment and education so that downstream complications are avoided and unnecessary ED/inpatient utilization decreases.

This project meets the following regional goals:
This project addresses the Region 10 needs for improved patient education about how lifestyle choices affect health outcomes as well as access to chronic disease management. Project implementation will lower ED visits for acute chronic disease symptoms.

**Challenges:**

**Underserved patients experience multiple barriers to effectively manage their chronic illnesses.** These include lack of knowledge, lack of social support, poor diets, insufficient physical activity, and limited access to care due to financial and transportation issues. By co-locating the chronic care management program within the primary care clinic, patients can receive medical care and chronic disease support at the same time. Additionally, the PCP’s medical management is informed by the chronic care management team’s interactions with the patient, which, in our experience, elicits new information regarding lifestyle and barriers to health. The RN/CHW model will be structured so that patient education is delivered in a format and context that is understandable and enjoyable for the patient. Lastly, the education and counseling will include lifestyle and self-management techniques so that this population can find ways to care for themselves that is relevant to their daily lives.

**5-Year Expected Outcome for Provider and Patients:**

Expected 5-year outcomes are: 1) at least 370 patients will receive care according to the Chronic Care Management model at the Baylor Clinic, 2) better clinical outcomes around HbA1c, foot exam completion and BP control, 3) more patients with a point of care test completed for their diabetes or asthma, 4) increased patient chronic disease, and 5) decreased rates of avoidable/unnecessary complications due to chronic disease.

**Starting Point/Baseline:**

Currently, the Baylor Clinic at the Baylor All Saints Medical Center at Fort Worth offers a limited program focused on diabetes education. Of the patients enrolled in the program, approximately 25% of clinic patients have an HbA1c > 9.0. This baseline is not directly comparable to the proposed project for chronic care management because we will be including CHF and asthma/COPD patients as well as part of the initiative. Our project will serve approximately 570 new patients over the course of the Waiver.298

**Rationale:**

We selected this project option because of chronic disease in region 10’s underserved population. Through co-locating primary care, behavioral health and chronic disease management services, we can improve clinical outcomes. By increasing the availability of chronic care services and utilizing a team based approach, more patients can receive focused attention for their complex needs and learn to self-manage their illnesses in an effective way. We have demonstrated

---

298 We estimated a target population based on the Community Health Needs Assessment. Eight percent of all Tarrant County residents have diabetes, which equates to almost 148,000 individuals in the county. Using the same 8% applied to the uninsured in Tarrant County, equates to approximately 35,000 individuals with just diabetes. This does not take into account CHF, asthma/COPD.
statistically significant reductions in mean HbA1c measures with a CHW model currently embedded in Baylor Clinics\textsuperscript{299}. Thus expanding the educational services to serve more diabetes patients, and beginning to serve CHF and Asthma/COPD patients will improve care of the population. The Community Health Needs Assessment identified the top five most prevalent conditions as: diabetes, obesity, hypertension, heart failure and COPD.\textsuperscript{300} This project addresses three of these illnesses directly and the other two indirectly and aligns with the needs of the Region and identified access challenges.

**Project Components:**
- We will engage in continuous quality improvement activities: (1) identifying key challenges with the expansion of this project, (2) determine opportunities to scale all or part of the project, depending on available resources and financial constraints, (3) find ways to continuously integrate the chronic disease management program into the care team as much as possible. We have chosen chronic care management metrics and milestones focus on finding the appropriate model for addressing multiple chronic illnesses in Tarrant County. We structured our metrics to focus on increasing access, awareness and education for individuals in the Region and in the latter years included metrics around increased compliance to recommended clinical protocols. We believe it will take time for patients to demonstrate improved self-management behaviors and yield clinical outcome improvements. We do anticipate some clinical improvement for those patients who have been engaged in the chronic care management program for an extended period of time. We have not historically completed programs for CHF and asthma/COPD. This project is an opportunity to create a continuous improvement environment for refining and modifying our approach.

**Unique community need identification numbers the project addresses:**
- CN.15 – Need for more education, resources and promotion of healthy lifestyles
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** We currently do not receive any federal funding for chronic disease education and providing services for CHF and Asthma/COPD are new to the Baylor Clinic. This project coincides with the need to focus on chronic illnesses, as they are the main drivers of health care costs in the US. Diabetes alone costs the US almost $174 billion dollars a year.\textsuperscript{301}

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

\textsuperscript{300} RHP 10 Community Health Needs Assessment Number of hospitalizations in Region 10 for chronic diseases: 4736 CHF; 1049 hypertension; 1558 asthma; 3300 COPD; 1136 short term diabetes; 1986 long term diabetes.

\textsuperscript{301} http://www.diabetes.org/diabetes-basics/diabetes-statistics/
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

**IT-1.10 Diabetes care: HbA1c poor control (>9.0%) – NQF 0059**

More than 8% of Tarrant County’s population has a diagnosis of diabetes with more than 37% of the population classified as obese and at risk for developing diabetes. Bodenheimer, et al. have found that patient self-management of chronic disease conditions, such as diabetes, when undertaken in a primary care setting led to significant improvement in HbA1c control in patients. A recent edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5,000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2,700 in hospitalization costs. Focusing efforts on increasing improvement of good glycemic control will result diminishing in other comorbid conditions and improve complication rates for these patients. We expect that at least 5 to 7% of regular Baylor Clinic patients will have improved HbA1c levels.

**IT-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061**

At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other comorbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman et al. showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic-based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

**IT-1.13 Diabetes care foot exam - NQF 0056**

An innovative part of this project is that the educators (CHWs and RN care managers) will be able to conduct diabetic foot exams as part of their patient education sessions. This will increase screening rates and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low-cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues. This is better utilization and management of resources through early identification and prevention of

Regional Healthcare Partnership  Region 10

serious diabetes foot-related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation.\(^\text{306}\)

**Relationship to Other Projects:**

135036506.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion This chronic care management project is directly related to the expansion of primary care capacity project as new staff will be brought in as part of this expansion to create more services for patients and allow more appointment availability.

135036506.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment The project involving developing care management functions to integrate primary and behavioral health needs of individuals is related to this project of chronic care management, because patients often have co-occurring chronic disease and mental health issues that require attention.

Several projects by other Region 10 providers also focus on Chronic Care Management program development: John Peter Smith has proposed a project to focus on diabetes education (126675104.2.10). Our project, which also includes Asthma and CHF, is focused more broadly on chronic disease management. University of North Texas Health Sciences Center will implement a school-based prevention program focused on Asthma (138980111.2.3). Baylor does not see many children in our clinics, thus we serve a different population.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and

\(^{306}\) American Diabetes Association: http://www.diabetes.org
outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor All Saints Medical Center at Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Baylor All Saints Medical Center at Fort Worth defined the population that will be directly impacted by the project as underserved patients who have diabetes, asthma, and/or CHF that are in need of education and treatment. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, she increases her ability to self-manage her illness(es) and maintain her health rather than relying on the physician or ED to manage her conditions.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his propensity to understand his illness, share his knowledge with others and help spread health literacy increases. Patients learn to manage their illnesses and escalations themselves rather than relying on expensive resources such as the ED.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

#### Year 2
(10/1/2012 – 9/30/2013)

**Milestone 1** [P-3]: Develop a comprehensive care management program

**Metric 1** [P-3.1]: Documentation of Care management program. Best practices such as the Wagner Chronic Care Model and the Institute of Chronic Illness Care’s Assessment Model may be utilized in program development.

Baseline/Goal: Determine exact care model to be used for CHF, Diabetes and COPD/Asthma patients

Data Source: Documentation of plan and report showing detailed plans for addressing chronic disease education program

**Milestone 1 Estimated Incentive Payment (maximum amount):** $306,786

#### Year 3
(10/1/2013 – 9/30/2014)

**Milestone 2** [P-9]: Develop program to identify and manage chronic care patients needing further clinical intervention

**Metric 1** [P-9.1]: Increase the number of patients identified as needing screening test, preventive tests, or other clinical services

Baseline/Goal: Determine exact care model to be used for CHF, Diabetes and COPD/Asthma patients

Data Source: Documentation of plan and report showing detailed plans for addressing chronic disease education program

**Milestone 2 Estimated Incentive Payment (maximum amount):** $306,786

#### Year 4
(10/1/2014 – 9/30/2015)

**Milestone 3** [P-2]: Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease care

**Metric 1** [P-2.1]: Increase percent of staff trained

Baseline/Goal: Train 100% of clinic staff on Chronic Care Model

Data Source: Documentation of in-service or signed proclamation of education

**Milestone 3 Estimated Incentive Payment (maximum amount):** $223,125

#### Year 5
(10/1/2015 – 9/30/2016)

**Milestone 4** [P-9]: Develop program to identify and manage chronic care patients needing further clinical intervention

**Metric 1** [P-9.1]: Increase the number of patients identified as needing screening test, preventive tests, or other clinical services

Baseline/Goal: Compare patients with at least (1) or more chronic diseases from CHF, Diabetes, Asthma/COPD that have uncontrolled clinical metrics over DY2 to determine prevalence of

**Milestone 4 Estimated Incentive Payment (maximum amount):** $223,125

**Milestone 6** [I-21]: Improvements in access to care of patients receiving chronic care management services using innovative project option.

**Metric 1** [I-21.2]: Documentation of increased number of unique patients served by innovative program.

Demonstrate improvement over prior reporting period.

Goal: At least 368 unduplicated patients will be served by Chronic Care Management program over DY2

Data Source: E.H.R

**Metric 2** [I-21.4]: Improved compliance with recommended care regimens.

Goal: 15% of patients in Chronic Care Management program (for at least 6 months) will have improved compliance with recommended care regimens.

Data Source: Patient survey, Educator Report /E.H.R

**Milestone 7** [I-21]: Improvements in access to care of patients receiving chronic care management services using innovative project option. The following metrics are suggested for use with an innovative project option but are not required.

**Metric 1** [I-21.2]: Documentation of increased number of unique patients served by innovative program.

Demonstrate improvement over prior reporting period.

Goal: At least 571 unduplicated patients will be served by Chronic Care Management program over DY2

Data Source: E.H.R

**Metric 2** [I-21.4]: Improved compliance with recommended care regimens.

Goal: 20% of patients in Chronic Care Management program (for at least 6 months) will have improved compliance with recommended care regimens.

Data Source: Patient survey,

**Project Option – 2.19.1 – Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment**

**Unique Project ID:** -135036506.2.4 (Pass 3b)

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 13503650

**Provider:** Baylor All Saints Medical Center at Fort Worth, located near downtown Fort Worth, is a full-service hospital dedicated to providing for the health care needs of the community. Baylor Fort Worth is among Tarrant County’s oldest not-for-profit hospitals and celebrated 100 years of service in 2006. The medical center has 525 licensed beds and offers a broad range of medical services including programs of excellence in cardiology, transplantation, neurosciences, oncology and women’s services. Baylor Fort Worth’s service area represents a population of 1.2 million.

**Intervention:** This project will co-locate and integrate outpatient behavioral health services using an LCSW to provide counseling services. Screenings for depression, substance abuse and anxiety will also be an integral part of the program. This is a new project that has not been done before. It will serve the BH needs of the Uninsured/Medicaid population.

**Need for the project:** This project will help provide care related to substance abuse, anxiety and depression. Behavioral and mental health issues are a large unmet need. Over 25% of Tarrant County residents experienced 5 or more days in which their mental health was not good during the past 30 days.

**Target population:** The target population is the Medicaid eligible and indigent PCMH patients at Baylor All Saints with underlying behavioral health issues. 500 new patients from DY3-DY5 will receive behavioral health interventions and services. In the indigent/uninsured community, patients do not see their behavioral health issues as a medical condition, thus the problems are often ignored and results in these patients use the ED.

**Category 1 or 2 expected patient benefit:** Data matching to find BH patients; patient engagement in BH program; and improved screening rates for depression, anxiety and substance abuse. These milestones and metrics tie into the project purpose through identifying patients with underlying BH issues, engaging those patients in BH interventions and increase the screenings for these patients.

**Category 3 outcomes:** (all baselines will be reevaluated and reestablished in DY2)

- **IT-11.1: Improvement in Clinical Indicator in Identified Disparity Group:** Improvement in Diabetes Metrics (HbA1c, LDL, BP) for disparate group of uninsured/Medicaid patients with an underlying BH issue. Our goal is to have 5% of patients in DY3 achieve improvement in Diabetes Metrics (HbA1c, LDL BP), 10% in DY4 and 15% in DY5.

- **IT-11.3: Improve utilization rates of clinical preventive services in target population with identified disparity:** Improve utilization of BH services for patients who have been screened/identified and diagnosed with an underlying BH issue. Disparate population is underserved population with BH issue. Our goal is to increase the patients who engage in BH treatment rates from 10% in DY3 to 20% in DY5. These outcomes reinforce participation in the BH program and treats the co-morbid diseases often associated with BH issues.
Project Option – 2.19.1 – Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment

Unique Project ID: -135036506.2.4 (Pass 3b)

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 13503650

Project Description:
This project will co-locate and integrate behavioral health services into the outpatient primary care setting. The model that we aim to develop would consist of providing a LCSW to provide basic counseling services to address behavioral health needs such as: anxiety, depression, and substance abuse issues. The screening tools we plan to use are evidence based and will most likely include: PHQ2 or 9, GAD-7 and alcohol and substance abuse screeners. Additionally, the LCSW would have the support of a Community Health Worker (CHW) to help with the screening and referral processes. The training for the CHWs, LCSWs and model development would occur at the Diabetes Health and Wellness Institute (Baylor entity in South Dallas) where the competencies and expertise would be created. From there, this staff can be triaged to clinics and community locations to provide behavioral health services. The behavioral health program would require that the LCSW and CHW to work together with the primary care team to: 1) identify the patients who have behavioral health issues, 2) coordinate the patient’s care and appointments to fit both the behavioral health and primary care appointment in the same visit and 3) help the primary care team to identify those patients whose behavioral health issues are impeding the management of their acute/chronic disease management models.

Goals and Relationship to Regional Goals:

Project Goals:
The goals of this project are to increase the baseline of behavioral health services provided and screenings conducted in an outpatient primary care setting to the underserved population in Tarrant County. By co-locating the behavioral health service with a patient’s PCMH, we anticipate increased compliance and adherence to attending behavioral health appointments. Through increased screening, awareness and intervention, we also anticipate that behavioral health issues such as anxiety, depression and substance abuse will be proactively identified and addressed and allow the clinician and patient to focus on more acute/chronic illnesses that require protocol adherence. This project will lead to decreased ED visits related to behavioral health issues manageable in the outpatient setting. Treating the underlying barriers associated with behavioral health will result in better health outcomes.

This project meets the following regional goals:
The RHP 10 Community Needs Health Assessment identified access to behavioral and mental health care as critical needs. Most important aspects of behavioral health access improvement are early interventions for targeted populations to prevent unnecessary use of services, increasing the number of providers and enhancing service availability. This project is directly aligned with the
regional need and is positioned to help facilitate care related to substance abuse, anxiety and depression.

Challenges:
The challenges with behavioral health initiatives are that identification of patients and willingness of those patients to participate in a formal program do not coincide. There is a stigma associated with receiving counseling or behavioral health services which makes it difficult for providers to identify patients that have these underlying behavioral health issues and even more difficult for providers to get patients to come in for these types of appointments. In the community, patients do not see their behavioral health issues as a medical condition, thus the problems are often ignored and results in these patients using the ED for their acute behavioral health escalations. While this program would not focus on serious psychiatric issues such as schizophrenia or bipolar disorders, identifying depression or anxiety can have a significant impact on the patient’s propensity to comply with medication and clinical recommendations/protocols. The way we plan to address the challenges mentioned above is through providing these services in a non-threatening way by individuals (CHWs/LCSWs) that come from the community they are serving. By using CHWs or LCSWs over physicians or other higher level providers, this should put the patient at ease. The program will also be presented in a counseling type environment rather than a psychiatric evaluation environment. Lastly, we will make behavioral health screenings a routine part of most primary care visits so that the assessments coincide with the patient’s typical care.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome is that at least 20% of the total unduplicated patients (approximately 570 patients) will receive behavioral health services at the Baylor Clinic. By identifying underlying behavioral health issues, acute and chronic medical issues can be addressed and compliance/adherence to clinical protocols should increase as well.

Starting Point/Baseline:
The baseline for this project would be 0 because there is no program for behavioral health offered at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth. The target population in the Tarrant county area is over 101,000 underserved individuals who suffer from a mental illness. We calculated this number taking the uninsured population in Tarrant County (443,000)\(^{307}\) and a 2011 statistic taken from the Centers for Disease Control and Prevention that found 23% of uninsured patients suffer from a mental illness.\(^{308}\)

\(^{307}\) http://quickfacts.census.gov/qfd/states/48/48439.html
\(^{308}\) CDC: http://www.cdc.gov
Rationale:
Behavioral health is a major regional need and Baylor Clinics have the infrastructure to effectively manage these types of issues within its PCMH framework. Many of our patients have underlying behavioral health issues which physicians simply do not have time to address during a typical primary care visit. This project model would allow patients to receive personalized attention for their behavioral health specific issues and allow physicians to spend time on managing clinical issues. By implementing a behavioral health component as part of the PCMH we have established patients will have improved overall health outcomes. Lastly, adding a behavioral health component to our primary care team will allow for cross communication between providers to understand all of the complex needs prevalent in this particular population.

Project Components:

a. Conduct data matching to identify individuals with co-occurring disorders who are:
   - not receiving routine primary care: Patients who enter into the behavioral health program will be automatically part of a PCMH
   - not receiving specialty care according to professionally accepted practice guidelines: We will be tracking this metric as part of our specialty care project- 1.9.2- Improving Access to Specialty Care
   - over-utilizing ER services based on analysis of comparative data on other populations: This is a metric that we already track and will continue to do so
   - over-utilizing crisis response services. This particular factor may be difficult to gather data on and is not typically a data point we collect
   - Becoming involved with the criminal justice system due to uncontrolled/unmanaged symptoms. This particular factor may be difficult to gather data on and is not typically a data point we collect

b. Review chronic care management best practices such as Wagner’s Chronic Care Model and select practices compatible with organizational readiness for adoption and implementation. We plan to review the most effective models that address both chronic care and behavioral health to determine which model would easily address the intersection of both programs

c. Identification of BH case managers and disease care managers to receive assignment of these individuals: We plan on hiring LCSWs and CHWs to act as BH care managers

d. Develop protocols for coordinating care; identify community resources and services available for supporting people with co-occurring disorders: As part of identifying which patients would be eligible and appropriate for this BH program, we will be developing clinical protocols to identify patients and coordinate their care within the Baylor Clinic PCMH

e. Identify and implement specific disease management guidelines for high prevalence disorders, e.g. cardiovascular disease, diabetes, depression, asthma. We plan to address this criteria through our Chronic Care Management project (2.2.1- Expand Chronic Care Management Models)

f. Train staff in protocols and guidelines. All staff will be made aware of this program and be trained on scheduling and identifying patients who could be part of this BH program

g. Develop registries to track client outcomes. We currently have a robust E.H.R in which we track other patient clinical metrics and measures, it would be redundant and inefficient to create a separate registry to track outcomes of this specific project. We intend to track outcomes in the current E.H.R.

h. Review the intervention(s) impact on quality of care and integration of care and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. As part of our monthly review of project status, this will be
included as will review of the other DSRIP projects the Baylor Clinic will be engaged in. We will focus on the key challenges associated with expansion and determine how and if the BH needs to be scaled to meet patient needs.

Unique community need identification numbers the project addresses:
CN.5 - Insufficient integration of mental health care in the primary care medical system
CN.10 – Overuse of ED services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project does not receive any federal funding and is a brand new initiative. There is currently no outpatient based behavioral health program offered to the underserved population at the Baylor Clinic at the Baylor All Saints Medical Center at Fort Worth.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Stand-alone measure)
We will measure the impact of diabetes management and control for patients who have enrolled in the proposed behavioral health program. A recent study conducted in early 2012, by Jeffery Johnson, et al. showed a direct correlation between diabetes and depression. They cited that depression is the most common comorbid condition present in 15-30% of patients with type 2 diabetes and less than 50% are recognized as having depression. Depression is associated with poorer self-care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.

Numerator : Number of patients with an improved Diabetes Percent of Opportunities Achieved (POA) improvement (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter.
Denominator: Total number of patients with a Behavioral Health intervention/encounter.

Because this is a new program, we do not have any historical data on the actual diabetes improvement for those patients who receive a behavioral health intervention. We only have

literature which has shown improvement in diabetes with interventions related to depression. Thus, the improvement targets we have listed for Category 3 may differ as we implement the program.

**IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Non-stand-alone measure)**

We plan to focus on the treatment component of this metric, defining treatment as those patients who engage in the behavioral health program. We anticipate that patients who enter our Baylor Clinic and are identified as individuals who would benefit from a behavioral health intervention will have improved treatment and utilization rates. Numerator: patients who are a Baylor Clinic patient and engage in the behavioral health program Denominator: patients who are a Baylor Clinic patient, eligible for behavioral health services

**Relationship to Other Projects:**

*135036506.2.1- Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program* The Chronic Care Management Model expansion is related to this project because the educational services would be provided the Baylor Clinic PCMH model. Additional staff that will be hired under this project of primary care capacity expansion will be utilized in providing education and management of CHF, diabetes and Asthma/COPD disease states. Lastly, services would be co-located and integrated to ensure that high risk patients with chronic disease would be identified, addressed and managed. The National Association of State Mental Health Program Directors (NASMHPD) reported that people with co-occurring behavioral health and medical illness incur the most cost, this combination of projects will help to resolve these patients’ issues.310

*135036506.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion* This behavioral health project is directly related to the expansion of primary care capacity project as new staff will be brought in as part of this expansion to create more services for patients and allow more appointment availability. Through the expansion project, we intend to integrate the behavioral health team with the overall primary care team to facilitate complete care for the patient. These services, chronic care management, behavioral health and expansion of primary care capacity are all interrelated and involve co-locating for maximizing effectiveness and efficiency.

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations. Impacts to Category 4 are listed below: RD-1.3, RD-1.7, RD-1.8, RD-1.1, RD-1.2; RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.7; RD-3.36, RD-4.1, RD-4.2 RD-5.

---

310 National Association of State Mental Health Program Directors: http://www.nasmhpd.org/index.aspx
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
Other performing providers that have projects in this area: 126675104.2.8- John Peter Smith Hospital: embed behavioral health managers; 081599501.2.3- Tarrant County MHMR: increase referrals to specialty and primary care. Our project differs from the two above because our focus is on counseling and screening. We will focus on disorders such as depression, anxiety and substance abuse.
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor All Saints Medical Center at Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)Bayelor All Saints Medical Center at Fort Worth defined the population that will be directly impacted by the project as the underserved PCMH Baylor Clinic patients with an underlying behavioral health issue(s). We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when people are positively impacted, their compliance and adherence to clinical protocols increases, their satisfaction increases and self-management of their illnesses increases. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her productivity in the community increases as mentioned in the Community Health Needs Assessment. Twenty-five percent of the population reported lost work days due to a mental health issue. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects.311
For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

Project Summary Template to be completed for each Category 1 and 2 project
Project Option – 2.9.1 – Establish/Expand a Patient Care Navigation Program- Care Connect
Unique Project ID: 135036506.2.3 135036506.2.5 (Pass 3b)
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Provider: Baylor All Saints Medical Center at Fort Worth, located near downtown Fort Worth, is a full-service hospital dedicated to providing for the health care needs of the community. Baylor Fort Worth is among Tarrant County’s oldest not-for-profit hospitals and celebrated 100 years of service in 2006. The medical center has 525 licensed beds and offers a broad range of medical services including programs of excellence in cardiology, transplantation, neurosciences, oncology and women’s services. Baylor Fort Worth’s service area represents a population of 1.2 million.

Intervention: This project will identify and connect underserved patients in the hospital to a PCP/PCMH, create a multi-disciplinary care plan for frequently admitted patients and provide comprehensive follow up calls to patients to ensure they have an appointment and transportation to get to it. This project would be a new initiative to Baylor All Saints Medical Center at Fort Worth.

Need for the project: Our database shows about 12,000 (Medicaid funded or indigent) patients annually come to the Baylor All Saints Medical Center at Fort Worth’s emergency department (ED) and say they do not have a medical home which results in these patients revisiting the ED because they lack appropriate medical care.

Target population: patients who visit the emergency department (ED) that need connection to medical homes. We estimate at least 70% of these patients are Medicaid eligible or indigent. Estimated number of patients to be served over course of waiver period: 5000 new patients from DY3-DY5 will receive services from Care Connect. The project will help patients connect to primary care thus reducing ED visits/costs to Medicaid and patients.

Category 1 or 2 expected patient benefits: Provide reports on types of navigation services provided to patients using the ED; and provide primary care referrals; and increase number of patients served by innovative program. These milestones and metrics tie into the project purpose connecting uninsured and Medicaid patients to PCMHs in the community.

Category 3 outcomes: all baselines will be reevaluated and reestablished in DY2) IT-5.1: Improved Cost Savings. Our goal is to increase cost savings of healthcare utilization (total cost of care in one year) of patients who have been connected to a PCP/PCMH appointment from 15% in DY3 to 25% in DY5.

IT-6.1: ED Appropriate Utilization. Our goal is to decrease all ED visits (including ACSC) from 25% in DY3 to 35% in DY5 and targeted conditions ED utilization (CHF, Diabetes, ESRD, CVD/Hypertension, BH/SA, COPD, Asthma) from 10% in DY3 to 20% in DY5. We will be excluding pediatric emergency visits as part of this metric measurement because Baylor All Saints Medical Center at Fort Worth does not see a large volume of pediatric patients in the ED. These outcomes reinforce connecting patients to appropriate resources and decrease overall cost utilization.
Project Option – 2.9.1 – Establish/Expand a Patient Care Navigation Program- Care Connect

Unique Project ID: 135036506.2.3 135036506.2.5 (Pass 3b)

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Project Description:
This project creates a fluid care navigation program at Baylor All Saints Medical Center at Fort Worth Emergency Department for patients without a primary care physician and/or patient-centered medical home to address their postacute care needs. Staff will provide patients with real-time assistance in finding a provider and connecting them with the appropriate discharge resources. We will include weekend staff coverage to ensure that patients are able to be seen and connected to resources seven days/week. Staff also will follow-up with patients to ensure they attend scheduled appointments. Staff will also be responsible for resolving transportation barriers that may otherwise stop patients from going to scheduled follow-up visits. Care Connect staff will receive email notifications anytime a patient revisits the hospital and proactively visit with the patient to ensure the patient can access their PCP/PCMH and/or recommended community resource(s). Care plans will be developed for patients with high hospital utilization (especially patients with frequent emergency department visits) and complex needs. Care plans will be reviewed by a social work supervisor, hospital medical director and other hospital staff. Patients with care plans will be contacted to ensure continuity of the care.

Goals and Relationship to Regional Goals:

Project Goals:
The goals for this project are: 1) to connect patients to a PCP/PCMH, 2) ensure patients have needed postdischarge resources, 3) reduce unnecessary ED visits and 4) create care plans for high risk patients that ensure follow-up care and identification upon future hospital admissions.

This project meets the following regional goals:
The project addresses two regional goals – to decrease unnecessary ED utilization and reduce costs of care in the region. The project’s focus is care coordination and ensuring patients are triaged to appropriate community and outpatient based resources. This project will help patients connect to essential primary care to maintain their health and will better focus community health care resources on lower cost, more appropriate service delivery.

Challenges:
One of the greatest challenges for the underserved population is lack of continuity of care across the continuum. This program aims to address this challenge (and the various reasons for it) by identifying patients who do not have a PCP/PCMH, finding one for them, ensuring they have the resources they need to keep their appointment, and following up with the patient.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes for this project include: (1) a minimum of 2,100 patients connected to a PCP, PCMH or community resource, (2) 35% of these patients will have confirmed appointments within 14 days postdischarge. We expect that there will be fewer ED visits and readmissions for this population that was connected through this program and will experience overall improved health outcomes due to receiving appropriate and adequate postacute care.

**Starting Point/Baseline:**
This program will be brand new to the hospital and will start from a baseline of 0. About 849 patients were served in nine months for the same program recently implemented at Baylor Medical Center at Garland. We will have to establish the baseline of this project and determine the potential number of patients who would benefit from this program at Baylor All Saints in DY2 and DY3. 2010 data indicates that approximately 12,000 Medicaid and self-pay patients reported not having a PCP/PCMH. We anticipate that the targeted population for the entire region is approximately 133,000 underserved/uninsured patients.\(^{312}\)

**Rationale:**
This project is a low-cost, effective way to promote continuity of care for the underserved by connecting them to community resources that address their complex needs. This project helps patients who do not have a PCP/PCMH connect to one and also offers continuous improvement to ensure further refinement. We selected this project for Baylor All Saints Medical Center because our experience in some of our other Baylor facilities has demonstrated its effectiveness in reducing readmissions and lowering ED utilization. This project will also create multidisciplinary care plans for the highest risk patients to identify and address triggers that cause them to (re)admit. This intervention enables staff to be involved with the patient at a grassroots level and gives patients a way to seek assistance with ongoing care and navigation needs.

**Project Components:**
This project includes components from the protocol: 1) identify frequent ED users and use navigators as part of a preventable ED reduction program, 2) train health care navigators in cultural competency, 3) deploy innovative health care personnel, as patient navigators, 4) connect patients to primary and preventive care, 5) increase access to care management and/or chronic care management, including education in chronic disease self-management, and 6) conduct quality improvement for project using methods such as rapid cycle improvement. We will connect with all ED patients without a PCP/PCMH. Our Care Plans will be developed for

\(^{312}\) This is calculated by taking the average rate of patients who are uninsured that do not have a PCMH/PCP (30%) multiplied by the total number of uninsured 443,956 (24% uninsured x total population of 1,849,815).
patients who are frequent ED utilizers as well. Lastly, the CHWs we will hire come directly from the communities they serve so they understand patients’ challenges/issues.

The selected milestones and metrics relate directly to two regional goals: 1) need for more care coordination and 2) overuse of ED services. The metrics we have in place increase the number of the target population served over the Waiver period and emphasize the connection rate to a PCP/PCMH. In addition, we have added a metric that creates regular reports that show comparative analyses year over year of the program. We believe detailed reports on what services were provided and how these coincide with the needs of the community will allow for maximum effectiveness and positive outcomes of the project. This project also will be part of a systemwide Baylor initiative that analyzes and evaluates progress and challenges/barriers for all DSRIP projects. We will focus on identifying key challenges associated with the expansion and opportunities to scale the project where appropriate.

Unique community need identification numbers the project addresses:
- CN.11 – Need for more care coordination
- CN.10 - Overuse of ED services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: This project does not receive any federal funds and is a new initiative.

Related Category 3 Outcome Measures:
The project’s Stand-alone and Non-stand-alone metrics come from 2 different domains because the true impact of this project is through ED appropriate utilization and cost savings. Both are Region 10 priorities.

Outcome Measures and Reasons/rationale for selecting the outcome measures:

IT-9.2 ED appropriate utilization (Stand-alone measure)
According to region 10’s Community Health Needs Assessment, there were 798,904 emergency department visits in 2011, comprising a majority of the 1 million plus visits in the region\(^{313}\). The stakeholder survey of Region 10 providers indicated significant overuse of emergency department services due to patients’ inability to access primary care. This metric is at the heart of the care navigation project and will have a direct impact on patients in Tarrant County utilizing the ED at a decreased rate. This project uses the popular concept created by Dr. Atul Gawande, referred to as “hot spotting” indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues.

---

\(^{313}\) RHP 10 Community Health Needs Assessment
Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.\textsuperscript{314}

\textit{IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Non- stand-alone measure)}

Financial constraints are a major region 10 barrier to providing high-quality care to the underserved. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the project’s cost effectiveness and cost utilization. According to the Texas Medical Association, a condition that could be treated in the doctor’s office for $56.21 (including lab and x-ray), costs $193.92 in the ED\textsuperscript{315}. This cost differential multiplied by the 443,000 uninsured in Tarrant County creates a significant additional cost to the county and Region. On a more global level, AHRQ found that the average cost in 2006 for an uninsured patient stay in the hospital cost was about $19,400.\textsuperscript{316}.

\textbf{Relationship to Other Projects:}

This Care Navigation project is related to:

\textit{Project 135036506.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion}. The navigation program is located in the hospital and will be connecting patients to the Baylor Clinic that are identified by the staff to not have a PCP/PCMH. Additionally, the navigation program includes a follow-up component which will ensure that patients have made the connection the Baylor Clinic. There will be increased capacity for the clinic to take on a greater number of patients identified through the navigation program. Coordination will be required between the navigation program and the Baylor Clinic to ensure that patients are connected and seen.

This project will help to support, reinforce and enable Category 4 population focused improvements through project design and appropriate intervention for targeted populations through lower utilization of high cost hospital-based resources and higher utilization of more appropriate community-based resources: RD-1.1, RD-1.2, RD-1.3, RD-1.4, RD-1.5, RD-1.7, RD-1.8; RD-2.1, RD-2.2, RD-2.3, RD-2.4, RD-2.5, RD-2.7; RD-4.1, RD-4.2; and, RD-5.1..

\textbf{Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:}

\textsuperscript{314} Gawande, A. The hot spotters: can we lower medical costs by giving the neediest patients better care? The New Yorker. (2011).
\textsuperscript{315} Texas Medical Association: http://www.texmed.org
\textsuperscript{316} AHRQ: http://www.ahrq.gov
Care Coordination models require an initial connection but also require community-based resources to which patients can be referred. Once a patient is identified to need a PCP/PCMH or another community resource, it becomes the region’s responsibility to ensure community resources. Care Navigation programs serve the patients located in the specific EDs/inpatient units of the performing providers and thus do not duplicate patients on a per visit basis. While our geographies overlap, these programs are localized to individual hospitals. Related projects are: 130614405.2.4: Texas Health Resources- Arlington Memorial Hospital; 112677302.2.1: Texas Health Resources- Harris Methodist Hospital Fort Worth; 136326908.2.5: Texas Health Resources- Harris Methodist Hurst Euless Bedford; and, 120726804.2.3: Texas Health Resources- Harris Methodist Hospital Southwest Fort Worth.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor All Saints Medical Center at Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Baylor All Saints Medical Center at Fort Worth defined the population that will be directly impacted by the project as the underserved/uninsured patients who do not have a PCP/PCMH that present in our Baylor All Saints ED or inpatient units. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is connected to community and primary care resources, she can find ways to manage her illnesses on a daily basis and have a contact for her care needs. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her ED utilization decreases, community resource burdens are relieved and a greater number of people have a PCMH.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and regional projects. These criteria took factors such as: transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability and partnership collaboration into account. This weighted scoring
criteria combined with the aforementioned literature based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the regional cap of funding into consideration.

#### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1** [P-2]: Establish/expand a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigator education.

**Metric 1** [P-2.1]: Number of people trained as patient navigators, number of navigation procedures, or number of continuing education sessions for patient navigators

- **Baseline/Goal:** Hire appropriate staff - 3 FTEs
- **Data Source:** Documentation of employment

**Metric 2** [P-2.2]: Number of unique patients enrolled in the patient navigation program;

- **Baseline/Goal:** Establish baseline of patients seen in DY2
- **Data Source:** E.H.R./Navigation database

**Metric 3** [P-2.3]: Frequency of contact with care navigators for high risk patients.

- **Baseline/Goal:** Track frequency of

**Milestone 3** [P-5]: Provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. The navigation program is accountable for making PCP or medical home appointments and ensuring continuity of care.

**Metric 1** [P-5.1]: Collect and report on all the types of patient navigator services provided

- **Baseline/Goal:** Provide completed report to compare types of navigation offered in DY2 v. DY3
- **Data Source:** E.H.R./Navigation notes and database

**Milestone 3 Estimated Incentive Payment:** $305,793

**Milestone 4** [I-10]: Improvements in access to care of patients receiving patient navigation services using innovative project option. The following metrics are suggested for use with an innovative project option to increase access to the services but are not required.

**Metric 1** [I-10.2]: Increased number of primary care referrals.

- **Goal:** Provide primary care referrals to at least 40% of patients identified by care navigation program
- **Data Source:** E.H.R./Patient Navigation program database

**Milestone 5 Estimated Incentive Payment:** $613,364

**Milestone 5** [I-10]: Improvements in access to care of patients receiving patient navigation services using innovative project option. The following metrics are suggested for use with an innovative project option to increase access to the services but are not required.

**Metric 1** [I-10.2]: Increased number of primary care referrals.

- **Goal:** Provide primary care referrals to at least 50% of patients identified by care navigation program
- **Data Source:** E.H.R./Patient Navigation program database

**Milestone 5 Estimated Incentive Payment:** $506,692

**Milestone 6** [I-10]: Improvements in access to care of patients receiving patient navigation services using innovative project option. The following metrics are suggested for use with an innovative project option to increase access to the services but are not required.

**Metric 1** [I-10.2]: Increased number of primary care referrals.

- **Goal:** Provide primary care referrals to at least 50% of patients identified by care navigation program
- **Data Source:** E.H.R./Patient Navigation program database

**Metric 2** [I-10.3]: Documentation of increased number of unique patients served by innovative program.

- **Goal:** Demonstrate improvement over prior reporting period.
- **Data Source:** E.H.R./Patient Navigation program database

**Milestone 6 Estimated Incentive Payment:** $506,692
### Establish/Expand a Care Navigation Program - Care Connect

#### Year 2 (10/1/2012 – 9/30/2013)
- Patient contact with navigator while in ED setting
  - Data Source: E.H.R./Patient Navigation program database

**Milestone 1 Estimated Incentive Payment (maximum amount): $280,301**

**Milestone 2** [P-5]: Provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. The navigation program is accountable for making PCP or medical home appointments and ensuring continuity of care.

**Metric 1** [P-5.1]: Collect and report on all the types of patient navigator services provided
  - Baseline/Goal: Create report format and educate navigators about data points to be collected
  - Data Source: Documentation of report created

**Milestone 2 Estimated Incentive Payment (maximum amount): $280,301**

#### Year 3 (10/1/2013 – 9/30/2014)
- Program
  - Data Source: E.H.R./Patient Navigation program database

**Metric 2** [I-10.3]: Documentation of increased number of unique patients served by innovative program. Demonstrate improvement over prior reporting period.
  - Goal: Identify at least 1080 patients
  - Data Source: E.H.R./Patient Navigation program database

**Milestone 4 Estimated Incentive Payment: $305,793**

#### Year 4 (10/1/2014 – 9/30/2015)

#### Year 5 (10/1/2015 – 9/30/2016)

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add milestone bundle amounts over Years 2-5): $2,292,244
Attachment 1: Project Summary Template to be completed for each Category 1 and 2

Project Option 2.2.1 – Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)

**Unique Project ID:** 136326908.2.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital HEB / 136326908

**Provider:** Texas Health Harris Methodist Hospital Hurst-Euless-Bedford has nearly 300 beds and more than 550 active physicians on its medical staff. THHEB provides emergency and acute inpatient care to the community. Nineteen percent of our patients are indigent, uninsured or covered by Medicaid.

**Intervention:** The goal of this project is to provide seamless care for low income and uninsured patients with a diagnosis of diabetes in the community who do not have access to receive care to manage their disease or those who need additional support in the management of their diabetes. Estimated number of patients to be served over course of waiver period is 567 based on 2011 figures. We expect to enroll 10% (56) of the target population in DY 4 and anticipate a 5% increase in subsequent years.

**Target population:** The target population is indigent or government-funded patients with a diagnosis of diabetes in the community who do not have access to receive care to manage their disease or those who need additional support in the management of their diabetes. Estimated number of patients to be served over course of waiver period is 567 based on 2011 figures. We expect to enroll 10% (56) of the target population in DY 4 and anticipate a 5% increase in subsequent years.

**Expected patient benefits:** A major goal of the region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to that goal by linking low income / uninsured residents of Tarrant County to a medical home and available Diabetes Self-management Education / Support resources to actively engage them in their self-care and reduce the likelihood of an acute condition that would require ED care and / or inpatient admission. The care providers will follow up with the clients on a regular basis. Clients will also have access to the team through email, phone and office visits.

**Category 1 or 2 expected patient benefits:** Development of a comprehensive care management program with a formalized multidisciplinary CARE team, combined with development / implementation of a program to assist patients to better self-manage their chronic condition will lead to improved access to care and an increased percentage of patients with self-management goals. These patients, linked to a medical home and actively engaged in their self-care, will experience improved health outcomes and rely less on acute and emergent care community resources.

**Category 3 outcomes:** Diabetes patients who benefit from this program will demonstrate improvement in HbA1c, compared to their initial or baseline value, thereby decreasing the percentage of patients age 18-75 with HbA1c >9%. By providing access to care and assistance in self-management of their disease, risk of admission and readmission is reduced, thereby
improving the Diabetes 30 day readmission rate and saving an estimated $8,297 cost for every inpatient admission avoided.

**Project Option 2.2.1 – Expand Chronic Care Management Models:** Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)

**Unique Project ID:** 136326908.2.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital HEB / 136326908

**Project Description:**
Historically underserved patients have not been effectively educated on how to manage their diabetes. Moreover, they have not been followed to measure their outcomes and long term goals. This program will be implemented to help those who need education on managing diabetes by providing a patient-centered medical home where they have access to exceptional and coordinated care. Patients will be identified by: first, partnering with primary care clinicians to utilize protocols: A1C>9, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education. Second, ED case management and inpatient diabetes educator will identify patients with the same criteria as above, and/or do not currently have a patient-centered medical home, have not received diabetes education ever or within the last five years, and all others appropriate for education

**Goals and Relationship to Regional Goals:**

**Project Goals:**
Challenge or issue being addressed: Linking diabetes patients who present to the ED or inpatients to a primary care physician and diabetes management resources to provide seamless care for this patient population, making diabetic education accessible to all individuals regardless of their financial situation as well as identifying pre-diabetics and providing education geared to prevent/prolong diagnosis of diabetes

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by improving the access to chronic care for individuals in Tarrant County who are underserved and who need diabetes education, training, and clinical interventions.

**Challenges:**
Some components of this program already exist, but the linking of the patients to the resources is lacking. A clinical nurse specialist would assist with coordination of efforts of ED and inpatient with the outpatient resources. In addition, nurse navigators and care managers would facilitate the transition of patients to resources in the community. Additionally, because large percentage of THHEB patients are uninsured/underinsured or otherwise have limited access to health
resources, it is paramount that we intervene by educating and treating the people in the community we serve.

5-Year Expected outcome for Provider and Patients:
Patients with diabetes would be linked to primary care and diabetes resources to actively engage them in their self-care and assist in the management of their disease therefore decrease readmissions and ED visits. This would decrease LOS for diabetes inpatients, decrease ED visits, and improve patient outcomes such as self-care goals, improvement in HgbA1c, referrals for eye exams, foot exams, and medication management

Starting Point/Baseline:
Currently, 407 patients were seen in the past year for outpatient diabetes education. Approximately 300 plus diabetic patients were seen as inpatients in the hospital. At least 50% of the inpatients seen are uninsured or underinsured and may not be able to come to afford outpatient diabetic education classes. Currently, we have one full time RN nurse diabetic educator (.8), and two part-time certified diabetic educator dieticians (.6)

Rationale:
One out every 12 individuals age 18 or older in Tarrant County have been told that they have diabetes. As the age of community increases, the percentage of diabetes increases. From the Community Needs Assessment data it was found that 28% of those individuals who report that they cannot work have a diagnosis of diabetes, therefore this disease impacts a large percentage of the community as well and can be financially devastating. An estimated 79 million adults, age 20 years or older, currently are pre-diabetic. In addition, a large population of patients are uninsured or underinsured and do not have access to adequate outpatient diabetic education resulting in a greater number of readmissions to the hospital and an increased number of diabetic complications. Therefore, there needs to be a link from ED and inpatient to outpatient resources and education.

The rational for selecting the category 3 outcome measures is clear. Evidence indicates that reducing HbA1c 1% can result in a significant decrease in diabetes-related long term complications. The Center for Healthcare Quality and Payment Reform estimates that 15-25% of patients discharged from the hospital will be readmitted within 30 days or less, and that many of these readmissions are preventable. Not only are these re-admissions costly but they negatively impact clients who may miss work and experience other consequences as a result of the hospitalization.

Project Components:
This project will address all required core components:
  a) Multi-disciplinary care teams will be designed and implemented to address the targeted diabetic patient’s healthcare needs.
b) THHEB will ensure patients have access to their care team in person, by phone and by email.

c) Patient engagement will be increased through education classes, self-management support, improved patient-provider communication and better coordination with community resources.

d) THHEB will empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions through education, support and goal setting,

e) Continuous quality improvement will be conducted using Plan, Study, Do, Act (PSDA) cycles.

This project would provide referrals to primary care physicians in the community therefore increase their practice. We would expand our comprehensive diabetes education program to include Medicaid, underinsured and unfunded individuals. The program would be staffed by a diabetes clinical nurse specialist, case managers and diabetes educators to provide comprehensive diabetes care. We will also consider partnering with THHEB Faith Community Nursing to provide resources to patients identified in these outreach programs.

Our milestones and metrics advance development of our program to help an increasing underserved population receive diabetes management through the Wagner Chronic Care Model and include: (1) Establishing a multidisciplinary team including Physicians, Nurse Practitioners, Diabetes Educators, Registered Dietitians, Clinical Social Workers, Registered Nurses, Pharmacists, and support staff. (2) Increasing the number of patients served under this model by 10% over baseline as recorded in the database. (3) Developing policies, procedures, and data collection tools to effectively run the coordinated program and monitor effectiveness, reducing fragmented care.

**Unique community need identification numbers the project addresses:**

- CN.8 – Lack of access to health care due to financial barriers
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

Linking diabetes patients who present to the ED or inpatients to a primary care physician is a new initiative. All of the current diabetic educators are trained in the Stanford model of Diabetes Management and have led a number of community workshops free to the public funded by the Area Agency on Aging of Tarrant County. This project could significantly enhance the number of patients who have accessibility to diabetic education. This project has not received any other federal funding.

**Related Category 3 Outcome Measures:**
Outcome Measures:
- 1.10 Diabetes care: HbA1c poor control (>9.0%)
- 3.3 Diabetes 30-day readmission rate

Relationship to Other Projects:
- **Related Category 1 and 2 projects:** This project relates to project 2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at risk patient who might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Clinic for management of their disease.
- **Related Category 4 Population-focused improvements:** RD.1: Potentially Preventable Admissions RD.1.2: Diabetes Admission Rate should improve for at-risk patients who would not otherwise be able to access care to manage their diabetes. Diabetics whose disease is managed will decrease their risk of developing complications from their disease that would result in hospital admissions. RD 2: 30 Readmission Rate – RD 2.2 Diabetes 30-day Readmissions are Category 3 Outcome Measures selected as an anticipated outcomes to measure the effectiveness of this project. By providing access to care and assistance in self-management of their disease, risk of admission and readmission are reduced.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
- **Approach/Methodology:** For every inpatient admission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.
- **Rationale:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).
• Community benefits were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.1 – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases – Improving management of heart failure patients and preventing readmissions

Unique Project ID: 136326908.2.2
Performing Provider Name/TPI: Texas Health Harris Methodist HEB (THHEB) / 136326908

Provider: Texas Health Harris Methodist Hospital Hurst-Euless-Bedford has nearly 300 beds and more than 550 active physicians on its medical staff. THHEB provides emergency and acute inpatient care to the community. Nineteen percent of our patients are indigent, uninsured or covered by Medicaid.

Intervention: The primary goal of the program is to improve the health of patients with heart failure through more effective disease management along the continuum of care with particular emphasis on transitions through post-acute phase.

The program’s goal is to improve delivery of care to patients with government-funded insurance, the uninsured and undocumented patient population resulting in improved management of their disease with corresponding reduction in readmissions to the hospital. The behavioral health clinic addressing depression/anxiety in those with chronic illness exists. The other initiatives are all new initiatives.

Need of the project: Most recent (YTD 2011) indicates a heart failure 30 day, all cause, readmission rate of 20.36% for the 301 (annualized) patients admitted with a principal diagnosis of heart failure. In 2012, 9.6% of our CHP readmissions were indigent; 6.7% were Medicaid patients; and 60% were Medicare patients. Without this funding, 75% of these patients (government-funded/uninsured) will have difficulty managing their disease.

Target population: The target population is indigent or government-funded patients with a diagnosis of heart failure in the community who do not have access to receive care to manage their disease or those who are need additional support in the management of their HF. Estimated 301 total patients and 225 of these government-funded will be served over course of waiver period.

Expected patient benefits: Medicaid beneficiaries and the uninsured will benefit from other root causes for readmission of the low-income and underserved HF patient often related to lack of financial resources (e.g., inability to purchase medications, healthy food or bathroom scales to monitor weight, lack of transportation to appointments, inability to obtain PCP, etc).

Category 1 or 2 expected patient benefits: Milestones include: 1) develop a comprehensive care management program utilizing best practices and 2) develop program to identify and manage chronic care patients needing further clinical interventions and disease self-management tools at the time of transitioning to an outpatient setting, ensuring that the patients understand their disease of CHF and have access to monitoring, physicians and other clinicians will decrease the CHF readmission rate for this population.

Category 3 outcomes: 1) disseminate findings including lessons learned at best practices to stakeholders 2) decrease 30-day readmission rate in patients with CHF which is the ultimate purpose of the project.
Project Option 2.2.1 – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases – Improving management of heart failure patients and preventing readmissions

Unique Project ID: 136326908.2.2

Performing Provider Name/TPI: Texas Health Harris Methodist HEB (THHEB) / 136326908

Project Description:
This project uses the Institute for Healthcare Improvement’s publication on Effective Interventions to Reduce Rehospitalizations to develop strategies to improve patient outcomes. This program will develop a process to identify heart failure patients and assess them for risk factors or barriers to effective management of their disease (e.g., lack of ongoing monitoring by a health care professional, inability to obtain medications or inadequate understanding of their disease and self-management interventions). Once barriers or risk factors are identified, RN navigators (case managers) will work with a multidisciplinary team including dietitians, pharmacists, nurses, social workers, and nurse practitioners/physicians to provide comprehensive patient education and coordinate appropriate resources based on identified needs. Resources might include obtaining prescribed medications the patient cannot afford to purchase, providing scales to help the patient monitor their weight, consulting a dietitian to provide education on the appropriate diet or assisting the patient in obtaining a primary care physician. Postacute monitoring will also include home visits provided by hospital partners including United Way Healthy at Home Care Transitions coaches (trained coaches using Dr. Eric Coleman model to empower patient to effectively manage their disease), Transitions House Calls nurse practitioner, the primary care providers and/or the treating cardiologists. The RN navigator will continue to monitor the progress of high-risk patients through telephonic communications to reinforce the plan of care and respond to any emerging needs of the patient. Ongoing evaluation and assistance with management of their disease will be provided on an outpatient basis using a multidisciplinary team approach (physicians, licensed mental health care givers, social workers, nurse practitioners, dietitians, pharmacists, registered nurses) coordinated by the RN case manager. Postacute monitoring of high risk for readmission patients will be completed in cooperation with the patient’s PCP and/or cardiologist. Other programs that will be developed as a result of lessons already learned are:

- A multidisciplinary intense outpatient group therapy model to address the depression and social isolation identified in 100% of a small study performed in 2012 of patients with heart failure readmissions. Patients will be enrolled in this clinic while still hospitalized. If necessary, transportation to and from their home to the clinic and back will be provided. The program will consist of two weeks of intensive outpatient group therapy led by a licensed mental health counselor who is overseen by a psychiatrist. In addition to addressing their depression, a multidisciplinary team of dieticians, pharmacists, physical therapists and cardiac rehab specialists will provide specific education and interventions targeted to individual needs.
• Implement a CHF Clinic that improves transition to self-care through medication management. In-house medication reconciliation by pharmacists will be performed prior to discharge. Pharmacists also will provide adjunct education on medication and disease state and perform incremental postdischarge follow-up in person or via phone, ensuring proper medication regimen (dosing/appropriate medication). Initially the pharmacists will communicate with appropriate practitioner regarding medication adjustments but ultimate goals are to develop physician-approved protocols.

• Implement 24/7 pharmacists in ED to address medication reconciliation and education of medications with CHF patients who frequently visit ED and don’t require admission.

• Enhance chronic disease case management and social worker in ED to identify high risks patients and intervene to address issues related to patients’ recurrent visits/admissions to ED and/or hospital.

• Dedicated CHF Case Manager for CHF patients with recurrent readmissions who will follow the patient from the inpatient setting into their homes.

• Develop a community outreach program with APN, case managers and social workers who visit the most high-risk patients in their homes on a regular basis or as needed in order to prevent readmissions.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The primary goal of the program is to improve the health of patients with heart failure through more effective disease management along the continuum of care with particular emphasis on transitions through postacute phase. Evidence of the effectiveness of the program will be demonstrated through reduced readmissions of the patients (for all causes) within 30 days of hospital discharge.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing an innovative chronic disease management program to help unfunded, including undocumented community members and government-funded community member of Tarrant County better manage their heart failure conditions, with a particular clinical support focus on reducing the readmission rate among project participants.

**Challenges:**
There are two primary challenges in reducing readmissions for inappropriate heart failure readmissions. The first challenge is ensuring that the patient has the necessary resources to receive evidence-based recommendations and is compliant with the recommendations. Barriers for a patient include limited financial resources to obtain health care, scales, transportation to/from health care providers and appropriate nutrition – along with adequate education.
regarding their disease and ability to self-manage their disease. Also recognized is that patients with heart failure and frequent readmissions frequently are depressed and isolated.

The second challenge is funding multidisciplinary projects already described, which addresses the patient-dependent challenges. Resources including the Texas Health System as well as external sources will be considered.

5-Year Expected outcome for Provider and Patients:
Improved health of patients with heart failure as evidenced by a 20% reduction in hospital 30-day, all-cause readmissions by the conclusion of the five-year time period.

Starting Point/Baseline:
Most recent (YTD 2011) indicates a heart failure 30-day, all-cause, readmission rate of 20.36% for the 301 (annualized) patients admitted with a principal diagnosis of heart failure. The goal of the project is to reduce readmissions for this patient population by 20% over the five-year course of the project to a readmission rate of <16%. Currently, one licensed professional counselor is working on developing an intensive outpatient clinic to address depressed, non-compliant heart failure patients with recurrent readmissions.

Rationale:
The target population includes individuals with heart failure diagnosis who are at risk for readmission due to inadequate monitoring or management of their chronic disease, specifically, CHF patients in our community who are underserved, unfunded and government-funded insurance populations, and patients with concomitant depression/anxiety. Heart failure is among Texas Health HEB hospital's reasons for admission with 301 patients admitted with a primary diagnosis of heart failure and 2,812 patients admitted with primary/secondary diagnosis of heart failure between June 2011 and May 2012. Readmission rates for these patients are 20%. According to Key Findings: Readmissions in North Texas, a report from the Dallas-Fort Worth Hospital Council (DFWHC) Foundation on hospital readmission in 2011 for patients 18 years and older, In 2011, patients admitting for congestive heart failure (CHF) had the highest number of readmissions with a readmission rate of 22.6%. Heart failure was also the number one reason for readmission for both the Medicare and uninsured patient demographics. There were 13,272 hospitalizations of North Texas heart failure patients who were followed by a readmission in 2011. Tarrant County Public Health Department Behavioral Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, congestive heart failure, and high blood pressure.

Project Components:
Our project contains all of the required core components including:

- Design and implement care teams tailored to the patient’s health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system. Our care team also includes the addition of mental health providers.
- Ensure that patients can access their care teams in person or by phone or email
- Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources
- Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions
- Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

The project was developed based on the Institutes for Healthcare Improvement Effective Interventions to Reduce Rehospitalizations: A Survey of the Published Evidence published 2009. Key components of the project include:

- Identification of HF patients by RNs through the development of a screening process including an enhanced multidisciplinary team approach to discharge process which addresses any potential barriers to effective postacute management
- Early postdischarge follow-up through coordination of health care provider home visits or provision of appointment with primary care provider or cardiologist or heart failure clinic PharmD or multidisciplinary intensive outpatient mental health clinic specializing in chronic diseases. Postdischarge assessment will include optimization of medication management, reinforcement of patient education regarding heart failure disease management. High risk patients will be evaluated by a health care provider within seven days of their hospital discharge.
- Front-loading home care visits to include care transitions coaches, home health nurses and/or nurse practitioners
- Front-loading follow-up with PharmD pre- and postdischarge to ensure medications received, medication education, and development of physical protocols that enable PharmD to adjust medications as required either in heart failure clinic or telephonically.
- Care Transitions coaches, based on Coleman model, in cooperation with United Way Healthy at Home program, can be coordinated by the CHF RN navigator to assist patients
post hospital discharge. Coaches focus on engaging patients in their own care as well as clarify and/or follow-up on postdischarge instructions.

- Ongoing postdischarge follow-up monitoring through telephonic assessments by RN case manager to respond to questions and evaluate for emerging needs.
- Implementation of intensive outpatient psychiatric clinic for chronic disease with a multidisciplinary approach including a licensed professional counselor, dieticians, specialists in cardiac rehabilitation.

Our milestones measure an increased population receiving chronic care management through a proven, effective model of care: (1) we are establishing a multidisciplinary team approach to identification of intervention with patients at risk for readmission, patient education, and postacute monitoring and (2) we are improving quality of life while decreasing cost of care as evidenced by decreasing the number of patients requiring readmission to the hospital within 30 days of discharge.

**Unique community need identification numbers the project addresses:**

- CN.1 – Lack of provider capacity
- CN.8 – Lack of access to health care due to financial barriers
- CN.10 – Overuse of emergency department services
- CN.11 – Need for more care coordination
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project is a new initiative and we have not received any other federal funding for it other than access to a Transitions APN funded by area Agency on Aging.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

**IT-3.2 Congestive Heart Failure 30-day readmission rate (Stand-alone measure)**

We have selected IT-3.2 CHF 30-day readmission rate as an outcome. It is a priority for the RHP because CHF is the number one cause of readmission in both Medicare and uninsured patients in our demographic area. Evidence shows that patients who have transitional support from the in-to outpatient arena, patients who have the tools to participate in their own care, and patients where anxiety and/or depression are addressed and treated have fewer readmissions.

**Relationship to Other Projects:**

**Related Category 1 and 2 projects**

*Expand Chronic Care Management Models (136326908.2.1)*

Patients with heart failure often also have diabetes. Diabetics, who also have heart failure, would be referred to the Chronic Care Management (Diabetes) Clinic for improving management of their diabetes.

*Establish/Expand Patient Care Navigation Program (136326908.2.5)*
Patient navigation program will assist with the identification of at-risk patient who might benefit from closer monitoring and support of the patient’s disease management and refer them to heart failure chronic care program.

Integration of Behavioral Health into Primary Care (136326908.2.3)

Associated behavioral health hospital with a multidisciplinary outpatient clinic dedicated to chronic disease will assist patients who have frequent readmissions triggered by depression/anxiety.

Related Category 4 Population-focused improvements: TBD

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.
- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

**Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using

Attachment 1 - Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.15.1 – Decrease readmissions through the integration of behavioral health into primary care

**Unique Project ID:** 136326908.2.3

**Performing Provider Name/TPI:** Texas Health Harris Methodists Hospital HEB/Springwood /136326908

**Provider:** THHEB is a 300 bed hospital serving Tarrant County. THHEB provides emergency and acute inpatient care to the community. Nineteen percent of our patients are indigent, uninsured or covered by Medicaid.”

**Intervention:** To integrate behavioral health services in the D/FW Metroplex with primary care services to help patients that have mental illness but also suffer from chronic medical co-morbidities. This will help these patients better manage their mental illness and chronic medical conditions by increasing access to needed services. Through the integration of behavioral health and physical health care services, opportunities will open for these patients to address both conditions during a single visit. This is a new project

**Need of the project:** A major goal of the region is to avoid unnecessary ED and acute care visits for patients due to a lack of ongoing preventive, behavioral, primary and chronic care. This project will integrated primary and behavioral health care in one setting so patients do not have to utilize higher cost acute and ED care or readmit to the hospital.

**Target population:** Patients in Tarrant County who have behavioral health illness with medical co-morbidities. Estimated 5,000 patients will be served over course of waiver period.

**Expected patient benefits:** They will be able to control their behavioral and medical issues allowing them to function outside of the hospital setting

**Category 1 or 2 expected patient benefits:** Milestones 1 [P-2], Milestone 2 [P-3] Milestones 3 and 4 [I-8] Our milestones measure the increase in patients receiving behavioral health care and physical healthcare in one site for an integrated model of care. These milestones and metrics will measure how many patients are receiving care at our integrated site (rather than fragmented behavioral and physical health care). The first milestone P-2 will help us identify existing clinics where we can begin integration. The second milestone P-3 will help us implement a set of standards that we can use to show effective data sharing through the EHR and that we are ensuring the most physically and mentally chronic patients are referred to an integrated site. Milestone 1.8 will allow us to track how many chronic mentally ill patients are receiving care at the integrated site and milestone 1-10 will show how many no shows we have and could possibly need more intensive case management to encourage integrated follow up appointments to prevent readmissions

**Category 3 outcomes:** IT.3.8 Evidence shows delivering specialty mental health in primary care settings produces greater engagement of patients in mental health care, which is a prerequisite for better patient outcomes. Emerging literature on co-located treatment and primary care has shown that patients have better outcomes, with the greatest improvement for those with poorer health.  

Medical cost offset may occur when patients use less medical care because they are receiving mental health services. The reduced physical health care cost offsets the cost of the mental health care.  

And diagnosis and treatment may significantly improve in co-located

---

317 Craven & Bland 2006  
318 Strosahl and Sobel 1996
Project Option 2.15.1 – Decrease readmissions through the integration of behavioral health into primary care

**Unique Project ID:** 136326908.2.3

**Performing Provider Name/TPI:** Texas Health Harris Methodists Hospital HEB/Springwood / 136326908

**Project Description:**

More than a third of patients who receive treatment for mental health disorders rely solely on primary care physicians. Additionally, many health insurers contract out psychiatric benefits to different companies. Unlike most referrals from physicians, this approach often requires patients to find an available psychiatrist by making calls from a list provided by their insurer. The Primary Care Behavioral Health Program will integrate behavioral health into the medical mindset and clinical setting through THPG primary care. This program will offer psychiatric consultative, referral, educational and administrative services to the primary care physician and their staff. This will result in medical providers being better suited to address the emotional illnesses found so frequently in the average primary care and medical practices. This model will guide the intentional, ongoing, and committed coordination and collaboration between all providers treating the individual. Ideally, a designated team of behavioral and physical health care providers will develop a common treatment plan that identifies and addresses both physical health and behavioral health care needs.

**Goals and Relationship to Regional Goals:**

**Project Goals:**

The goal of this project is to integrate behavioral health services in the Dallas/Fort Worth Metroplex with primary care services to help patients who have mental illness but also suffer from chronic medical comorbidities. This will help these patients better manage their mental illness and chronic medical conditions by increasing access to needed services. Co-location of behavioral and physical health providers when coupled with protocols, training, technology and team building will improve communications and enhance coordination of care for these patients. The medical and behavioral health conditions will be monitored and these patients will no longer have the inappropriately high reliance on acute medical and behavioral services or emergent care resources. These patients will be monitored to decrease their readmissions to psychiatric facilities. Additionally, access to care is enhanced because individuals do not have to incur the cost or inconvenience of arranging transportation or making multiple trips to different locations to address physical and behavioral health needs. Finally, given the ever-increasing cost of transportation, a “one stop shop” approach for health care improves the chances that individuals with multiple health needs will be able to access the needed care in a single visit and thereby overcome the negative synergy that exists between physical and behavioral health conditions.

This project meets the following Regional goals:
A major goal of the Region is to avoid unnecessary ED and acute care visits for patients due to a lack of ongoing preventive, behavioral, primary and chronic care. This project would contribute to achieving that goal by implementing integrated primary and behavioral health care in one setting so patients do not have to utilize higher cost acute and ED care or readmit to the hospital.

Challenges:

- **Policy and regulation**—Policies at both the federal and state levels are seldom structured to encourage and support collaborative practice; instead they frequently act as barriers. This is particularly true of state regulations regarding behavioral health treatment planning and service documentation, which result in lengthy and time consuming paper and work processes that is not a good match to the pace of primary care, in either the behavioral health or the primary care setting. Despite the recent documentation of the chronic health conditions and early death experienced by people living with serious mental illnesses, people living with serious mental illnesses are not designated as a health disparities population.

- **Workforce**—skills needed to work in an integrated team are not generally part of academic training for clinicians, and as noted above, the success of person-centered health care homes will depend on bridging the cultural differences between primary care and behavioral health practitioners—an issue that requires attention in clinical training programs at all levels.

- **Clinical information sharing**—HIPAA is perceived as (but isn’t necessarily) a barrier to communication—sharing information for the purposes of care collaboration is a permitted use under HIPAA, with the exceptions of HIV status and receipt of substance abuse treatment. The evolving electronic health record (EHR) systems for behavioral health and primary care do not easily intersect, and some of the EHRs being developed for use in behavioral health settings do not have data fields for health status and the health care services provided to people with serious mental illnesses.

- **Physical facilities**—integrated models of care rely on teams working in close physical proximity, difficult to accomplish in facilities which are frequently fully occupied when an integration initiative begins. The requirements for developing primary care in behavioral health settings are space and capital intensive, necessitating constructing and equipping exam rooms with examination tables and the type of equipment that primary care practitioners expect to have easily accessible in the course of a physical examination.

- **Research**—Given the enormous rate of activity on the primary care/behavioral health interface, it is critical that services research be informed by, and help inform, these evolving models. Researchers must be willing to move from the more traditional “top down” models of intervention design to partnerships with administrators and community leaders to develop and evaluate these evolving models. In order to ensure timeliness and relevance, these evaluations will need to use innovative approaches beyond those used in traditional randomized trials, and include careful cost analyses to understand if, and how, these models can be sustained in real world settings.

5-Year Expected outcome for Provider and Patients:
Our five year goal is to reduce acute behavioral health readmissions by 50% through integrating psychiatric nurse practitioners into the primary care setting within THPG primary care model. This will allow for patients to have a home for both medical and behavioral care. THPG has 234 primary care physicians and at the five year mark we will have integrated 20% of the primary care offices as co-locations for primary and behavioral health care. We will also integrate a primary care nurse practitioner into our behavioral health outpatient satellites.

**Starting Point/Baseline:**

The population in Tarrant County from the 2011 census is 1,849,815. One in four persons suffers from a diagnosable mental disorder, which would be 462,453 people in Tarrant County. Our inpatient discharges for 2011 were 2,433 with a readmission rate of 10.8%. The majority of these patients have a comorbid chronic medical issue. Most of these patients are receiving uncoordinated fragmented care. We have had discussions with providers and they recognize the need for this project to go forward. We have provided training to our staff on recognizing the comorbid patient and have put together a chronic disease booklet for mentally ill.

**Rationale:**

In the past decade, the number of practicing psychiatrists has grown from 39,494 to 40,904—an uptick of only 1,410, according to 2010 data from the American Medical Association's *Physician Characteristics and Distribution in the U.S.* An estimated 26% of Americans age 18 and older suffer from a diagnosable mental disorder in a given year. The estimated lifetime prevalence of any mental disorder among the U.S. population is 46%. The interconnections between chronic disease, injury, and mental illness are striking. The evidence is extensive for associations between mental illness and chronic diseases, such as cardiovascular disease, diabetes, obesity, asthma, arthritis, epilepsy, and cancer. The provision of behavioral health services leads to a decline in use of medical services. This phenomenon is commonly referred to as the cost-offset effect. In the presence of active behavioral health treatment, patients with behavioral and medical comorbidities reduced their overall medical costs by 17% and decreased their readmissions to inpatient facilities.

**Project Components:**

Our project contains all of the core components including:

- Identify sites for integrated care projects, which would have the potential to benefit a significant number of patients in the community. Examples of selection criteria could include proximity/accessibility to target population, physical plant conducive to provider interaction; ability/willingness to integrate and share data electronically; receptivity to an integrated team approach.
- Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers could be facilitated.
Regional Healthcare Partnership

- Establish protocols and processes for communication, data-sharing, and referral between behavioral and physical health providers.
- Recruit a number of specialty providers (physical health, mental health, substance abuse, etc.) to provide services in the specified locations.
- Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include:
  - Regular consultative meetings between physical health and behavioral health practitioners;
  - Case conferences on an individualized as-needed basis to discuss individuals served by both types of practitioners; and/or
  - Shared treatment plans co-developed by both physical health and behavioral health practitioners.
- Acquire data reporting, communication and collection tools (equipment) to be used in the integrated setting, which may include an integrated electronic health record system or participation in a health information exchange – depending on the size and scope of the local project.
- Explore the need for and develop any necessary legal agreements that may be needed in a collaborative practice.
  - Arrange for utilities and building services for these settings.
- Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individuals treated in these integrated service settings.
  - Conduct quality improvement for project using methods such as rapid cycle improvement.
- Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

Our milestones measure the increase in patients receiving behavioral health care and physical health care in one site for an integrated model of care. These milestones and metrics will measure how many patients are receiving care at our integrated site (rather than fragmented behavioral and physical health care). The first milestone P-2 will help us identify existing clinics where we can begin integration. The second milestone P-3 will help us implement a set of standards that we can use to show effective data sharing through the EHR and that we are ensuring the most physically and mentally chronic patients are referred to an integrated site. Milestone 1.8 will allow us to track how many chronic mentally ill patients are receiving care at the integrated site and Milestone 1-10 will show how many no shows we have and could possibly need more intensive case management to encourage integrated follow up appointments to prevent readmissions.
Unique community need identification numbers the project addresses:
- CN.5 – Insufficient integration of mental health care in the primary care medical care system
  - CN.1 – Lack of provider capacity
- CN.4 – Lack of access to mental health services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funds for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:
IT-3.8 Behavioral Health/Substance Abuse 30-day readmission rate

By the end of the Waiver our goal is to reduce readmissions by 50% by integrating behavioral health and primary care and utilizing a “one location” for chronic behavioral health and physical health issues. Emerging literature on co-located treatment and primary care has shown that patients have better outcomes, with the greatest improvement for those with poorer health. Diagnosis and treatment may significantly improve in co-located models. This reduces readmissions into the hospital. This is attributed to behavioural health clinicians taking an active role in teaching and coaching primary care providers.

Relationship to Other Projects:
- Related Category 1 and 2 projects
  * Expand Chronic Care Management Models (136326908.2.1)
  Patients with heart failure often also have diabetes. Diabetics, who also have heart failure, would be referred to the Chronic Care Management (Diabetes) Clinic for improving management of their diabetes.
  * Establish/Expand Patient Care Navigation Program (136326908.2.5)
  Patient navigation program will assist with the identification of at-risk patient who might benefit from closer monitoring and support of the patient’s disease management and refer them to heart failure chronic care program.

Related Category 4 Population-focused improvements: TBD
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

**Valuation:**

- **Approach/Methodology:** For every behavioral health readmission avoided, $7,491 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale:** Behavioral health outcome improvement targets are dependent on the target population served (aging populations will have increased readmissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, readmission rates can only decrease) and also current processes in place that already prevent avoidable readmissions.

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

- **Individual benefits** were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** $2,272,147
Attachment 1: Project Summary Template to be completed for each Category 1 and 2
Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

Unique Project ID: 136326908.2.4

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Hurst Euless Bedford / 136326908

Provider: Texas Health Harris Methodist Hospital Hurst-Euless-Bedford has nearly 300 beds and more than 550 active physicians on its medical staff. THHEB provides emergency and acute inpatient care to the community. Nineteen percent of our patients are indigent, uninsured or covered by Medicaid.

Intervention: Goals for the project include improved management of patient health care needs resulting in a reduction of inappropriate ED utilization for non-emergent conditions and increased navigation of patients to appropriate health care resources, including establishing a PCP. This is an expansion of existing initiative.

Need of the project: There are an estimated 10,000 people in our hospital system that come for emergency services that are in the targeted population.

Target population: The target population is patients, primarily those patients without insurance or with government funded insurance, who present to the ED for care that could be provided at a lower level or those with frequent utilization of the ED routine healthcare. Estimated 38,101 patients will be served over course of waiver period. Target population is based on each separate THR entity's internal data for 2011 ED visits.

Expected patient benefits: The ED case manager will navigate patients to appropriate healthcare facilities or community programs refer to area resources or assist in establishing a medical home. The ED case manager will continue to follow the patient post discharge to provide necessary education, re-enforce discharge plans and monitor patient compliance with follow-up care to improve their health.

Category 1 or 2 expected patient benefits: Milestones selected include expansion of the ED health care navigation program to include hiring, training and providing ongoing education to RN case managers acting as navigators with the support of social workers and other health care team members. A process for tracking and reporting on the patients enrolled, interventions implemented would be developed. Tracking outcomes of the programs including PCP referrals for patients without a medical home and decrease in avoidable patient use of the ED would be monitored.

Category 3 outcomes: Our project goal is to implement programs that will improve the health of patients who are most at risk of receiving disconnected and fragmented care by improving appropriate use of the ED over the course of the project.
Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

Unique Project ID: 136326908.2.4
Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Hurst Euless Bedford / 136326908

Project Description:
The Emergency Department (ED) care navigation team of clinical and support staff will provide the targeted patients with support for psychosocial and clinical issues. This includes education, coaching, and navigation through the health care system, introduction to pertinent resources and a medication assistance program. Encouragement and help to develop the necessary tools to manage their disease process is also a primary role. The ED RN case manager will work with a multidisciplinary health care team to assist disadvantaged patients without primary care access to:

- Navigate patients to obtain necessary community resources to meet identified patient needs.
- Facilitate finding and obtaining a primary care provider (PCP) or enroll in a nurse practitioner -run chronic disease management clinic to more effectively manage their disease on an ongoing basis.
- Intervene as necessary to provide education, monitor identified patients post discharge to encourage compliance with their follow-up plan, and provide ongoing care/support for their health care needs.
- Facilitate arrangements for care, as clinically appropriate, at a less resource intense level, such as an outpatient clinic or skilled nursing facility to avoid hospital admission and reduce risk of ongoing utilization of ED for non-emergent care needs.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to develop and implement an innovative system with clinical and support staff that will guide the targeted patient population into programs that will help them stay out of the hospital and lead more productive enjoyable lives. This would include developing an in hospital program that will help low income senior or disabled individuals of the mid-cities better self-manage their chronic issues. The navigator program is a mandatory part of helping the patient understand why getting to the right place at the right time is important, since these patients are almost always seen in the Emergency Department that is the most logical place to have such a system. This program will focus on patients who have been identified through researching our area to be at risk. This is the seniors, self-pay, frequent flyers chronically ill and the mentally ill. The goal is to see all of the above individuals placed in the program so that help can be obtained. Education and support from the navigator, teaching to utilize the system,
finding a physician and facilitating visits is a part of the duties that would be needed to facilitate all that needs to take place and is now impossible. Of the 63,000 patients seen each year, it is documented approximately 10,000 need significant assistance. The average readmissions rate in North Texas is 20.6%.

There are no resources in North Tarrant County or lower Denton County for these patients. They are seen in the ED, given instruction and information about the few resources that are available and then there is only minimal follow up. A trip to JPS Health Network is much too far as the majority have no transportation. The hospital navigator would have the ability to help the patient access what is available and then follow into the community-based clinic as it becomes a reality. Referrals to dietitians, pharmacists and other support professionals through the hospital network would also be part of the navigation program as well as the clinic.

This project meets the following Regional goals:
A major goal of North Texas is to provide improved access to ongoing preventive, primary and chronic care. This navigator project would contribute to the management of the hospital patients, alignment with the local agencies, providing primary care and chronic disease management. In reaching this hospital’s part of the overall goal it is projected that ED visits that could be reduced 3%. Here we have been working on this for at least 2 years and have managed a 6% reduction with this help we feel our personal goal of 10% could be managed as the project comes together.

Challenges:
Higher than the national average of around 8%, 9.7% adults 18 years and older in Texas are diagnosed with diabetes (i.e., about 1.8 million adults). Among the elderly population (older than 65, the rate is 23%, and among adults between 45-64 years of age, the rate is 14%). While chronic conditions are a growing concern for all U.S. populations, the uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable hospitalizations. Those who are uninsured or without access to appropriate care have been widely reported in clinical research literature as having the greatest difficulty in managing chronic conditions due to lack of a medical home, minimal or no primary care access, limited or no access to medications necessary for disease management, and limited or no access to regular lab work.

As a community hospital we have seen in the last 3 years our self-pay go from 10% to 16%. This has been a change in the demographics and large increase in unemployment. Our mission is to

care for our community and to provide for them as best we can. The lack of resources in our area is being addressed and the coordination between all areas of the proposal will do that.

5-Year Expected outcome for Provider and Patients:
Our five-year goal is to deliver chronic care management utilizing the ED navigator program. This will be measured utilizing the internal mechanisms in place for readmissions, frequent fliers, and chronic disease identification.

Starting Point/Baseline:
There are currently two case managers and one support person working on this project in our hospital. They have made a difference in the lives of patients they are seeing; this is an average of 45 people a week. They work on providing primary and preventive care. The goal is to increase the self-reliance of the client so they will be able to receive more appropriate care when the need reoccurs. This is less than 3% of the identified ED population. We have seen our percentage of self-pay go down the last three months to 10% so we are making a difference but it is all we can do with the resources we have. Baseline numbers are collected and utilized. As the clinics begin to occur in the Texas Health system our resources for patients will have increased and with a true ED navigator program we will be able to not only help the community but the hospital.

Rationale:
There are an estimated 10,000 people in our hospital systems that come for emergency services that are in the targeted population. With advances in technology and the increase in chronic illness a “make-over” in which primary care access is the basis for the model our plan will pursue. The ED navigator program will insure the patients can receive the needed coordination of care. Additionally, we have focused this project on a population disproportionately affected by the lack of primary care, economically disadvantaged and underserved adults living with a chronic disease.

Project Components:
1) Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
2) Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
3) Connect patients to primary and preventive care.
4) Increase access to care management and/or chronic care management, including education in chronic disease self-management.
5) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.
The rational for the above is the lack of resources and the identified need in the community.

Our milestone measures are based on the identified increase of patients in our community that are without resources. The metrics will measure all facets of the program. The priority is to begin in the hospital ED and help those that are presenting with an immediate need. The resources will grow as the navigation team grows and expands out into the community.

**Unique community need identification numbers the project addresses:**

- CN.10 – Overuse of emergency services
- CN.11 – Inefficient care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The small program in the hospital’s ED is working well it is just not big enough. The project proposed has many of the same elements, limited by finances. There is no federal funding.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**IT-9.2 Right Care, Right Setting – ED appropriate utilization (Stand-alone measure)**

This project will reduce inappropriate ED visits for the following target condition – Congestive heart failure (CHF), diabetes, end-stage renal disease (ESRD), cardiovascular disease (CV)/hypertension, behavioral health (BH)/substance abuse, chronic obstructive pulmonary disease (COPD), asthma

This project provides navigation services so the patient gets the right care, in the right setting and in a timely fashion, avoiding unnecessary ED visits and avoidable hospital admissions. (See data discussed in Section 4.a). Many studies have demonstrated the effectiveness of case management/navigation program to improve management of patient health, reduce risk of avoidable readmissions and provide better primary care access. RN Navigators will assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health. Patients with effectively managed disease and access to a dedicated health care provider will be less likely to utilize the ED for non-emergent conditions and will manage their health through primary and non-emergency health care providers. The program also assists in avoiding inpatient hospitalizations by providing patients with more appropriate alternatives to receive care and coordinating the necessary services from the ED.

**Relationship to Other Projects:**

- Related Category 1 and 2 projects:
This project is related to project 2.2 Expand Chronic Care Management Models. The ED case manager will utilize the chronic care clinics as a resource to refer patients needing assistance with management of their chronic condition.

- **Related Category 4 population-focused improvements:**
  - RD1: Potentially Preventable Admissions 1. Congestive Heart Failure Admission Rate; 2. Diabetes Admission Rate; 3. Behavioral Health and Substance Abuse Admission Rate; 4. Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate
  - RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)
  - The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
- **Approach/Methodology:** For every ED visit avoided, $535 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.
- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.
- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
### 2.9.1  Project Components:  2.9.1 (a-e)  
Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

**Milestone 1 [P-2]**: Establish/expand a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train (and hire the RN case managers to act as ) navigators, develop procedures (including data collection mechanism) and establish continuing navigator education

**Metric 1 [P-2.3]**: Frequency of contact with care navigators for high risk patients.

Baseline/Goal: 170 encounters  
Data Source: Patient navigation program materials and database, EHR

Milestone 1 Estimated Incentive Payment *(maximum amount)*:  
$139,200

**Milestone 4 [P-8]**: Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing these improvements.

**Metric 1 [P-8.1]**: Participate in semi-annual face-to-face meetings or seminars organized by the RHP.

Baseline/Goal: Attend 2 programs/year  
Data Source: Documentation of semiannual meetings including meeting agendas slides from

Milestone 4 Estimated Incentive Payment: $213,221

**Milestone 6 [I-6]**: Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.

**Metric 1 [I-6.2]**: Percent of patients without a primary care provider (PCP) who received education about a primary care provider in the ED

Goal: 50% of identified patients  
Data source: Administrative data on patient encounters and scheduling records from patient navigator program

Milestone 6 Estimated Incentive Payment: $213,221

**Milestone 8 [I-6]**: Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.

**Metric 1 [I-6.2]**: Percent of patients without a primary care provider (PCP) who received education about a primary care provider in the ED

Goal: 60% of identified patients  
Data source: Administrative data on patient encounters and scheduling records from patient navigator program

Milestone 8 Estimated Incentive Payment: $172,166

**Milestone 7 [I-8]**: Reduction in ED use by identified ED frequent users receiving navigation services

**Metric 1 [I-8.1]**: ED visits pre- and post navigation program

#### Year 5 (10/1/2015 – 9/30/2016)

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over DYs 2-5): **$1,592,699**
Project Option 2.1.1 – Enhance Medical Homes

**Unique Project ID:** 138910807.2.1 (Pass 2)

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Provider:** Children’s has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children’s has pediatric specialty outpatient services in Dallas, Plano and Grapevine (Region 10). Children’s also has a system of primary care centers, MyChildren’s, which focuses on providing primary care to children covered by Medicaid and CHIP. There is one MyChildren’s office in Grapevine (Region 10). Annually, Children’s has approximately 600,000 patient contacts. Children’s has the largest market share for pediatrics in the DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). Payor mix for MyChildren’s: 75% Medicaid, 15% CHIP, 5% self-pay (uninsured) and 5% Commercial insurance.

**Intervention:** The purpose of this project is to transform the MyChildren’s primary care office into an NCQA-certified medical home. It is a new initiative.

**Need for the project:** The need for this project is documented in the community needs assessment, specifically: CN. 1 Lack of provider capacity, CN. 10 Overuse of emergency department (ED) services, CN. 11 Need for more care coordination, CN. 12 Need for more culturally competent care to address unmet needs, CN. 13 Necessity of patient education programs, and CN. 14 Need for more education, resources and promotion of healthy lifestyles.

**Target population:** Children in RHP 10 covered by Medicaid and CHIP who will receive care in a medical home setting. Estimated number of patients to be served over course of waiver period: 31,000 patient visits. Provide primary care and preventive care services to children in the medical home setting to allow for better coordination care, improved health outcomes and improved satisfaction for children and their families.

**Category 5 Patient Panel estimates:** 6,700

**Category 1 or 2:** How do they tie into project’s purpose? Process and improvement milestones were selected to support the successful implementation of the project and to support care delivery in a medical home environment.

**Category 3 outcomes:** OD-9 Preventive and Primary Care IT-9.2 ED appropriate utilization. (Stand-alone measure) Access to care delivered in a medical home environment should reduce both the use of the ED for inappropriate reasons as well as reduce overall use of the ED for patients receiving care in a medical home setting. Studies have shown a decrease of 25% or more in inappropriate use of the ED by patients enrolled in a medical home as well as a decrease in overall use of the ED patient receiving care in a medical home environment.
Project Option 2.1.1 – Enhance Medical Homes

**Unique Project ID:** 138910807.2.1 (Pass 2)

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Project Description:**
- In Children’s Medical Center (CMC) pediatric primary care center, MyChildren’s, in Tarrant County, develop and implement a medical home team-based approach to care, transforming the existing fee-for-service delivery system from a reactive, fragmented approach to a proactive, comprehensive approach to improving the health of a population.
- Expand staff roles to ensure that all staff practice at the top of their license; redesign processes in the CMC primary care center to effectively use technology and staff to take responsibility for the health of a defined population and improve cost, quality, health and satisfaction outcomes.
- Implement the effective use of IT systems, including patient identification, risk adjustment/analysis/scoring, predictive modeling, data warehousing, gaps in care alert system, provider profiling, outcomes measurement and reporting system capable of aggregating data at all levels, including individual patient, chronic disease, pediatric physician panel, clinic and systemwide.
- Build, implement and spread a pediatric patient/family care coordination system for the Tarrant County CMC primary care center.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of the project is to build infrastructure to expand the CMC primary care medical home capability and perform extensive innovation and redesign to achieve the outcome of NCQA Primary Care Medical Home recognition. This five-year project will involve capacity to manage chronic diseases, increase screening for potentially treatable and preventable conditions, and contribute to reduction in avoidable ED care and avoidable admissions/readmissions.

The expansion of a pediatric medical home approach complements and leverages the expansion of CMC’s primary care centers such that the incremental primary care centers will be able to achieve a higher level of comprehensive, coordinated care and better quality, cost, health and satisfaction outcomes. By spreading the medical home model to all our primary care centers in order to empanel thousands of patients comprehensively and systematically, we can make a measurable difference in the experience, results and costs of health care.

Expanded prevention, wellness and patient/family education programs also feeds into the expansion of medical homes and more organized care delivery, better prevention and wellness programs specific to immunizations and well-child care, better prevention and management of chronic conditions, integrated physical-behavioral health care and better utilization of health care...
resources. Patients and families have better access to care, better access to behavior change programs, better access to social support networks and better access to health education, all of which is delivered in a patient/family-focused and culturally appropriate manner.

The medical home model increases opportunities to prevent disease and treat it early, where patients and families, upon patient discharge, can be scheduled for follow-up appointments at a medical home, thereby reducing the risk and consequences of worsening health conditions. Additionally, staff takes responsibility for proactively reaching out to high-risk patients, patients transitioning from one care setting to another and patients due for preventive services.

This project meets the following regional goals:
The project is related to the regional goals of increased access to medical homes, improved patient and family satisfaction with services and better coordination of care.

Challenges:
A major challenge will be the thoughtful and careful redesign of care delivery and communications processes resulting in a team approach to patient/family-centered care, requiring a formally structured, inclusive project management approach. This project will use proven process improvement methodologies to guide the redesign, as well as use lessons learned from providers who have successfully redesigned care delivery in their practices.

5-Year Expected Outcome for Provider and Patients:
Five-year expected outcomes include increased access to care, improved patient and family satisfaction, increased patient navigation and care coordination services for patients with chronic diseases, increased availability of information on healthy lifestyle choices and self-management and decreased low-complexity emergency department visits.

Starting Point/Baseline:
Baseline measurements will be established using DY1 data.

Rationale:
The project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (lack of coordination of care).
The demand for both primary and specialty care services exceeds that of available physicians in Tarrant County for children covered by Medicaid and CHIP, thus limiting health care access for many low-level management or specialized treatment for prevalent health conditions. Additionally, many individuals in North Texas suffer from chronic diseases that present earlier in life, are becoming more prevalent, and exhibit more severe complications. Finally, emergency departments are treating high volumes of patients with preventable conditions, or conditions that are suitable to be addressed in a primary care setting. Additionally, readmissions are higher than desired, particularly for those with severe chronic diseases or behavioral health.

The impact of the limited primary and specialty care is profound for children and families in the Region. With the current pediatric need being more than 80% of the current supply, in rural and urban areas the demand for primary care services is much higher than the current supply. In the North Texas Corridor, almost 40% of children were either uninsured or enrolled in Medicaid or CHIP in 2010, exacerbating the issue of availability of primary care access and treatment. Additionally, data indicate that many of the pediatric specialists are limited, creating a backlogged pipeline for those needing specialty services after seeking primary care.

As we seek to develop pediatric medical homes through National Committee for Quality Assurance (NCQA) Patient Centered Medical Home (PCMH) recognition, MyChildren’s will have the opportunity to provide better care through improved prevention screenings and routine primary and chronic care. The majority of the MyChildren’s primary care providers are still functioning in a more traditional fee-for-service approach. We want to make sure the pediatric medical home model is embedded within the care delivery model at MyChildren’s so that all patients can receive the right care in the right place at the right time. This is a strategic priority for MyChildren’s because by providing more patients with family-centered, culturally appropriate coordinated care services grounded in their primary care medical homes, children can stay healthier and families can take better care of their children, thereby reducing avoidable ED visits, specialty visits, admissions and readmissions. Children will be identified via the IT support systems and then receive this care in a proactive, planned manner so that they can receive evidence-based interventions across the care continuum. The staff will be complemented to include nutritionists, social workers, community health workers and therapists as part of the family-focused patient care teams. Services will include group visits, care management, chronic care management, telephone outreach and home health care. Heavy emphasis will be placed on a patient/family-focused approach that incorporates evidence-based clinical protocols, and is applied in a consistent and documented manner. Rigorous measurement of both processes of care and pediatric outcomes will ensure continuous improvement and sustainability over time.

MyChildren’s will utilize the IT support systems to track and monitor prevention and wellness programs, with targeted improvements in key quality indicators, such as well-child visits, immunizations and potentially preventable acute care services. Currently, primary care capacity, resources, infrastructure and technology are severely limited. Our goal is to better treat the volume of patients who need preventive and wellness interventions in addition to chronic care.
management. The IT support systems will promote tracking, trending timely intervention and also support patient/family education.

**Project Components:**
All the project components of 2.1 will be included in this project, as they are all relevant to the successful implementation of the project:

a. Utilize a gap analysis to assess and/or measure the primary care providers’ readiness for National Committee for Quality Assurance (NCQA) Patient Centered Medical Home (PCMH) status

b. Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status

c. Conduct educational sessions for primary care physician offices, hospital board of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision

d. Conduct quality improvement for the project using methods such as rapid cycle improvement

All milestones and metrics are based on the relevancy to RPH 10’s population, community needs, RHP priorities and the starting point for the project.

**Unique community need identification numbers the project addresses:**
- CN. 1 Lack of provider capacity
- CN. 10 Overuse of emergency department (ED) services
- CN. 11 Need for more care coordination
- CN. 12 Need for more culturally competent care to address unmet needs
- CN. 13 Necessity of patient education programs
- CN. 14 Need for more education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project represents a new initiative to bring medical home practices into MyChildren’s Primary Care Centers practices. Significant changes to practice, staffing, process and productivity will be reflected in the process of becoming qualified medical homes.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
OD-9 Preventive and Primary Care  IT-9.2 ED appropriate utilization. (Stand-alone measure)

Access to care delivered in a medical home environment should reduce both the use of the ED for inappropriate reasons as well as reduce overall use of the ED for patients receiving care in a medical home setting. Studies have shown a decrease of 25% or more in inappropriate use of
the ED by patients enrolled in a medical home as well as a decrease in overall use of the ED patient receiving care in a medical home environment

**Relationship to Other Projects:**
1.1 Expand Access to Pediatric Care
1.2 Expand Disease Management Services
1.3 Expand/Enhance Behavioral Health Care

**Related Category 4 Population-focused improvements**
RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-4 Patient-centered Health care
RD-6 Initial Core Set of Health Care Quality Measures

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

This project was valued using a Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals: 3
- Addresses Community Needs: 2
- Project Scope: 1
- Project Investment: 2
- Value Weight of the Project: 8

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and
beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

#### Year 2
(10/1/2012 – 9/30/2013)

**Milestone 2 [P-4]:** Develop staffing plan to expand primary care team roles; Expand and redefine the roles and responsibilities of primary care team members.

**Metric 1 [P-4.1]:** Expanded primary care team member roles;

Rationale/Evidence: “Primary care physicians are expected to provide acute, chronic, and preventive care to their patients while building meaningful relationships with those patients, and managing multiple diagnoses according to a host of evidence-based guidelines. A research study estimates that it would take 7.4 hours per working day to provide all recommended preventive care to a panel of 2,500 patients plus an additional 10.6 hours to adequately manage this panel’s chronic conditions. It is clear that primary care physicians in the 15-minute visit can no longer do what their patients expect and deserve.”

**Data source:** Administrative data

#### Year 3
(10/1/2013 – 9/30/2014)

**Milestone 3 Estimated Incentive Payment (maximum amount):** $140,625

**Milestone 4 [P-7]:** Track the assignment of patients to the designated care team

**Metric 1 [P-7.1]:** Tracking medical home patients

Rationale/Evidence: Review panel status (open/closed) and panel fill rates on a monthly basis for equity to be able to adjust to changing environment (e.g., patient preference, extended provider leave).

Goal: Tracking report developed by 9/30/14

**Data Source:** Submission of tracking report. Can be tracked through the practice management system, EHR, or other documentation as designated by Performing Provider

**Milestone 5 Estimated Incentive Payment (maximum amount):** $87,500

#### Year 4
(10/1/2014 – 9/30/2015)

**Goal:** 100% of eligible clinics receive medical home certification by 9/30/15, 1 clinic

**Data Source:** Documentation of recognition/accreditation from nationally recognized agency (e.g., NCQA)

**Milestone 8 Estimated Incentive Payment (maximum amount):** $97,500

#### Year 5
(10/1/2015 – 9/30/2016)

**Milestone 9 [I-17]:** Medical home provides population health management by identifying and reaching out to patients who need to be brought in for preventive and ongoing care

**Metric 1 [I-17.1]:** Reminders for patient preventive services

**Rationale/Evidence:** Panel manager (or staff on care team) identifies patients who have process or outcome care gaps and contacts them to come in for services. This approach has been used

- Year 5 Estimated Milestone Bundle Amount: $195,000

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,057,500
**Project Option 2.7.6 – Promoting Physical and Mental Health Among At-risk, Underserved African-American Pre-teen Girls in Tarrant County**

**Unique Project ID:** 138980111.2.1  
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Providers:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** Deliver educational and activity-based programming to improve self-esteem and provide alternatives to risky behaviors for African American preteen girls would be expanded using existing youth serving organizations such as the A B Christian Learning Center, YMCA, and similar existing organizations. SPARK-based interventions include age-appropriate physical activity and self-management curriculum to promote physical activity as part of personal development and a healthy lifestyle. In addition activities include nutrition education and demonstrations. Beyond the SPARK-based intervention, activities will focus on self-esteem and self-efficacy development through a series of small group sessions that focus on body awareness and self-respect, character development, appropriate response to peer and other pressures, an awareness of problematic habits that effect lifestyle, i.e., obesity, lack of physical fitness, poor eating habits, smoking, alcohol and drugs, and the development of strong mentoring relationships. This project is a new initiative that seeks to increase access for African American preteen girls to youth-serving organizations, social services, and medical services.

**Need for the project:** African American young women in Tarrant County have high levels of risk factors for poor birth outcomes as indicated by the infant mortality rate for African American women (12.7 infant deaths per 1000 live births in 2010), which is over twice that for other women in the county. Increased access to youth serving organizations, social services, and medical services should result in healthier births by healthier women, which should reduce the demand for NICU and services related to poor birth outcomes.

**Target population:** African American pre-teen girls who are at risk for poor birth outcomes. Estimated 40 patients will be served over course of waiver period.

**Expected patient benefits:** Targeting at-risk, underserved African American pre-teen girls will help to improve health knowledge and health behaviors in the near term, which will have long-term impact on the health access and health outcomes of these women and their families as they grow and mature.

**Category 1 or 2 expected patient benefit:**
- 25 - pre-teen African American girls receiving intervention consistent with evidence-based model by DY4 and 40 by DY5
- Increase access to disease prevention programs by 10% over baseline by DY4 and 20% over baseline by DY5

**Category 3 outcomes:**
- IT-10.1 – Increase over baseline in quality of life score as measured by PedsQL of 2% by DY4 and 5% by DY5
**Project Option 2.7.6** – Promoting Physical and Mental Health Among At-risk, Underserved African-American Pre-teen Girls in Tarrant County

**Unique Project ID:** 138980111.2.1  
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Project Description:**
**Project Area:** Implement Evidence-based Disease Prevention Programs  
**Project Intervention:** Implement other evidence-based project to implement evidence-based disease prevention programs in an innovative manner.

Research has demonstrated an association of obesity, a major risk factor for subsequent disease and poor self-image, and self-perceptions, healthy diet, and physical activity behaviors. Self-efficacy has also been linked to lower drug use and reduced alcohol use in adolescents. (Stockton et al 2009) Obesity is a risk factor for diseases such as diabetes, heart disease, hypertension, cancer, and respiratory and circulatory conditions which are costly to the healthcare system and lead to poor quality of life for individuals. Preteen African-American girls are at higher risk to be obese and as a result, tend to have higher healthcare costs. (Caprio et al 2008) - This project will deliver educational and activity-based programming to improve self-esteem and provide alternatives to risky behaviors for African-American preteen girls employing evidence-based interventions based on SPARK’s and GEMS’ programming. (McKenzie et al 2009, Klesges et al 2010, Doswell et al, 1998) - Project inventions will be delivered through youth serving organizations such as the A B Christian Learning Center and the YMCA that base their programming on these and related models. While the project intervention is a holistic approach in its focus on self-esteem and health awareness, it will seek to impact risk factors for specific diseases such as obesity through education and age-appropriate activities. SPARK-based interventions include age-appropriate physical activity and self-management curriculum to promote physical activity as part of personal development and a healthy life style. In addition activities include nutrition education and demonstrations. Beyond the SPARK-based intervention, activities will focus on self-esteem and self-efficacy development through a series of small group sessions that focus on body awareness and self-respect, character development, appropriate response to peer and other pressures, and the development of strong mentoring relationships.

**Goals and Relationship to Regional Goals:**
Project Goals:
The purpose of this project is to engage pre-teen girls in youth-serving organizations to improve their self-esteem and related health behaviors. The goals of this project are to 1) increase access to educational programming for pre-teen African-American girls that offers positive preconception health knowledge and 2) engage pre-teen African-American girls in behaviors that provide alternatives to risk behaviors that negatively impact their long term health.

This project meets the following Regional goals:
African-American young women in Tarrant County have high levels of risk factors for poor birth outcomes as indicated by the infant mortality rate for African-American women (12.7 infant deaths per 1,000 live births in 2010), which is over twice that for other women in the County. These women lack access to youth serving organizations, social services, and medical services. This project will increase their access to these services by developing necessary outreach infrastructure. Healthier births by healthier women should reduce the demand for NICU and services related to poor birth outcomes.

Challenges:
Recent research links stress in the African-American community to poor health outcomes.(Boutwell & Hwu 2009) This stress results from continued racial discrimination, economic circumstances, family and neighborhood situations, and other disparate social conditions and is compounded by biological predispositions. In addition, Michael Lu and his associates have demonstrated that a life course perspective is needed to address the high rates of infant mortality and other poor birth outcomes in the African-American community associated with this stress. (Boutwell & Hwu 2009) Life course factors are believed to influence pregnancy outcomes through not only the early life or fetal programing pathway, but also through a cumulative, wear and tear mechanism, known as weathering. For both the fetal programing and weathering pathway, (Boutwell & Hwu, 2009) stress is believed to be the underlying mechanistic factor to which the body responds. (Boutwell & Hwu 2009, Coleman) The implementation of life course perspective at the Northern Manhattan Perinatal Partnership reduced its infant mortality rate from 27.7 deaths per 1,000 live births in 1990 to 6.1 in 2008. The child development programs of many national youth serving organizations provide approaches for girls to learn to cope with the life stresses of their environment. To demonstrate the effectiveness of their programs, these organizations have conducted their own evaluations, expanded the capacity of its affiliates to evaluate their programming, and commissioned (Premier Quality Advisor, Coleman) independent evaluators to study program, training, and management effectiveness (Readmissions in North Texas, Premier Quality Advisor).

5-Year Expected Outcome for Provider and Patients:
This project seeks to increase the mental and physical health of African-American pre-teen girls in Tarrant County prior to first conception. The project will engage 40 or more girls in the program and increase their access to prevention programs. Specific project outcomes include:

- Development and implementation of the project plan
- Execution and documentation of the learning and diffusion strategy
- Execution and documentation of the evaluation process, tools, and analytics
- Identification of 40 African-American pre-teen girls to participate in the program
- Increased access to disease prevention programs by program participants
- 5% increase in the PedsQL score by DY5
- Implementation of age-appropriate evaluation techniques such as maintaining a food diary and measuring BMI

**Starting Point/Baseline:**
Focus group information indicated a lack of access for African-American youth to youth-serving organizations in the target area of Tarrant County. This is a new project that will serve 40 African-American pre-teen girls. Baseline rates for this project will be defined in DY2.

**Rationale:**
Extensive focus group analysis in this community has identified the need for services to build self-esteem among young women before they reach their teenage years. Recent research links stress in the African-American community to poor health outcomes (Boutwell & Hwu 2009). This stress results from continued racial discrimination, economic circumstances, family and neighborhood situations, and other disparate social conditions and is compounded by biological predispositions. In addition, Michael Lu and his associates have demonstrated that a life course perspective is needed to address the high rates of infant mortality and other poor birth outcomes in the African-American community associated with this stress (Coleman). Life course factors are believed to influence pregnancy outcomes through not only the early life or fetal programing pathway, but also through a cumulative, wear and tear mechanism, known as weathering. For both the fetal programing and weathering pathways, stress is believed to be the underlying mechanistic factor to which the body responds. (Coleman) The implementation of life course perspective at the Northern Manhattan Perinatal Partnership reduced its infant mortality rate from 27.7 deaths per 1,000 live births in 1990 to 6.1 in 2008. The child development programs of many national youth serving organizations provide approaches for girls to learn to cope with the life stresses of their environment. To demonstrate the effectiveness of their programs, these organizations have conducted their own evaluations, expanded the capacity of its affiliates to evaluate their programming, and commissioned independent evaluators to study program, training, and management effectiveness (Readmissions in North Texas, Premier Quality Advisors).

**Project Components:**
No required core components were listed. Core activities for this project include baseline data collection, hiring and training team members, project planning and implementation of a comprehensive intervention to address the needs of this high risk population, and project evaluation and analysis.

Texas spends over $2.2 billion per year in the Medicaid program for birth and delivery services. Half of the births in Texas are Medicaid births. Costs related to infant care are increasing and NICU utilization is growing. Over 60% of Medicaid program birth and delivery costs are for extremely premature babies (51.3%) or premature infants with problems (10.8%). Approximately $51,000 is spent for every premature infant. These statistics provide a compelling business case for improving preconception health of women in Tarrant County, especially African-American women.

The process milestones selected as the initial stages of this project intervention will be planned in conjunction with stakeholder organizations providing evidence-based youth services and the specific resources that will be needed to accomplish the project will be identified. This planning will also include the determination of timelines and the methods to document implementations. The outcome improvement target was selected to demonstrate the potential improvement in quality of life experienced by pre-teen African-American girls based on their participation in the intervention.

Quality Milestone P-7- was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
CN.12 – Need for more culturally competent care to address unmet needs (e.g.,, Latino-population need care, translators, translated materials
CN.13 – Necessity of patient education programs
CN.15 – Need for more education, resources and promotion of healthy lifestyles (free and safe places to exercise, health screenings, health education, healthy environments, etc.)

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
African-American youth in Tarrant County have high levels of risk factors for poor birth outcomes as indicated by the infant mortality rate for African-American women (12.7 infant deaths per 1,000 live births in 2010), which is over twice that for other women in the County. These women lack access to youth-serving organizations, social services, and medical services. This project will increase their access to these services by developing the necessary outreach infrastructure.

**Related Category 3 Outcome Measures:**
Outcome Measures and Reasons/rationale for selecting the outcome measures:

**Outcome Measure 1:** IT-10.1 Quality of life

Demonstrate improvement in quality of life scores, as measured by evidence-based and validated assessment tool (PedsQL), for the target population.

**Improvement Target:** 5% increase in the PedsQL score by the end of the Waiver period.

**Rationale:** The outcome improvement target was selected to demonstrate the potential improvement in quality of life experienced by pre-teen African-American girls based on their participation in the intervention. Meaningful child health outcome measurement must go beyond narrow morbidity and mortality measures to assess broader health concerns such as physical, emotional, social, and school functioning. The PedsQL is a complex measure that includes indicators of physical functioning, emotional functioning, social functioning, and school functioning. The measure also has the benefits of brevity (23 questions), time required (approximately five minutes) as well as established reliability, validity, sensitivity, and responsiveness to changes in overall health. (Varni et al. 2003.) The broad based intervention that is used by youth serving organizations may have different impacts on each factor, although a generally positive impact. Hence, in the absence of baseline data, the projected 5% increase indicates a general positive effect, while effects in each subarea may be greater or less. In addition, there are confounding factors such as age and family SES that may influence the effect.

**Relationship to Other Projects:**

138980111.2.4 Tarrant County - Perinatal Health Promotion Initiative. Both this project and the project proposed in this document employ a life course perspective and focus on the health of women at different stages of their physical and mental health development, especially populations experiencing health disparities. The proposed project focuses on the preteen years and the development of physical and emotional coping behaviors while the Tarrant County Health Promotion project focuses on addressing awareness, education and risk factor reduction for poor birth outcomes prior to pregnancy or interconception.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Implement Evidence-based Disease Prevention Programs - Implement other evidence-based project to implement evidence-based disease prevention programs – 2.7.6: Promoting Physical and Mental Health Among At-risk, Underserved African American Pre-teen Girls in Tarrant County

- 126675104.2.15 JPS Health Network-Journey to Life. The project is related to the proposed project in that it focuses on the life course of women who are pregnancy and need access to prenatal care. For women to have healthy births during their life course, four stages must be addressed: the preconception health of women from childhood on,
prenatal care, care during delivery, and post-natal care for mother and infant. These two projects address two of these stages.

- **130614405.2.3 Texas Health Arlington Memorial Prenatal Care.** This project is related to the proposed project in that it also focuses on the life course of women prior to pregnancy. Specifically, the project focuses on prenatal care of pregnant women by adding access to care and using the CenteringPregnancy model. If preteens are physically and emotionally healthier based on the proposed project, their prenatal care, if available, will have a greater likelihood of reducing poor birth outcomes.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Specifically, this project’s value was calculated on a single outcome, quality of life.

a. For quality of life, UNT Health Science Center defined the population that will be directly impacted by the project as Pre-teen African-American girls who are at risk for poor birth outcomes, which would be approximately 40 patients. We are anticipating that we will test the entire population, and are expecting to increase the quality of life scores for the project by 3%.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $25,000 (as cited in the article, "Mapping the EQ-5D Index from the SF-12: US General Population Preference in a Nationally Representative Sample” in the journal, Medical Decision Making and “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s School of Public Health), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. -This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
Implement Evidence-based Disease Prevention Programs – Implement other
evidence-based project to implement evidence-based disease prevention
programs – 2.7.6: Promoting Physical and Mental Health Among At-risk,
Underserved African-American Pre-teen Girls in Tarrant County

**Milestone 1 [P-1]:** Development of an innovative evidence-based project for targeted population (African-American pre-teen girls [with a focus on specific high-incidence diseases for this population, specifically obesity]).

**Metric 1 [P-1.1]:** Document innovational strategy and plan
Baseline/Goal: Strategy and plan developed
Data Source: Program records

**Milestone 2 [P-2]:** Implement evidence-based innovational project for targeted population (African-American pre-teen girls).

**Metric 1 [P-2.1]:** Document implementation strategy and testing outcomes
Baseline/Goal: Implementation

**Milestone 3 [P-3]:** Execution of learning and diffusion strategy for testing, spread, and sustainability

**Metric 1 [P-3.1]:** Document learning and diffusion strategic plan
Baseline/Goal: Learning and diffusion strategic plan documented
Data Source: Program records

**Milestone 4 Estimated Incentive Payment (maximum amount):** $171,743

**Milestone 5 [P-4]:** Execution of evaluation process for project innovation

**Metric 1 [P-4.1]:** Document evaluation process, tools, and analytics
Baseline/Goal: Evaluation process, tools, and analytics documented
Data Source: Program records

**Milestone 5 Estimated Incentive Payment:** $183,725

**Milestone 6 [I-5]:** Identify 25 patients in defined population receiving innovative intervention consistent with evidence-based model (African-American pre-teen girls).

**Metric 1 [I-5.1]:** Number of patients in defined population receiving innovative intervention consistent with evidence-based model
Goal: 25 pre-teens in DY4
Data Source:

**Milestone 6 Estimated Incentive Payment:** $183,725

**Milestone 7 [I-5]:** Identify 40 patients in defined population receiving innovative intervention consistent with evidence-based model (African-American pre-teen girls)

**Metric 1 [I-5.1]:** Number of patients in defined population receiving innovative intervention consistent with evidence-based model
Goal: 40 pre-teens in DY5
Data Source:

**Milestone 7 Estimated Incentive Payment:** $177,512

**Milestone 8 [I-7]:** Increase access to disease prevention programs using innovative project option

**Metric 1 [I-7.1]:** Increase percentage of target population reached
Goal: 10% increase over baseline.
Data Source:

**Milestone 8 Estimated Incentive Payment:** $183,725

**Milestone 9 [I-7]:** Increase access to disease prevention programs using innovative project option

**Metric 1 [I-7.1]:** Increase percentage of target population reached
Goal: 20% increase over baseline

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project
Project Option 2.8.1 – Improving Primary Care Clinical Processes to Reduce Hospitalization Risk

Unique Project ID: 138980111.2.2
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: Utilizing an integrated, multi-faceted educational model shown to result in reductions in preventable hospitalizations in communities around Texas, a series of educational interventions targeting primary care interprofessional and multidisciplinary teams will be used to provide training and education on process improvement related to the management of Bacterial Pneumonia, Chronic Obstructive Pulmonary Disease, Diabetes Long-term Complications, and Hypertension (High Blood Pressure). This is a new initiative.

Need of the project: This project meets regional goals of improving health of populations and reduction of costs by addressing processes that impact the issues of poorly managed conditions, suboptimal application of clinical guidelines and inadequate patient and provider community resources.

Target population: Patients of primary care workforce receiving training who have diagnosis of COPD, Adult Asthma and/or are at high risk for contracting bacterial pneumonia. It is estimated that 1,100 providers will be trained, and 110 providers/clinics will undertake process improvement methodologies, impacting approximately 700 patients in RHP 10.

Expected patient benefits: The project is important because the conditions targeted to be impacted by enhanced processes can be costly to CME when they result in hospitalization, as frequently occurs with poor management.

Category 1 or 2 expected patient benefits: This project seeks to conduct 15 trainings by DY3; have -10 providers/clinics undertake process improvement initiatives by DY3, 50 more by DY4, and 50 more by DY5; designate 100 process improvement champions by DY3 and see 5% of providers by DY4 and 10% of providers by DY5 trained to realize improved efficiencies.

Category 3 outcomes:
  i. IT 2.5 Our goal is to improve COPD admission rates by 1% by DY4 and 3% by DY5 in patients of targeted population.
  ii. IT 2.6 Our goal is to improve Adult Asthma admission rates by 1% by DY4 and 3% by DY5 in patients of targeted population.
  iii. IT 2.10 Our goal is to improve flu and pneumonia admission rates by 1% by DY4 and 3% by DY5% in patients of targeted population.
Project Option 2.8.1 – Improving Primary Care Clinical Processes to Reduce Hospitalization Risk

Unique Project ID: 138980111.2.2
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Project Description:

Project Area: Apply Process Improvement Methodology to Improve Quality/Efficiency
Project Intervention: Design, develop, and implement a program of continuous, rapid process improvement that will address issues of safety, quality, and efficiency.

Utilizing an integrated, multifaceted educational model shown to result in reductions in preventable hospitalizations in communities around Texas, a series of educational interventions targeting primary care interprofessional and multidisciplinary teams will be used to provide training and education on process improvement related to the management of bacterial pneumonia, chronic obstructive pulmonary disease, diabetes long-term complications, and hypertension (high blood pressure). Education will target primary care clinics and providers in RHP 10 and demonstrate how improving clinical processes can result in patients who are better managed and can better self-manage, and reduce hospital admissions related to the targeted conditions. A series of live, face-to-face, live and on-demand online activities, printed material and individual coaching will facilitate process improvement.

Goals and Relationship to Regional Goals:

Project Goals:
The intent of this project is to realize a measured reduction in hospitalizations related to the four conditions targeted resulting from improved processes that lead to better care and patient management. Specific goals of this project are:
- 10% (110) of providers trained will realize improved efficiencies
- Costs related to admissions from the targeted conditions will be reduced throughout the RHP 10
- 15 Trainings will be conducted
- 110 providers/clinics will undertake process improvement methodologies
- 10% (110) of providers/clinics trained will realize improved efficiencies

This project meets the following Regional goals:
The Region’s goals are to improve the experience of care, improve health of populations and reduce costs of health care. Many potentially preventable hospitalizations result from poorly managed conditions (clinical process inefficiencies), suboptimal application of clinical guidelines (clinical process inefficiencies) and inadequate patient and provider community resources. This project addresses each of these causes to reduce hospitalizations which cost the...
community billions of dollars each year, decreases experience of care and decreases the health of the population through training and working with primary care physicians in best practices for improving primary care clinical processes.

**Challenges:**
Poor clinical management of chronic diseases is often a result of inadequate or absent clinical processes/methods, resulting in an escalation of adverse events from the disease. Clinical guidelines are slow to be translated into practice in primary care and meaningful practice assessments are insufficient.

**5-Year Expected outcome for Provider and Patients:**
The overall five-year goal of this project is to realize a reduction of admissions and health care costs related to diabetes short term complications, COPD, Hypertension and bacterial pneumonia through process improvement strategies, methodologies and culture, with a focus on clinical performance improvement. This project will reduce flu and pneumonia admission rates by 3% over baseline, reduce COPD admission rates by 3% over baseline and reduce adult asthma admission rates by 3% over baseline for patients of PCP providers receiving the intervention.

**Starting Point/Baseline:**
Between 2005 and 2010, potentially preventable hospitalizations (PPHs) accounted for $39.5 billion in Texas hospital charges. UNTHSC will employ a multidimensional, longitudinal educational model shown to contribute to fewer hospitalizations in Texas communities to reduce potentially-preventable hospitalizations related to bacterial pneumonia, chronic obstructive pulmonary disease, diabetes long-term complications, and hypertension (high blood pressure) throughout RHP-10. Health care cost savings due to reduced admissions (cost efficiencies), improved application of clinical guidelines (clinical efficiencies), and improved clinical processes (cost and clinical efficiencies) will be the expected outcomes. Human service delivery systems change relies in part on the identification and leveraging of unanticipated, complementary events. Reduction of hospitalizations can be attributed to educational interventions.

**Rationale:**
UNTHSC PACE has demonstrated its ability to use certified interdisciplinary continuing education and community partnerships to reduce potentially preventable hospitalizations (PPH) on a county-by-county and Regional basis in rural, semi-rural and metropolitan counties. Many PPHs result from poorly managed conditions (clinical process inefficiencies), suboptimal application of clinical guidelines (clinical process inefficiencies) and inadequate patient and provider community resources. This project addresses each of these causes to reduce hospitalizations which cost the community billions of dollars each year. Corresponding milestones: Specific workflows/processes/clinical areas targeted; Identify/target metric to
measure impact of processes. This project addresses the challenges by identifying processes in primary care clinics that result in less than optimal patient outcomes and, if improved, result in improved patient health, self-management and outcomes, leading to fewer hospitalizations in the targeted disease states. For example, clinical guidelines state that primary care should regularly perform spirometry for individuals over 55 with a history that includes risk factors for COPD. The majority of PC clinics do not regularly perform spirometry and, if they do, the test is of poor quality and results are often interpreted incorrectly. Improving these processes would result in increased assessment of patients so resources are not wasted on those without COPD and those with COPD can receive early intervention and slow the progression of the disease. Clinical processes have also been identified as barriers to smoking cessation ascertainment, patient education and immunization provision.

Project Components:

- Core activities include:

  A. Provide training and education to clinical staff on process improvement strategies, methodologies, and culture. Implementation of this activity will be accomplished through UNTHSC PACE’s existing continuing education process, which relies of rigorous assessment, evidence-based educational design, program execution and assessment. Alignment with milestones 3, 5, 7, 11, and 15.

  B. Define key safety, quality, and efficiency performance measures and develop a system for continuous data collection, analysis, and dissemination of performance on these measures (i.e. weekly or monthly dashboard). The content development committee will define these measures and, at a minimum, UNTHSC PACE will incorporate ongoing data collection into a monthly dashboard to continually assess performance. Alignment with milestones 1 and 2.

  C. Develop standard workflow process maps, staffing and care coordination models, protocols, and documentation to support continuous process improvement. These workflows will be based on best practices and evidence-based practices, adapted as teaching and learning aids and practice guides. Alignment with milestone 4.

  D. Evaluate the impact of the process improvement program and assess opportunities to expand, refine, or change processes based on the results of key performance indicators. Implementation will be accomplished through continuous data collection and comparison of data trends to baseline measures and benchmarks. Alignment with milestones 9, 10, 13 and 14.

  E. Develop an employee suggestion system that allows for the identification of issues that impact work will not be an activity of this project due to the inability to enforce the activity with the target population of this project – Primary Care Physicians in RHP 10.

  F. Implement software to integrate workflows and provide real-time performance feedback will not be an activity of this project due to the inability to enforce the
activity with the target population of this project – Primary Care Physicians in RHP 10.

The milestones selected for this project will allow us to reach and/or measure the accomplishment of our 5-year expected outcome to improve coordination of care which will positively impact patient self-management through enhanced patient education and use of preventive measures. The milestones and metrics will demonstrate the effectiveness of improved processes in primary care practices. The demographic and geographic diversity of RHP 10 provides opportunity to make significant improvements in practices that will result in an improvement in self-management and a reduction in hospitalizations. Data for each milestone and metric demonstrate a need due to high rates of hospitalizations. Quality Milestone P-13 was selected to promote collaborative learning around shared or similar projects.

Unique community need identification numbers the project addresses:
- CN.11 – Need for more care coordination
- CN.13 – Necessity of patient education programs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:

Outcome Measure 1: IT-2.5 Chronic Obstructive Pulmonary Disease (COPD) Admission Rate – PQI 5
Numerator: All non-maternal discharges of age 18 years and older with a principal diagnosis code for COPD
Denominator: Population in Metro Area or county, age 18 years and older
Data Source: EMR, Claims
Target Improvement: 3% improvement in admission rate
Rationale: COPD is one of the highest causes of potentially preventable admissions in RHP 10, with 3,300 admissions in 2010 alone. COPD can be effectively managed in primary care when appropriate processes for screening, diagnosis and management/follow-up are combined with appropriate patient education material.

Outcome Measure 2: IT-2.6 Adult Asthma Admission Rate – PQI 15
Numerator: All discharges of age 18 years and older with a principal diagnosis code of asthma
Denominator: Population in Metro Area or county, age 18 years and older
Data Source: EMR, Claims
Target Improvement: 3% improvement in admission rate

**Rationale:** Asthma is one of the highest causes of potentially preventable admissions in RHP 10, with 1,558 admissions in 2010 alone. Asthma can be effectively managed in primary care when appropriate processes for screening, diagnosis and management/follow-up are combined with appropriate patient education material.

**Outcome Measure 3: IT-2.10 Flu and Pneumonia Admission Rate**

Numerator: All discharges of age 18 years and older with a principal diagnosis code of flu or pneumonia.
Denominator: Population in Metro Area or county, age 18 years and older
Data Source: EMR, Claims
Target Improvement: 3% improvement in admission rate

**Rationale:** Hospitalizations from bacterial pneumonia/influenza are a significant problem in RHP 10. In 2010, bacterial pneumonia alone resulted in 4,628 admissions. When appropriate immunization screening and patient education processes are applied, admissions for pneumonia/flu are reduced.

**Relationship to Other Projects:**
138980111.1.4 Increase Training of Primary Care Workforce – “Other” project option: Update primary care training programs to include training on the medical home and chronic care models, disease registry use for population health management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement – 1.2.1: Training Primary Care Workforce in Evolving Healthcare Delivery Models. This project supports interventions in category 138980111.1.4 because many of the providers targeted in 138980111.1.4 will also receive targeted information during this project, reinforcing the intervention and supporting the outcomes measures for both projects.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
N/A for non-hospital providers.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Specifically, this project’s value was calculated on three outcomes, which included (1) chronic obstructive pulmonary disease admissions rates, (2) adult asthma admission rates, and (3) flu and pneumonia admission rates.

a. For Chronic Obstructive Pulmonary Disease (COPD) Admission Rate, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for COPD and receive services from PCPs receiving intervention, which would be approximately 330 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for COPD in the target population by 3%, equating to 10 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it is determined that the valuation amount for each positive outcome realized would be $7,931 (TX Dept. of State Health Services data)

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $4,759 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit provided to the individual, the resulting additional valuation amount is $3,172 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For Adult Asthma Admission Rate –PQI 15, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for adult asthma and receive services from PCPs receiving intervention, which would be approximately
156 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for adult asthma in the target population by 3%, equating to 5 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Regional providers to determine the value to the health care system, it was determined that the value amount for each positive outcome realized would be $6,285 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $3,771 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit provided to the individual, the resulting additional valuation amount is $2,514 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For Flu and Pneumonia Admission Rate, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for flu or pneumonia and receive services from PCPs receiving intervention, which would be approximately 463 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for flu or pneumonia in the target population by 3%, equating to 14 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $8,047 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $4,828 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit provided to the individual, the resulting additional valuation amount is $3,219 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Project Option 2.2.2 – Expand Chronic Care Management Models – Apply evidence-based care management model to patients identified as having high-risk health care needs – 2.2.2: ASTHMA 411 – A Sustainable School-Based Asthma Program

**Unique Project ID:** 138980111.2.3

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Provider:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** Asthma 411 provides a school-based program for asthma management to improve the school’s ability to help asthmatic students manage their asthma, reduce absenteeism from class due to asthma morbidity, increase use of a primary care provider, and improve asthma outcomes. This project is a new initiative to help asthmatic children manage their asthma through school-based clinics.

**Need for the project:** This project meets a number of regional goals, which are aligned with the goals of the waiver and CMS’ triple aim. Specifically, this project will improve the health of asthmatic children which, in turn, improves the quality of life for members of their family and their community. In addition, through better management of their asthma, we will improve the health outcomes of this population, while lowering health care cost for the region due to decreased hospitalizations and ED use. In Tarrant County, the only school district which has been found with a specific school based asthma program is the Keller ISD. The Keller ISD program is limited in scope and the health services director (Cindy Parsons, BSN, RN) has expressed an interest in participating as has the health services director (Michael Steinert, MA, LPC) of Fort Worth ISD, the largest district in Tarrant County.

**Target population:** K-12 students with asthma in the Fort Worth Independent School District. Estimated 6,000 patients to be served over the period of the waiver.

**Expected patient benefits:** It is estimated that approximately 83% of school age children with asthma at FWISD are eligible for Medicaid. Improved asthma management and linkage with a regular primary care provider and a medical home provided through this project will reduce asthma-related inpatient admissions, inappropriate ED visits, and decrease school absences due to asthma.

**Category 1 or 2 expected patient benefits:**
- i. 10% (600 students) by DY4 and 20% (1,200 students) by DY5 of students (based on an estimated baseline of 6000) with asthma will have self-management goals (healthcare provider prepared asthma action plan)
- ii. 2% (12 students) increase over baseline by DY4 and 4% (24 students) by DY5 increase over baseline of identified K-12 students with asthma using school health services (based on an estimate of 600 students – 10% of 6000)

**Category 3 outcomes:**
- i. IT-3.11 – 2% decrease by DY4 and 5% (estimated at 1 readmission) decrease by DY5 from baseline in the number of hospital readmissions
- ii. IT-9.3 – 10% (estimated at 6) by DY4 and 20% (estimated at 12) by DY5 reduction from baseline in the number of ED visits from school due to asthma
Project Option 2.2.2 – Expand Chronic Care Management Models – Apply evidence-based care management model to patients identified as having high-risk health care needs – 2.2.2: ASTHMA 411 – A Sustainable School-Based Asthma Program

Unique Project ID: 138980111.2.3
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Project Description:
Asthma 411 provides a school-based program for asthma management to improve the school’s ability to help asthmatic students manage their asthma, reduce absenteeism from class due to asthma morbidity, increase use of a primary care provider, and improve asthma outcomes. The Asthma 411 approach is based on the CDC’s Strategies for Addressing Asthma within a Coordinated School Health Program. Asthma 411 is a care management model that provides tools, methods and strategies to support or redefine the existing health service and administrative structures and policies present in schools. Asthma 411 utilizes a consulting physician (which may be through linkage with a school-based clinic or other health services), the implementation of standing medication orders for respiratory distress, use of absenteeism data to identify high risk students, facilitates use of primary care practitioners and linkage with community resources. The goal is to reduce asthma morbidity in children on a population basis through a school-based program.

Goals and Relationship to Regional Goals:

Project Goals:

The project goal is to reduce asthma-related morbidity through implementation of a school-based asthma management program for children. The 5-year goals are listed in 2c.
Pediatric asthma is a serious chronic disease issue in Tarrant County. Fort Worth, Tarrant County and surrounding Region 10 counties have high asthma prevalence rates. Cook Children’s 2008 Community-wide Children’s Health Assessment and Planning Survey (CCHAPS 2009 Report) identified elevated asthma prevalence (~18.59%) in Tarrant County as a major concern. This childhood asthma rate is approximately double the national average of 9% and greater then Texas’ average of 8.8%. Of Tarrant County children ages 0-14 years, approximately 75,500 have asthma. By age nine fully 25% of the County’s children have been diagnosed with asthma, with a disproportion number of cases occurring among the county’s African-American children. The county’s Hispanic children also have elevated rates of asthma (19%), even though Hispanics traditionally have a lower rate of asthma than white non-Hispanics. Asthma was the primary diagnosis for 5% for all admits at the Cook Children’s Hospital Medical Center in Fort Worth, with 36% of these as asthma as the primary diagnosis. Further, 27% of absences lasting three days or longer were due to asthma.
This project meets the following Regional goals:
This project meets a number of Regional goals, which are aligned with the goals of the Waiver and CMS’ triple aim. Specifically, this project will improve the health of asthmatic children which, in turn, improves the quality of life for members of their family and their community. In addition, through better management of their asthma, we will improve the health outcomes of this population, while lowering health care cost for the Region due to decreased hospitalizations and ED use.

Challenges:
Pediatric asthma is a serious chronic disease issue in Tarrant County. Our target population is characterized by a high rate of ED visits and hospital admissions due to asthma, and low use of primary care physicians (PCPs) and care management through a medical home. It is also estimated that approximately 83% of school-age children with asthma at FWISD are eligible for Medicaid (FWISD Annual Report 2011-2012). Improved asthma management and linkage with a regular primary care provider and a medical home provided through this project will reduce asthma-related inpatient admissions.

Additionally, this population is limited in its usage of asthma action management plans (AAPs). This project will improve access to AAPs through school nurses implementing program procedures to increase PCP prepared AAPs submitted to school nurse, and the use of these plans to help improve asthma management, reduce morbidity and further decrease ED usage and hospital admissions. So far at least six school districts in the DFW area have indicated interest in participation.
There are 2 specific challenges. #1 concerns access to data. Most of the data necessary to determine baselines and follow-up of outcome success are not presently tracked or recorded (this includes absences or visits to school clinics due to asthma, ED or hospitalization if not from school, and readmission incidents). Mechanisms for collecting this information will need to be established. The two initial participating schools districts as well as JPS and CCH, the two major hospitals which serve the majority of this population and also have clinics associated with schools, have indicated interest in working to establish and implement mechanisms to track this information. In addition, the NorTex Primary Care Research Institute, a consortium of physicians which treat a large portion of the children with asthma, will be collaborating as well. #2 concerns consent for participation. In the prior implementation of this program in St. Louis, MO, it was required for participants to ‘opt-out/non-consent’ rather than ‘opt-in/consent’, which resulted in close to 100% participation. Interpretation of the Family Education and Privacy Act (FERPA) regulations now requires participants to opt-in, primarily in regards to data acquisition, which will entail additional recruitment efforts. Both school districts have indicated their willingness and effort to maximize recruitment. Additionally, a number of the implementation activities would become standard health services activities and will not require consent. For both of these primary challenges program implementation staff has been added to address the data collection and consent challenge. Although other implementation challenges of varying types exist, prior experience of implementing this program as well as the school districts interest in performing will help to minimize those issues. These other challenges include school staff resistance to change, technology compatibilities for data and information transfer, and arranging training, education and professional development programs at times when health services staff are available.

5-Year Expected Outcome for Provider and Patients:
This program will provide a school-based program for asthma management to improve students’ ability to better manage their asthma, reduce student absenteeism due to asthma morbidity, and improve their asthma-specific health outcomes. Specifically, the program will:

- Reduce school absences due to asthma by 10% (Based on an estimated 12,000 absence days of students with asthma/year, this would reduce absences by 1,200 days annually by DY5).
- Reduce number of 911 calls/ED visits from school due to asthma by 20% (based on an estimated 60/year, this would reduce the number of 911 calls/ED visits from school by 12 annually by DY5).
- Increase the number of health care provider-prepared asthma action plans for individual students submitted to school by a minimum of 20% (based on an estimated 1200 asthma action plans, this would increase the number by 240 by DY5).
- 25% decrease in school clinic visits due to asthma symptoms (based on an estimated 600 clinic visits, this would reduce the number of clinic visits in school by 150 annually by DY5).
- Provide a school-based program for asthma management to improve the school’s ability to address asthma-related issues, reduce absenteeism from class due to asthma morbidity, and improve asthma outcomes.
Starting Point/Baseline:
School districts are the project’s primary providers of the Asthma 411 Program. The starting point is the students with asthma at the schools and the school-based health services personnel. The project will begin with establishing baseline data (i.e. number of children with asthma, prevalence of asthma action management plans, ED utilization and hospitalization rates related to asthma, etc.) and establishing project processes (such as how to integrate program into school health services). The expected project outcome is an integrated and sustainable program that results in decreased morbidity and absenteeism due to asthma.

Rationale:
Pediatric asthma prevalence in North Texas (and Texas as a whole) has a significant negative impact on school-based learning, resulting in increased student absenteeism and decreased productivity for working parents.

Project Components:
No core components are required. However, the core activities for the project include training of school health services staff to do the following: (1) identify and document children with asthma, (2) encourage development of health care provider action plans, (3) track asthma trigger events and outcomes, and (4) perform respiratory treatment for asthma attacks. School districts will also have a consulting physician available to write standing orders for albuterol treatments for students with asthma. We anticipate these core project activities will prevent ED visits and reduce school absences.

The project team selected milestones and metrics to achieve project improvement targets. Our project approach is based on similar proven school-based approaches used in the St. Louis Metropolitan area (Moonie, et al., 2006; Richmond, et al., 2006; Moonie, et al., 2008; Wilson, et al., 2008; Wilson, et al., 2009). The project is being implemented in Region 10 based on the high-prevalence of asthma in children as mentioned above. Quality Milestone P-16- was selected to promote collaborative learning around shared or similar project.

Unique community need identification numbers the project addresses:
- CN.10 – Overuse of emergency department (ED) services
- CN.13 – Necessity of patient education programs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative to help asthmatic children manage their asthma through school-based clinics. In Tarrant County the only school district which has been found with a specific school-based asthma program is the Keller ISD. - The Keller ISD program is limited in scope and the health services director (Cindy Parsons, BSN, RN) has expressed an interest in participating as has Michael Steinert, MA, LPC, the health services director of Fort Worth ISD, the largest school district in Tarrant County. - This is a new initiative which is not receiving federal funds from other sources.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

a. **Outcome Measure 1: IT-3.11 Pediatric Asthma 30-Day Readmission Rate (Age group defined as those attending grades K-12 in the participating school districts)**

**Numerator:** The number of readmissions for asthma among students in participating school districts within 30 days of discharge from the index asthma admission. If an index admission has more than 1 readmission, only first is counted as a readmission.

**Denominator:** The number of admissions among students in participating school districts with a principal diagnosis of asthma and with a complete claims history for the 12 months prior to the admission.

*Improvement target:* By DY5, reduce the number of readmissions by 5% (estimated reduction of 1 readmit annually by DY5) from baseline.

**Rationale:** The outcome improvement target to reduce readmission rates by 5% is determined as a conservative estimate based on a similar proven approach used in the St. Louis metropolitan area. Using data from Cook Children’s Hospital for 2011 it is estimated there are up to 20 readmits annually due to asthma.

b. **Outcome Measure 2: IT-9.3 Pediatric/Young Adult Asthma Emergency Department Visits – NQF 1381**

**Numerator:** Numerator is all patients with asthma who have greater than or equal to one visit to the emergency department for asthma during the measurement period. (Percentage of students identified with asthma that have greater than or equal to one visit from the school to the emergency department for asthma during the measurement period).

**Denominator:** Denominator is all patients age two through age 20, diagnosed with asthma during the measurement period. (All students in K-12 identified with asthma during the measurement period)

**Improvement target:** By the end of DY5 reduce by 20% (Based on 60 ED visits from school annually, estimated reduction of 12 ED visits annually by DY5) from baseline the number of ED visits from school due to asthma.

**Rationale:** The outcome improvement target of reduction of school-based ED visits
due to asthma by 20% is determined as a conservative estimate from reduction rates seen from the implementation in the St. Louis metropolitan area over a similar time period, where the reduction was ~35%.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

Expand Chronic Care Management Models – Apply evidence-based care management model to patients identified as having high-risk health care needs – 2.2.2: ASTHMA 411 – A Sustainable School Based Asthma Program

- 126675104.2.16 JPS School-Based Chronic Care – JPS would be performing this program through their 19 school based clinics throughout Tarrant County. In discussions with Ms. Dowling at JPS, The Director of the School Based Health Centers, we have agreed to work out methods to better link/follow up visits by students to the clinics due to asthma (or other chronic conditions) at the schools participating in the Asthma 411 with the school nurses. This would improve recognition and management of those most at risk. Additionally, this would improve the ability to evaluate impact of the program through tracking of increases (ambulatory) or decreases (such as ED) in health care usage.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates - that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
Specifically, this project’s value was calculated on two outcomes, which included (1) pediatric asthma 30-day readmission rates and (2) pediatric/young adult asthma emergency department visits.

- For Pediatric Asthma 30-day Readmission Rates, UNT Health Science Center defined the population that will be directly impacted by the project as school age children (K-12) identified by school health services as having asthma in FWISD. We estimate that 20 school age children will be readmitted due to asthma-related illness. The percentage of the population expected to be positively impacted by the project is 5%, equating to 1 life positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $2,996 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,495 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

- For Pediatric/Young Adult Asthma Emergency Department Visits, UNT Health Science Center defined the population that will be directly impacted by the project as 138 school-age children (K-12) identified by school health services as having asthma in FWISD. The percentage of the population expected to be positively impacted by the project is 20%, equating to 28 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,200. For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $480 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $720 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Project Option 2.7.4 – Tarrant County Perinatal Health Promotion Initiative

Unique Project ID: 138980111.2.4

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: This project addresses the health and well-being of women - of reproductive age in Tarrant County through an outreach and home visitation intervention applied during the - interconception period. This project is a new initiative.

Need for the project: This project directly responds to a community priority – the reduction of infant mortality. Tarrant County has led the state in the highest rate of infant mortality for most of the past two decades. African American women in Tarrant County have high levels of risk factors for poor birth outcomes as indicated by the infant mortality rate for African American women (16.6 infant deaths per 1000 live births in 2010), a rate which is over twice that of other women in the county. Women who experience an adverse birth outcome are at an increased risk of having a subsequent adverse outcome (Adams, et al 2000, Mercer et al., 1999, Surkan et al., 2004).

Target population: Low income - women in Tarrant County - with previous adverse birth outcomes (preterm birth, low birth weight infant, infant death, infant with neural tube defect and stillbirth).- Estimated population served throughout the waiver period is - 150 - women.

Expected patient benefits: This project will improve care coordination for women with a history of poor birth outcomes, increase their access to medical and social services including family planning, - and provide needed patient education -- that will result in healthier lifestyles, improved infant health and reduced health care costs.

Category 1 or 2 expected patient benefits:

iii. 10% increase by DY4 and 20% (150 total) increase by DY5 over baseline of women in defined population who receive - interconception care intervention

iv. 10% increase by DY4 and 20% increase by DY5 in access to health programs and activities among program participants

Category 3 outcomes:

i. IT-8.2 – 5% reduction by DY4 and 10% reduction by DY5 from baseline in low birth weight births among participants

ii. IT-8.9 – 60% of women by DY4 and 65% (98) of women by DY5 achieve a pregnancy interval of at least - 9 months
**Project Description:**

**Project Area:** Implement Evidence-Based Disease Prevention Programs

**Project Intervention:** Implement innovative evidence-based strategies to reduce low birth weight and preterm births.

This project is a community-based interconception intervention targeting low-income women of reproductive age in Tarrant County that have experienced previous adverse birth outcome. The intervention employs intensive case management and peer health worker outreach and coordination to deliver services in the community setting (i.e., home visitation) to women who have experienced a previous adverse birth outcome (i.e., low birth weight, infant death, preventable birth defect, stillbirth, etc.). The goal is to reduce the chances of a subsequent poor birth outcome. Care coordination, health teaching, advocacy, counseling, social support and community services collaboration are interventions included in this case management model. For this project key social and medical preconception services include health care coverage, primary care/medical home, family planning, nutrition counseling, mental health counseling, substance abuse treatment, smoking cessation, financial counseling/assistance, and housing.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goals of this project are: increased awareness of the importance of positive preconception health behaviors, increased awareness of the importance of reproductive life planning, and optimal pregnancy spacing, increased access to care for high-risk women who have had previous adverse birth outcome, increased receipt of relevant community services and ultimately increases in positive interconception behaviors that should result in improvements in birth outcomes for women at risk of a subsequent adverse birth outcome or unintended pregnancy.

This project meets the following Regional goals:
This project meets a number of Regional goals, which are aligned with the goals of the Waiver and CMS’s triple aim. Improving birth outcomes and reducing the significant racial/ethnic disparities in birth outcomes are national, state and local priorities. Additionally, this project will provide needed patient education programs for women that will result in healthier lifestyles and reduced health care costs. This project also directly responds to a community priority: the reduction of infant mortality. Tarrant County has led the state in the highest rate of infant mortality for most of the past two decades. (Tarrant County Public Health, 2010) African-American youth and adult women in Tarrant County have high levels of risk factors for poor birth outcomes as indicated by the infant mortality rate for African-American women (16.6 infant deaths per 1,000 live births in 2010), a rate which is over twice that of other women in the county. (Tarrant County Public Health, 2011).
Challenges:
Preconception health conditions, such as asthma, obesity, diabetes, hypertension and other chronic diseases have been shown to increase adverse outcomes. (Johnson, et al., 2006; Atrash, et al., 2006) Health behaviors that place women at risk for a poor birth outcome include a history of sexually transmitted infections, tobacco use, alcohol use, illegal drug use and short pregnancy intervals. Women who experience an adverse birth outcome are at an increased risk of having a subsequent adverse outcome (Adams, et al. 2000, Mercer et al., 1999, Surkan et al., 2004). The interpregnancy period is an opportune time, if not only time for many low-income women, to provide interventions for women who have had a previous adverse outcome, maternal health condition or behavior. However, most low-income women lack access to health services and related health promotion programs in between pregnancies. Unintended pregnancies are associated with greater risks for adverse birth outcomes, particularly when other high-risk variables are present and not managed, such as smoking, substance abuse, obesity, and other medical conditions such as diabetes and hypertension. (Pulley, et al, 2002, Orr, et al, 2000). Research also shows that women with unwanted pregnancies are more likely to smoke, use alcohol, use illegal drugs, enter prenatal care in the last trimester and less likely to breastfeed. (Pulley, et al, 2002, Orr, et al, 2000). These poor health conditions, behaviors and poor birth outcomes disproportionately affect low-income and minority women.

5-Year Expected outcome for Provider and Patients:
Increase in the number of low income women of reproductive age in Tarrant County who receive - interconception health education - and preventive services-and reduction in risks indicated by a previous adverse outcome. Over the period of the project the following metrics will be met: the development, implementation and evaluation of the evidence-based project; at least - 150 patients (cumulative from DY3, DY4 and DY5) in defined population will receive intervention consistent with evidence-based model

Starting Point/Baseline:
This is a new project that will address the health and well-being of women of reproductive age in Tarrant County through interventions applied during the interconception period. This project will target low-income women with previous adverse birth outcomes to reduce the possibility of subsequent poor birth outcomes such as preterm birth, low-birth weight, infant mortality, neural tube defects and stillbirths. Baseline information on type of previous adverse outcomes will be collected from program participants during program enrollment and will be used to develop individualized service plans.

Rationale:
Texas spends over $2.2 billion per year in the Medicaid program for birth and delivery services. Half of the births in Texas are Medicaid births. Costs related to infant care are increasing and NICU utilization is growing. Over 60% of Medicaid program birth and delivery costs are for extremely premature babies (51.3%) or premature infants with problems (10.8%).
Approximately $63,124 is spent on the first year of life for every premature infant compared to $404.00 for a term infant. (Lakey, 2012) These statistics provide a compelling economic case for improving - the interconception health of women in Tarrant County, especially African-American women. Addressing risk factors for poor birth outcomes during the preconception (prior to pregnancy), and interconception (between pregnancies), is a recommended evidence-based approach to improving the health of women and infants.

The proposed - interconception intervention- corresponds to the CDC’s recommendations to improve preconception health published in 2006. (Johnson, et al., 2006).

The interventions are based on evidence the CDC used to support their recommendations, evidence-based best practices (e.g., Magnolia Project, Grady Memorial Interpregnancy Care Program), information gathered from existing community assessments (e.g., Fort Worth Women’s Health Assessment) and information that will be collected from potential program participants via focus groups and in-depth interviews as part of a currently funded study.

**Project Components:**

The project components (consumer awareness, access to preventive care and family planning and community services, outreach, education, - peer support and intensive case management services) were selected because they enhance the access and care delivery infrastructure by strengthening the link between the women, clinical health care providers and community health and social services. This approach addresses social health needs that contribute to poor clinical outcomes that can best be addressed in the context of community. Because the focus is primarily on non-pregnant women of childbearing age, - including social -contributors to poor outcomes, the proposed project will engage a wide group of health and social providers.

These milestones and metrics were selected based on their ability to accurately assess improvements in risk reduction that will improve birth outcomes in the target population. The milestones and metrics are based on best practices from evidence-based interventions. This project will fill a gap in the local community for programs and services that address interconception health. Quality Milestone P-7- was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**

- CN. 11 – Need for more care coordination
- CN. 13 – Necessity of patient education programs
- CN. 15 – Need for more education, resources and promotion of health lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This is a new project for this institution that will fill a gap in the local community for programs and services that address -interconception health through consumer awareness, access to care and
community services, outreach, education, peer support and intensive case management services. There is currently no other federal funding being received for this project.

**Related Category 3 Outcome Measures:**

**Outcome Measure 2:** IT-8.2 Percentage of Low Birth-weight Births
**Rationale:** Low birth weight is considered one of the most important indicators of a newborn’s chances of survival, with low birth weight being a major risk factor for perinatal and infant mortality. Low birth weight babies are more likely to have health and developmental problems including learning difficulties, hearing and visual impairments, and chronic respiratory problems such as asthma and chronic diseases later in life.

**Outcome Measure 3:** IT-8.9 Other Outcome Improvement Target: Interpregnancy interval/birth spacing
**Rationale:** The improvement target is to achieve a pregnancy interval of at least 9 months of a previous birth among 65% (98) of the women enrolled in the interconception intervention. Spacing of less than six months is highly predictive of a subsequent poor birth outcome and pregnancy intervals of 12-18 months are associated with high rates of uterine rupture, maternal morbidities, preterm birth, low birth weight, and small for gestational age infants.

**Relationship to Other Projects:**
138980111.2.1 Promoting Physical and Mental Health Among At-risk, Underserved African-American Pre-teen Girls in Tarrant County. These projects are related because they represent a continuum of services across the reproductive life course for at-risk girls and women in Tarrant County. The Promoting Physical and Mental Health Among At-risk, Underserved African-American Pre-teen Girls in Tarrant County focuses on self-esteem and decision-making in young girls- antecedents to positive preconception health behaviors, while the Perinatal-Health Promotion project focuses on women at risk for poor outcomes.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Implement Evidence-based Disease Prevention Programs - Implement innovative evidence-based strategies to reduce low birth weight and pre-term births - 2.7.4: Tarrant County - Perinatal Health Promotion Initiative

- 126675104.2.15 JPS Health Network-Journey to Life-This project will provide a source of high-quality and evidence-based prenatal care for pregnant women. Existing relationships between UNT Dept of Ob/Gyn and JPS will facilitate seamless referrals into early prenatal care and timely postpartum care.
- 130614405.2.3 Texas Health Arlington Memorial Prenatal Care
028817305.2.1 Tarrant County Public Health FIMR-The Perinatal - Health Promotion Initiative interventions will be guided by findings of the FIMR. This will ensure that interventions will reflect the birth outcome experiences of women in Tarrant County and respond to identified gaps in services, behaviors, etc. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

a. Specifically, this project’s value was calculated on two -outcomes, which included (1) - percentage of low birth-weight births, - and (2) Interpregnancy interval/birth spacing. -For Percentage of Low Birth-weight Births, UNT Health Science Center defined the population that will be directly impacted by the project as women with previous low weight births, which would be approximately 50 patients. The percentage of improvement by the project is 10%, equating to 5 lives positively impacted by this outcome.-

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $44,482. -For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $26,689 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $26,689 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
b. For Other Outcome Improvement Target: Interpregnancy Interval/Birth Spacing, UNT Health Science Center defined the population that will be directly impacted by the project as women with previous adverse birth outcome, including infant mortality, which would be approximately 150 women. The improvement target is to achieve a pregnancy interval of at least 9 months of a previous birth among 65% of the women enrolled in the interconception intervention, equating to 98 lives positively impacted.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $51,589 (as cited in the article, “Preterm Birth: Causes, Consequences, and Prevention, Chapter 12: Societal Costs of Preterm Birth” in the journal National Academies Press) due to the reduction in the cost for care of infants born preterm.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $30,953 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $30,953 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Project Option 2.12.2 – Discharge Planning and Care Coordination for Medicaid-eligible elders

Unique Project ID: 138980111.2.5
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: This project will implement an enhanced transition of care program for discharged Medicaid eligible elders of Tarrant County that includes a transition of care coordinator and in home medical care team. The team will facilitate an enhanced discharge plan, coordinate care, and provide evaluation and treatment. This model will provide collaboration between clinical and administrative representatives from a number of health care providers. This is a new initiative for UNTHSC that utilizes an enhanced discharge planning process to improve the health of discharged patients and reduce hospital re-admission rates and does not overlap with projects 1389800111.1.2, 138980111.1.3, or 138980111.1.6 though it can provide services to patients from those program who are hospitalized and transition them from the hospital back to those programs.

Need for the project: This project will contribute to achieving the region goal of improved access to chronic care services by focusing on a key population, low-income seniors, which the community needs assessment has found to be the population experiencing the highest growth rate, as well as the costliest. Additionally, the enhanced discharge plan will reduce hospital re-admissions, which is a very costly health burden to RHP 10 and CMS.

Target population: Medicaid eligible elders discharged from hospitals in Tarrant County are the targeted population. It is estimated that 750 Medicaid eligible elders will be served by this project.

Expected patient benefits: Medicaid elders suffer from multiple chronic conditions and are at high risk for hospital admissions followed by re-admissions, which is a financial drain on the medical care system. This project will improve the health of those served, better manage the chronic conditions and reduce health expenditures.

Category 1 or 2 expected patient benefits: This project seeks to serve 750 patients, implement standard care transition processes, identify and report on conditions, socioeconomic factors or other characteristics resulting in highest rates of re-admissions for 15% (113) of discharged targeted patients by DY4 and 25% (188) by DY5 - and increase percent of targeted patients in case management registry by 20% (15) by DY4 and 40% (300) by DY5.

Category 3 outcomes:

v. IT 3.1 Our goal is to reduce readmission rates by 5% (8 readmissions prevented) over baseline by DY4 and 10% (15 readmissions prevented) over baseline by DY5.

vi. IT 10.1 Our goal is to improve Quality of Life scores by 5% over baseline by DY4 and 10% over baseline by DY5.
vii. IT 4.5- Our goal is to reduce the number of falls by 5% (13 falls prevented) over baseline by DY4 and 10% (23 falls prevented) over baseline by DY5.
Project Option 2.12.2 – Discharge Planning and Care Coordination for Medicaid-eligible elders

Unique Project ID: 138980111.2.5
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Project Description:
Project Area: Implement/Expand Care Transitions Programs
Project Intervention: Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population: Implement a discharge planning program and postdischarge support program to prevent rehospitalizations in Medicaid-eligible elders

This project proposes a delivery model which will include an in home medical care team that coordinates care and provides evaluation and treatment with existent home health care services and will be implemented for discharged Medicaid-eligible community dwelling Tarrant County older adults. This model will provide collaboration between clinical and administrative representatives from acute care, skilled nursing, ambulatory care, health centers and home care providers. Each discharged older adult will have a plan of care developed that includes discharge phone calls and visits by some of the members or the in home medical care team consisting of a PA/NP, Medical Assistant, Social Worker Care Coordinator and PT under the supervision of a geriatrician within the first 72 hours from discharge. The PA/NP and Medical Assistant will receive the discharge plans from the hospital and have full access to the hospital records in order to provide medication reconciliation with home medication lists, evaluate the patients’ clinical, cognitive, and functional status and provide patient and family health education. The Social Worker Care Coordinator will collaborate with the Hospital Discharge Planner and identify the psychosocial and financial needs of the patient and provide assistance with referrals to appropriate aging network provider agencies. The PA/NP under the supervision of the geriatrician will develop and individualized plan of care and provide appropriate in home visits with the home health care program weekly until the patient has reestablished his or her baseline health status and is ready to return to his or her primary care practitioner. The PT will be responsible for evaluating/assessing home safety and needs of discharged patients and formulating treatment plans in a home care environment. Individual level of fall risk will be assessed with necessary interventions provided to further reduce risk of hospitalization. Evidence-based strategies and clinical protocols will be utilized that will support the seamless care transitions and reduce the preventable 30-day rehospitalizations. As mentioned, once successful transition back to home and stability is accomplished, the older adult will return to the prior primary care practitioner. Coordination will occur with the primary care practitioner regarding the post hospital needs of the vulnerable elder and detailed plan of post hospital care.
Goals and Relationship to Regional Goals:

Project Goals:
The purpose of performing this project is to decrease the multiple causes of rehospitalization for Medicaid-eligible older adults which, in turn, will provide a substantial cost savings to the health care system and to implement a successful discharge planning and postdischarge support program. The five-year goals of this project are to reduce rehospitalizations among Medicaid-eligible elders living in the community in Tarrant County by implementing the following: (1) implement and enhance the discharge planning process and services, (2) increase access to care coordination post hospital discharge and (3) provide an interprofessional in home care team to evaluate and manage the vulnerable older adult in their homes post hospitalization.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to chronic care services. This project would contribute to achieving that goal by focusing on a key population, low-income seniors, which the Community Needs Assessment has found to be the population experiencing the highest growth rate, as well as the costliest.

Challenges:
The rates of rehospitalizations are higher in the two weeks following discharge for older chronically ill adults. The cause of rehospitalizations has been linked to poor information transfer between the hospital and the patient and family members and the primary care offices, lack of consistent medication reconciliation, lack of in home care and services and need for closer disease management for patients with exacerbations of chronic disease processes or new diagnosis. Especially for the older adults who return home, the convalescence period represents an increased potential for falls due to their deconditioned state, combination of medical factors, and the sometimes overwhelming task of coping with the transition of care. The transition for these older adults back home may be marked by inaccurate medication lists that may cause adverse drug reactions, lack of attention to the medical condition that prompted the hospitalization because of inability to get in to see the primary care physician in a timely manner, lack of understanding about the discharge instructions from the hospital, lack of in home services or equipment that are necessary to remain independent in the home to name a few. This project aims to decrease the multiple causes of rehospitalization for Medicaid-eligible older adults which, in turn, will provide a substantial cost savings to the health care system and to implement a successful discharge planning and postdischarge support program.

5-Year Expected outcome for Provider and Patients:
At the end of the Waiver period this project expects to demonstrate an enhanced discharge planning process, an increased access to care coordination post hospital discharge and decreased rehospitalizations for this Medicaid-eligible population of older adults. The 5-year outcomes of
this project are to: 1) reduce all-cause 30-day readmission rates by 10% (15 readmissions prevented) over baseline for patients receiving intervention, 2) improve quality of life scores (SF-36) by 10% over baseline for patients receiving intervention, and 3) decrease the number of falls by 10% (23 falls prevented) over baseline for patients receiving intervention. These goals will be achieved through hiring of new providers and staff and deployment of an enhanced discharge planning process and in home care coordination model for Medicaid-eligible community dwelling elders of Tarrant County.

**Starting Point/Baseline:**
This project is designed to provide transitions services to hospitalized elders receiving services from hospitals who have affiliations with UNTHSC Division of Geriatrics. Baseline data will be collected in DY3 for the Medicaid-eligible older adults in Tarrant County regarding: 1) rehospitalization rate, 2) quality of life scores, and 3) number of falls and injuries possibly related to these falls.

**Rationale:**
The proposed expanded care transitions project that includes geriatrician oversight of a team comprised of a PA/NP, Medical Assistant, Physical Therapist and Social Service Coordinator to provide the assessments and the services for discharged older patients will decrease the rehospitalization rates of this vulnerable population, and therefore, save Medicare hospitalization costs. This project will also provide enhancement of the discharge planning process for the Medicaid-eligible elder population.

**Project Components:**
The proposed expanded care transitions project that includes geriatrician oversight of a team comprised of a PA/NP, Medical Assistant, Physical Therapist and Social Service Coordinator to provide the assessments and the services for discharged older patients will decrease the rehospitalization rates of this vulnerable population, and therefore, save Medicare hospitalization costs. This project will also provide enhancement of the discharge planning process for the Medicaid-eligible elder population.

**Project Components:**
There are no required core project components for this project area. Core activities of this project will include discharge checklists, hand off communication plans with receiving providers, patient and family education initiatives including patient self-management skills and “teach-back”, postdischarge.

By achieving our milestones of developing and implementing best practices for effectively communicating with patients and families and implementing standard care transition processes, we will accomplish our goals of reducing rehospitalization, improving quality of life scores and
decreasing the number of falls for Medicaid-eligible receiving the intervention. Quality Milestone P-12- was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
- CN.11 – Need for more care coordination
- CN.9 – Need for increased geriatric, long-term, and home care resources

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

Outcome Measure 1: IT 3.1 All-cause 30-day readmission rate – NQF 1789: 1 All-cause 30-day readmission rate for Medicaid-eligible elders 65 and above who are hospitalized at local partners of the UNTHSC Division of Geriatrics. Improvement goal is 5% (8 readmissions prevented) reduction in all-cause hospitalization rate over baseline in DY4 and a 10% (15 readmissions prevented) reduction in all-cause readmission rate over baseline in DY5.

Rationale: Approximately 20% of Medicaid-eligible elders are readmitted to hospitals within 30 days of discharge, which is a significant financial drain. Through implementation of our discharge planning and care coordination model, we will reduce 30-day readmission rates thereby providing a substantial cost savings.

Outcome Measure 2: IT 10.1 Quality of Life – Demonstrate improvement in quality of life (QOL) scores, as measured by evidence-based and validated assessment tool, for the target population.
Rationale: QOL is related to a range of diseases as well as health status, which in turn can be utilized to guide interventions (CDC). Higher QOL is related to improved utilization of medical services and reduced overall health costs. Through implementation of this discharge planning and care coordination model, we will significantly improve quality of life, which will have substantial positive impacts on other areas of health thereby offering significant cost savings.

Outcome Measure 3: IT 4.5 Patient Fall Rate – NQF 0141 -Rationale: Falls among the elderly is a significant health care issue. Every 18 seconds an older adult is treated in an ED for falls, which is the leading cause of hospital admissions for trauma among the elderly. Approximately one third of older adults fall each year in the U.S. The project will have targeted fall prevention education provided to patients. Preventing future falls will have a significant impact in reducing hospital 30-day readmissions among this targeted population.
Relationship to Other Projects:
138-980111.1.3 Expand Primary Care Capacity – Expand Existing Primary Care Capacity – 1.1.2: Expanding Geriatric Primary Care and Consultative Services to Medicaid-eligible Elders. The current project will support and reinforce the Expanding Geriatric Primary Care and Consultative Services project as it will provide evidence-based transitions of care to all hospitalized Medicaid-eligible patients seen by the UNTHSC Geriatrics Clinic. Therefore, these projects will work in tandem serving hospitalized Medicaid-eligible elders.

138-980111.1.2 Expand Primary Care Capacity – Expand Mobile Clinics -1.1.3: Community-Based Primary Care for the Elderly. Many hospitalized poor elderly do not have regular access to geriatric primary care (or other primary care services). Therefore, the Community-Based Primary Care for the Elderly will provide a referral mechanism for hospitalized elders being discharged from the hospitals. The transitions-care teams will work with patients regarding discharge plans and provide a seamless transition to the Community-Based program for follow-up primary care services. Together, these programs will provide optimal evidence-based care that will reduce further hospitalizations.

This project serves hospitalized patients, which are not provided discharge services by projects 138980111.1.3, 138980111.1.2, and 138980111.1.6. The goals of this project will be examined independently of all other projects.

N/A for non-hospital providers

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Specifically, this project’s value is calculated on three outcomes, which include (1) patient fall rate, (2) quality of life/functional status – quality of life, (3) 30-day readmission rates.
a. For Patient Fall Rate, UNT Health Science Center defined the population that will be directly impacted by the project as elderly patients who are eligible for coverage by Medicaid, which we have estimated to be approximately 750. It is anticipated 30% of these patients (225) will be experience a fall. The percentage of improvement is expected to be 10% (23 falls prevented).

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $17,500 (as cited in the article “Cost of Falls Among Older Adults” by the CDC).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $14,000 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as Elderly patients who are eligible for coverage by Medicaid, which we have estimated to be 750 individuals. We are anticipating that we will test the entire population, and are expecting to increase the quality of life scores for the project by 10%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755 (as cited in the article “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”,

due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For 30-Day Readmission Rates, UNT Health Science Center defined the population that will be directly impacted by the project as elderly patients who are eligible for coverage by Medicaid and receive care from UNT HSC Division of Geriatrics physicians – which was 750 patients in FY 2011. It is anticipated that 20% of these patients (150) will be readmitted within 30 days of discharge. Our goal is to reduce hospitalization rates by 10% (15 readmissions prevented).

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data). For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $5,993 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved with the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $7,800,499
Project Option 2.13.1 – Health Navigation and Incentives for Dual Diagnosis Patients

Unique Project ID: 138980111.2.6
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: A technology-enhanced navigation program for high-risk dual diagnosis patients will be developed, implemented, and evaluated. The project will draw on prior research on brief patient navigation systems that utilize motivational interviewing and wellness incentives to specifically target the relationship between substance abuse and mental health in this high-risk population. This project is a new initiative.

Need for the project: The primary goals are to reduce alcohol and drug use indicators (use, problems, severity), to reduce depression symptomatology (as measured by the PHQ-9), and to improve quality of life (as measured by the Q-LES-Q) among a group of previously homeless individuals residing in the Ft. Worth Permanent Supportive Housing (PSH) programs, who meet criteria for a co-occurring disorder. This project supports the regional goals of increasing access to mental health services, and improving coordination of care for more vulnerable individuals.

Target population: Dually-diagnosed patients enrolled in Ft. Worth permanent supportive housing (PSH) programs. Residents in PSH programs have typically demonstrated a history of chronic homelessness, which includes a disabling health, mental health or substance abuse condition. Estimated 300 patients.

Expected patient benefits: Reduce alcohol/drug use, reduce depression symptoms, and improve quality of life of dually-diagnosed diagnosis patients residing in the Fort Worth PSH programs by increasing access to mental health services, raising individual motivation to change, and improving coordination of care for more vulnerable individuals. We expect to reduce alcohol and drug use indicators by at least 5% each in Years 4 and 5, for a total of 10% reduction. We expect to remit depression symptoms by at least 5% each in Years 4 and 5, for a total of 10% remission among patients who report moderate to severe depression. We expect to increase quality of life scores by at least 5% each in Years 4 and 5, for a total of 10% improvement. Finally, as a result of decreased drug and alcohol use, we expect to reduce admits to the criminal justice system by 2.5% each in Years 4 and 5, for a total of 5% reduction. Most outcomes refer to a reduction in mean scores for the group; for depression remission, the total number of people impacted will depend on enrolled participants’ baseline scores on the PHQ-9.

Category 1 or 2 expected patient benefits:
viii. 2.5% decrease over baseline by DY4 and 5% decrease over baseline by DY5 in preventable admissions and readmissions into Criminal Justice System
ix. Reduce alcohol/drug use and problems by at least 5% over baseline by DY4 and 10% over baseline by DY5

Category 3 outcomes:
i. IT-1.9 – Remission of depression symptoms for 5% of patients by DY4 and 10% of patients by DY5 as evidenced by a reduction of PHQ-9 scores greater than 9 (i.e., at least moderate depression) to less than 5 (i.e., minimal or no depression). The total number of people impacted will depend on baseline scores of enrolled participants on the PHQ-9.

ii. IT-10.1 – 5% increase from baseline by DY4 and 10% increase from baseline by DY5 in quality of life scores as measured by the Quality of Life Enjoyment and Satisfaction Questionnaire (Q-LES-Q)
Project Option 2.13.1 – Health Navigation and Incentives for Dual Diagnosis Patients

**Unique Project ID:** 138980111.2.6  
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Project Description:**

**Project Area:** Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting

**Project Intervention:** Design, implement, and evaluate research-supported and evidence-based interventions tailored toward individuals in the target population.

A technology-enhanced navigation program for high-risk dual diagnosis patients will be developed, implemented, and evaluated. The project will draw on prior research on brief patient navigation systems that utilize motivational interviewing and wellness incentives to specifically target the relationship between substance abuse and mental health in this high-risk population (Olsen & Nesbitt, 2010; Lundahl & Burke, 2009). The project team has extensive experience designing and implementing motivational interviewing interventions for similar populations (Neff, et al., in press; Pengchit et al., 2011; Walters, et al., 2007).

Our subject population will include 300 previously homeless individuals residing in Ft. Worth Permanent Supportive Housing (PSH) programs. PSH programs combine housing rental vouchers with limited case management services around basic needs. Residents in PSH programs have typically demonstrated a history of chronic homelessness, which includes a disabling health, mental health or substance abuse condition. Targeting PSH residents will allow us to reduce attrition and to pilot test our health intervention to best determine efficacy and effectiveness. In addition, we will have the added benefit of providing data integrity and fidelity through the use of PSH case manager confirmation of substance use slips and/or relapses.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
Reduce alcohol/drug use and problems by at least 10% over 2 years; reduce depression scores by 10% over 2 years; improve quality of life scores by 10% over 2 years; reduce criminal justice admits by 5% over 2 years.

This project meets the following Regional goals:
Our primary goals are to reduce alcohol and drug use indicators (use, problems, severity), to reduce depression symptomatology (as measured by the PHQ-9), and to improve quality of life (as measured by the Q-LES-Q) among a group of previously homeless individuals residing in Ft. Worth PSH programs, who meet criteria for a co-occurring disorder. Recruiting from this pool
will allow us to test our health intervention on a well-defined and accessible population before it is disseminated to the larger group of dual diagnosis Medicaid patients in Tarrant County. This project supports the Regional goals of increasing access to mental health services, and improving coordination of care for more vulnerable individuals.

**Challenges:**
More than 5 million Americans have a co-occurring mood and substance use disorder, also called dual diagnosis (Center for Substance Abuse Treatment, 2007; Kessler et al., 2005). Roughly 30% of people diagnosed with any mental illness abuse alcohol or drugs, and about 50% of those with severe mental illnesses have substance abuse problems. People with co-occurring disorders have a much greater likelihood of violence, medication noncompliance, and treatment failures, than people with only substance abuse or mental illness. As a consequence, people with dual diagnosis are more likely to have acute medical crises that propel them into the hospital emergency center. For instance, in sample of dual diagnosis Medicaid-eligible patients in Tarrant County, 60% had chronic medical illnesses that required regular doctor visits (Nejtek et al., 2011). Finally, people with co-occurring disorders are much more likely to be homeless or jailed. In Tarrant County, an estimated 2,123 people meet the official definition of homeless (Tarrant County Homeless Coalition, 2012). The most recent analysis of this data showed that about 55% of the sheltered homeless population is considered trimorbid, which includes the DSM-IV criteria for co-occurring psychiatric and substance use disorders, as well as at least one chronic health condition. The demographics of this population are 63% male and 37% female with an age range of 24-68 years. The vast majority are either African-American (52%) or White (46%) (Spence-Almaguer, et al., 2012). This project will address the syndemic problems of substance abuse and mental health in this high-risk population, with a targeted intervention that utilizes motivational interviewing, an evidence-based counseling style (Miller & Rollnick, 2012), and wellness incentives. Navigators will meet with patients in the community 1-2 times per month to help identify health and wellness needs, while providing them with referral to medical or mental health resources. Patients will have access to a wellness account of up to $1000 per year to purchase navigator-approved supplies and services related to their health goals. A computer tracking system will assist the health navigator in tracking patient goals and conducting the interview. Our goals over 2 years are to reduce alcohol/drug use and problems by at least 10%; remit depression by 10%; improve quality of life scores by 10%; and reduce criminal justice admissions by 5%.

**5-Year Expected outcome for Provider and Patients:**
Reduce alcohol/drug use, reduce depression symptoms, and improve quality of life of dually-diagnosed diagnosis patients residing in the Ft. Worth PSH programs. Our goals are to reduce alcohol/drug use and problems by at least 10%, improve quality of life by 10%, and to reduce depression symptomatology by 10% over 2 years. Most outcomes refer to a reduction in mean scores; for depression remission, the total number of people impacted will depend on baseline
scores of enrolled participants on the PHQ-9.

**Starting Point/Baseline:**
The first aim is to conduct a baseline needs assessment and establish a database linking providers who serve dual diagnosis patients in Tarrant County. The second aim is to develop and implement a behavioral intervention to reduce alcohol/drug use, reduce depression symptomatology, and improve quality of life in a group of dually-diagnosed patients residing in the Ft. Worth PSH programs. Substance abuse and depression frequently co-occur. Recent data from the PSH programs showed that 20% thought they had a problem with drugs or alcohol in the past 2 weeks (the screening question asked only about problem perception, not actual severity, which is likely much higher). The majority of patients demonstrated some level of dissatisfaction with their physical health (60.5%) and mood (59.9%), which when added to income (75.7%) comprise the three most problematic areas in the quality of life assessment. Between one-third and one-half of PSH residents reported regular frequency of depression and related symptoms such as: stopping enjoying things they used to enjoy (36.4%), difficulty concentrating, having racing thoughts or feeling out of control (37.8%) and having periods of intense unease or anxiety (48%). Overall, 35% reported dissatisfaction with their general happiness and more than one-quarter reported medication management problems during the prior two weeks.

**Rationale:**
People with co-occurring disorders have a much greater likelihood of violence, medication noncompliance, and treatment failures, than people with only substance abuse or mental illness. As a result, they are more likely to be homeless and to present in hospital or criminal justice settings.

**Project Components:**
The project contains all of the core components, including:

- e. Assess size, characteristics and needs of target population(s)
- f. Review the literature/experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes
- g. Develop project evaluation plan using qualitative and quantitative metrics to determine outcomes
- h. Design models which include an appropriate range of community-based services and residential support
- i. Assess the impact of interventions based on standardized quantitative measures and qualitative analysis relevant to the target population.

Substance use, depression, and quality of life are major indicators of mental health functioning, and appropriate for patients with a co-occurring mental health and substance abuse diagnosis.
Our pilot data suggest that the improvement milestones of reducing alcohol and drug use and problems by at least 10%, improving quality of life by 10%, and reducing depression symptomatology by 10% over 2 years are justified based on past work with similar community populations. Quality Milestone P-3 was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
- CN.4 – Lack of access to mental health services
- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**Outcome Measure 1: IT-1.9: Depression management: Depression Remission at 12 Months (NQF #0710)**
Reduction in depression symptomatology as measured by the PHQ-9. **Improvement Target:** By DY5, 10% of patients who report moderate to severe depression will have a significant reduction in depression symptomatology, as evidenced by a reduction of PHQ-9 scores greater than 9 (i.e., at least moderate depression) to less than 5 (i.e., no depression). The total number of people impacted will depend on baseline scores of enrolled participants on the PHQ-9.

**Rationale:** The improvement milestone of remitting depression symptomatology for at least 10% of patients is justified based on published research with similar community populations (Baker et al., 2012; Westera et al., 2011).

**Outcome Measure 2: IT-10.1 Quality of Life**
Demonstrate improvement in quality of life (QOL) as measured by evidence-based and validated assessment tool for the target population. **Improvement Target:** By DY5, 10% increase in quality of life scores for the target population as measured by the Quality of Life Enjoyment and Satisfaction Questionnaire (Q-LES-Q). **Rationale:** The improvement milestone of improving quality of life by at least 10% is justified based on published research with similar community populations (Lundahl & Burke, 2009).

**Relationship to Other Projects:**
Our project does not relate to any other UNTHSC projects.
N/A for non-hospital providers

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting - Design, implement, and evaluate research-supported and evidence-based interventions tailored towards individuals in the target population – 2.13.1: Health Navigation and Incentives for Dual Diagnosis Patients

- 126675104.2.3 This project will be closely coordinated with the JPS “Care Connections for the Homeless” project. Our project specifically targets supportive housing tenants who have co-occurring mental health and substance abuse problems. This subgroup of people transitioning out of homelessness has special needs that may benefit from our more intensive navigator project, which specifically targets those with substance abuse and mental health problems. Staff of this project will regularly meet with JPS and actively cross-refer patients for the unique services delivered by the “Care Connections for the Homeless” and vice versa.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

Specifically, this project’s value is calculated on two outcomes, which include (1) depression management and (2) Quality of Life.

a. For Depression Management: Depression Remission at Twelve Months, UNT Health Science Center defined the population that will be directly impacted by the project as 300 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are expecting to decrease depression symptomatology for at least 10% of patients, equating to 30 lives positively impacted by this outcome. - -.
Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as 300 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are anticipating that we will test the entire population, and are expecting to increase quality of life scores by 10%.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16,750 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. - This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s
payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Milestone 9- Estimated Incentive Payment (maximum amount): $559,749**

**Year 2 Estimated Milestone Bundle Amount: (add incentive payments amounts from each milestone): $2,507,833**

**Year 3 Estimated Milestone Bundle Amount: $2,616,215**

**Year 4 Estimated Milestone Bundle Amount: $2,798,741**

**Year 5 Estimated Milestone Bundle Amount: $2,704,098**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add milestone bundle amounts over Years 2-5): $10,626,887**
Regional Healthcare Partnership

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program

Unique Project ID: 186221101.2.1

Performing Provider Name/TPI: Methodist Mansfield Medical Center / 186221101

Provider: Methodist Mansfield Medical Center is a 168-bed facility in southeast Tarrant County serving a 403 square mile area and a population of approximately 387,000. Methodist Mansfield Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, nearly twenty-nine percent of Methodist Mansfield’s patients were Medicaid eligible or uninsured representing $78 million in charges for those services.

Intervention: To provide patient navigation services in the ED to patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will connect patients to primary and preventive care and increase access to care management and/or chronic care management which should improve unnecessary ED utilization as well as the health condition of those most at risk for costly chronic conditions. This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Need for the project: A major goal of the region is to reduce the unnecessary utilization in the Emergency Departments of the DFW hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients that are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the region as well as provide a knowledge base that could be applied to other regional hospitals.

Target population: The target population is frequent users of the emergency department, defined as six or more visits per year, estimated to be 7.3% of total ED visits, or 3,700 patients per year. Approximately 43% of our ED patients are either Medicaid eligible or uninsured so we expect about 43% of the patients helped by the program to be Medicaid eligible or uninsured.

Category 1 or 2 expected patient benefits: I-6 Increase number of PCP referrals for patients without a medical home who use the ED, urgent care and/or hospital services. Improvement Target: Baseline will be established in DY3 which is expected to be 3,705 targeted patients identified as frequent users of ED services. The project seeks to refer at least 50% of this target population or 1,835 to a more appropriate primary care setting for follow up care in DY4 and 70% of the original baseline referred to primary care in DY5. I-8 Reduction in ED use by identified ED frequent users receiving navigation. Improvement Target: Baseline will be established in DY3 which is expected to be 1,835. The project seeks to realize a 2.5% reduction over baseline expected in DY4 and an additional improvement of 2.5% of the prior year in DY5.

Category 3 outcomes: IT-9.2 Appropriate ED Utilization. Improvement Target: Baseline will be established in DY3 which is expected to be 1,835. Decrease utilization of ED patients from baseline by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5. IT-3.1 All cause 30 day readmission rate. Improvement Target: Baseline will be established in DY3 which is expected to be 252 readmissions. Decrease readmissions to the hospital from baseline targeted population by 2.5% in DY4 and an additional reduction of 2.5% over prior year in DY5. These improvement milestones and outcomes support the project’s objective to reduce utilization of high cost
Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program

Unique Project ID: 186221101.2.1
Performing Provider Name/TPI: Methodist Mansfield Medical Center / 186221101

Project Description:
This project will provide patient navigation services in the emergency department to targeted patients who are at high risk of disconnecting from institutionalized health care services or are identified as not having a primary care physician and/or medical home to address their needs. This project will identify frequent ED users and use navigators as part of a preventable ED reduction program. This project will increase the number of people trained and deployed for innovative health services such as social workers. This project will connect patients to primary and preventive care and increase access to care management and/or chronic care management. This project should improve the utilization of unnecessary ED utilization as well as improve the health condition of those most at risk for costly chronic conditions.

This project will apply to the following ZIP codes in the hospital service area that fall within Region 10: 76001, 76002, 76016, 76017, 76018, 76060 and 76063. Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment. Region 10 and Tarrant County data indicate that the 26% of non-elderly individuals who are without health insurance exceeds the nearly 19% nationally of non-elderly individuals are without health insurance. These rates increase for individuals with lower incomes. Minority and low-income individuals without insurance generally lack a regular source of medical care, and suffer from medical conditions that are either preventable or easily treated in the outpatient setting.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to utilize community health workers, case managers or other types of health care professionals as patient navigators to provide enhanced social support and culturally competent care to vulnerable and/or high-risk patients. Patient navigators will help and support these patients to navigate through the continuum of care services. Patient Navigators will ensure that patients receive timely, coordinated and site appropriate health care services. Navigators may assist in connecting patients to primary care physicians and/or medical home sites, as well as diverting non-urgent care from the ED to site-appropriate locations. Implementing this project
will identify health care workers, case managers or other types of health professionals needed to engage with patients in a culturally and linguistically appropriate manner that will be essential to guiding the patients through the integrated health care delivery systems.

This project meets the following Regional goals:
A major goal of the Region is to reduce the unnecessary utilization in the Emergency Departments of the Region 10 hospitals. This project will contribute to that goal by providing patient navigation resources that would identify patients who are eligible to receive care in a more appropriate setting. This project will impact a specific portion of the population in the Region as well as provide a knowledge base that could be applied to other Regional hospitals.

Challenges:
Emergency Departments have become a vital source of care for those without insurance who generally lack a source of primary care, since they are required to evaluate and treat patients regardless of the ability to provide payment. Consequently, although care delivered through the ED is frequently for non-urgent problems, it is substantially more costly than care delivered in a more appropriate setting. Region 10 and Tarrant County data indicate that the 26% of non-elderly individuals who are without health insurance exceeds the nearly 19% nationally of non-elderly individuals are without health insurance. These rates increase for individuals with lower incomes. Minority and low-income individuals without insurance generally lack a regular source of medical care, and suffer from medical conditions that are either preventable or easily treated in the outpatient setting. Consequently, the uninsured are four times more likely than the insured to forgo or postpone needed preventive care. The ED has become a societal solution for those with chronic conditions and/or lacking access to primary care. The patient navigation project will be focused on overcoming these societal challenges. Additional challenges will include the acquisition of professional resources that have a background and training to provide social services and navigation care services, as well as overcoming the reliance on personal accountability of the patient to follow up with a provider in a more appropriate care setting.

5-Year Expected outcome for Provider and Patients:
The expected outcomes for the patient navigation project are to:

- Identify frequent ED users and use of navigators as part of preventable ED reduction program.
- Train health care navigators in cultural competency.
- Deploy innovative health care personnel such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connect patients to primary and preventive care.
- Increase access to care management and/or chronic care management, including education in chronic disease self-management.
- Decrease of inappropriate ED utilizations.
Starting Point/Baseline:
Currently the baseline is zero. During DY2 frequent ED users will be identified based on a needs assessment to identify the patient population for which the program will be targeted. Patient navigation and care management will be provided to these patients. DY3 will serve as the baseline period for the project. Based on the number of patients served by the project, the number of providers trained to support the program will be identified and implemented.

Rationale:
Emergency Department utilization in Region 10 exceeds national utilization rates resulting in higher costs for providing care to the Region. The Community Health Needs Assessment points to a lack of accessing primary care sites and the inability to redirect patients to a more appropriate care setting. The patient navigator project will provide resources to help patients and their families better locate and navigate appropriate care locations.

Project Components:
The following core project components were selected because each component is designed to provide and improve navigation services to targeted patients who are at high risk of disconnect from institutionalized health care:

- Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
- Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators
- Connect patients to primary and preventive care
- Increase access to care management and/or chronic care management, including education in chronic disease self-management
- Conduct quality improvement for project using methods such as rapid cycle improvement.

Our milestones measure the reduction in the number of patients who frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED, 2) increasing the number of patient navigators available to provide services to those patients, and 3) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of ED visits by those enrolled in the program by 5% by DY5. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

Unique community need identification numbers the project addresses:
- CN.1
- CN.2
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative because the hospital does not provide patient navigation services in the ED currently and has not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:
There are two Related Category 3 Outcome Measures for this project:

The first is Outcome Measure “Right Care, Right Setting” (OD-9) and IT-9.2 ED Utilization. Specifically there will be a reduction in all ED visits if the patient navigation program is effective. By identifying frequent users of the ED and providing navigation services, these patients will be exposed to alternative care locations that would be more effective for managing their non-urgent health conditions and health need. The IT-9.2 measures is the most appropriate indicator to assess the results of care experienced by patients, including patients’ clinical events, patients’ recovery and health status, patients’ experiences in the health system, and efficiency/cost.

The second is Outcome Measure “Potentially Preventable Re-admissions – 30 Day Readmission Rates” and IT-3.1 All-cause 30-day readmission rate. The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the lack of chronic disease management and lack of access to appropriate sites of care. The patient navigator program will re-direct patients from the ED to a more appropriate care setting, where management of chronic conditions will be better suited. A reduction in frequent ED users and access to better care site for chronic conditions will lead to a reduction in readmission rates for those enrolled in the program.

Relationship to Other Projects:
This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1(Preventable Admissions).1-CHF Admission Rate
- RD-1(Preventable Admissions).2-Diabetes Admission Rate
- RD-1(Preventable Admissions).4-COPD/Asthma Admission Rate
- RD-1(Preventable Admissions).5-Hypertension Admission Rate
- RD-2 (Preventable 30-day Readmissions).1-CHF Readmission Rate
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Methodist Mansfield Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

Methodist Mansfield Medical Center defined the population that will be patients who frequent the ED. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

Project Option 2.2.2 – Expand Chronic Care Management Models  
Unique Project ID: 186221101.2.2  
Performing Provider Name/TPI: Methodist Mansfield Medical Center / 186221101  
Provider: Methodist Mansfield Medical Center is a 168-bed facility in southeast Tarrant County serving a 403 square mile area and a population of approximately 387,000. Methodist Mansfield Medical Center provides a full range of acute care services to broad range of patients with all types of injuries and diseases across the continuum of care. Other than transplants, all other medical specialties are represented at this facility. In the last year, nearly twenty-nine percent of Methodist Mansfield’s patients were Medicaid eligible or uninsured representing $78 million in charges for those services.  

Intervention: The primary purpose of this project is to develop and implement a chronic disease management intervention geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.  

Need for the project: Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing. More than half of individuals with a chronic condition have multiple conditions.  

Target population: The target population is our ED patients that have either a principal or secondary diagnosis of diabetes and need education on managing diabetes and have high risk needs associated with diabetes based on clinical protocols of HbA1c >9.0%, at least one ED visit in the past 12 months and/or have not received diabetes education within the past five years. Our annual ED visits are approximately 45,000. Those diagnosed with diabetes as the primary or secondary diagnosis is 2,988. Approximately 29% of our patients are either Medicaid eligible or uninsured so we expect about 29% of the patients enrolled in the program to be Medicaid eligible or uninsured.  

Category 1 or 2 expected patient benefits: I-17: Apply the chronic care model to targeted chronic diseases which are prevalent locally such as Diabetes. Of our target population, we expect 30% to be eligible or in need of diabetes care model. Our baseline is zero as this is a new program at the hospital. In DY3 the goal is to begin providing care through the new program with 10 new patients receiving care under the chronic care management program by 9/30/14, increasing that number to 1000 in DY4 with an additional improvement of 5% over DY4 in DY5. I-18: Improve the percentage of diabetic inpatients with self-management goals. The baseline is zero as this is a new program at the hospital. The project seeks to improve number of diabetic ED patients with self-management goals from 0 to 5% of the target population (those identified above as eligible for the chronic care management program), or 50 patients in DY4 and an additional 5% or 100 patients in DY5.  

Category 3 outcomes: IT-1.11 Diabetes care: Blood pressure control (<140/80 mm Hg). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 25% of the 1000 eligible expected to be in the program or 250 patients will have controlled blood pressure. Therefore, in DY4, the goal is to increase the number of target
patients in the program with controlled blood pressure by 1.5% and an additional improvement in DY5 of 1.5% over DY4.

IT-1.10 Diabetes care: HbA1c poor control (>9.0%). Improvement Target: While the baseline is zero as this is a new program at the hospital, it is expected that 65% of the target population or 650 patients will have uncontrolled A1c levels. Therefore, in DY4, the goal is to decrease the number of target patients in the program with uncontrolled A1c levels by 1.5% with an additional decrease of 1.5% over DY4 in DY5.

IT-3.3 Diabetes 30 day readmission rate. Improvement Target: The target population in DY4 for this program is expected to be 1000 patients. Historically the diabetes readmission rate is 6.8%. Therefore, we expect the diabetes 30-day readmission rate among this target population to be 6.8% or 68 patients. In DY4, the goal is to decrease diabetes 30-day readmissions to the hospital from this target population by 10% with an additional 10% reduction over DY4 in DY5.
Project Option 2.2.2 – Expand Chronic Care Management Models

Unique Project ID: 186221101.2.2
Performing Provider Name/TPI: Methodist Mansfield Medical Center / 186221101

Project Description:
This project will apply evidence-based care management models for ED patients identified as having high-risk health care needs associated with diabetes. The project will develop chronic disease management education, protocols and self-management criteria for patients through a multidisciplinary process. These protocols, once developed will be implemented in the hospital through new outpatient and inpatient education services, through the network of primary care physicians and made available to community clinics supporting diabetic patients. Historically, patients who do not effectively manage their diabetes tend to develop chronic diabetes complications, comorbidities and lead to higher utilization and costs related to health care services. This program will be implemented to help those who need education on managing diabetes and providing monitoring services where they are being treated. Patients will be identified by partnering with primary care physicians, community clinics and inpatient nurse/care managers. Patients identified as having high risk needs associated with diabetes will be based on clinical protocols of A1C>9, at least one ED visit in the past 12 months and/or have not received diabetes education within the past five years.

This project will apply to the following ZIP codes in the hospital service area that fall within Region 10: 76001, 76002, 76016, 76017, 76018, 76060 and 76063. Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to develop and implement chronic disease management interventions that are geared toward improving effective management of chronic conditions and ultimately improving patient clinical indicators, health outcomes and quality, and reducing unnecessary acute and emergency care utilization. The purpose for implementing a chronic disease management program for diabetes is based on hospital and community data. Diabetes-related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Tarrant county population having been diagnosed with diabetes. The development and implementation of chronic disease management interventions for diabetes will lower costs and improve outcomes for the diabetic patients and community health status.
This project meets the following Regional goals:
A major goal of the Region is to improve the rate of chronic disease self-management and education. This project will contribute to that goal by providing patient education resources based on clinical management protocols.

Challenges:
Hospital and market data indicates that approximately 40% of ED outpatient visits and 30% of inpatients with diabetes are Medicaid and uninsured patients. In the northern portion of the hospital service area 31% of the population is Hispanic and represents the fastest growing population segment. Hispanics are 1.5 times as likely to develop diabetes as non-Hispanic populations according to the CDC. Effective communication and creativity in reaching this community demographic has been identified as a challenge for this project. Additional challenges include the need to create a registry to track patients; we will be reliant on others responding to our requests for information as well as the patient’s desire and ability to better manage their disease; and also the challenge of bringing a diverse independent medical staff together to develop this pathway.

5-Year Expected outcome for Provider and Patients:
The five year expected outcomes for the patient navigation project are to have:

- Formed multidisciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar
- Developed a comprehensive diabetes care management program
- Developed and implemented plan for standing orders for diabetes patients
- Trained staff in the Chronic Care Model, including essential components of a delivery system that supports high-quality clinical and chronic diabetes management, and on the standing orders for diabetes patients
- Developed and implemented OP Diabetes Education Clinic and IP Educator program to assist patients to better self-manage their chronic diabetes
- Improved number of patients with self-management goals
- Improved number of patients being treated under the Chronic Care Model and/or Standing Orders for Diabetes

Starting Point/Baseline:
Diabetes-related diagnoses account for the third highest patient segment for readmissions to the hospital. Diabetes management is also one of the top five community health needs with over 10% of the Tarrant county population having been diagnosed with diabetes. The hospital currently does not offer outpatient diabetes education clinic services or inpatient diabetes education; therefore, our current baseline is zero. During DY2 and DY3 as the chronic health management program and clinical protocols for standing orders are developed, the target
populations will begin to be identified. Historically, the ED has seen approximately 3,000 patients that also have a principal or secondary diagnosis of diabetes. We expect to target 30% of those with the program; 25% (or 250) are expected to have controlled blood pressure and 65% (or 650) uncontrolled A1c levels > 9.0%.

**Rationale:**
Promoting effective change in provider settings to support evidence-based clinical and quality improvement across a wide variety of health care settings will make a significant improvement to the self-management of chronic conditions such as diabetes. CDC data indicates that almost half of all Americans, more than 145 million, live with a chronic condition. In the hospital market more than 10% of the population has been diagnosed with diabetes and the number is growing. More than half of individuals with a chronic condition have multiple conditions. The challenge in the community due to the lack of proper self-management of chronic conditions is higher rates of illness, higher utilization of high cost services and lower quality of life.

**Project Components:**
The following core project components were selected because each component is designed to apply evidence-based care management model to patients identified as having high-risk health care needs related to diabetes:

- Formalize multidisciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model
- Develop a comprehensive care management program
- Develop and implement a plan for standing orders
- Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease management
- Develop and implement an OP Diabetes Education Service and Inpatient Educator Program to assist patients to better self-manage their chronic conditions
- Application of chronic care management model to diabetes
- Improve the percentage of patients with self-management goals

An integral part of this project is to provide patient education and self-management support. We will incorporate learnings from the hospital’s current medical home and ACO initiatives to improve patient provider communication techniques and coordination with community resources.

We will conduct ongoing quality improvement efforts for the project. The hospital’s quality committee of the board meets regularly to assess ongoing programs at the facility and will be used to evaluate the success and improvement opportunities of the chronic care management project as well.
Currently we use the Plan Do Check Act version of quality improvement for all of our programs at the hospital. We incorporate this process into any new program we do so that we embark with proper planning and have the systems in place to identify improvement opportunities throughout all stages of implementation.

Our process milestones measure the development of chronic care management program for diabetes, training and education of care givers in multiple care sites, development of standing orders for diabetic patients and the development of a new Outpatient Diabetes Education service and new Inpatient Educator program. The Improvement milestones measure the number of individuals who will be targeted for the education and self-management protocols, as well as the increased number of patients with self-management goals. The specific improvement targets for the number of patients provided services for education and the number of patients with self-management goals will be determined during DY2.

**Unique community need identification numbers the project addresses:**
- CN.13 – Necessity of patient education programs
- CN.15 – Need for more information to promote healthy lifestyles
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative because the hospital does not have standing orders for diabetes protocols, does not offer dedicated diabetes education on self-management and has not received any other federal funding for it.

**Related Category 3 Outcome Measures:**
- IT-1.10 Diabetes Care: HbA1c poor control
- IT-1.11 Diabetes Care: Blood Pressure control
- IT-3.3 Diabetes 30-Day Readmission Rate

**Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:**
There are three Related Category 3 Outcome Measures for this project. The first two fall within Outcome Measure “Primary Care and Chronic Disease Management” (OD-1). Specifically the two Improvement Targets are IT-1.10 (Diabetes Care: HbA1c poor control (>9.0%)) and IT-1.11 (Diabetes Control: Blood pressure control (<140/80 mm Hg)). This project will identify patients in the ED who are identified as having poor diabetes control. Based on the project’s efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in
the service area providing consistent methodology for diabetes care in the market ultimately leading to better diabetes control outcomes.

The third Related Category 3 Outcome Measure falls within the Outcome Measure “Potentially Preventable Readmissions – 30-Day Readmission Rates” and IT-3.3 Diabetes 30-day readmission rate. This project will identify ED patients who have poor diabetes control and ultimately at high risk for readmission to the hospital. Based on the project’s efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market. Better preparing patients for self-management, education and ongoing support for diabetes care will ultimately lead to reduced diabetic readmissions from this target population.

**Relationship to Other Projects:**
This project will support, reinforce and enable the following Category 4, Reporting Domains through the project design and intervention for appropriate targeted patients:

- RD-1(Preventable Admissions).2-Diabetes Admission Rate
- RD-2 (Preventable 30-day Readmissions).2-Diabetes Readmission Rate
- RD-4 (Patient-centered Health Care).2-Medication Management

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Methodist Mansfield Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.
Methodist Mansfield Medical Center defined the population that will be high risk diabetic patients. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.1.1 – Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards (WCCA PCMH).

Unique Project ID: 206106101.2.1 (Pass 2)
Performing Provider Name/TPI: Wise Clinical Care Associates/206106101

Provider: There are five providers working in three primary care clinics located in cities in Wise County… Bridgeport, Boyd, and Decatur. Patients come from a wide area which includes Wise, Montage, Jack, Parker, and portions of Tarrant County. The WCCA providers are one of the only providers in Wise County accepting Medicaid for primary care. Approximately 20% of the total patient base is Medicaid with some providers as high as 45% payor mix of Medicaid.

Intervention: Our project will involve changing the care delivery model of three primary care clinics within WCCA into patient centered medical homes. The intervention emphasizes adding personnel, training, and education. This is a new intervention to redesign our care model to focus on patient-centered care.

Need for the project: This project is designed to fulfill the community need, CN.11 Need for more care coordination. The clinics will work in coordination with various hospitals, MHMR, and children’s hospitals.

Collaboration: This project is a collaboration between Wise Regional Health System and Wise Clinical Care Associates, although WCCA will be the Performing Provider. Within the base of primary care physicians referring patients to Wise Regional Health System, none are currently following the patient centered medical home model. Since WCCA would be the first, this project is transformative. Other physicians will be looking to WCCA and watching its ability to be successful with this care model. It is also transformative in that it provides education to local physicians on PCMH. This is a collaborative project for a couple of reasons. First, the coordination of care will have to come from the clinic side as well as the physician side. The offices of WCCA will communicate with case management in Wise Regional Health System to make sure their patients have a medical home from which they can receive care. The second reason it is collaborative is because the valuation per patient empaneled in a PCMH is closely tied to savings on the inpatient side. Implemented correctly, much of the savings to the health system come from reduced ED use and admissions into the acute care setting. This result helps the hospital systems begin to respond to changes in reimbursement and care delivery.

Target population: All WCCA patients, with an emphasis on those with diabetes. We anticipate close to 6,000 patients to be served through the medical home model with over 72,000 visits over 5 years. The number of patients per year will be as follows DY1 4606, DY2 5527, DY3 5530, DY4 5546, and DY5 5559. This projection includes a 20% attrition rate and a conservative estimate of 935 new patients each year. The total number of unique patients served over the 5 years is estimated to be 8,330. This number is greater than the number above because it includes the patients who will be served but attrition out. The 6,000 number referenced about does not include the attrition patients.
**Expected patient benefits:** In Wise County there are a limited number of resources available for Medicaid and uninsured patients. As a Medicaid provider we can increase our capacity to through PCMH.

**Category 1 or 2 expected patient benefits:** The metrics and milestones chosen are sequential and logical steps to establish the project goal, hire appropriate support staff, operate as a medical home and gain recognition by NCQA.

**Category 3 outcomes:** The first Category 3 measure selected is IT-1.10 Diabetes care: HbA1c poor control, with the implementation of the Patient Centered Medical Home, registries will be developed to capture and track patients based on diagnoses of chronic conditions, namely diabetes. This measure will provide insight to the effectiveness of our plan. Secondly, IT-6.1 Percent improvement over baseline of patient satisfaction scores - (2) how well their doctors communicate, will be used as a measure to determine that the implementation of this project is in fact improving the providers’ ability to effectively communicate through-out the patient care process and ultimately improving the patients’ overall satisfaction.
Project Option 2.1.1 – Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards (WCCA PCMH).

Unique Project ID: 206106101.2.1 (Pass 2)
Performing Provider Name/TPI: Wise Clinical Care Associates/206106101

Project Description:
Our project will involve changing the care delivery model of three primary care clinics within Wise Clinical Care Associates (WCCA) into patient centered medical homes. WCCA is a non-profit healthcare organization. It has an all physician board of four members. The intervention chosen will emphasize the training and education that is essential to make the necessary changes towards patient centered care. We will focus these efforts on care coordination and supporting our primary care physicians in health accountability for our target population. We will hire or put in place at least two additional staff members and restructure existing staff members to accommodate a more coordinated model. Team members will not only each have a responsibility in managing the care of each patient, they will also use existing technology to help in this process. WCCA uses eClinical Works as its EMR. We will use the chronic disease management capabilities of this technology. Specifically, we will utilize our diabetes registry more fully through this process. We will have a person responsible for the administrative requirements of PCMH and one person responsible for the clinical requirements of PCMH. Our focus will be on diabetes care, but we will provide coordinated care to all empaneled patients. Staff members will be trained in the NCQA PCMH requirements and additional emphasis will be given to diabetes and patient satisfaction. We will make the necessary changes to adopt the requirements needed to operate as a PCMH and, by the end of the Waiver period, attain accreditation as a PCMH by NCQA. We will measure and improve HbA1c poor control and patient satisfaction by the end of the Waiver. We will also review weekly data to see how new ideas, solutions, practices, or tools can be implemented to achieve goals of the project. The number of patients impacted per year will be as follows DY1 4606, DY2 5527, DY3 5530, DY4 5546, and DY5 5559. This projection includes a 20% attrition rate and a conservative estimate of 935 new patients each year. The total number of unique patients served over the 5 years is estimated to be 8,330. This number is greater than the number above because it includes the patients who will be served but attrition out. The 6,000 number referenced about does not include the attrition patients.

Goals and Relationship to Regional Goals:

Project Goals:
The project goals are to reorganize our primary care clinics into care teams to support a more proactive care model to our patients. Our goal of implementing the medical home model is for all stakeholders in this care model to enjoy the proven outcomes which similar models have achieved across the country. We expect to increase quality, patient satisfaction, and reduce overall health related costs by coordinating care with and around our patients. Our goal is to train our staff on the primary care model and gain recognition as a PCMH through NCQA.
This project meets the following regional goals:
This project addresses a common gap found throughout the region, lack of care coordination. Our regional goals are to strive for the triple aim of healthcare and the PCMH model has shown to be one of the most effective ways of reducing costs, improving quality, and increasing patient satisfaction.

Challenges:
Our primary care providers feel they are unable to make a difference in patient driven measures, such as HbA1c control, with the current delivery model. By adopting the PCMH model, they will have support from other team members who can provide support in the health accountability of patients. Besides reorganizing our current staff into care teams who work at the top of their licenses, we will need to hire or put into place at least two additional staff members to implement the PCMH model. We will provide training to leadership and clinical support personnel on the patient centered medical home model and patient satisfaction. This additional support staff will provide a greater amount of health education for our patients.

5-Year Expected outcome for Provider and Patients:
The 5-year expected outcome is that we would reduce the percent of patients with poor HbA1c control from the current 35.94% to below 20%. We hope to increase the current percentage of diabetic patients listed in our diabetes registry from our current 32% to 75%. We will also have an increase in our overall patient satisfaction scores over baseline, specifically the perception of how well our doctors communicate.

Starting Point/Baseline:
We currently have two primary care physicians, two part time nurse practitioners, one full time nurse practitioner, three medical assistants, and three office support staff working in three locations spread 14 miles apart. From August 31, 2011 to September 30, 2012, the five providers had encounters from 4,606 patients. This number will serve as the target number of patients for empanelment in DY3. In DY4 we expect to lose 20% of those empaneled patients to attrition, but we expect to gain approximately 935 patients each year following. This would put the number of empaneled patients at 4,620 in DY4 and 4,631 in DY5. Also from August 31, 2011 to September 30, 2012 for the same patient population, we had 32% of diabetic patients registered in the registry. We wish to increase this number to 75% while at the same time reducing the number of patients poor HbA1c (>9) control from 35.94% to below 20%. We also measure patient satisfaction, including how well the provider communicates with patients, through patient satisfaction surveys. Our current frequency is too low to provide statistical relevancy. While measuring our patient satisfaction we will also increase our utilization rates for our survey.
**Rationale:**
The PCMH model has been one of the changes to the delivery system of care that has shown multiple and consistent results for improvement. The care delivery system in Wise County is still fractured and silo’ed. It has been the desire of Wise Clinical Care Associates to provide the best quality care to the residents of Wise County, and this means coordinated care. As a new delivery mode, this project option was chosen for PCMH implementation because of the need for education to local providers as well as the physicians implementing PCMH.

**Project Components:**
We will do all core project components for this project. We believe it not only benefits our own organization but also the physicians in our area to provide education and awareness of the medical home model. Our core components will be met in the following ways:

a) Utilize a gap analysis to assess and/or measure hospital-affiliated and/or PCPs’ NCQA PCMH readiness. –NCQA offers a Gap Analysis tool. This tool will be used throughout the PCMH readiness process in not only DY1, but also while getting ready to gain accreditation. The tool is a question and answer set of questions on our readiness.

b) Conduct feasibility studies to determine necessary steps to achieve NCQA PCMH status. – The Gap Analysis tool will be used to see what questions were answered with a “no”. This assessment will be used to determine the feasibility of achieving the additional requirements for NCQA PCMH accreditation.

c) Conduct educational sessions for primary care physician practice offices, hospital boards of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision. – The Board meetings for WCCA will include ongoing education for PCMH. We will also provide education for the hospital Board, and opportunities to local physicians. These sessions will be documented.

d) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. – Our clinical PCMH coordinator, our administrative analyst, the clinic operations manager, and our physicians will conduct regular meetings in identifying lessons learned and key challenges during implementation and in the years following. The lessons learned and the findings will be documented.

The metrics and milestones chosen and the years of implementation in the plan are sequential and logical steps to operate as a medical home and gain recognition by NCQA. The process milestones are more focused on preparation and education for the staff, which includes 2 physicians, 3 nurse practitioners and 12 staff members, involved in nursing and front office responsibilities, in DY2 and DY3. The milestone of implementing the PCMH model in DY3 is
aggressive in the timeline of change adoption, but is feasible with prior education and training. In DY2 and 3 two additional staff members will be hired, one will be responsible for the administrative requirements of PCMH and the other responsible for the clinical requirements of PCMH. Two improvement milestones were chosen to reflect the desire to increase new patient adoption into the medical home and gain recognition as a PCMH.

**Unique community need identification numbers the project addresses:**
CN.11 Need for more care coordination.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**Outcome Measure #1:** IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059
Several outcomes could have been chosen for the PCMH model. Hospital admissions, readmissions, and ED use have all shown to have been lowered through adoption of the PCMH model. We chose diabetes care for two reasons.

1) Diabetes is an important disease to try to affect for both the region and Wise County because of its cost to the healthcare system and its projected increase in prevalence. Wise County CHNA has shown that approximately 9% of residents have diabetes. The PCMH model has shown a reduction in the HbA1c poor control by bringing awareness and education to the patients. (Grundy, Paul; Grumback, Kevin, Outcomes of Implementing Patient Centered Medical Homes:A Review of the Evidence from Prospective Evaluation Studies in the United States.UpdatedNovember 2010.) Available at “www.pcpcc.net/files/evidence_outcomes_in_pcmh.pdf”. Another example of the effect on HbA1c levels in patients of PCMH of a similar size to the population we propose was shown by Westminster Medical Clinic. “From Jan. 31, 2010 to Jan. 31, 2011, the percentage of active patients whose most recent HbA1c level was over 9 dropped from 27 percent to 14 percent.” Available at “http://www.setma.com/InTheNews/diabetes_guide_2011.pdf”

2) We wanted to use an outcome that is directly tied to the population in which the care is provided. This data comes from clinic EMR and is descriptive of the patients who will receive care from the PCMH.

**Outcome Measure #2:** IT-6.1 Percent improvement over baseline of patient satisfaction scores - (2) how well their doctors communicate; (Standalone measure)
Communication will be emphasized throughout the process of changing to the PCMH. This measure was chosen to track and evaluate physician communication from the patients’ perspectives. More team members will be having health related conversations with patients. We want to be sure the patients maintain a positive perception of the amount of communication they are receiving from their physicians. We use a company called Survey Vitals to deliver the CG-CAHPS approved survey. We will need to assess our survey to make sure it is meeting NCQA standards for PCMH as well. Several areas are measured through the survey, but we chose this measure in particular because it reflects an area that is important to our physicians and patients. An example of where the PCMH implementation has shown an increase in patient satisfaction, and in particular the quality of interaction between physician and patients, was exhibited by Group Health Cooperative in Seattle, WA when they piloted the PCMH model.

**Relationship to Other Projects:**

2.12.1 Expand Care Transitions Programs

Care transition is dependent upon care after inpatient stays. Likewise, care coordination through a PCMH will rely on communication from local hospitals. Both have shown a reduction on admissions and readmissions. Although both are unique, both projects benefit through increased communication between patient, clinic, and hospital.

The PCMH model has a wide impact since all patients associated with category 4 measures are in contact with primary care. This project will have the greatest impact on the following domains: RD-1.2, RD-1.8, RD-2.2, RD-2.7, RD-4.1, and RD-4.2

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Instead of valuing each outcome for our PCMH individually, we used our RHP 10 method of providing a value per empaneled patient at the end of the waiver and multiplying that times 5 years to reflect the value of the project as a whole. We used values determined by Baylor Health System of $2,366 in savings for empaneled patients in their first year and $1,186 per patient in subsequent years. We assumed a 20% attrition rate. We also added 935 patients per year based on historical numbers. Using this valuation model we counted 4606 new empaneled patients in
the first year for a year one value of $10,897,796. The second year had 3,685 existing patients and 935 new patients for a second year value of $6,582,382. Third year used 3,696 existing patients and 935 new patients for a value of $6,595,476. Fourth year has 3,705 existing patients and 935 new patients for a value of $6,605,951. The fifth year assumes 3,712 existing patients and 935 new patients for a value of $6,614,331. The total value of this project based on this valuation model is $37,295,937. Although using this method gave us the value for this project, we are only able to get funding valuation of $20,235,621 to apply across categories 1, 2, 3, and 4. We get this by combining the DSRIP allocation of $16,428,516 from WCCA and $3,897,105 from WRHS.

We took our overall value for project 2.1.1 and applied it proportionately across all categories with weighting per year reflecting the weighting change each category. We then allocated the amount for Category 1 for each DY equally on attainment of metrics.
**Wise Clinical Care Associates**

**Year 2 (10/1/2012 – 9/30/2013)**

**Milestone 1** [P-9]: Train medical home personnel on PCMH change concepts.  
**Metric 1** [P-9.1]: Number of medical home personnel trained  
Baseline/Goal: 100% of staff currently 5 providers and 12 staff members, to have PCMH initial training by 9/30/2013  
Data Source: HR Records

Milestone 1 Estimated Incentive Payment: $1,425,857

**Milestone 2** [P-5]: Determine the appropriate panel size for primary care provider teams, potentially based on staff capacity, demographics, and diseases. Empanelment should be based on the following principles: Assign all patients to a provider panel and confirm assignments with providers and patients; review and update panel assignments on a regular basis; Assess practice supply and demand, and balance patient load accordingly; Use panel data and registries to proactively contact and track patients by disease status, risk status, self-management status, community and family need.  
**Metric 1** [P-5.1]: Determine Panel size

**Year 3 (10/1/2013 – 9/30/2014)**

**Milestone 4** [P-4]: Develop staffing plan to expand primary care team roles; Expand and redefine the roles and responsibilities of primary care team members.  
**Metric 1** [P-4.1]: Expanded Primary care team member roles;  
Baseline/Goal: Define roles for every member, currently 5 providers and 12 staff members  
Data Source: Job Description Documentation

Milestone 4 Estimated Incentive Payment: $1,487,659

**Milestone 5** [P-11]: Identify current utilization rates of preventive services and implement a system to improve rates among targeted population (must

**Year 4 (10/1/2014 – 9/30/2015)**

**Milestone 7** [I-13]: New patients assigned to medical homes receive their first appointment in a timely manner  
**Metric 1** [I-13.1]: Improve number or percent of new patients assigned to medical homes that are contacted for their first patient visit within 60-120 days  
Goal: 70%  
Data Source: eClinical Works, Documentation of PCMH Assignment

Milestone 7 Estimated Incentive Payment: $2,391,104

**Milestone 8** [P-13]: Review project data and respond to it every week with tests of new ideas, practices, tools, or solutions.  
**Metric 1** [P-13.1]: Number of new ideas, practices, tools, or solutions tested by each provider.  
Baseline/Goal: Ideas shared by staff each quarter  
Data Source: Brief description of the idea, practice, tool or solution tested by each provider.

Milestone 8 Estimated Incentive Payment: $2,391,105

**Year 5 (10/1/2015 – 9/30/2016)**

**Milestone 9** [I-13]: New patients assigned to medical homes receive their first appointment in a timely manner  
**Metric 1** [I-13.1]: Improve number or percent of new patients assigned to medical homes that are contacted for their first patient visit within 60-120 days  
Goal: 85%  
Data Source: eClinical Works, Documentation of PCMH Assignment

Milestone 9 Estimated Incentive Payment: $1,540,164

**Milestone 10** [I-18]: Obtain medical home recognition by a nationally recognized agency (e.g., NCQA, URAC, AAHC, etc.). The level of medical home recognition will depend on the practice baseline and accrediting agency.  
**Metric 1** [I-18.1]: Medical home recognition/accreditation  
Goal: Attain PCMH NCQA Accreditation. Level TBD  
Data Source: Documentation from NCQA

### Milestone 10 Estimated Incentive Payment: $1,540,164

**Milestone 11 [P-13]: Review project data and respond to it every week with tests of new ideas, practices, tools, or solutions.**

**Metric 1 [P-13.1]: Number of new ideas, practices, tools, or solutions tested by each provider.**

**Baseline/Goal:** Ideas shared by staff each quarter

**Data Source:** Brief description of the idea, practice, tool or solution tested by each provider.

**Milestone 11 Estimated Incentive Payment:** $1,540,164

### TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add milestone bundle amounts over Years 2-5): $18,143,252

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.4.1 – Implement processes to measure and improve patient experience – becoming a facility with the culture of always

Unique Project ID: 216719901.2.1 (Pass 2)
Performing Provider Name/TPI: Glen Rose Medical Center/216719901

Provider: GRMC is a rural 16 bed hospital in Glen Rose, Texas serving a population of 7584 in 2011 with a 23% growth in Seniors (65 and over). GRMC is the county hospital in Somervell County for all indigent care as well as being the only facility in Somervell County.

Intervention: To improve patient satisfaction, quality of care and reduce cost by increasing our HCAHPS scores. This is a new initiative.

Need for the project: Improving patient satisfaction has shown patients become more engaged and make healthier lifestyle choices.

Target population: All patients of GRMC (community residents). Estimated number of patients to be served over course of waiver period: 1800.

Category 1 or 2 expected patient benefits: An improvement of HCAHPS scores “Stay at home healthcare” Satisfaction will spread in the community, but the scores will be of benefit to publish “our story”. Example: This is what your neighbors have to say about your hometown hospital. Each milestone chosen will lead us along the path to a total hospital personnel buy in of a “culture of always.”

Category 3 outcomes: Percent improvement over baseline of patient satisfaction. This outcome should result in improved health outcome of patients and reduced cost.

Project Option 2.4.1 – Implement processes to measure and improve patient experience – becoming a facility with the culture of always
Unique Project ID: 216719901.2.1 (Pass 2)
Performing Provider Name/TPI: Glen Rose Medical Center/216719901

Project Description:
We propose gathering baseline HCAHPS scores and improving them with the realization that improving our scores will improve quality and clinical outcomes. Glen Rose Medical Center will, once the baseline is assessed, develop a process to incorporate patient satisfaction into every employee’s everyday function. We propose to increase patient experience by 25% in the areas where patients are unsatisfied by becoming a facility where the culture of always is an everyday affair.

Goals and Relationship to Regional Goals:

Project Goals:
Focusing on what patients want in their care is the cornerstone of improving clinical outcomes, compliance and quality. Satisfied patients are more inclined to listen and follow any education provided to them during their hospitalization. Systems that have done this have seen a reduction in malpractice risk and improvements in market share as well as physician satisfaction. By using the HCAHPS scores we can locate our weaknesses and create processes to improve those areas, thus making our patients feel taken care of and cared about.

This project meets the following regional goals:
The main goal of the region is the triple aim of improving patient experiences, reducing the cost and improving the health of our patients. Improving our patients’ experience will impact the health of our patients and keep them involved in their health care.

Challenges:
Currently our HCAHPS scores are the lowest they have been in two years. An organizational improvement must be made to ensure satisfied patients. HCAHPS is an apples-to-apples comparison, and the results are tied to quality and clinical outcomes. Since quality of care is what all health care organizations strive for and will ultimately be what they are judged on when value-based purchasing begins in 2013, an improvement in our scores is a win for all. An improvement of HCAHPS will help drive our facility to a culture of always where quality care is not an exception but the norm.

5-Year Expected Outcome for Provider and Patients:
At the end of the five-year period, GRMC will increase our HCAHPS scores by 25% overall and will display our organization’s performance both internally and externally.

Starting Point/Baseline:
GRMC is a small, 16-bed rural hospital that averages 1,000 acute care patients, 765 surgeries, 1,285 outpatient scopes, and 7,000 ER visits in a year, as well as thousands of patients receiving outpatient MRIs, X-rays, lab testing and physical and occupational therapy. Being a small hospital, all employees are critical to our patients’ impression of our facility. All staff has the power to encourage greater patient care, which will ultimately lead to improved health outcomes and a better experience for our patients. GRMC will establish its baseline in DY2.

Rationale:
This project addresses the need to improve patient experience, thereby improving health and lowering cost.

Project Components:
By being a small facility, all employees and patients are critical. With a lower patient volume, even a small number of unsatisfied patients impact HCAHPS scores greatly. The New England Journal of Medicine found that quality of care was significantly better in hospitals that performed better on HCAHPS. The data also supports that the patient experience is linked to great clinical care, reduced medical error and the advanced performance outcomes. Currently, a few of our poor HCAHPS scores are “nurse listens carefully to you” – 77%, “staff describes side effect” – 47%, as well as “area around room quiet at night” – 68%. We struggle with these results and realize that we must hardwire the culture of always into our management and employees. When patients feel cared for and cared about they are more apt to listen to the caregivers’ instructions and guidelines, and follow the plan that will enable them to stay healthier and live better while decreasing the cost of inappropriate admissions/readmissions. We currently use Press Ganey as our survey vendor, so the core component D has already been established. We will use all core components:

a) Organizational integration and prioritization of patient experience
b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience
c) Implementing processes to improve patients’ experience in getting through to the clinical practice
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

321 Strosahl and Sobel 1996
We have gathered HCAHPS scores for a number of years, and have continually struggled with the scores but have never taken a systematic, hospital wide approach. Some departments realize the importance more than others but by appointing one executive to drive the process we will create a cultural change which will give ALL employees the ability to make a difference in our patients lives. With the selected milestones and metrics, we will integrate the patient experience into each employee and managers training allowing it to become hardwired into the entire employee population, and not just in a few areas. The entire organization must walk the walk to achieve lasting impact and improved satisfaction, lower costs, and better patient health. This cannot be just a management concern, but must be a concern of all GRMC employees.

**Unique community need identification numbers the project addresses:**
CN. 11- Need for more care coordination
CN. 13- Necessity of patient education programs
CN. 15- Need for more education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

a) **Outcome Measure #1**: IT-6.1 Percent improvement over baseline of patient satisfaction cores

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
“Analyzing patient safety measures can alert hospitals to communication breakdowns that lead to lapses in care. Increasing patient satisfaction can thus significantly impact the quality of care and patient safety.”

The New England Journal of Medicine article on patients’ perception of hospital care in the United States found that patients’ satisfaction with care was associated with the quality of clinical care in the hospitals. With this in mind, we plan to increase our HCAHPS scores by 25%.

**Relationship to Other Projects:**
This project is directly related to our Category 1 project (216719901.1.1) Expand Primary Care Capacity) of increasing primary care clinic hours. With the expansion of clinic hours we will be able to have a follow-up appointment already scheduled, which will ensure our patients leave satisfied and in control of their care.

This project is related to Patient-centered health care, patient satisfaction (216719901.4.1)

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

322 Koyanagi 2004
323 HCUP
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Glen Rose Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Glen Rose Medical Center defined the population that will be directly impacted by the project as all patients seen within our facility, whether inpatient or outpatient. The percentage of the population expected to be positively impacted by the project is 25%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when people are positively impacted, their inclination is to listen more intently to instructions and education given to them, leading them to practice healthier habits and lifestyles which in turn decreases sick days and decreases cost of care.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, the burden on society is lessened through healthier habits and lifestyles. The ability to serve as role models to children and/or coworkers is increased.

Implement processes to measure and improve patient experience.

Glen Rose Medical Center

Surveys and/or focus groups as alternative methodologies to written surveys; Conduct care experience flow mapping; Implement a survey of employee experience; Roll out a pilot of real-time electronic methodology for capturing patients’ feedback during the process of care; and/or implement another innovative method for obtaining patient and/or employee experience information. Documentation of inquiry materials. Data Source: Depends upon methodology selected. Rationale/Evidence: Written mail-in surveys are most commonly used in obtaining patient experience information, yet this methodology often yields small numbers of responses given the socio-economic circumstances of certain patient populations. Therefore, it is important to test other methodologies that may be more applicable and convenient for the Performing Provider’s patient populations. Baseline/Goal: Old Survey tool is baseline and new Goal to completely redo survey tool or revise as indicated by the assessment.

Category 3: Quality Improvement
Title of Outcome Measure (Improvement Target): IT-6.1- Percent Improvement over baseline of patient satisfaction scores

**Unique RHP outcome identification number(s):** 020950401.3.1

**Performing Provider Name/TPI:** Medical Center of Arlington / 020950401

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**

In DY2 we will establish baseline data to measure for patient satisfaction scores. The target for the outcome measure is 10% improvement in scores over baseline in DY4 and 20% in DY5. In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. It will also be necessary to develop and test data systems for establishing an internal measurement of patient satisfaction for timely feedback on improvement plans and corrective actions. In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders.

**Rationale:**

The process milestone to establish the baseline rate is necessary to understand the starting point of patient satisfaction scores. The outcome improvement targets were selected as they are congruent with other goals of the organization and will result in improved health outcome of patients and reduce cost to the health system.

The target for the outcome measure is to increase patient satisfaction scores by 20% by the end of the Waiver period. We have implemented some initiatives improve scores however this has not moved score significantly in the last year. We believe a renewed focus is necessary to make significant improvement.

In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. These are necessary steps to ensure all stakeholders (IP /OP, out of hospital providers, etc.) are identified and included in the plan. Identifying capacity and resource needed to implement are required for budgeting purposes. Establishing timelines and documenting a plan are a guide to knowing when things need to occur, who is responsible for making them happen and the ultimate expectations and goals of the project. The documented plan and timelines serve as a tool to measure the performance in executing the project.

It will also be necessary in DY2 to develop and test data systems for timely measurement of patient satisfaction in order to correctly measure improvement targets. CMS published HCAHPS score are not expedited very timely so the process milestone to develop and test internal
measurements is necessary to have timely feedback for correcting actions for the patients’ experience improvement planning.

In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders. This would include intervention impacts, learning from follow up on successes or failures and identified best practices. This feedback is significant to adjusting plans findings and continued engagement of stakeholders

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center of Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Medical Center of Arlington defined the population that will be directly impacted by the project as patients with Medicare and all patients who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 4 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The rate per Medicare case of $10,661 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY 5 -1.05% . This totaled $1,236,300.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $ 532,000. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $ 539,000.

The total value of the project was calculated at $2,307,724. Approximately 79% of the project value was assigned to the Category 2 project, $1,824,718 and 21% to the Category 3 project, $483,010.
We did not value the process milestones and outcome targets differently in Category 3 as we believe they are all equally important to overall success of the project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $483,010*
Title of Outcome Measure (Improvement Target): IT-4.8- Sepsis mortality (Stand-alone measure)

Unique RHP outcome identification number(s): 020950401.3.2
Performing Provider Name/TPI: Medical Center of Arlington / 020950401

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
In DY2 we will establish baseline rates for sepsis mortality to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis mortality reduction of 25% by the end of the Waiver.

Rationale:
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Medical Center Arlington defined the population that will be directly impacted by the project as patients diagnosed with Sepsis. Medical Center Arlington defined the population that will be
directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for the Category 2 project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 3%, which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 50. The estimated pricing for morality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages , and quality of life. This totaled approximately $500,000 for 5 years.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $500,000.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of mortality reduction at $440,000.

The total value of the project then was estimated at $4,643,316. Approximately 79% of the total value was assigned to Category 2 project and the remaining 11% of value assigned to Category 3 outcome for Sepsis Mortality and 9.7% assigned to Category 3 outcome for reduced Average Length of Stay.

The value for the total outcome was determined based on the population targeted for Sepsis, size of the population, and costs and steps necessary to achieve reductions in mortality. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $518,760
**Title of Outcome Measure (Improvement Target):** IT-4.9 Average length of stay (Non-stand-alone measure)

**Unique RHP outcome identification number(s):** 020950401.3.3

**Performing Provider Name/TPI:** Medical Center of Arlington / 020950401

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**
In DY2 we will establish baseline rates for sepsis average length of stay to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis average length of stay of TBD by the end of the Waiver. The improvement target will be determined in DY2 and implemented starting in DY3.

**Rationale:**
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Medical Center Arlington defined the population that will be directly impacted by the project as patients diagnosed with Sepsis. The total sepsis population is expected to be positively impacted
by the project for a reduction in length of stay of 2 days from baseline average of 9 days per patient. This was estimated at total of reduced in patient days by DY 5 of 1765. The estimated cost per day for a sepsis patient is $907. This totaled approximately $1,600,000

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 1. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $962,000.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $641,000.

The total value of the project then was estimated at $4,643,316. Approximately 79% of the total value was assigned to Category 2 project and the remaining 11% of value assigned to Category 3 outcome for Sepsis Mortality and 9.7% assigned to Category 3 outcome for reduced Average Length of Stay.

The value for the total outcome was determined based on the population targeted for sepsis, size of the population, baseline average length of stay, cost avoidance and steps necessary to achieve reductions in average length of stay. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD**  
(add outcome amounts over DYs 2-5): $453,088
**Title of Outcome Measure (Improvement Target):** IT-3.2- Congestive Heart Failure 30-day readmission rate

**Unique RHP outcome identification number(s):** 020950401.3.4

**Performing Provider Name/TPI:** Medical Center of Arlington / 020950401

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**
The outcome measure is to reduce the readmissions to hospital for those patients with CHF that have had a readmission the prior 12 months. The target for the outcome measure for the CHF 30-day readmission rate is to reduce the rate by 15% by the end of the Waiver period. In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. It will also be necessary to establish a baseline rate for readmissions in order to correctly measure a rate reduction. In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders. This reduction is estimated to be 80 CHF readmissions over course of the waiver.

**Rationale:**
The process milestone to establish the baseline rate is necessary to understand the starting point of patients to focus on. Various data points from both internal and external reporting vary and it will be necessary to ensure the defined population is known so targeted interventions are addressed. The outcome improvement targets were selected as they are congruent with other goals of the organization and will result in improved health outcome of patients and reduce cost to the health system.

The target for the outcome measure of CHF 30-day readmission rate is to reduce the rate by 15% by the end of the Waiver period. We have implemented initiatives to reduce readmissions (i.e. improved discharge planning, etc) but the readmission rate reduction has been moved significantly in the last year. We believe a renewed focus is necessary to make significant reductions in rate.

In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. These are necessary steps to ensure all stakeholders (IP /OP, out of hospital providers, etc) are identified and included in the plan. Identifying capacity and resource needed to implement are required for budgeting purposes. Establishing timelines and documenting a plan are a guide to knowing when things need to occur, who is responsible for making them happen and the ultimate expectations and goals of the project. The documented plan and timelines serve as a tool to measure the performance in executing the project.
It will also be necessary in DY2 to establish a baseline rate for readmissions in order to correctly measure a rate reduction. The process milestone to establish the baseline rate is necessary to understand the starting point of patients to focus on. Various data points from both internal and external reporting vary and it will be necessary to ensure the defined population is known so targeted interventions are addressed.

In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders. This would include intervention impacts, learning from follow up on successes or failures and identified best practices. This feedback is significant to adjusting plans findings and continued engagement of stakeholders.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center of Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

The value for the total outcome was determined based on the population targeted for CHF, size of the high risk population, and cost avoided from readmissions and mortality and morbidity impacts from achieved reductions in readmission rates. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

Medical Center of Arlington defined the population that will be directly impacted by the project as patients admitted with congestive heart failure who are at risk for readmission. The percentage of the population expected to be positively impacted by the project is 5%, which was determined based on studies of similar projects implemented elsewhere. This was approximately 16 CHF readmissions per year, for 5 years would be 80 readmissions. The cost saved per admission was striated between $7,000 to $8,500 in the region. Our cost estimate was $7250 per readmission saved for a total of $590,000 saved. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted by avoiding a hospitalization, there is an avoided financial burden, better health outcomes and improved quality of life. The value calculated was based on a
proportion of total value of readmission reduction savings of $590,000. An index value of 3 for five years was valued at $354,000.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases, and the burden on society is reduced. The value calculated was based on a proportion of total value of readmission of $590,000. An index value of 1 for five years was valued at $118,000.

The total value for avoided costs, value to the individual and community was calculated at $1,063,000. The Category 3 Project was valued at 20.88% of total value based on the funding protocol guidance on values share by category.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $222,788*
Title of Outcome Measure (Improvement Target): IT-9.2- Right Care, Right Setting. IT-9.2 ED appropriate utilization by establishing more primary care clinics (Develop one additional Cook Children’s pediatric neighborhood clinic in an identified area of need.)

Unique RHP outcome identification number(s): 021184901.3.1
Performing Provider Name/TPI: Cook Children’s Medical Center / 021184901

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:

DY2: [P-1] Project planning – engage stakeholders, determine timelines and document implementation plans.
DY4/DY5: [IT-9.2] ED appropriate utilization. The new pediatric neighborhood primary care clinic will provide a primary care medical home for children ages 0-14 who live in ZIP 76119 by reducing the number of inappropriate visits to the Cook Children’s Medical Center emergency department.

Numerator: The number of visits to the Cook Children’s pediatric neighborhood clinic who live in ZIP code 76119.
Denominator: The number of visits to the Cook Children’s ED with a triage level of 4 or 5, i.e., primary care for children ages 0-14 who live in ZIP code 76119.
Improvement target: The ratio of NHC visits to ED visit for primary care will show a ratio >1.0 which improves by 10% per year for each demonstration year.

Rationale:
The selection of these process milestones and outcome improvement target is to specifically document and demonstrate expanded primary care and medical home access to an identified population that is currently underserved and achieve the following goals:
1. Expand pediatric primary care capacity by constructing a new primary care clinic.
2. Expand primary care providers by hiring physician, nursing and support staff.
3. Reduce the burden of providing primary care in potentially inappropriate settings.

It is hoped that, upon demonstrating successful outcomes, other providers can replicate this model in other parts of Region 10.

Outcome Measure Valuation:
Valuation assumes the NHC will enroll 6,000 pediatric patients in the 76119 ZIP code that are at high risk for lack of primary care services. The project forecasts an inverse relationship between
ED visits and primary care visits, with a forecasted 10% decrease in ED visits per year, once the clinic is established. Annual pediatric emergency department’s visits from 76119 are 1,700 visits per year. The result of the decrease in ED visits also assumes a corresponding decrease in Medicaid and/or other governmental funding sources for high-cost services in the ED. The cost per ED visit, established by the Region 10 Anchor hospital, is $1,200 per visit. We estimate a decrease of 170 ED visits per year from the 76119 ZIP code. The project also assumes that increased access to primary care results in decreased hospital admissions. Cook Children’s currently experiences an 11.4% ED admit rate. We estimate a decrease of 19 inpatient admissions from the 76119 ZIP code. On average, a Cook Children’s pediatric admission costs $28,475.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $2,609,486
**Title of Outcome Measure (Improvement Target):** IT-9.2- Right Care, Right Setting. IT-9.2 ED appropriate utilization by establishing more primary care clinics (Develop one additional Cook Children’s pediatric urgent care clinic in an identified area of need.)

**Unique RHP outcome identification number(s):** 021184901.3.2
**Performing Provider Name/TPI:** Cook Children’s Medical Center / 021184901

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**

**DY2:** [P-1] Project planning – engage stakeholders determine timelines and document implementation plans
**DY2/DY3:** [P-2] Establish baseline rates.
**DY4/DY5:** [IT-9.2] ED appropriate utilization. The new pediatric urgent care clinic will provide one-time urgent care needs for children ages 0-14 who live in a specific geographic area (to be determined in DY2) reducing the number of inappropriate visits to the Cook Children’s Medical Center emergency department.

Numerator: The number of visits to the Cook Children’s pediatric urgent care clinic who live in selected geography.
Denominator: The number of visits to the Cook Children’s ED with a triage level of 4 or 5, i.e., primary care for children ages 0-14 who live in that same geography.
Improvement target: The ratio of NHC visits to ED visit for primary care will show a ratio >1.0 which improves by 10% per year for each subsequent demonstration year.

**Rationale:**
The selection of these process milestones and outcome improvement target is to specifically document and demonstrate expanded urgent care access to an identified population that is currently underserved and achieve the following goals:

1. Expand pediatric urgent care capacity by constructing a new pediatric urgent care clinic.
2. Expand pediatric primary care / urgent care providers by hiring physician, nursing and support staff.
3. Reduce the burden of providing urgent care in potentially inappropriate settings.

It is hoped that upon demonstrating successful outcomes other providers can replicate this model in other parts of Region 10.

**Outcome Measure Valuation:**
Valuation assumes the Urgent Care Clinic will treat 8000 pediatric patients per year in the 76119 ZIP code that are at high risk for lack of urgent care and/or primary care services. The plan projects a 10% decrease in ED visits per year, once the clinic is established. Annual pediatric emergency department’s visits from 76119 are 1,700 visits per year. The result of the decrease in
ED visits also assumes a corresponding decrease in Medicaid and/or other governmental funding sources for high-cost services in the ED. The cost per ED visit, established by the Region 10 Anchor hospital, is $1,200 per visit. We estimate a decrease of 170 ED visits per year from the 76119 ZIP code. The project also assumes that increased access to Urgent Care services will result in decreased hospital admissions. Cook Children’s currently experiences an 11.4% ED admit rate. We estimate a decrease of 19 inpatient admissions from the 76119 ZIP code. On average, a Cook Children’s pediatric admission costs $28,475. Note: the 76119 ZIP code is used in this analysis for modeling purposes, since there is a demonstrated community need in that area. The urgent care center will likely have a wider geographic base and Cook Children’s plans to locate this center in an area that is most likely to meet the underserved needs of the broader Tarrant County area.

</tbody>
</table>

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $2,270,450
Title of Outcome Measure (Improvement Target): IT-7.2- Oral Health. IT-7.2 Cavities: Percentage of children with untreated dental caries. (Establish one new Cook Children’s Pediatric Dental Clinic in an identified area of need.)

Unique RHP outcome identification number(s): 021184901.3.3
Performing Provider Name/TPI: Cook Children’s Medical Center / 021184901

Outcome Measure Description:
Numerator: The number of visits to the Cook Children’s pediatric dental clinic for treatment of dental caries whose residence is in the identified service area – to be determined in DY2.
Denominator: The population of children ages 0-14 in the dental clinic’s service area.
Improvement target: The percentage of children treated for dental caries in the defined population will show a reduction of 10% per year from baseline for each subsequent demonstration year.

Process Milestones and Outcome Improvement Targets for each year:
- DY2/DY3: [P-1] Project planning – engage stakeholders determine timelines and document implementation plans
- DY3: [P-2] Establish baseline rates
- DY4/DY5: IT-7.2 Cavities: Percentage of children with untreated dental caries. The new pediatric dental care clinic will provide a service for children ages 0-14, thereby reducing the number of children with untreated dental caries.

Rationale:
The selection of these process milestones and outcome improvement targets is to, specifically document and demonstrate expanded pediatric dental care access to a population that is currently underserved and achieve the following goals:
1. Expand pediatric dental care capacity by constructing a new dental clinic.
2. Expand dental care providers by hiring a dentist and support staff.
3. Reduce the burden of providing dental care in potentially inappropriate settings, i.e., outpatient surgery.

It is hoped that upon demonstrating successful outcomes other providers can replicate this model in other parts of Region 10.

Outcome Measure Valuation:
Project valuation assumes 5,400 pediatric dental visits annually beginning DY4 and a 10% growth each year thereafter. Population is comprised primarily of pediatrics with little or no access to dental care. As a result, we assume that a sizable portion of the population has untreated dental caries (30% or 1,620 pediatric patients), with the project expecting to impact 10% or 162 of these patients with caries in year one and a 10% reduction per year thereafter in
the ZIP code where the clinic is located. In addition, the increased access to dental treatments is projected to reduce ambulatory dental surgeries by 10% per year for the corresponding ZIP codes where the clinic is located. Both the reduction in treatment for dental caries and ambulatory surgeries is expected to reduce governmental program costs by at least $201 and $2,741 per case, respectively.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $1,612,768
Performing Provider Name: Tarrant County/dba Tarrant County Public Health
Texas Provider Identifier: 022817305

Title of Outcome Measure (Improvement Target):
IT5.1- Improved Cost savings: Demonstrate cost savings in care delivery – ED visits
Unique RHP Outcome Identification Number: -022817305.3.1

Outcome Description:
The selected milestones and metrics (Outcome Measures IT-5.1) will measure the progress of participating RHP Performing Providers with regards to controlling costs arising from emergency department care (cost savings in care delivery) as assisted by HIE data. Using data from Region 10 RHP Providers and the NTAHP, DY2 will consist of project planning wherein stakeholders will be engaged, baseline rates, current capacity and needed resources will be identified, and timelines and document implementation plans will be determined. In DY 3, participating RHP Providers will develop and test data systems which will be followed by PDSA cycles to improve data collection and intervention activities in DY 4. In DY 5 using data from RHP Providers and the NTAHP HIE, cost savings in care delivery performed in Tarrant County hospitals by participating Region 10 RHP Providers will be demonstrated as evidenced by an average savings of $2-9 per -Emergency -Department (ED) visit when comparing patients who were queried against the HIE compared to those for whom such queries were not made. These findings, including lessons learned and best practices, will be disseminated to stakeholders.

Rationale:
By the end of the Waiver Period, because of their use of the data within the HIE, Region 10 RHP performing providers will be able to demonstrate cost savings related to care delivery and per-episode cost of care by eliminating unnecessary or duplicate testing. The collective end results of the project will be decreased potentially avoidable hospitalization and readmission rates and improved cost efficiency, both internal and external to the hospital environment. Participating Region 10 RHP performing providers will establish their own baselines for cost of care delivery and per-episode cost of care, and, at the end of the Waiver Period, they will be able to demonstrate a decrease from their individual baselines. The five-year expected outcome is that TCPH and other Region 10 RHP participants will use the shared information to pinpoint issues and then efficiently and effectively allocate education, preventive and/or management resources to those concerns. Continual reassessment using the data will further highlight additional modes and areas for improvement and refinement. Region 10 performing providers’ abilities to communicate with each other regarding individual private health information will also be positively impacted, thus resulting in improved patient safety and satisfaction and decreased health care delivery costs. The project will benefit specific at-risk populations because there will be an emphasis on using the data and subsequent analyses and assessments to facilitate intervention and program development (which may include interventions or programs designed to address care coordination, chronic disease treatment, patient self-management, and/or health promotion and prevention) that is specific to and will best address the needs of these special populations. The project also benefits the disproportionately medically disadvantaged/disenfranchised populations by setting the foundation for a system to stratify outcomes and quality measures by Race, Ethnicity And Language (REAL) demographic information to identify health disparities and develop strategies to ensure equitable outcomes.

Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and
outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

Rationale/Justification:
Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

-TCPH defined the population directly impacted by the project as Emergency Department (ED) patients who visit facilities participating in the HIE. ED visits totaled 791,926 with a daily average of 2,170 in 2011. The percentage of the Tarrant County population expected to be positively impacted by the project is 0.5% of DY5 ED visits as compared to baseline ED visits. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. A cost savings of $29 per visit times 3,960 ED visits (3,960 is the number of 0.5% ED visits with a cost decreases in DY5) equals $114,829. [“The Business Case for Payer Support of a Community-Based Health Information Exchange” by Tzeel, Lawnicki and Pemble] This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. The actual HIE total project valuation for 5 years equals $16,455,337. However, due to DSRIP Public Health funding available the project value was discounted by 57.8% to $6,947,507.

-To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because; the reduction in tests will save patient time, pain, diagnostic time and money. To determine the value to the community - impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe this to be the correct number because; it will save the community resources and money by reducing duplicative radiology and lab tests.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $169,756
Performing Provider Name: Tarrant County/dba Tarrant County Public Health
Texas Provider Identifier: 022817305

Title of Outcome Measure (Improvement Target):
- IT-5.2: Improved Cost savings: Demonstrate cost savings per episode cost of care – reduced radiology testing cost

Unique RHP Outcome Identification Number: - 022817305.3.2

Outcome Description:
The selected milestones and metrics (Outcome Measures IT-5.1) will measure the progress of participating RHP Performing Providers with regards to decreasing costs (cost savings in per episode of care) through enhancing capacity through efficient/effective use of radiology resources as assisted by HIE data. Using data from Region 10 RHP Providers and the NTAHP, DY2 will consist of project planning wherein stakeholders will be engaged, baseline rates, current capacity and needed resources will be identified, and timelines and document implementation plans will be determined. In DY 3, participating RHP Providers will develop and test data systems which will be followed by PDSA cycles to improve data collection and intervention activities in DY 4. In DY 5 using data from RHP Providers and the NTAHP, cost savings in per episode of care as evidenced by a 2% reduction in cost of radiology testing performed in Tarrant County hospitals by participating Region 10 RHP Providers will be demonstrated. These findings, including lessons learned and best practices, will be disseminated to stakeholders.

Rationale:
By the end of the Waiver Period, because of their use of the data within the HIE, Region 10 RHP performing providers will be able to demonstrate cost savings related to care delivery and per-episode cost of care by eliminating unnecessary or duplicate testing. The collective end results of the project will be decreased potentially avoidable hospitalization and readmission rates and improved cost efficiency, both internal and external to the hospital environment. Participating Region 10 RHP performing providers will establish their own baselines for cost of care delivery and per-episode cost of care, and, at the end of the Waiver Period, they will be able to demonstrate a decrease from their individual baselines.

The five-year expected outcome is that TCPH and other Region 10 RHP participants will use the shared information to pinpoint issues and then efficiently and effectively allocate education, preventive and/or management resources to those concerns. Continual reassessment using the data will further highlight additional modes and areas for improvement and refinement. Region 10 performing providers’ abilities to communicate with each other regarding individual private health information will also be positively impacted, thus resulting in improved patient safety and satisfaction and decreased health care delivery costs. The project will benefit specific at-risk populations because there will be an emphasis on using the data and subsequent analyses and assessments to facilitate intervention and program development (which may include interventions or programs designed to address care coordination, chronic disease treatment, patient self-management, and/or health promotion and prevention) that is specific to and will best address the needs of these special populations. The project also benefits the disproportionately medically disadvantaged/disenfranchised populations by setting the foundation for a system to stratify outcomes and quality measures by Race, Ethnicity And Language (REAL) demographic information to identify health disparities and develop strategies to ensure equitable outcomes.
Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B. Continuing to work on this section so valuing of the project is in a more consistent manner with the methodology designed by RHP 10.

Rationale/Justification:
Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

- TCPH defined the population directly impacted by the project as Emergency Department (ED) patients who visit facilities participating in the HIE. ED visits totaled 791,926 with a daily average of 2,170 in 2011. According to the “National Hospital Ambulatory Medical Care Survey 2006 Emergency Department Summary,” 44.2% of ED visits resulted in orders for radiological studies. The percentage of the Tarrant County population expected to be positively impacted by the project is 0.5% of DY5 ED visits as compared to baseline ED visits. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. An average cost savings per episode of care of $214 per radiology test X 1,000 (based on an overall 2% reduction in radiology tests performed equaling a decrease of 1,000 tests) is $214,000. [Hospital Costs Index by Cleverly & Associates 2007] This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. The actual HIE total project valuation for 5 years equals $16,455,337. However, due to DSRIP Public Health funding available the project value was discounted by 57.8% to $6,947,507. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because; the reduction in tests will save patient time, pain, diagnostic time and money.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe this to be the correct number because; it will save the community resources and money by reducing duplicative radiology tests.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $406,145
Performing Provider Name: Tarrant County/dba Tarrant County Public Health
Texas Provider Identifier: 022817305
Title of Outcome Measure (Improvement Target):
IT-5.3 Improved cost savings: reduced laboratory testing costs
Unique RHP Outcome Identification Number: 022817305.3.3

Outcome Description:
The selected milestones and metrics (Outcome Measures IT-5.3) will measure the progress of participating RHP Performing Providers with regards to decreasing costs (cost savings in per episode of care) through enhancing capacity through efficient/effective use of laboratory resources as assisted by HIE data. Using data from Region 10 RHP Providers and the NTAHP, DY2 will consist of project planning wherein stakeholders will be engaged, baseline rates, current capacity and needed resources will be identified, and timelines and document implementation plans will be determined. In DY 3, participating RHP Providers will develop and test data systems which will be followed by PDSA cycles to improve data collection and intervention activities in DY 4. In DY 5 using data from RHP Providers and the NTAHP, cost savings in per episode of care as evidenced by a 2% reduction in cost of laboratory testing performed in Tarrant County hospitals by participating Region 10 RHP Providers will be demonstrated. These findings, including lessons learned and best practices, will be disseminated to stakeholders.

Rationale:
By the end of the Waiver Period, because of their use of the data within the HIE, Region 10 RHP performing providers will be able to demonstrate cost savings related to care delivery and per-episode cost of care by eliminating unnecessary or duplicate testing. The collective end results of the project will be decreased potentially avoidable hospitalization and readmission rates and improved cost efficiency, both internal and external to the hospital environment. Participating Region 10 RHP performing providers will establish their own baselines for cost of care delivery and per-episode cost of care, and, at the end of the Waiver Period, they will be able to demonstrate a decrease from their individual baselines.

The five-year expected outcome is that TCPH and other Region 10 RHP participants will use the shared information to pinpoint issues and then efficiently and effectively allocate education, preventive and/or management resources to those concerns. Continual reassessment using the data will further highlight additional modes and areas for improvement and refinement. Region 10 performing providers’ abilities to communicate with each other regarding individual private health information will also be positively impacted, thus resulting in improved patient safety and satisfaction and decreased health care delivery costs. The project will benefit specific at-risk populations because there will be an emphasis on using the data and subsequent analyses and assessments to facilitate intervention and program development (which may include interventions or programs designed to address care coordination, chronic disease treatment, patient self-management, and/or health promotion and prevention) that is specific to and will best address the needs of these special populations. The project also benefits the disproportionately medically disadvantaged/disenfranchised populations by setting the foundation for a system to stratify outcomes and quality measures by Race, Ethnicity And Language (REAL) demographic information to identify health disparities and develop strategies to ensure equitable outcomes.
Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section Continuing to work on this section so valuing of the project is in a more consistent manner with the methodology designed by RHP 10.

Rationale/Justification:
Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

- TCPP defined the population directly impacted by the project as Emergency Department (ED) patients who visit facilities participating in the HIE. ED visits totaled 791,926 with a daily average of 2,170 in 2011. According to the “National Hospital Ambulatory Medical Care Survey 2006 Emergency Department Summary,” 38.2% of ED visits resulted in orders for laboratory testing. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. An average cost savings per episode of care of $363 per laboratory test times 2,000 (based on an overall 2% reduction in laboratory tests performed equaling a decrease of 2,000 tests) is $726,000. [Hospital Costs Index by Cleverly & Associates 2007]. This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. The actual HIE total project valuation for 5 years equals $16,455,337. However, due to DSRIP Public Health funding available the project value was discounted by 57.8% to $6,947,507.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because; the reduction in tests will save patient time, pain, diagnostic time and money.

To determine the value to the community - impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 4. We believe this to be the correct number because; it will save the community resources and money by reducing duplicative laboratory tests.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $169,756**
Title of Outcome Measure (Improvement Target): IT-11.1 Improvement in clinical indicator in identified disparity group.

Unique RHP outcome identification number(s): - 022817305.3.5

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/ 022817305

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
The Process Milestones include hiring and training an individual to act as coordinator for the PRIDE Program. The individual will be trained to train the community organizational leaders, provide guidance on best practices for communicating with youth, and begin to identify community agencies to incorporate the PRIDE Program. The next process milestone is to provide PRIDE curriculum to 125 youth in the target area. In year the PRIDE curriculum will be reassessed with a focus on outcome indicators to make sure the appropriate messages are being retained by the youth. This program assessment will be performed by The University of North Texas, Health Science Center and will focus on behavioral changes in the youth. In year 5, there should be a reduction in STD case levels in Tarrant County. Using the 2011 annual STD case report, there should be a 15% reduction in cases for 2015 in the 15 – 24 year old category. This reduction will meet the improvement target of Improvement in clinical indicator in the identified disparity group.

Rationale:
The process milestones reflect the steps necessary to provide Sexually transmitted Disease (STD) information to youth populations (15-24) in a non-threatening, non-judgmental environment. The ultimate outcome is a reduction in STD rates for Tarrant County.

Outcome Measure Valuation:
- Approach/Methodology: Valuation of each outcome measure is based upon the cost of implementing each component of the PRIDE Program. Cost saving and return on investment occurs, when each participant gains the knowledge and understanding of the PRIDE curriculum and begins to take responsibility for their sexual health. This in-turn will reduce the disease incidence in the community, reducing the medical cost of treatment and/or complications from STD infection.

- Rationale/Justification: Early identification and treatment of STD’s reduces the risk of complications and hospitalizations for individuals and will reduce the medical cost to the community. This program will increase the knowledge levels of the youth, allowing better choices, understanding what is required to reduce individual risk, and providing factual information to seek medical services when certain symptoms are noticed on the individual or a friend or partner. Early identification and treatment of STD’s reduces the risk of complications and hospitalizations for individuals who are diagnosed with an
infection. In 1994 dollars the cost for chlamydia and associated sequelae in the U.S. was $1,513.9 (millions) with the STD total $5.025.0 (millions) nationally. Hospital costs for treating Pelvic Inflammatory Disease (a complication of gonorrhea or chlamydia) was $4.148. Million in direct cost services.

Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of Tarrant County minority STDs under age 24. The percentage of the population expected to be positively impacted by the project in DY5 with a 11.11% decrease in chlamydia rates for Tarrant County minority youth ages 15-24 by the end of DY5. That means that a minimum of 537 youth will not contract chlamydia by the end of DY5. The medical cost savings per person is $1,700.42. This total value of $912,279.00 is multiplied by the individual impact of 3 and the community impact of 2 to determine the values per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the project valuation of $11,859,621.00. This actual amount had to be discounted due to Public Health DSRIP available funding to a total value of $5,618,849.00 or a 52.6% valuation discount.

We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYS 2-5): $603,056
Title of Outcome Measure (Improvement Target): IT-11.1 –Improvement in Clinical Indicator in identified disparity group– (Improvement in target population to reduce Gonorrhea and Chlamydia STD rates in the City of Arlington)

Unique RHP outcome identification number(s): - 022817305.3.6
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/ 022817305

Outcome Measure Description:
IT-11.1 –Improvement in Clinical Indicator in identified disparity group-- (Improvement in target population to reduce Gonorrhea and Chlamydia STD rates in the City of Arlington)

Identify, hire and train medical staff for STD clinical operations in Arlington. Develop schedule to allow a Saturday clinic for at least 6 hours. Begin to advertise and inform the community of the new clinic schedule. Outcome measures in year 3 and 4 will increase clinic utilization by 10% annually. By the end of year 5, with an additional 10% increase in client utilization, there should be a 10% reduction in minority syphilis STD rates reported in Arlington when compared to the baseline rates in 2011.

Process Milestones:
- DY2:
  - P-2– Establish base line rates for each of the reportable STD infections (syphilis, gonorrhea, chlamydia and HIV) in the minority population.

Outcome Improvement Targets for each year:
- DY3:
  - IT-1.1: Arlington Minority STD Rates for gonorrhea and chlamydia are reduced by 3% when compared to baseline 2011 reports.
- DY4:
  - IT-1.1: Arlington Minority STD Rates for gonorrhea and chlamydia are reduced by 6% when compared to baseline 2011 reports.
- DY5:
  - IT-1.1: Arlington Minority STD Rates for gonorrhea and chlamydia are reduced by 10% when compared to baseline 2011 reports.

Rationale:
The number of Sexually Transmitted Diseases (STD) diagnosed cases continues to increase in Tarrant County. The Arlington area continues to produce a high number of new STD infections (11,621 chlamydia, gonorrhea, syphilis and HIV reported by ZIP code to Tarrant County Public Health, Adult Health Services Division, Surveillance Unit in 2011). The Arlington area does not have a full time STD/HIV medical provider to service the population on a daily basis. Minority populations, Blacks and Hispanics, are disproportionately affected by chlamydia, syphilis, gonorrhea and HIV infections. Implementing a full service STD/HIV clinic, 5 days per week,
within the City of Arlington, will provide essential STD services and begin to reduce the STD reservoir. The outcome measure is to reduce STD/HIV morbidity by 10% from 2011 STD/HIV levels.

The process milestones reflect the steps necessary to provide STD services to the clients in the City of Arlington to reduce STD rates in the city and the County.

**Outcome Measure Valuation:**

- **Approach/Methodology:** The National Centers for Disease Control and Prevention have developed program standards to achieve reductions in STD levels in state, county and city STD Programs. Best practices for program implementation and operation are available at the CDC website. The Texas State Department of Health Services has adopted the same requirements and lists them on the state website. Tarrant County implemented the same basic standards for clinical operations. The outcome measures are related to a reduction of individuals reported with sexually transmitted infections. Baseline data is listed below:

- STD trends continue to increase in Arlington ZIP codes. The target for this intervention is the minority populations in the City of Arlington. The current population is 365,438 (2010 Census) with 29% Hispanic and 17% African-American, 8% “other” (mixed race, Native American, Asian and not listed) for a total minority population of about 54%. Youth under the age of 24 are the fastest growing group of individuals acquiring STD/HIV infections. Current disease trends list ages 15-24 as having 51% of new syphilis infections, 73% of the chlamydia cases and 35% of the new HIV cases. This young age group is less likely to seek medical services in other areas of the County, especially since there is a transportation deficit in Arlington. Syphilis and HIV cases have increased in Arlington by 20% over the previous year.

- The cost savings for 143 minority gonorrhea and chlamydia cases at a savings of $1,562.29 per case for each case prevented. This total value of $223,564.00 is multiplied by individual impact of 3 and a community impact of 2 to determine values per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total gonorrhea and chlamydia outcome valuation of $2,906,328.00. The combined category 3 valuation equals $6,864,828.00. The actual project value was discounted due to the amount of total Public Health DSRIP funds available to $3,252,417.00. This is a 52.6% valuation discount.

**2011 Arlington STD Cases Reported**

Chlamydia and Gonorrhea 2,241
Minorities 1,431 or 63.86%

**Rationale/Justification:** Using the Bureau of Labor Statistics inflation calculator to calculate 2012 dollars, preventing a Central Nervous System (CNS) case of syphilis saves $16,473.31 per serious case of CNS Impairment. Serious and very severe CNS Impairment occurs in 6% to 16% of Syphilis cases = $16,473.31. For valuation purposes we utilized $15,000.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYS 2-5): $147,785
**Title of Outcome Measure (Improvement Target):** IT-2.3: Hypertension Admission Rate

**Unique RHP outcome identification number(s):** 022817305.3.8

**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/ 022817305

**Outcome Measure Description:**

**Process Milestones:**

- P-1: Project planning- engage community stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans community.
- P-2: Establish baseline.
- P-3: Develop and test data systems

**Outcome Improvement Targets for each year:**

- IT-6: 20%, 25% and 35% respectively, of the patients in the defined population receiving innovative intervention consistent with evidence-based model will have a reduction in admissions relating to hypertension and strokes.

**Rationale:**

Tarrant County residents spent Nearly $87 million on preventable hospitalizations relating to hypertension between 2005-2010⁸. Between 2005 and 2010 the number of PPH increased by 25%⁸. Evidence shows that the CDSMP has helped to decreased the number of hospitalization days thereby saving medical dollars while helping to sustain individual quality of life.¹²,¹⁰ The program has realized a savings between $390 and $520 per participant over a study period of two years due in part to participants being hospitalized fewer days in the first six-months of the program². This project will help clients self-manage their blood pressure and make appropriate use of the primary care provider setting as opposed to using the ED for management¹.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** Performing providers in Region 10 recognize that Category three outcomes represent the value that CMS hopes to achieve through the Waiver.
Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

- Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of participants in the Chronic Disease Self-Management Program (CDSMP) education. The percentage of the population expected to be positively impacted by the project in DY5 is 35%. Of that 35%, 10% would possibly have been hospitalized for a stroke. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

- To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because; with the CDSMP education the participants will have increased knowledge to assist them in managing their hypertension.

  To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when

**Title of Outcome Measure (Improvement Target):** IT-12.6- Other Outcome Improvement Target

**Unique RHP outcome identification number(s):** - 022817305.3.9

**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/ 022817305

**Outcome Measure Description:**

**Process Milestones:**

- In DY2 protocols will be created for LTBI treatment with rifapentine, staff will be hired and trained and enrollment in the program will begin. Also the current LTBI database will be maintained and a second one will be created for tracking patients’ rifapentine doses.
- In DY3 100% of the patients on rifapentine will have doses tracked in the database created to monitor for patients missing multiple doses. Those missing doses will be contacted by staff to ensure patients are not “lost” and to find areas where the program can improve.
  - LTBI treatment completion rates will increase by 20% compared to baseline established in DY2

**Outcome Improvement Targets for each year:**

- In DY4 Contacts, homeless shelter residents and refugees LTBI treatment completion rates will continue to improve by 25% over DY2 baseline.
- By the end of DY5, completion rates will increase by 30% for contacts, homeless shelter residents and refugees combined. All of these outcome improvements are possible and could be better because of the shorter treatment duration and following patients’ doses in the database.

**Rationale:**
Currently completion rates among these high risks groups is less than 60%. Much of this can be attributed to the 9 month (270 doses) regimen required to complete LTBI treatment. Although this 12 dose regimen is more expensive than other types of treatment a CDC study has shown greater compliance and completion of treatment. Also the price of treating a single case of TB without having any complications of drug resistances can still be much more than treating the 15 people a single case of TB can expose.

The process milestones setup involve creating protocols, hiring/ training staff and creating a database specifically designed to track patients on rifapentine and document all information required for treatment.
The outcome improvements reflect the increasing LTBI treatment completion rates that will be a result of the shorter rifapentine regimen.

Outcome Measure Valuation:

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. It has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of LTBI clients receiving rifapentine medication. The percentage of the population expected to be positively impacted by the project is 30%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. The goal by the end of DY5 is local hospitals will not report more than a 30% increase in Active TB cases (among Tarrant County residents). The cost savings for the 174 additional LTBI clients that complete their LTBI medication treatment is the cost to the medical system to restart the medication treatment after the failure of $1,092 per client (174 X $1,092 = $190,008). This total value of $190,008 is multiplied by individual impact of 3 and community impact of 3 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the actual total outcome valuation of IT-5.1 of $2,717,114.

- To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is does not successfully complete the medication treatment it is possible for the latent TB to convert to a case of Active TB. Once converted to active TB the individual health is affected. If the medication treatment was partially completed there is an enhanced chance of developing a drug resistant strain of TB. This type TB is usually treated with IV therapy. Drug resistant TB is more serious and costly.

- To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because; when a person does not successfully complete the
medication treatment it is possible for the latent TB to convert to a case of Active TB. Once converted to an Active TB case it is possible for the individual to transmit TB to others. The completion of LTBI medication treatment provides the client with a lifelong health benefit with the prevention of the conversion to an active case of TB. Without the LTBI medication completion a conversion to active TB could occur anytime within the individuals lifetime. In addition to the clients health benefits LTBI medication treatment completion also protects and provides benefits to the clients family members and other close connect individuals.

**Outcome Measure 1: 3.IT-5.1 –Valuation Reference**
$1,092 cost to the system to restart medication treatment after failure

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $114,037
**Title of Outcome Measure (Improvement Target):** 3.IT-5.1: Improved cost savings:
Demonstrate cost savings in care delivery

**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/022817305

**Unique RHP Outcome Identification Number:** 022817305.3.15 (Pass 2)

**Outcome Measure Description:**
By the conclusion of the Waiver, our goal is to increase the number of clients who complete their LTBI treatment by 20% and show cost savings by having assisted those patients with completion of their plan of care.

**Process Milestones:**
- **DY2:** Establish projects plans and baseline rates for LTBI treatment completion to be compared with project completion rates.
- **In DY3:** Test the current data collection system and serve the first clients in the after-hours clinic.

**Outcome Improvement Targets:**
- **DY4:** Improvement in patients who complete LTBI treatment by 10% over DY2 baseline
- **DY5:** Improvement in patients who complete LTBI treatment by 20% over DY2 baseline. Of that 20% increase, 10% would have been expected to convert to active TB. Cost savings are calculated on 10% of the clients who completed LTBI treatment. Ten percent is the known percentage that would be expected to convert to active TB when LTBI treatment is not completed. This is calculated by multiplying the cost of treatment of active TB case times the number that would have converted to active TB if left untreated.

**Rationale:**
Both the milestones and improvement targets were set to improve the cost of treating tuberculosis in Tarrant County. By increasing completing LTBI treatment before progressing to active disease, the cost to individuals and the health care system is reduced. LTBI patients accrue a cost of approximately $205 for a nine-month treatment course and the cost of six months of standard treatment for TB disease is approximately $12,511.71. Since approximately 10% of identified contacts to known cases will progress to active disease, the savings will be substantial. Tarrant County identifies approximately 990 LTBI cases per year that are initiated on treatment. Currently 46% complete LTBI treatment. By increasing TB clinic hours, it is anticipated that the LTBI completion rate at the end of DY5 will be 66%, with a cost valuation goal of preventing nine additional LTBI clients from converting to an active TB case.

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed...
at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

**Rationale/Justification:**

Tarrant County Public Health defined the population that will be directly impacted by the project as the number of LTBI clients seen in DY5 compared to the number seen in 2011. The percentage of the population expected to be positively impacted by the project is a 20% increase in LTBI clients seen. Of that 20% seen, 10% would have been expected to convert to active TB; therefore approximately nine will be positively impacted by nonconversion to active TB. Based on HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 10.74% of the total project valuation was allocated to Category 3. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. **Outcome Measure 2: 3.IT-5.1** 91 additional clients are expected to complete LTBI treatment of those 91 clients 10% would have been expected to convert to active time without LTBI treatment completion or 9. At least $12,307 is saved for each of the 9 LTBI treatment completion clients ($12,307 X 9 = $110,763. $110,763 is multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-1.20 actual total outcome valuation of $1,583,911. However due to Public Health DSRIP funding availability the project was discounted 7.8%.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is does not successfully complete the medication treatment, it is possible for latent TB to convert to active TB. Once converted to active TB, the individual’s health is affected. If the medication treatment is partially completed, there is increased likelihood of developing a drug-resistant strain of TB. Usually treated with IV therapy, drug-resistant TB is more serious and costly.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment it is possible for latent TB to convert to active TB. Once converted to active TB, it is possible for the individual to transmit TB to others. If the TB strain transmitted is a drug-resistant strain, treatment costs are further increased.

**Valuation Reference**

**Outcome Measure : 3.IT-5.1**

$12,307 saved on each non conversion to active TB compared to the cost of LTBI treatment

Holland et al. Costs and cost-effectiveness of four treatment regimens for latent tuberculosis infection.
**Baseline Data:** The actual number of LTBI patients currently accepting treatment and serviced by the Tarrant County Public Health Tuberculosis Clinic as noted in the current database managed at the clinic.

**Target Population:** The diagnosed Tarrant County Population who have latent tuberculosis and who accept preventive 6-9 month treatment for that infection.

**Specific Number:** The number varies yearly but is expected to be approximately 990 cases per year.

**Description of the Population:** The majority of the population served is low income families exposed to a recent case of tuberculosis, homeless or otherwise in congregate settings. In addition special contacts occur within schools, jails, hospitals, as new immigrants/refugees, and medically underserved.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): - $156,789
Title of Outcome Measure (Improvement Target): IT-10.1: Quality of Life

Unique RHP Outcome Identification Number: 022817305.3.16 (Pass 3)
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Outcome Measure Description:
Process Milestones:
By the end of the waiver, our goal is to reach 60% of smokers who have Medicaid and are patients in the Texas Health Resources (THR) network. DY2 initial phase will be to conduct project planning whereby we engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans to establish a tobacco-cessation program that THR and other stakeholders will use. In DY2 we will also establish baseline rates of Health Related Quality of Life (HRQOL) survey for tobacco users in Tarrant County. In DY3 as a part of our CQI requirements we will conduct the Plan Do Study Act in order to ensure that we are on the right track to help facilitate the smoking cessation and quality of life improvements we are aiming to realize among program participants.

Outcome Improvement Targets:
In DY3, DY4 and DY5 we will see enrollment of 40%, 50% and 60% respectively of target population into the program, with 90% of program participants having an improved HRQOL survey result upon completion of the program. In DY5, 60% or 600 program participants will have an improved HRQOL survey result upon program completion.

Rationale:
We selected our process outcomes and improvement targets to develop a program that stakeholders and community partners will want to access and refer clients to. We selected the five-year target of 60% referral rate because we want to impact the smoking Medicaid population in Tarrant County, and realize that not all smokers will want to enroll into our program, but may choose to use an alternative tobacco-cessation program upon being introduced to it through our program. By the end of DY5, 25% of DY4 participants will remain smoke-free for one year. We selected to measure quality of life because it includes all aspects of life that can directly or indirectly affect the appropriate use of medical services, productivity and sustainability of employment, all of which affect the finances of Tarrant County, Texas and the federal government. According to research conducted by Megan Piper and the University of Wisconsin School of Medicine, Tobacco Research and Intervention from 2005-2007, those who practiced tobacco-cessation experienced improved mood and fewer stressors for up to three years after stopping tobacco use.325

Outcome Measure Valuation:
Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed

at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V. B. for a full explanation of the model.)

**Rationale/Justification:**

Tarrant County Public Health computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V. B. for a full explanation of the model.)

Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as Tarrant County smokers with Medicaid who participate in Tarrant County Public Health smoking-cessation classes. The total number of the Tarrant County population expected to be positively impacted by the end of DY5 is approximately 2,400 cessation class participants. The goal by the end of DY5 is 60% or approximately 600, will have an improved HRQOL survey result upon program completion. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.26% of the total project valuation was allocated to Category 1 and 2. The 600 participants with improved quality of life times two quality of life values (productivity of $3,961.88 and medical cost of $2,342.56) or 600 X $6,304 equals $3,782,664. This amount is multiplied by individual impact of 5 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project valuation. The actual Tobacco Intervention total project valuation for 5 years equals $68,844,485. However, due to the DSRIP Public Health funding available and the project valuation maximum the Tobacco Intervention project was discounted by 67.5% to a total project valuation of $22,405,703.

We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Dollar valuations for the expected impact are from Penn State, “Potential costs and benefits of smoking cessation for Texas, Tables 2 and 3, April 30, 2010.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because upon being tobacco free for one year it is assumed the participant will remain smoke free for life. This has great impact on of the health improvement, increase in productivity and the reduction in medical cost as a results of being a non-smoker/ex-smoker. We believe this to be the correct number because as the FDA warnings on cigarette packages and advertising state, “cigarettes causes fatal lung disease,” “cigarettes cause cancer,” and “cigarettes cause strokes and heart disease.”

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because reducing the number of smokers for a life time also reduces the harm to nonsmokers in the community from secondhand smoke. The FDA warnings on cigarette packages and advertising state, “tobacco smoke can harm your children” and “smoking during pregnancy can harm your baby.” In addition, it will save community resources and medical costs by reducing smoke-related medical services for both the new non-smokers and those with health issues as a result of the second hand smoke.

| Year 2 Estimated Outcome Amount: $0 | Year 3 Estimated Outcome Amount: $546,635 | Year 4 Estimated Outcome Amount: $585,734 | Year 5 Estimated Outcome Amount: $1,273,336 |

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $2,405,705**
Title of Outcome Measure (Improvement Target): IT-2.14- Other Admission Rate

Unique RHP outcome identification number(s): 022817305.3.17

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Outcome Measure Description:

Process Milestones:
- In DY2 a baseline rate for TB cases reported to TCPH-TB Division will be established. This will be done by reviewing data of TB cases from 2002-2012 and dividing the number of those reported by Tarrant County hospitals by the total number of cases during that timeframe. Based on the data collected the baseline rate for local hospitals reporting new TB cases is 59 per year.

Outcome Improvement Targets for each year:
- In DY3 the number of Tarrant County residents admitted to local hospitals for undiagnosed, Active Tuberculosis will decrease by 1% compared to the baseline established in DY2.
- In DY4 the number of Tarrant County hospitals admitting undiagnosed TB cases will decrease by 2% from DY2 baseline.
- By the end of DY5 the number of undiagnosed TB cases admitted to local hospitals will decrease by 3% from baseline established in DY2. The outcome improvement targets above are possible, and with Rifapentine treatment being offered to those at high risk of developing Active TB, undiagnosed cases of TB within Tarrant County could be better than projected. This treatment for Latent TB Infection (LTBI) will not only impact the next 3 years but many more in the future as TB Infection can become active at any point in someone’s life.

Rationale:
Three groups of people with higher risks of developing Active TB are: contacts to TB cases, homeless shelter residents and refugees (foreign born). Each of these groups has a greater risk of developing the disease for various reasons.
By introducing a shorter medication regimen to treat LTBI; these groups of high risk individuals are more likely to complete treatment and a result prevent them from going on to develop Active TB. The more high risk individuals completing LTBI treatment will lead to fewer of them developing Active TB later in life and passing the bacteria on to others.

The process milestone created involves analyzing data for TB cases from 2002-2012 and establishing a baseline percentage for Tarrant County hospital reported cases.
The outcome improvements reflect an expected decrease in the number of TB cases admitted to hospitals within the County as a result of the LTBI regimen.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** Tarrant County Public Health defined the population that will be directly impacted by the project as individuals indentified as the number of LTBI clients receiving Rifapentine medication. The percentage of the population expected to be positively impacted by the project is 30%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. The goal by the end of DY5 is local hospitals will have a reduction of 3% in reported TB cases. Based on a 10 year average 59 TB cases per year are hospital reported cases. There is a savings of $20,100 per potentially preventable TB hospital admissions for the 3% decrease in hospital reported TB cases ($20,100 X 2 = $40,200). $40,200 is then multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-2.14 actual total outcome valuation of $574,860.

- To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is does not successfully complete the medication treatment it is possible for the latent TB to convert to a case of Active TB. Once converted to active TB the individual health is affected. If the medication treatment was partially completed there is an enhanced chance of developing a drug resistant strain of TB. This type TB is usually treated with IV therapy. Drug resistant TB is more serious and costly.

- To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because; when a person does not successfully complete the medication treatment it is possible for the latent TB to convert to a case of Active TB.
Once converted to an Active TB case it is possible for the individual to transmit TB to others. The completion of LTBI medication treatment provides the client with a lifelong health benefit with the prevention of the conversion to an active case of TB. Without the LTBI medication completion a conversion to active TB could occur anytime within the individuals lifetime. In addition to the clients health benefits LTBI medication treatment completion also protects and provides benefits to the clients family members and other close connect individuals.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $24,127
Title of Outcome Measure (Improvement Target): IT-2.14 Other Admission Rate

Unique RHP Outcome Identification Number: 022817305.3.18 (Pass 2)
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Outcome Measure Description:
Process Milestone:
DY2: A Baseline rate for TB cases reported to TCPH-TB Division will be established. This will be accomplished by reviewing the data of TB cases reported from 2002-2012 and dividing the number of those reported by Tarrant County hospitals by the total number of cases during that time frame.

Outcome Improvement Targets:
DY3: The number of Tarrant County residents admitted to local hospitals for undiagnosed, Active Tuberculosis will decrease by 1% over the baseline established in DY2.
DY4: The number of Tarrant County hospitals admitting undiagnosed TB cases will decrease by 2% of the DY2 baseline.
DY5: By the end of DY5, the number of undiagnosed TB cases admitted to local hospitals will decrease by 3% over the baseline established in DY2. The outcome improvement targets above are possible in combination with the Rifapentine treatment project that targets high risk populations and the increased LTBI treatment follow up hours that provide flexibility in treatment follow through. Improved Latent TB Infection (LTBI) treatment will impact the community not only in these 3 years but significantly for the future by curtailing the transition of latent infection into active disease.

Rationale:

The number of patients identified to smear positive tuberculosis cases fluctuates from year to year. Some cases have larger families and significant community contact points that must be evaluated. Others do not live with anyone and may be employed in areas with limited contact with others. In a five-year retrospective look at completion rates, the trend in Tarrant County is below the targeted number set by the CDC as described in Healthy People 2020. To improve on that rate, the opportunity for more contact with clients diagnosed with latent tuberculosis has the potential to decrease active disease in the community.

The process milestone create involves analyzing data for TB cases from 2002-2012 and establishing a baseline percentage for Tarrant County hospital reported cases. The outcome improvements reflect the expected decrease in the potential number of TB cases admitted to hospitals within the County as a result of the LTBI treatment programs.
Valuation:

**Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V. B. for a full explanation of the model.)*

**Rationale/Justification:**
Tarrant County Public Health defined the population that will be directly impacted by the project as the number of LTBI clients seen in DY5 compared to the number seen in 2011. A 20% increase in LTBI clients seen is the positive population impact of this project. The positive impact is a 3% decrease in the annual hospital reported TB cases. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 10.74% of the total project valuation was allocated to Category 3. **Outcome Measure 3: 2.14** Based on a 10 year average 59 TB cases per year are hospital reported cases. There is a savings of $20,100 per potentially preventable TB hospital admissions for the 3% decrease in hospital reported TB cases ($20,100 X 2 = $40,200). $40,200 is then multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-2.14 actual total outcome valuation of $574,860. However due to Public Health DSRIP funding availability the project was discounted 7.8%.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment, it is possible for latent TB to convert to active TB. Once converted to active TB, the individual’s health is affected. Active TB can result in long-term negative health effects and, in some cases, death. If the medication treatment is partially completed, there is increased likelihood of developing a drug-resistant strain of TB. Usually treated with IV therapy, drug-resistant TB is more serious and costly.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment, it is possible for latent TB to convert to active TB. Once converted to active TB, it is possible to infect other individuals in the community.

## Project Description

**Project Number:** 022817305.3.18  
**Title:** 3.IT-2.14 Other Admission Rate-Decrease in Tuberculosis hospital admissions (providing additional treatment follow up hours/access with routine LTBI treatment and Rifapentine short coarse treatment to prevent active disease)

### Tarrant County/dba Tarrant County Public Health

| Related Category 1 or 2 Projects: | 022817305.1.2 :Expand Primary Care Capacity-TB Clinic Expansion |

### Starting Point/Baseline:

- **Baseline Data:** From 2002-2012, 52% of all TB cases were reported from local hospitals (652 out of 1254). Based on this data, the baseline is 59 new active TB cases/year reported by local hospitals of Tarrant county residents.
- **Target Population:** The diagnosed Tarrant County Population who have latent tuberculosis and who accept preventive 6-9 month treatment for that infection.
- **Specific Number:** The number varies yearly but is expected to be approximately 990 cases per year.
- **Description of the Population:** The majority of the population served is low income families exposed to a recent case of tuberculosis, homeless or otherwise in congregate settings. In addition special contacts occur within schools, jails, hospitals, as new immigrants/refugees, medically underserved and all others who meet the medical criteria for treatment per the health and safety code. Many of these people do not have a medical home and use the hospital as their primary care.

### Total Estimated Incentive Payments for 4-Year Period

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $56,905**
Title of Outcome Measure (Improvement Target): IT-- 8.4 Reduce incidence of - preterm births in women with a history of spontaneous preterm birth.

Unique RHP outcome identification number(s): -022817305.3.19

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Outcome Measure Description:

Process Milestones:
- DY2 - Develop training plan for providers regarding the use of antenatal steroids.
- DY3 - Develop campaign to educate women with a history of preterm birth about the option of using antenatal steroids.

Outcome Improvement Targets for each year:
- DY4 - Reduce the incidence of preterm birth for women with a history of spontaneous preterm births by 10%.
- DY5 - Reduce the incidence of preterm birth for women with a history of spontaneous preterm births by 20%.

Rationale:
Selection of the Category 2 project to implement the use of antenatal steroids for the prevention of preterm birth, in women with a history of preterm birth is listed as an evidenced based practice. Reducing preterm births and low birth weight will lower costs and improve quality of life. The data include Texas Vital Statistics Reports, the Tarrant County Infant Mortality Report, and the TCFIMR reports.

Outcome Measure Valuation:
- Approach/Methodology: Please describe your approach for valuing each outcome measure (and its associated process milestones and outcome improvement targets). Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Rationale/Justification:
Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 10.73% of the total project valuation was allocated to Category 3. The DY5 goal is for
the estimated 110 pregnant women with a history of spontaneous preterm birth at least 20% will have infants born full term or approximately 22 full term births.

**Outcome Measure 1: -IT 8.4 Reduce Preterm birth** The 2005 United States annual societal economic cost associated with preterm birth is $51,600 per infant (22 X $51,600 = $1,135,200). This total value is multiplied by individual impact of 3 and community impact of 2 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the actual total outcome valuation of IT-8.4 of $14,757,600. Based on the RHP 10 valuation model Category 3 is 10.73% of the total project value or $1,583,894.

If the Bureau of Labor Statistics Consumer Price Index calculation was applied to the 2005 societal economic costs for 2012 dollars the cost would be $60,660 per preterm birth. In 2012 dollars the total project valuation would be $17,348,760. Therefore the project valuation is discounted by 14.9% to the $14,757,600 total project valuation.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because a full term birth contributes to improved outcomes and quality of life.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because reducing preterm births reduces the annual societal economic cost associated with preterm birth.

**Valuation Reference**

**Outcome Measure 1: -IT 8.4 Reduce Preterm birth rate**

$51,600 per infant born preterm. This is the annual societal economic burden associated with a preterm birth in the United States in 2005.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $0
Title of Outcome Measure (Improvement Target): IT 12.6 Improved Patient Treatment Access

Unique RHP Outcome Identification Number: - 022817305.3.20 (Pass 2)
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Outcome Measure Description:
Process Milestone:
DY2: Process Milestone 1 provides for setting the targeted baseline for the population of patients diagnosed with latent tuberculosis who are offered preventive treatment. Included in this data will be a retrospective look at the number of patients who were offered treatment and accepted treatment but assessing the number of subsequent visits each of those people actually completed. This is where we will establish the baseline visits that reflect the patients who did not complete and the efforts needed to have them access the new clinic hours to assist in completion. At this current time it is estimated that there are 2,106 annual patient visits with LTBI.

DY3: Process Milestone 2 provides for engaging stakeholders and specifically identifying resources needed to improve treatment completion (staff and additional clinic hours) through offering of nontraditional service hours. This milestone allows for training and equipping staff with tools to improve client interactions and client understanding of the benefits of preventive tuberculosis treatment. Development of tools such as a database that tracks visits that are missed even when a patient is told that the service is walk in and not a formal appointment, using reminder calls and texts to improve utilization, and case management to assist patients with workable refill times that are routine or flexible to increase the visits. 13% of walk in clinic time is evening focused and an increase by 9 evening hours will provide the opportunity for a 20% increase in evening treatment access. (31 total clinic hours/4 evening hours currently improved to 40 total clinic hours/13 evening hours).

Outcome Improvement Targets:
The improvement targets for DY4 and DY5 are the evaluation of the percentage increase in patients coming for follow-up treatment over baseline after initiating the program. The expected improvements are 10% in DY4 over baseline and 20% in DY5 over baseline.

Rationale:
The number of patients identified to smear positive tuberculosis cases fluctuates from year to year. Some cases have larger families and significant community contact points that must be evaluated. Others do not live with anyone and may be employed in areas with limited contact with others. In a five-year retrospective look at completion rates, the trend in Tarrant County is below the targeted number set by the CDC as described in Healthy People 2020. The milestones were chosen to identify a starting point and provide staff training to improve Tarrant County completion of therapy rates in this group. The improvement targets were designed to set an attainable goal toward the overall national objectives set forth in 2010 of 79-85% completion of
therapy rates. (CDC MMWR-Guidelines for the Investigation of Contacts of Persons with Infectious Tuberculosis, Dec 16, 2005/Vol. 54/No. RR-15, pp 1-37.)

**Outcome Measure Valuation:**

**Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V. B. for a full explanation of the model.)*

**Rationale/Justification:**

Tarrant County Public Health defined the population that will be directly impacted by the project as the number of LTBI clients seen in DY5 compared to the number seen in 2011. A 20% increase in LTBI clients seen is the positive population impact of this project. Based on HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 10.74% of the total project valuation was allocated to Category 3. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. **Outcome Measure 1: 3.IT-12.6** $4,000 economic benefit for the 20% increase in LTBI client seen by the TB Clinic expansion with 66% of those clients expected to complete LTBI or 91 additional LTBI clients completing treatment ($4,000 X 91=$364,000). $364,000 is multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-12.6 actual total outcome valuation of $5,205,200. However due to Public Health DSRIP funding availability the project was discounted 7.8%.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment, it is possible for latent TB to convert to active TB. Once converted to active TB, the individual’s health is affected. Active TB can result in long-term negative health effects and, in some cases, death. If the medication treatment is partially completed, there is increased likelihood of developing a drug-resistant strain of TB. Usually treated with IV therapy, drug-resistant TB is more serious and costly.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment, it is possible for latent TB to convert to active TB. Once converted to active TB, it is possible to infect other individuals in the community.

**Valuation Reference**

Outcome Measure 1: 3.IT 12.6
$4,000 economic benefit of each LTBI client completing treatment.
### Process Milestone 1 [12.6]: Establish Baseline Rates
At this time the estimated patient visits for patients with LTBI is 2,106 reflecting the 26% completion rate of above noted patients.

**Data Source:** LTBI database and EMR.

**Process Milestone 1 Estimated Incentive Payment (maximum amount):** $0

### Process Milestone 2 [12.6]: Project Planning
- Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation.
- Data Source: Policy and Procedures Manual, DSHS protocols and guidelines, MMWR on treatment of LTBI (CDC), CDC TB module training and testing, other training as needed i.e. phlebotomy training.

**Process Milestone 2 Estimated Incentive Payment:** $-$117,078

### Outcome Improvement Target 1 [IT-12.6]: Other
- Improve the number of patients seen for follow up visits by 10% over the baseline from DY2
- Improvement Target: 10% increase in the number of patients seen over DY2 baseline
- **Data Source:** EMR, LTBI database
- Estimated Incentive Payment: $125,453

### Outcome Improvement Target 2 [IT-12.6]: Other
- Improve the number of patients seen for follow up visits by 20% over the baseline from DY2
- Improvement Target: 20% increase in the number of patients seen noted over DY2 baseline
- **Data Source:** EMR, LTBI database
- Estimated Incentive Payment: $272,723
### Other Outcome Improvement Target: IT 12.6 Improved Patient Treatment Access

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $515,254
Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization

Unique RHP outcome identification number(s): 081599501.3.1

Performing Provider Name/TPI: MHMR of Tarrant County (MHMRTC) / 081599501

Outcome Measure Description:
IT-9.2 ED appropriate utilization

Reduce Emergency Department visits for target conditions: Behavioral Health/Substance Abuse. By enhancing behavioral health services availability to increase services to uninsured adults who are currently identified as waiting for psychiatric care, ED visits for wait list clients will be reduced by 25-% of baseline.

Process Milestones:
- DY3:
  - P-2 – Establish baseline rates

Outcome Improvement Targets for each year:
- DY4: Reduce Emergency Department visit for MHMRTC -clients no longer on wait list by 15% from baseline for target conditions: Behavioral Health/Substance Abuse
- DY5: Reduce Emergency Department visit for MHMRTC clients no longer on wait list by 25% from baseline for target conditions: Behavioral Health/Substance Abuse

-Rationale:
One in 8 visits to the emergency room is related to mental illness. Without access to appropriate treatment, people with mental illnesses are more likely to experience crises that lead them to utilize costly emergency room services. More than 40% of emergency room visits related to mental health or substance abuse result in an inpatient admission.

-Admission and readmission to Emergency Departments is disruptive and deleterious to recovery of behavioral health disorders. Interventions, such as adequate staffing and access to services in outpatient behavioral health clinics, which can prevent individuals from cycling through the Emergency Department can help avert poor health and mental health outcomes, reduce long term medical costs and improve functioning for the individuals served.

The supply of behavioral health care providers is inadequate in most of the State. In 2011, 195 (77%) of Texas 254 counties held federal designations as whole county Health Professional

1 http://www.thenationalcouncil.org/galleries/policy-file/Spill%20Over%20Effect_State%20Budgets_NCSL.pdf
2 http://www.hcup-us.ahrq.gov/reports/statbriefs/sb92.pdf
Shortage Areas (HPSAs) in relation to behavioral health. Indeed, Texas ranks far below the national average in the number of mental health professionals per 100,000 residents. By enhancing our workforce by increasing the volume of staff in outpatient settings, patients will receive the services they need in the right place at the right time.

**Outcome Measure Valuation:**

**Approach:**
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing our the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale:**
The calculation of the value of successful interventions for this project was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Our target population of 7,050 clients will be impacted by this project as our capacity increase will increase access to services. Of that population, 884 are expected to come off of the wait list and into services during the waiver period. Others will be identified through other service providers or as the result of the availability of additional capacity. The full value of this additional capacity will not be limited to the interventions delivered during the waiver period.
since we intend to permanently operate with the 500 additional patients annually as we move to transform the system rather than make temporary changes for the sake of the waiver. The volume and intensity of services will vary spanning from very high intensity case management and counseling to outpatient services such as medication refills. Data shows that we deliver between 3 and 5 services per month to each of our clients which will keep them engaged and drive our identified value for the project.

For this project, the QALY analysis shows this intervention to yield 0.1859 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $929,500. At full implementation we will be serving 500 additional people annually, yielding a value of $4,647,500. We then applied the incentive multiplier of 5 deriving a full valuation of $23,237,500. (No value is built in for additional services provided to existing clients) Due to our funding limitation in pass 1, we had to discount each of our Pass 1 projects. The discounted value of this project is $20,833,325 of which $18,607,529 has been spread to Category 1 and $2,225,796 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $2,225,796
**Title of Outcome Measure (Improvement Target):** IT-6.1 Percent improvement over baseline of patient satisfaction scores

**Unique RHP outcome identification number(s):** 081599501.3.2

**Performing Provider Name/TPI:** MHMR of Tarrant County (MHMRTC) / 081599501

**Outcome Measure Description:**
IT-6.1 Percent improvement over baseline of patient satisfaction scores-(Stand-alone measure).

**Process Milestones and Outcome Improvement Targets for each year:**
By the end of the Waiver, our goal is to have 10% improvement over the baseline of patient satisfaction scores relative to consumers getting timely care, appointments and information.

- In DY3 we will establish a baseline rate of consumer satisfaction using a newly selected standardized satisfaction survey. We currently measure consumers’ level of satisfaction in more than 20 domains using a survey that was developed by our agency.
- In DY4 consumers’ level of satisfaction relative to getting timely care, appointments and information will improve by 5% from the baseline score
- In DY5 consumers’ level of satisfaction relative to getting timely care, appointments and information will improve by 10% from the baseline score

**Rationale:**

Ford and Zarate indicate in their article, “Closing the Gaps: The Impact of Inpatient Detoxification and Continuity of Care on Client Outcomes,” that psychosocial areas will improve when treatment services are provided.\(^{326}\)

Client outcomes were positive, particularly outcomes of clients who completed detoxification treatment services and received follow-up care. Their functioning relative to sobriety, employment, homelessness improved and arrests and days incarcerated decreased as compared to measures prior to clients participating in treatment services. The quality of life improvements resulting from enhanced detoxification services should be reflected in patient satisfaction scores.

**Outcome Measure Valuation:**

Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper

method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
We will be serving 1900 people in total with an additional 550 over our current baseline throughout the waiver period. The full value of this additional capacity will not be limited to the interventions delivered during the waiver period since we intend to permanently operate at the higher capacity as we move to transform the system rather than make temporary changes for the sake of the waiver.

Economic benefits of Drug Treatment: A Critical Review of the Evidence for Policy Makers, as study performed by the University of Pennsylvania identified reductions from baseline in medical status, psychiatric status, employment, criminal activity, and in treatment accounting for $12,437 per consumer. In addition the study showed Medicare/Medicaid savings in the amount of $4,439 bringing the total value for one successful intervention to $16,876. At full implementation we will be serving an additional 300 patients annually, yielding a value of $4,219,000. (This amount was originally computed on 250 patients – we have since increased our population) We then applied the incentive multiplier of 5 deriving a full valuation of $21,095,000. Due to our funding limitation in pass 1, we had to discount the project to $13,508,921, of which $12,065,652 has been spread to Category 2 and $1,443,269 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

The valuation above was computed on an additional 250 clients annually we planned (we have since increased our population) but does not account for the improved level of care we anticipate delivering to the current 500 clients we are seeing. Because the value on
250 patients is already higher than that the maximum DSRIP payment, we have opted not to value the increased outcomes for the original 500 clients or for the increase in our original population estimate.

We selected this outcome because we are able to develop and analyze the data internally. Based on the evidence, the outcome is also a strong indicator of successfully delivering the value calculated. Patient satisfaction is a strong indicator of successfully delivering the value of this project because consumers utilizing the detoxification services will be responding to a list of questions which address the various components of value identified by the research.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $721,635
Title of Outcome Measure (Improvement Target): IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)

Unique RHP outcome identification number(s): 081599501.3.3
Performing Provider Name/TPI: MHMR of Tarrant County (MHMRTC) / 081599501

Outcome Measure Description:
IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018)
By the end of the Waiver, our goal is to have 10% of patients with hypertension to have their blood pressure adequately controlled (BP less than 140/90mm).

Process Milestones and Outcome Improvement Targets for each year:
Our milestones include the following:
- In DY 3, we establish the baseline for this project by identifying the percentage of patients at the MHMRTC center aged 18 to 85 who have a diagnosis of hypertension.
- In DY 4 and 5, we implement measures to control the high blood pressure of persons receiving both primary care and behavioral health services.

Rationale:
Approximately 21.6% of seriously mentally ill individuals have high blood pressure. Numerous clinical trials have shown that aggressive treatment of high blood pressure reduces mortality from heart disease, stroke and renal failure. A pool of past clinical trials demonstrated that a 5mm to 6mm Hg reduction in diastolic blood pressure was associated with a 42% reduction in stroke mortality and 14% to 20% reduction in mortality from coronary heart disease (CHD). Literature from clinical trials indicates that 53% to 75% of people under treatment achieved control of their blood pressure. The specifications for this measure are consistent with current guidelines, such as those of the U.S. Preventive Services Task Force and the Joint National Committee.

Outcome Measure Valuation:
Approach/Methodology: Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant
incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:** The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to integrate primary care services and behavioral health services for the population impacted by this project. Consequently, the study provides a measurement for the triple aim elements. The performing provider has determined that tracking HbA1c, blood pressure and ED visits within the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

The QALY analysis shows this intervention to yield 0.335 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $1,675,000. At full implementation we will be serving 500 additional people annually, yielding a DY5 value of $8,375,000. We then applied the incentive multiplier of 5 deriving a full valuation of $41,875,000 related to patient experience.

Due to our funding limitation in pass 1, we had to discount each of our projects. The discounted value of this project is $22,435,239 of which $20,000,000 is for category 2 and $2,435,239 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $811,746*
**Title of Outcome Measure (Improvement Target):** IT-10.1 – Quality of Life/Functional Status

**Unique RHP outcome identification number(s):** 081599501.3.4

**Performing Provider Name/TPI:** MHMR of Tarrant County (MHMRTC) / 081599501

**Outcome Measure Description:**
IT-10.1 – Quality of Life

**Process Milestones and Outcome Improvement Targets for each year:**
By the end of the Waiver, our goal is to have 10% improvement in quality of life scores as measured by the AQoL or another validated quality of life assessment tool for the IDD population.

- In DY 3 we will establish a baseline rate. We don’t currently measure quality of life.
- In DY4 we will improve quality of life scores by 5% from baseline.
- In DY5 we will improve quality of life scores by 10% from baseline.

**Rationale:**
The RN care management project is designed to help improve symptoms and function, two essential components of quality of life. According to the National Quality Forum, care coordination is foundational to quality health services including quality of life (National Quality Forum, 2010). -Leonard, McGlone and Boardman (2012), used a “feet to the street” integrated care management model, which showed improved health outcomes and patient satisfaction as well as reduction in inpatient and ED services.327 -There was a 45.9% reduction in total inpatient costs in the two years after enrollment and 44.7% decrease in number of admissions.328

**Outcome Measure Valuation:**
Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing our the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the

reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
The calculation of the value of successful interventions for this project was based on an extensive literature review utilizing studies in which similar interventions were implemented and the impacts to the healthcare system were recorded.

Our target population of 1,100 clients will be impacted by this project as RN care coordination services will be available to all. Of that population 480 are expected to come into services during the waiver period. The full value of these intensive supports will not be limited to the interventions delivered during the waiver period since we intend to permanently operate a RN Care Coordination model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, cost savings have been identified in several areas including $9,964 savings versus the inpatient setting, savings with regard to the level of claims expenditures in the amount of $6,359, and $483 of net Medicare/Medicaid savings totaling $16,806 for each consumer. At full implementation we will be serving 480 additional people annually, yielding a value of $8,066,880. We then applied the incentive multiplier of 5 deriving a full valuation of $40,334,400. Due to our funding limitation in Pass 1, we had to discount each of our Pass 1 projects. The discounted value of this project is $21,521,621, of which $19,224,968 has been spread to Category 2 and $2,299,653 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

The performing provider has determined that tracking quality of life, ED utilization, and inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.
### Starting Point/Baseline:
Baseline data: In DY3 we will establish a baseline rate. We don’t currently measure quality of life.

Title of Outcome Measure (Improvement Target): 3.IT-6.1 Percent improvement over baseline of patient satisfaction scores

Unique Project ID: 081599501.3.6 (Pass 3)
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Outcome Measure Description

By the end of the waiver, our goal is to achieve 20% improvement over baseline of patient satisfaction scores.

Process Milestones:

In DY3, we will establish the baseline-of patient satisfaction scores.

Outcome Improvement Targets for each year:

- In DY 4, Improvement Target-6.1 is to achieve 10% improvement over baseline of patient satisfaction scores. Percentage will be measured by percent improvement in targeted patient satisfaction.
- In DY5, Improvement Target-6.1 is to achieve 20% improvement over baseline of patient satisfaction scores. Percentage will be measured by percent improvement in targeted patient satisfaction.

Rationale:

Assuming this project is successful, people who currently have needs that cannot be met in the community and therefore must rely on emergency services will be able to manage their conditions more successfully. The goal is to avoid crises and the resulting stress on patients and their caregivers. Thus, success at meeting our goals will mean that patients are more satisfied with the services they are receiving.

Outcome Measure Valuation:

Approach/Methodology: Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate
Incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:** The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to develop crisis prevention and intervention services in populations impacted by this project. Consequently, the study provides a measurement for all of the triple aim goals. The performing provider has determined that tracking patient satisfaction, ED utilization, and psychiatric inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

Our target population of 900 clients will be impacted by this project due to the supports developed. Of that population, 350 unique patients per year are expected to receive full START services at full implementation. Full implementation is expected by DY4 meaning that 500 clients are targeted to be served during the waiver period. The full value of these additional supports will not be limited to the interventions delivered during the waiver period since we intend to continue the program as we move forward to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.03 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $150,000, or $1,500 per consumer. At full implementation we will be serving 350 additional people annually, yielding a value of $5,552,750. We then applied the incentive multiplier of 5 deriving a full valuation of $27,763,750. Due to our funding limitation in pass 1, we had to discount each of our Pass 2&3 projects. The discounted value of this project is $17,035,361, of which $15,206,473 has been spread to Category 1 and $1,828,888 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.
We selected the patient satisfaction outcome because we can administer the patient satisfaction surveys internally rather than relying on outside data. The outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**Title of Outcome Measure (Improvement Target):** IT-1.10 Diabetes care: HbA1c poor control (>9.0%) – NQF 0059

**Unique RHP outcome identification number(s):** 081599501.3.7

**Performing Provider Name/TPI:** MHMR of Tarrant County (MHMRTC) / 081599501

**Outcome Measure Description:** IT-1.10 Diabetes care: HbA1c poor control (>9.0%) – NQF 0059

By the end of the waiver, it is our goal to reduce by 10% the number of patients in the served population with HbA1c >9.0%.

**Process Milestones and Outcome Improvement Targets for each year:**

Our milestones include the following:

- In DY 3, we establish the baseline for this project by identifying the percentage of patients at the MHMRTC center aged 18 to 75 who have a diagnosis of diabetes.
- In DY 4 and 5, we implement measures to control the HbA1c of persons receiving both primary care and behavioral health services.

**Rationale:**

According to the Substance Abuse and Mental Health Services Administration, 7.7% of patients with serious mental illness have diabetes, which is a rate nearly 17% above the average in the population. Medications used to treat mental health problems often create worse problems with the management of glucose levels. Moreover, these patients are much less likely to receive appropriate care for their diabetes, which exacerbates any issues with glucose levels. As a result, the population can be expected to experience significant diabetic complications.

**Outcome Measure Valuation:**

**Approach/Methodology:** Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive
portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:** The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to integrate primary care services and behavioral health services for the population impacted by this project. Consequently, the study provides a measurement for the triple aim elements. The performing provider has determined that tracking HbA1c, blood pressure and ED visits within the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

The QALY analysis shows this intervention to yield 0.335 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $1,675,000. At full implementation we will be serving 500 additional people annually, yielding a DY5 value of $8,375,000. We then applied the incentive multiplier of 5 deriving a full valuation of $41,875,000 related to patient experience.

Due to our funding limitation in pass 1, we had to discount each of our projects. The discounted value of this project is $22,435,239 of which $20,000,000 is for category 2 and $2,435,239 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**Title of Outcome Measure (Improvement Target):** IT-9.2 ED Appropriate Utilization

**Unique RHP outcome identification number(s):** 081599501.3.8

**Performing Provider Name/TPI:** MHMR of Tarrant County (MHMRTC) / 081599501

**Outcome Measure Description:** IT-9.2 ED Appropriate Utilization
By the end of the waiver, it is our goal to reduce by 9% ED visits from the baseline average number of ED visits in the target population.

**Process Milestones and Outcome Improvement Targets for each year:**
Our milestones include the following:

- In DY 3, we establish the baseline for this project by identifying the number of patients at the MHMRTC center with ED visits in the prior year and the number of those visits.
- In DY 4 and 5, we measure the number of ED visits of persons receiving both primary care and behavioral health services.

**Rationale:**
The Center for Health Care Strategies issued a report evaluating a 2 year Pennsylvania project that integrated primary care and behavioral health services in a severely mentally ill population. In that population the rate of emergency department use was an estimated 9% below the control population. While the performing provider believes this to be an aggressive improvement target, it has chosen 9% as a result of these findings.12

**Outcome Measure Valuation:**
**Approach/Methodology:** Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until

---

the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:** The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to integrate primary care services and behavioral health services for the population impacted by this project. Consequently, the study provides a measurement for the triple aim elements. The performing provider has determined that tracking HbA1c, blood pressure and ED visits within the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

The QALY analysis shows this intervention to yield 0.335 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $1,675,000. At full implementation we will be serving 500 additional people annually, yielding a DY5 value of $8,375,000. We then applied the incentive multiplier of 5 deriving a full valuation of $41,875,000 related to patient experience.

Due to our funding limitation in pass 1, we had to discount each of our projects. The discounted value of this project is $22,435,239 of which $20,000,000 is for category 2 and $2,435,239 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**Total Estimated Incentive Payments for 4-Year Period (add outcome amounts over DYs 2-5):** $811,747
**Title of Outcome Measure (Improvement Target):** *IT-9.1* Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons.

**Performing Provider Name/TPI:** MHMR of Tarrant County/081599501

**Unique RHP outcome identification number(s):** - 081599501.3.9  (Pass 2)

**Outcome Measure Description:**
*IT-9.1* *IT-9.1* Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons.

DY3: Project planning by engaging stakeholders, identifying current capacity and needed resources, determining timelines and documentation of implementation plans. In addition, a process for collecting data from CMBHS ASI assessments will be established and the baseline percentage of jail admissions for mental health/substance use disorder patients will be determined.

DY4: Reduce jail admissions by 5% for patients who are involved in treatment program

DY5: Reduce jail admissions by 10% for patients who are involved in treatment program

**Rationale:**
A study conducted by the National Center on Addiction and Substance Abuse at Columbia University found that 24.4% of prison and jail inmates have both mental illness and substance abuse problems. Incarceration is expensive for the community and has a significant negative impact on the individual.

**Outcome Measure Valuation:**

Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system
adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
The calculation of the value of successful interventions for this project was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Our target population of 3,000 clients will be impacted by this project as integrated substance abuse services will be available to all. Of that population 1,350 are expected to come into services during the waiver period. The full value of this integration will not be limited to the interventions delivered during the waiver period since we intend to permanently operate in an integrated model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.11135 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $556,750. At full implementation we will be serving 725 additional people annually, yielding a value of $4,036,438. We then applied the incentive multiplier of 5 deriving a full valuation of $20,182,188.

Due to our funding limitation in passes 2 and 3, we had to discount each of our Pass 2 and 3 projects. The discounted value of this project is $19,217,415, of which $17,154,265 has been spread to Category 2 and $2,063,150 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

Unique RHP outcome identification number(s): 081599501.3.10 (Pass 2)

Outcome Measure Description:
IT-9.2 ED appropriate utilization - Percent improvement over baseline of patients incurring an ED admission during substance use disorder treatment. (Stand-alone measure). By the end of the Waiver, our goal is to have 10% reduction from the baseline.

DY3: Determine the baseline of how many patients with substance use disorder are presenting in the emergency department at JPS hospital.

DY4: Reduce emergency room visits by substance use disorder patients by 5% from the baseline determined in DY3.

DY5: Reduce emergency room visits by substance use disorder patients by 10% from the baseline determined in DY3.

Rationale:
In a report to Congress, SAMHSA reported that the combination of mental illness and substance abuse disorder can result in poor response to traditional treatments and increases the risk for other serious medical problems. As a result, individuals with co-occurring disorders often require high-cost services such as inpatient and emergency room care.\textsuperscript{329} In 2007, 1 in 8 emergency room visits was related to mental health or substance abuse. Almost 12% of those visits were for co-occurring disorders.\textsuperscript{330}

Outcome Measure Valuation:

Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate

\textsuperscript{329} http://www.nasmhpdp.org/docs/Policy/Behavioral\%20Health\%20Primary\_CoOccurringRTC.pdf
\textsuperscript{330} http://www.hcup-us.ahrq.gov/reports/statbriefs/sb92.jsp
valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing -the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
Our target population of 3,000 clients will be impacted by this project as integrated substance abuse services will be available to all. Of that population 1,350 are expected to come into services during the waiver period. The full value of this integration will not be limited to the interventions delivered during the waiver period since we intend to permanently operate in an integrated model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.11135 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $556,750. At full implementation we will be serving 725 additional people annually, yielding a value of $4,036,438. We then applied the incentive multiplier of 5 deriving a full valuation of $20,182,188.

Due to our funding limitation in passes 2 and 3, we had to discount each of our Pass 2 and 3 projects. The discounted value of this project is $19,217,415, of which $17,154,265 has been spread to Category 2 and $2,063,150 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $ 687,717
Title of Outcome Measure (Improvement Target): IT-10.7 Functional status assessment for patients discharged from substance use disorder treatment program.

Performing Provider Name/TPI: MHMR of Tarrant County/081599501
Unique RHP outcome identification number(s): 081599501.3.11 (Pass 2)

Outcome Measure Description:
IT-10.7 The Percentage of individuals receiving specialized interventions who demonstrate improved functional status on standardized instrument (Addiction Severity Index, ASI).

DY3: Project planning for measuring functional status – engage stakeholders, identify current capacity and needed resources, determine timelines for assessments and document implementation plans.

DY4: 20% of individuals in program demonstrate improved functional status.

DY5: 35% of individuals in program demonstrate improved functional status.

Rationale:
Functional status measures the improvement that patients have achieved over the course of the program and a reduced abuse of unhealthy substances. Patients with reduced dependence on substances such as alcohol and drugs will increase functioning in life. This increased functioning can lead to employment, stable housing, and reduced dependence on entitlement programs.

Outcome Measure Valuation:

Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system
adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
The calculation of the value of successful interventions for this project was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Our target population of 3,000 clients will be impacted by this project as integrated substance abuse services will be available to all. Of that population 1,350 are expected to come into services during the waiver period. The full value of this integration will not be limited to the interventions delivered during the waiver period since we intend to permanently operate in an integrated model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.11135 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $556,750. At full implementation we will be serving 725 additional people annually, yielding a value of $4,036,438. We then applied the incentive multiplier of 5 deriving a full valuation of $20,182,188.

Due to our funding limitation in passes 2 and 3, we had to discount each of our Pass 2 and 3 projects. The discounted value of this project is $19,217,415, of which $17,154,265 has been spread to Category 2 and $2,063,150 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

We selected this outcome because data is available and the outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization

Performing Provider Name/TPI: MHMR of Tarrant County/081599501
Unique RHP outcome identification number(s): 081599501.3.12

Outcome Measure Description:
IT-9.2 ED appropriate utilization - Percent improvement over baseline. (Stand-alone measure). Our goal is to reduce ED utilization in the year following discharge from the detoxification unit by-20% from the baseline.

DY3: Determine the baseline of average ED visits in the year following detoxification unit discharge for patients discharged prior to implementing the enhanced services.

DY4: Reduce emergency room visits by substance use disorder patients by 10% from the baseline determined in DY3.

DY5: Reduce emergency room visits by substance use disorder patients by 20% from the baseline determined in DY3.

Rationale:
The study about which Ford and Zarate’s article was written resulted in an approximate 19% decrease in ED visits post-discharge from the detoxification unit.

Outcome Measure Valuation:
Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed
that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
We will be serving 1900 people in total with an additional 550 over our current baseline throughout the waiver period. The full value of this additional capacity will not be limited to the interventions delivered during the waiver period since we intend to permanently operate at the higher capacity as we move to transform the system rather than make temporary changes for the sake of the waiver.

Economic benefits of Drug Treatment: A Critical Review of the Evidence for Policy Makers, as study performed by the University of Pennsylvania identified reductions from baseline in medical status, psychiatric status, employment, criminal activity, and in treatment accounting for $12,437 per consumer. In addition the study showed Medicare/Medicaid savings in the amount of $4,439 bringing the total value for one successful intervention to $16,876. At full implementation we will be serving an additional 300 patients annually, yielding a value of $4,219,000. (This amount was originally computed on 250 patients – we have since increased our population) We then applied the incentive multiplier of 5 deriving a full valuation of $21,095,000. Due to our funding limitation in pass 1, we had to discount the project to $13,508,921, of which $12,065,652 has been spread to Category 2 and $1,443,269 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

The valuation above was computed on an additional 250 clients annually we planned (we have since increased our population) but does not account for the improved level of care we anticipate delivering to the current 500 clients we are seeing. Because the value on 250 patients is already higher than that the maximum DSRIP payment, we have opted not to value the increased outcomes for the original 500 clients or for the increase in our original population estimate.

We selected this outcome because while data is held by other entities, we should be able to work with others to determine outcomes. Based on the evidence, the outcome is also a strong indicator of successfully delivering the value calculated.

Title of Outcome Measure (Improvement Target): 3.IT-9.2 ED Appropriate Utilization

Unique Project ID: 081599501.3.13 (Pass 3)
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Outcome Measure Description

By the end of the waiver, our goal is to achieve a 40% decrease over baseline of ED utilization by patients in this program.

Process Milestones:
- In DY3, we will develop and test data systems
- In DY3, we will establish the baseline of ED utilization

Outcome Improvement Targets for each year:
- In DY 4, Improvement Target-9.2 is to achieve 20% improvement over baseline of ED utilization. Percentage will be measured by percent decrease in targeted patient ED utilization.
- In DY 5, Improvement Target-9.2 is to achieve 40% improvement over baseline of ED utilization. Percentage will be measured by percent decrease in targeted patient ED utilization.

Rationale:
1 in 8 emergency department visits is for mentally ill patients. IDD/ASD patients with mental illness present unique problems and are even more likely to use emergency mental health services that other forms of community mental health care. This intervention is designed to fill the gaps in the community system that cause the overuse of the emergency system. A reduction in ED visits by this population will be a good measure of whether the goals of the project were realized.

Outcome Measure Valuation:
Approach/Methodology: Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate
incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:**
The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to develop crisis prevention and intervention services in populations impacted by this project. Consequently, the study provides a measurement for all of the triple aim goals. The performing provider has determined that tracking patient satisfaction, ED utilization, and psychiatric inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

Our target population of 900 clients will be impacted by this project due to the supports developed. Of that population, 350 unique patients per year are expected to receive full START services at full implementation. Full implementation is expected by DY4 meaning that 500 clients are targeted to be served during the waiver period. The full value of these additional supports will not be limited to the interventions delivered during the waiver period since we intend to continue the program as we move forward to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.03 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $150,000, or $1,500 per consumer. At full implementation we will be serving 350 additional people annually, yielding a value of $5,552,750. We then applied the incentive multiplier of 5 deriving a full valuation of $27,763,750. Due to our funding limitation in pass 1, we had to discount each of our Pass 2&3 projects. The discounted value of this project is $17,035,361, of which $15,206,473 has been spread to Category 1 and $1,828,888 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.
While we do not control ED visit data internally, most of our patients present at JPS’ ED. We anticipate being able to work with that entity to obtain the data we need to establish baselines and track progress. The outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

Title of Outcome Measure (Improvement Target): 3.IT-2.13 Other Admissions Rate

Unique Project ID: 081599501.3.14 (Pass 3)
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Outcome Measure Description

By the end of the waiver, our goal is to achieve a 40% decrease over baseline of psychiatric inpatient hospitalizations.

Process Milestones:
- In DY3, we will develop and test data systems.
- In DY3, we will establish the baseline of psychiatric admissions.

Outcome Improvement Targets for each year:
- In DY 4, Improvement Target-9.13 is to achieve a 20% improvement over baseline of psychiatric admissions.
- In DY 5, Improvement Target-9.13 is to achieve a 40% improvement over baseline of psychiatric admissions.

Rationale:
A similar START intervention developed in North Carolina noted 43% of the patients referred had a psychiatric inpatient stay in the year prior to involvement in START. Most of these hospitalizations could have been avoided had appropriate alternatives been present. Meeting the goals of this intervention would show decreases in the need for psychiatric inpatient care in the IDD/ASD population. A reduction in psychiatric admissions by this population will be a good measure of whether the goals of the project were realized.

Outcome Measure Valuation:
Approach/Methodology: Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful
intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

**Rationale/Justification:**
The calculation of the value of a successful intervention was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The study was conducted to determine the benefit of implementing a project to develop crisis prevention and intervention services in populations impacted by this project. Consequently, the study provides a measurement for all of the triple aim goals. The performing provider has determined that tracking patient satisfaction, ED utilization, and psychiatric inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

Our target population of 900 clients will be impacted by this project due to the supports developed. Of that population, 350 unique patients per year are expected to receive full START services at full implementation. Full implementation is expected by DY4 meaning that 500 clients are targeted to be served during the waiver period. The full value of these additional supports will not be limited to the interventions delivered during the waiver period since we intend to continue the program as we move forward to transform the system rather than make temporary changes for the sake of the waiver.

For this project, the QALY analysis shows this intervention to yield 0.03 quality-adjusted life years gained for each consumer. The calculation of value takes into account the value of $50,000 per life year gained, which is standard threshold for valuing life years in cost-based evaluation of interventions. The value generated for QALY gained per 100 people calculates to $150,000, or $1,500 per consumer. At full implementation we will be serving 350 additional people annually, yielding a value of $5,552,750. We then applied the incentive multiplier of 5 deriving a full valuation of $27,763,750. Due to our funding limitation in pass 1, we had to discount each of our Pass 2&3 projects. The discounted value of this project is $17,035,361, of which $15,206,473 has been spread to Category 1 and $1,828,888 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

While we do not control psychiatric admissions data internally, most of our patients present at JPS’ ED. We anticipate being able to work with that entity to obtain the data we need to
establish baselines and track progress. The outcome is also a strong indicator of successfully delivering the value calculated with the QALY analysis.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $609,631*
Title of Outcome Measure (Improvement Target): 3.IT-9.2 – ED Appropriate Utilization

Unique RHP outcome identification number(s): 081599501.3.15
Performing Provider Name/TPI: MHMR of Tarrant County (MHMRTC) / 081599501

Outcome Measure Description:

By the end of the waiver, our goal is to achieve a 15% decrease over baseline of ED utilization by patients in this program.

Process Milestones and Outcome Improvement Targets for each year:
- In DY 3 we will establish a baseline rate.
- In DY 4, our goal is to achieve 5% improvement over baseline of ED utilization.
- In DY 5, our goal is to achieve 15% improvement over baseline of ED utilization.

Rationale:
Problems with the health care delivery system related to chronic disease management are exacerbated in the IDD population because of communication problems and problems with understanding what is needed to manage disease. Without proper understanding, chronic conditions are likely to become acute episodes resulting in the need for emergency care, often ending in hospitalization.

Outcome Measure Valuation:
Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing our the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.
Rationale:
The calculation of the value of successful interventions for this project was based on an extensive literature review utilizing studies in which similar interventions were implemented and the impacts to the healthcare system were recorded.

Our target population of 1,100 clients will be impacted by this project as RN care coordination services will be available to all. Of that population 480 are expected to come into services during the waiver period. The full value of these intensive supports will not be limited to the interventions delivered during the waiver period since we intend to permanently operate a RN Care Coordination model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, cost savings have been identified in several areas including $9,964 savings versus the inpatient setting, savings with regard to the level of claims expenditures in the amount of $6,359, and $483 of net Medicare/Medicaid savings totaling $16,806 for each consumer. At full implementation we will be serving 480 additional people annually, yielding a value of $8,066,880. We then applied the incentive multiplier of 5 deriving a full valuation of $40,334,400. Due to our funding limitation in Pass 1, we had to discount each of our Pass 1 projects. The discounted value of this project is $21,521,621, of which $19,224,968 has been spread to Category 2 and $2,299,653 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

The performing provider has determined that tracking quality of life, ED utilization, and inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $766,553
Title of Outcome Measure (Improvement Target): IT-4.8- Sepsis mortality (Stand-alone measure)

Unique RHP outcome identification number(s): 094105602.3.1

Performing Provider Name/TPI: North Hills Hospital / 094105602

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
In DY2 we will establish baseline rates for sepsis mortality to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis mortality reduction of 25% by the end of the Waiver.

Rationale:
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. North Hills Hospital has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

North Hills Hospital defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 4%, which was determined based on outcome
target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 21. The estimated pricing for mortality of $10,000 per life was used. This reflected such considerations as costs for care, lost wages, and quality of life. This totaled approximately $218,700 for 5 years.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $218,700.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.

This value was estimated as a proportion of mortality reduction at $210,700.

The total value of the project then was estimated at $1,844,000. Approximately 79% of the total value was assigned to Category 2 project and the remaining 9% of value assigned to Category 3 outcome for Sepsis Mortality and 11.8% assigned to Category 3 outcome for reduced Average Length of Stay.

The value for the total outcome was determined based on the population targeted for sepsis, size of the population, and costs and steps necessary to achieve reductions in mortality. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $166,598
Title of Outcome Measure (Improvement Target): IT-4.9- Average length of stay (Non-stand-alone measure)

Unique RHP outcome identification number(s): 094105602.3.2
Performing Provider Name/TPI: North Hills Hospital / 094105602

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
In DY2 we will establish baseline rates for sepsis average length of stay to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis average length of stay of TBD by the end of the Waiver. The improvement target will be determined in DY2 and implemented starting in DY3.

Rationale:
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. North Hills Hospital has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.) North Hills Hospital defined the population that will be directly impacted by the project as patients diagnosed with Sepsis. There were 2 outcomes for this project, sepsis mortality and
average length of stay for sepsis patients. The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 7.3 days per patient. This was estimated at total of reduced in patient days by DY 5 of 650. The estimated cost per day for a sepsis patient is $828. This totaled approximately $544,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 3. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $326,000.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $326,000.

The total value of the project then was estimated at $1,844,000. Approximately 79% of the total value was assigned to Category 2 project and the remaining 9% of value assigned to Category 3 outcome for Sepsis Mortality and 11.8% assigned to Category 3 outcome for reduced Average Length of Stay.
The value for the total outcome was determined based on the population targeted for Sepsis, size of the population, baseline average length of stay, cost avoidance and steps necessary to achieve reductions in average length of stay. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $219,377
**Title of Outcome Measure (Improvement Target):** IT-6.1- Percent Improvement over baseline of patient satisfaction scores

**Unique RHP outcome identification number(s):** 094193202.3.1

**Performing Provider Name/TPI:** Plaza Medical Center Fort Worth / 094193202

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**

In DY2 we will establish baseline data to measure for patient satisfaction scores. The target for the outcome measure is 10% improvement in scores over baseline in DY4 and 20% in DY5. In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. It will also be necessary to develop and test data systems for establishing an internal measurement of patient satisfaction for timely feedback on improvement plans and corrective actions. In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders.

**Rationale:**

The process milestone to establish the baseline rate is necessary to understand the starting point of patient satisfaction scores. The outcome improvement targets were selected as they are congruent with other goals of the organization and will result in improved health outcome of patients and reduce cost to the health system.

The target for the outcome measure is to increase patient satisfaction scores by 20% by the end of the Waiver period. We have implemented some initiatives improve scores however this has not moved score significantly in the last year. We believe a renewed focus is necessary to make significant improvement.

In DY2, we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plan. These are necessary steps to ensure all stakeholders (IP /OP, out of hospital providers, etc) are identified and included in the plan. Identifying capacity and resource needed to implement are required for budgeting purposes. Establishing timelines and documenting a plan are a guide to knowing when things need to occur, who is responsible for making them happen and the ultimate expectations and goals of the project. The documented plan and timelines serve as a tool to measure the performance in executing the project.

It will also be necessary in DY2 to develop and test data systems for timely measurement of patient satisfaction in order to correctly measure improvement targets. CMS published HCAHPS score are not expedited very timely so the process milestone to develop and test internal
measurements is necessary to have timely feedback for correcting actions for the patients’ experience improvement planning.

In DY3, we will disseminate findings, including lessons learned and best practices, to stakeholders. This would include intervention impacts, learning from follow up on successes or failures and identified best practices. This feedback is significant to adjusting plans findings and continued engagement of stakeholders.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Plaza Medical Center Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

The percentage of the population expected to be positively impacted by the project is all patients surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 4 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The rate per Medicare case of $11,759 was used to calculate the estimated loss of revenues using these penalty % for DY 2-0.50%, DY 3- 0.75%, DY 4-0.94%, and DY 5 -1.05% . This totaled $2,161,220.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $1,396,542. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $1,294,779.

The total value of the project was calculated at $4,852,541. Approximately 79% of the project value was assigned to the Category 2 project, $3,836,901 and 21% to the Category 3 project, $1,015,640.
We did not value the process and outcome targets differently as we believe they are all equally important to overall success of the project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $1,015,640
Title of Outcome Measure (Improvement Target): IT-4.8- Sepsis mortality (Stand-alone measure)

Unique RHP outcome identification number(s): 094193202.3.2
Performing Provider Name/TPI: Plaza Medical Center Fort Worth / 094193202

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
In DY2 we will establish baseline rates for sepsis mortality to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis mortality reduction of 25% by the end of the Waiver.

Rationale:
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Plaza Medical Center Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
Plaza Medical Center Fort Worth defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 3.5%, which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 31. The estimated pricing for morality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages, and quality of life. This totaled approximately $315,000 for 5 years.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $315,000.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of mortality reduction at $252,000.

The total value of the project then was estimated at $1,943,133. Approximately 79% of the total value was assigned to Category 2 project and the remaining 6.3% of value assigned to Category 3 outcome for Sepsis Mortality and 14.69% assigned to Category 3 outcome for reduced Average Length of Stay.

The value for the total outcome was determined based on the population targeted for Sepsis, size of the population, and costs and steps necessary to achieve reductions in mortality. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $121,136*
Title of Outcome Measure (Improvement Target): IT-4.9 Average length of stay (Non-stand-alone measure)

Unique RHP outcome identification number(s): 094193202.3.3
Performing Provider Name/TPI: Plaza Medical Center Fort Worth / 094193202

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
In DY2 we will establish baseline rates for sepsis average length of stay to measure for improvement targets. In DY2 and 3 we will conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. By DY4 and DY5, the improvement target is Sepsis average length of stay of TBD by the end of the Waiver. The improvement target will be determined in DY2 and implemented starting in DY3.

Rationale:
The process milestone selected for conducting Plan Do Study Act (PDSA) will implement a continuous quality improvement model consisting of a logical sequence of four repetitive steps for continuous improvement and learning that will assist in the achievement of improvement targets.

According to the Center for Disease Control and Prevention (CDC) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Plaza Medical Center Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Plaza Medical Center Fort Worth defined the population that will be directly impacted by the project as patients diagnosed with sepsis. The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 8.7
days per patient. This was estimated at total of reduced in patient days by DY 5 of 1017. The estimated cost per day for a sepsis patient is $750. This totaled approximately $763,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 1. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $152,685.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $145,385.

The total value of the project then was estimated at $1,943,133. Approximately 79% of the total value was assigned to Category 2 project and the remaining 6.3% of value assigned to Category 3 outcome for Sepsis Mortality and 14.69% assigned to Category 3 outcome for reduced Average Length of Stay.

The value for the total outcome was determined based on the population targeted for Sepsis, size of the population, baseline average length of stay, cost avoidance and steps necessary to achieve reductions in average length of stay. We did not value the process and outcome targets differently as we believe they are all equally important to overall success of project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $285,584
**Title of Outcome Measure (Improvement Target):** 1.10 Diabetes Care: HbA1c poor control (>9.0%)

**Unique RHP outcome identification number(s):** 112677302.3.4

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Outcome Measure Description:**
Our goal is that diabetes program participants will demonstrate improvement in HbA1c, compared to their initial or baseline value. By the end of the Waiver, our goal is to decrease by 25% the number of diabetes program participants whose HbA1c is >9%.

**Process Milestones:**
- In DY2, we will:
  - Complete project planning, including identification and hiring of necessary staff, development of policies / procedures and processes
  - Develop and test reporting

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to reduce by 10% the rate of participants with HbA1c > 9%, and to conduct Plan Do Study Act cycles to identify and improve collection and intervention activities.
- In DY4 we will reduce by 15% from baseline the rate of diabetes patients whose HbA1c is > 9.0%, and
- in DY5, reduce by 25% from baseline the rate of diabetes patients whose HbA1c is >9.0%.

**Rationale:**
The goal of this project is to develop and implement a more comprehensive care management program, using a CARE team of clinical and support staff to link project participants to a medical home and diabetes management resources to help reduce the rates of uncontrolled diabetes. Our goal is provide seamless care for low income and uninsured residents of Tarrant County, to improve the health outcomes and diabetes self-management competency and decrease inappropriately high reliance on acute and emergent care community resources. While chronic conditions are a growing concern for all U.S. populations, the uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable hospitalizations. THFW data indicates that of the patients readmitted within 30 days for diabetes, about 13% have Medicaid, and an additional 6% are self-pay or uninsured. They are without access to the resources and self-management education needed to prevent these hospitalizations and readmissions.

The identified process milestones will assist our organization in developing and implementing the structure needed to coordinate care for these patients. Process milestones identified in DY2
include (P-1) project planning involving the establishment of a comprehensive care management program and formalization of the multidisciplinary Diabetes CARE team to link these patients to a medical home and resources / self-management education. In DY2, we will also (P-3) develop and test data systems to provide a mechanism for identifying and tracking high risk patients with diabetes and monitoring the effectiveness of interventions to begin analysis of information and determine potential improvement opportunities.

In DY3, conducting Plan Do Study Act (PDSA) cycles (P-4) will allow us to implement performance improvement initiatives based on opportunities identified. In addition, a reporting mechanism will be developed to disseminate information regarding the project.

In DY4 and DY5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

89% of medically managed patients who enrolled the current outpatient diabetes self-management training program at THFW achieved HbA1c <7% by program completion. Using this comparison for this higher-risk, economically disadvantaged population of people with diabetes, we conservatively project a goal of decreasing by 25% the number of diabetes program participants whose HbA1c is >9% by DY5.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient admission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
**Primary Care and Chronic Disease Management – IT-1.10 Diabetes care: HbA1c poor control (>9.0%) — NQF 0059 (Stand-alone measure)**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $137,010
**Title of Outcome Measure (Improvement Target):** Potentially Preventable Complications – 3.3 Diabetes 30 day readmission rate

**Unique RHP outcome identification number(s):** 112677302.3.5

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Outcome Measure Description:**
3.3 Diabetes 30 day readmission rate

Our goal is to decrease readmissions (all-cause) for diabetes. By the end of the Waiver, our goal is to decrease 30 day readmission (all-cause) for diabetes patients by 15%.

**Process Milestones:**
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
  - Establish the baseline for this rate.

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to reduce this rate by 4% and to conduct Plan Do Study Act cycles to improve collection and intervention activities.
- In DY4, to reduce diabetes patient readmissions by 10% from baseline, and
- In DY5, to reduce diabetes patient readmissions by 15% from baseline.

**Rationale:**
The goal of this project is to develop and implement a more comprehensive care management program, using a CARE team of clinical and support staff to link project participants to a medical home and diabetes management resources to help reduce the rates of uncontrolled diabetes. Our goal is provide seamless care for low income and uninsured residents of Tarrant County, to improve the health outcomes and diabetes self-management competency and decrease inappropriately high reliance on acute and emergent care community resources. While chronic conditions are a growing concern for all U.S. populations, the uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable hospitalizations. THFW data indicates that of the patients readmitted within 30 days for diabetes, about 13% have Medicaid or Managed Care Medicaid, and an additional 6% are self-pay or uninsured. They are without access to the resources and self-management education needed to prevent these hospitalizations and readmissions. Our proposed intervention will help individuals who are traditionally underserved and give them...
access to diabetes resources and education so they can better manage their diabetes and break the cycle of avoidable hospitalizations and readmissions.

The identified process milestones will assist our organization in developing and implementing the structure needed to coordinate care for these patients. Process milestones identified in DY2 include (P-1) project planning involving the establishment of a comprehensive care management program and formalization of the multidisciplinary Diabetes CARE team to link these patients to a medical home and resources / self-management education. In DY2, we will also (P-3) develop and test data systems to provide a mechanism for identifying and tracking high risk patients with diabetes and monitoring the effectiveness of interventions to begin analysis of information and determine potential improvement opportunities.

In DY3, conducting Plan Do Study Act (PDSA) cycles (P-4) will allow us to implement performance improvement initiatives based on opportunities identified. In addition, a reporting mechanism will be developed to disseminate information regarding the project.

In DY4 and DY5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

Today, THFW has an outpatient diabetes management program for medically managed patients. The improvement target for the readmission rates was decided on using the assumption that we can successfully reduce readmission rates close to the level achieved by the medically managed diabetes population, when we establish the diabetes care management program for the Medicare, Medicaid and unfunded population (~15%)\(^3\).

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient readmission avoided, $8,297 in cost is saved by the health care system\(^3\). Health care costs are calculated by multiplying $8,297 by the total individuals affected. The average length of stay per admission is multiplied

---

by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g., aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g., keeping lower acuity patients under observation instead of admitting them).
### Potentially Preventable Complications – 3.3 Diabetes 30-day readmission rate

<td>0.464%</td>
<td>0.459%</td>
<td>0.449%</td>
<td>0.440%</td>
</tr>
</tbody>
</table>

Process Milestones:
- In DY2, Project planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Baseline rates of admissions will also be established.
- In DY3, Will conduct Plan Do Study Act cycles to improve data collection and intervention activities. Finding will be disseminated to stakeholders regarding lessons learned and best practices. Outcome goal will be to decrease overall population requiring admission due to Heart Failure by 1% from hospital CHF baseline volume.

Outcome Improvement Targets for each year:
- In DY4, to reduce HF patient admissions by 2% more from baseline total community members requiring admission with principal diagnosis of heart failure.
- In DY5 to reduce HF patient admissions by 2% more from baseline total community members requiring admission with principal diagnosis of heart failure.

Rationale:
The target population includes individuals with heart failure diagnosis who are at risk for hospitalization due to inadequate monitoring or management of their chronic disease, specifically, HF patients within our service area who are underserved, unfunded, or underinsured.
- According to a report published in 2011 on readmissions in North Texas\(^{336}\), patients admitting for congestive heart failure (CHF) had the highest number of readmissions (22.6%). Heart failure was also the number one reason for readmission for both the

Medicare and uninsured patient demographics. There were 13,272 hospitalizations of North Texas heart failure patients that were followed by a readmission in 2011.

- Tarrant County Public Health Department *Behavioral Risk Factor Surveillance System 2009/2010* notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, CHF, and high blood pressure.

- Also noted in “Checkup for Tarrant County-2008”, prepared in 2009 from 2008 data: Cardiovascular Disease is identified in Tarrant County as having higher rates than in the state or the U.S. population. This same report noted that the areas in and adjacent to THFW had a significant population within the poverty level which leads to underserved populations without a health insurance safety net.

- The Society of Cardiovascular Patient Care notes that Heart Failure is currently the only cardiovascular disease that is increasing in both incidence and prevalence. Being the end-stage of all cardiac diseases, heart failure is responsible for 6.5 million hospital days annually.

**Outcome Measure Valuation:**

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the validation of a baseline rate for measuring our effectiveness in future project years as well supporting and strengthening our recent start-up CHF postdischarge clinic, additionally, strengthening the liaison between inpatient areas/ED and the staff that plan postdischarge services and care. In DY3 – in addition to evaluating the effectiveness of the postdischarge clinic, it is anticipated that the clinic hours will increase to increase the capacity for seeing patients who otherwise might not be seen in a timely manner by a primary or specialist physician postdischarge.

In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

- **Approach/Methodology:** For every CHF admission avoided, $9,203 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals.

---

337 Texas Department of State Health Services with 30% ccr assumption.

http://www.dshs.state.tx.us/ph/county.shtm

338 See table 4 in referenced article for differences in readmission rates between payer groups - Jiang et al. (September, 2005) Racial/ethnic disparities in potential preventable readmissions: the case for diabetes, American Journal of Public Health, Vol 95, No. 9, 1561-1567

341 Checkup 2008 Trends and Highlights, 2009, prepared for Healthy Tarrant County, Parkland.

affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).
- Community benefits were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.
- Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $199,700
**Title of Outcome Measure (Improvement Target):** Potentially Preventable Readmissions – 30-Day Readmission Rates (PPRs)- IT.3.2 Congestive Heart Failure 30-day readmission rate

**Unique RHP outcome identification number(s):** 112677302.3.7

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Outcome Measure Description:**
IT.3.2 Congestive Heart Failure 30-day readmission rate

**Process Milestones:**
In DY2, we will:
- Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
- Develop plans/protocols for HF Clinic managed by nurse practitioners. Obtain necessary supplies and equipment
- Develop and test reporting and monitoring process to evaluate
- Establish the baseline for this rate. An initial data pull from our database shows that the baseline rate may be as high as 22%

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects toward further reductions and to disseminate information to key stakeholders regarding our progress
- In DY4 and DY5: In DY4 our goal is to reduce HF patient readmissions by 10% from baseline and in DY5 to reduce HF patient readmissions by 15% from baseline.

**Rationale:**
The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run heart failure clinic including hiring and training hospital and clinic staff in Wagner's Chronic Care model and processes being implemented to improve care and education of the at risk HF patient. Evaluation of the need for additional CareTransitions coaches and PrimeMedics will also be completed and staff engaged/trained as needed. In DY2, we will also 1) develop a mechanism for identifying and tracking high-risk HF patients, 2) develop a screening tool to assist in identifying needs putting the HF patient at risk for readmission 3) monitor effectiveness of interventions (education, medication reconciliation, ability to meet patients’ identified health care need – medication, supplies, primary care provider, transportation to health care appointments, care transitions coach, telemonitoring, postdischarge telephonic case management, home visits, HF Clinic etc.) and begin analysis of our information to determine potential
improvement opportunities 4) collaborate with community health care providers to develop protocols to improve health of HF patients posthospital discharge and along the continuum of care.

In DY3, performance improvement initiatives will be implemented based on opportunities identified from information learned through data collection and analysis. A reporting mechanism will be developed to disseminate information to key partners regarding the project.

In DY4 and 5, the identified outcomes measures will monitor our effectiveness in achieving the desired outcome of preventing HF patient readmissions. We will also continue to evaluate for improvement opportunities and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **A343pproach/Methodology:** For every CHF admission avoided, $8252 in cost is saved by the health care system.\(^{344}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

### Starting Point/Baseline:

**Baseline Data:** 953 inpatient CHF admissions with a readmission rate of 22%

### Year 2 (10/1/2012 – 9/30/2013)

**Data Source:** Internally developed database using EMR data to monitor project and produce reports.

**Process Milestone 3 Estimated Incentive Payment:** $8,005

**Goal:** Reduce readmissions by 4%

**Data Source:** Identified database determined in DY2

**Outcome Improvement Target 1 Estimated Incentive Payment:** $1,2654

**Year 2 Estimated Outcome Amount:**

(Add incentive payments amounts from each milestone/outcome improvement target): $24,017

### Year 3 (10/1/2013 – 9/30/2014)

**Goal:** Reduce readmissions by 4%

**Data Source:** Identified database determined in DY2

**Year 3 Estimated Outcome Amount:**

$37,962

### Year 4 (10/1/2014 – 9/30/2015)

**Goal:** Reduce readmissions by 4%

**Data Source:** Identified database determined in DY2

**Year 4 Estimated Outcome Amount:**

$40,610

### Year 5 (10/1/2015 – 9/30/2016)

**Goal:** Reduce readmissions by 4%

**Data Source:** Identified database determined in DY2

**Year 5 Estimated Outcome Amount:**

$97,111

### Total Estimated Incentive Payments for 4-Year Period

(Add outcome amounts over DYs 2-5): $199,700
Title of Outcome Measure (Improvement Target): Right Care, Right Setting IT-9.2 – ED appropriate utilization

Unique RHP outcome identification number(s): 112677302.3.8

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth / 112677302

Outcome Measure Description:
The outcome measure is provided in the table below:
By the end of the Waiver, our goal is to improve appropriate ED utilization for the targeted populations by 18%.

Process Milestones:
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
  - Establish the baseline.

Outcome Improvement Targets for each year:
- In DY4, to reduce ED utilization for the targeted populations by 10% from baseline, and
- in DY5 to reduce ED utilization for the targeted populations by 18% from baseline.

Rationale:
The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of a process for hiring and training staff, identifying individuals who are frequent users of the ED or who are utilizing the ED for services that might be provided at a lower level of care, and developing a process to navigate the individuals to more appropriate health care venues. In DY2, we will also develop a mechanism for 1) tracking patients, 2) monitoring the effectiveness of interventions and 3) monitoring impact on compliance with care plan. Analysis of our information will be completed to determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

In DY4 and 5, we will continue to monitor our effectiveness to achieve target outcomes and take action to improve performance as needs are identified.
Outcome Measure Valuation:

- **Approach/Methodology:** For every ED visit avoided, $526 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

Region 10 RHP Plan

Page 1393
Title of Outcome Measure (Improvement Target): Potentially Preventable Complications and Health Care Acquired Conditions - IT-4.8 Sepsis Mortality

Unique RHP outcome identification number(s): 12677302.3.9

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth Hospital / 12677302

Outcome Measure Description:
IT-4.8 – Sepsis Mortality Rate: The rate of mortality for THFW patients hospitalized for septicemia or sepsis.

Process Milestones:
In DY2 the program plan for the project will include stakeholder engagement, assessing for resources, establishing a timeline, and creating plan implementation protocols (P-1). In addition, we will re-evaluate current baseline sepsis mortality rates for accuracy (P-2) in DY2. In DY3 the Plan-Do-Study-Act Cycle will be implemented and findings will be disseminated to stakeholders (P-3, P-4).

Outcome Improvement Targets for each year:
The outcome measure is to reduce mortality in patient with sepsis through the consistent, timely, implementation of an evidence-based sepsis resuscitation bundle. Estimated current mortality rate is 17.6%. The improvement target will decrease from DY2 to DY5 by a total of 2.1%. Thus, projected improvement targets are 16.9%, 16.2%, and 15.6% in DY3, DY4, and DY5 respectively (0.5% per year).

Rationale:
Establishing a plan is essential to any successful implantation of a plan/project. Determining the current baseline rate will allow for benchmarking in subsequent demonstration years. This information can then be used for decision making, programmatic changes, and assess the program success(P-2). The Plan Do Study Act (P-4) process will be a useful tool to document changes in current practice and ongoing implementation. The diffusion of the results and finding through appropriate communication channels will continue the adoption of the sepsis resuscitation bundle (P-5). The targets established are based on a sample of medical sepsis patient from 2008. Chart reviews were conducted assessing for compliance of the bundle. Initial implementation of a Clinical Nurse Specialist (CNS) was conducted resulting in decreased from 40% mortality to 20%. The CNS model was not sustained which will result in the need for re-education of health care providers.

Outcome Measure Valuation:
• **Approach/Methodology:** Decreased mortality rate does not bring and direct health care cost savings. Lives saved dare utilized to calculate individual and community costs. The total valuation is calculated by summing up individual and community costs.

• **Rationale/Justification:** Community benefits were calculated using lost productivity (net of lost wages), loss in payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Title of Outcome Measure (Improvement Target): IT-4.9 Average Length of Stay (Sepsis)

Unique RHP outcome identification number(s): 12677302.3.10

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth / 12677302

Outcome Measure Description:
Outcome Measure IT-4.9 – Average Length of Stay (Sepsis): The average length of hospital stay for THFW patients hospitalized for septicemia or sepsis.

Process Milestones:
In DY2 the program plan the for the project will include stakeholder engagement, assessing for resources, establishing a timeline, and creating a implementation plan (P-1). As well in DY2 we will re-evaluate current baseline sepsis mortality rates for accuracy (P-2). In DY3 Conduct a Plan Do Study Act and disseminate findings to stakeholders (P-4, P-5).

Outcome Improvement Targets for each year:
The outcome measure is to reduce average length of stay (LOS) in patient with sepsis through the consistent, timely, implementation of an evidence-based sepsis resuscitation bundle. Estimated current LOS is 8.4 days. The improvement target will decrease from DY2 to DY5 by a total of 1.8 days (0.6 days per year). Thus, projected improvement targets are 7.8 days, 7.2 days, and 6.6 days in DY3, DY4, and DY5 respectively.

Rationale:
Establishing a plan is essential to any successful implantation of a plan/project. Determining the current baseline rate will allow for benchmarking. This information can then be used for decision making, programmatic changes, and assess the program success(P-2) The Plan Do Study Act (P-4) process will be a useful tool to document changes in current practice and ongoing implementation. The diffusion of the results and finding through appropriate communication channels will continue the adaption of the sepsis resuscitation bundle (P-5). The targets established are based on a sample of medical sepsis patient from 2008. Chart reviews were conducted assessing for compliance of the bundle. Initial implementation of a Clinical Nurse Specialist (CNS) was conducted resulting in decreased LOS from 7.24 day to 6.72 days. The CNS model was not sustained which will result in the need for re-education of health care providers.

Outcome Measure Valuation:
• **Approach/Methodology:** For each day reduced for sepsis admissions, $2,412 in cost is saved by the health care system.\(^1\) The average length of stay per inpatient admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale/Justification:** Sepsis inpatient admissions outcome improvement targets are dependent on the hospitals current average length of stay per patient, target population being served, size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already reduced length of stay for sepsis inpatients. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $959,725
**Title of Outcome Measure (Improvement Target):** Primary Care and Primary Prevention – IT-12.1 Breast Cancer Screening (HEDIS 2012) *(Non-stand-alone measure)*

**Unique RHP outcome identification number(s):** 112677302.3.11

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Outcome Measure Description:**
By the end of the Waiver, our goal is to increase mobile mammography screenings by 11,298 over baseline to be determined in DY3. Our milestones include the following:

**Process Milestones:**
- **DY2:**
  - P- 1 Project planning - Engage stakeholders – renew service contracts with local Texas Breast and Cervical Cancer Program Contractor(s). Identify current capacity- evaluate current processes and capacity with two mobile health teams and validate needed resources (human and equipment) to increase capacity, determine timelines for the acquisition of another fully equipped mobile coach and document implementation plans
  - P- 2 Validate existing baseline rates for screening mammograms with the two existing mobile coaches.
  - P- 4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities- The following components will be evaluated: Administrative Run-up (navigation/tracking system, hire/train staff, collect/enter baseline data, acquire third mobile coach), Community Outreach (enhance community outreach designed to implement community screening activities, engage local schools, businesses, churches and service organizations), Reduce barriers to screening (evaluate language barriers, transportation issues, coordinate use of Federal, State and local resources), Patient Navigation Program (evaluate current navigation process), Internal / External Reporting (develop reporting timeline).

**Outcome Improvement Targets for each year:**
- **DY2:** 738 screening mammograms will be performed in RHP 10
- **DY3:** 3,520 screening mammograms will be performed in RHP 10
- **DY4:** 3,520 screening mammograms will be performed in RHP 10
- **DY5:** 3,520 screening mammograms will be performed in RHP 10

**Rationale:**
There is a need in Region 10 for increased comprehensive mammography services and appropriate follow-up. There is a lack of access to affordable mammograms in the area and access to a systems method of proper follow-up. The continued collaboration with Moncrief Cancer Institute and the Breast and Patient Navigation project will address this need and become a model for the State of Texas and the nation.
Estimates from the 2010 Behavioral Risk Factor Surveillance System indicate that 116,547 (26.5%) screen eligible women in RHP 10 have not had a mammogram within the past two years (Public Health Administration Region 2/3).

- Numerator: 11,298 target number of women ages 40 – 69 that receive a screening mammogram;
- Denominator: 31,942 screen eligible women in RHP 10

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every patient affected from early detection of breast cancer screening, $6,072 in cost is saved by the health care system. The average length of stay is multiplied by the total affected population to determine the total days saved. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Breast cancer screening outcome improvement targets are dependent on the target population served, size (e.g., if a MHU is at maximum capacity, rates can only decrease), and current processes in place. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $373,396
Title of Outcome Measure (Improvement Target): Primary Care and Primary Prevention – IT-12.2 Cervical Cancer Screening (HEDIS 2012) (Non-stand-alone measure)

Unique RHP outcome identification number(s): 112677302.3.12

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Fort Worth / 112677302

Outcome Measure Description:
By the end of the Waiver, our goal is to increase mobile cervical cancer screening of 4752 over baseline (to be determined in DY3). Our milestones include the following:

Process Milestones:
• DY2:
  o P- 1 Project planning - Engage stakeholders – renew service contracts with local Texas Breast and Cervical Cancer Program Contractor(s). Identify current capacity- evaluate current processes and capacity with two mobile health teams and validate needed resources (human and equipment) to increase capacity, determine timelines for the acquisition of another fully equipped mobile coach and document implementation plans
  o P- 2 Validate existing baseline rates for screening mammograms with the two existing mobile coaches.
  o P- 4 Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities- The following components will be evaluated:
    Administrative Run-up (navigation/tracking system, hire/train staff, collect/enter baseline data, acquire third mobile coach), Community Outreach (enhance community outreach designed to implement community screening activities, engage local schools, businesses, churches and service organizations), Reduce barriers to screening (evaluate language barriers, transportation issues, coordinate use of Federal, State and local resources), Patient Navigation Program (evaluate current navigation process), Internal / External Reporting (develop reporting timeline).

Outcome Improvement Targets for each year:
• DY3: 1,584 cervical cancer screenings will be performed in RHP 10
• DY4: 1,584 cervical cancer screenings will be performed in RHP 10
• DY5: 1,584 cervical cancer screenings will be performed in RHP 10

Rationale:
Cervical cancer and colon cancer are significant health problems in Texas and in Region 10. At least 33,271 of 120,577 women age 21 – 64 in RHP 10 reported that they did not have a Pap smear within the last 3 years. Five of the nine counties in RHP 10 are designated as Medically Underserved Areas or Medically Underserved Populations.
• Numerator: 4,752 cervical cancer screenings women ages 21 to 64
• Denominator: 33,271 cervical cancer screen eligible women in the target population (RHP 10).

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every patient affected from early detection of cervical cancer screening, $16,910 in cost is saved by the health care system. The average length of stay is multiplied by the total affected population to determine the total days saved. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Cervical cancer screening outcome improvement targets are dependent on the target population served, size (e.g., if a MHU is at maximum capacity, rates can only decrease), and current processes in place. Community benefits were calculated lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $373,396
**Title of Outcome Measure (Improvement Target):** Primary Care and Primary Prevention – IT-12.3 Colorectal Cancer Screening (HEDIS 2012) *(Non-stand-alone measure)*

**Unique RHP outcome identification number(s):** 112677302.3.13

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Fort Worth / 112677302

**Outcome Measure Description:**
By the end of the Waiver, our goal is to increase mobile cervical cancer screening by 675 over the baseline to be measured in DY3. Our milestones include the following:

**Process Milestones:**
- **DY2:**
  - **P-1** Project planning - Engage stakeholders – renew service contracts with local Texas Breast and Cervical Cancer Program Contractor(s). Identify current capacity - evaluate current processes and capacity with two mobile health teams and validate needed resources (human and equipment) to increase capacity, determine timelines for the acquisition of another fully equipped mobile coach and document implementation plans
  - **P-2** Validate existing baseline rates for screening mammograms with the two existing mobile coaches.
  - **P-4** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities - The following components will be evaluated: Administrative Run-up (navigation/tracking system, hire/train staff, collect/enter baseline data, acquire third mobile coach), Community Outreach (enhance community outreach designed to implement community screening activities, engage local schools, businesses, churches and service organizations), Reduce barriers to screening (evaluate language barriers, transportation issues, coordinate use of Federal, State and local resources), Patient Navigation Program (evaluate current navigation process), Internal / External Reporting (develop reporting timeline).

**Outcome Improvement Targets for each year:**
- **DY3:** 225 colorectal cancer screenings will be performed in RHP 10
- **DY4:** 225 colorectal cancer screenings will be performed in RHP 10
- **DY5:** 225 colorectal cancer screenings will be performed in RHP 10

**Rationale:**
Colorectal cancer is the third most common cancer diagnosed in men and women and the second leading cause of deaths overall. Blacks have the highest incidence and mortality followed by non-Hispanic whites and Hispanics. There are higher colorectal cancer incidence rates in rural counties.
Out of an estimated 166,853 population of adults age 50 – 75 in RHP 10, 113,595 have reported not having a blood stool test in the past 2 years.

We anticipate a 64% Fecal Occult Blood Test return rate. The return rate for each year of the last two years has been 64%, largely due to individualized teaching by the Family Nurse Practitioner at the time of the visit on the mobile unit compared to return rates of 30% through a direct-mail approach.

- Numerator: 675 adults age 50 – 75 that receive a Fecal Occult Blood Test
- Denominator: 113,595 adults age 50 – 75 in RHP 10.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every patient affected from early detection of colorectal cancer screening, $24,756 in cost is saved by the health care system.\(^{351}\) The average length of stay is multiplied by the total affected population to determine the total days saved. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Colorectal cancer screening outcome improvement targets are dependent on the target population served, size (e.g., if a MHU is at maximum capacity, rates can only decrease), and current processes in place. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Starting Point/Baseline:**

Target population is 113,595 people who have reported not having a blood stool test in the past 2 years. Intervention population is 675 adults age 50 – 75 that receive a Fecal Occult Blood Test.
**Title of Outcome Measure (Improvement Target):** IT-3.2 Congestive Heart Failure 30-day readmission rate (Stand-alone Measure)

**Unique RHP outcome identification number(s):** 109574702.3.1

**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**

Outcome Measure IT-3.2: Congestive heart failure 30-day readmission rate. Reduce 30-day readmission rate for CHF patients by 6% (2.0% points increase each year DY-3, DY-4, and DY-5 over baseline).

- Process Milestone P-1: Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- Process Milestone P-2: Establish baseline rates
- Process Milestone P-4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities, also allowing for review, analysis, and changes as indicated by the process.
- Process Milestone P-5: Disseminate findings, including lessons learned and best practices, to stakeholders.
- Outcome Milestones 6 through 8 (IT-3.2): Incorporate CQI measure 30-day readmission rate for CHF with a target of 2% incremental improvement from DY3 to DY5

**Rationale:**

These process milestones were chosen for measurement because they are the innovative approaches within the entire program that we envision. This program will also include the more conventional methods such as transition nurses, case managers and ensuring that patients with limited to no financial resources have the tools they need to self-manage their disease.

As cited in the Category 2 Project Narrative, 30-day readmission rates have become a high-cost, high-focus area for CMS and the importance of putting resources into these milestones and outcomes cannot be underestimated.

Evaluating our current capacity and needed resources will assist in determining process changes that need to be implemented.

**Outcome Measure Valuation:**
• **Approach/Methodology:** For every CHF admission avoided, $9,203 in cost is saved by the health care system. The average length of stay per admission (5.6 days) is multiplied by the number of avoidable admissions (20.6 admissions avoided over project term) to determine the total days saved by the individuals affected (115.4 days). Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

• **Individual benefits** were calculated using lost wages, caretaker expense and extension of life (if applicable).

• **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

<th>109574702.2.1 Reduction in 30-Day Hospital Readmission Rates (Potentially Preventable Readmissions)</th>
</tr>
</thead>
</table>

**Starting Point/Baseline:**

Baseline Data: Preliminary data indicates approximately 350 patient admissions with principal diagnosis of heart failure annually. Baseline data to be determined in DY2 but preliminary data shows 30-day HF patient readmission rate near 20 - 21%

Target Population: Low income, disadvantaged community members with a diagnosis of heart failure that do not have access to care.

Specific Number: Numbers will vary but anticipate approximately 394 HF patients annually by DY5.

Description of Population: Individuals with heart failure living within Region 10, particularly those in north Johnson or southern Tarrant Counties

Year 2 Estimated Outcome Amount: (add incentive payments amounts from each milestone/outcome improvement target): $9,844

Year 3 Estimated Outcome Amount: $15,560

Year 4 Estimated Outcome Amount: $16,645

Year 5 Estimated Outcome Amount: $39,804

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $81,852
Title of Outcome Measure (Improvement Target): IT-4.8 Sepsis Mortality (Stand-alone Measure)

Unique RHP outcome identification number(s): 109574702.3.2
Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702

Outcome Measure Description:
Process Milestones, and Outcome Improvement Targets for each year:

The measure itself measures the number of patients with sepsis, severe sepsis or septic shock and/or an infection and organ dysfunction expiring during a given time period against the same number of patients with the same inclusion criteria who don’t expire.

Process milestones include identifying and setting targets for each part of the resuscitation bundle; defining data elements; and developing the internal data base. This is all of the planning process. Other process milestones include developing an internal database which will be utilized in data analysis in order to target opportunities for improvement not only in reducing sepsis mortality. A quality dashboard which can be used for dissemination of data and participation in learning and improvement meetings are the additional process milestones. The goals of each process milestone is to complete the task, i.e., develop a dashboard or internal database. Once a baseline is established in Y2 for the actual implementation rate of the different components of the sepsis resuscitation bundle, then we will determine targets/goals for Y3-5.

Rationale:
Process milestones include identifying and setting targets for each part of the resuscitation bundle; defining data elements; and developing the internal data base. This is all of the planning process. Other process milestones include developing an internal database which will be utilized in data analysis in order to target opportunities for improvement not only in reducing sepsis mortality. A quality dashboard which can be used for dissemination of data and participation in learning and improvement meetings are the additional process milestones and used in communicating process outcomes to key stakeholders. The goals of each process milestone is to complete the task, i.e., develop a dashboard or internal database. Once a baseline is established in Y2 for the actual implementation rate of the different components of the sepsis resuscitation bundle, then we will determine targets/goals for Y3-5. Improvement Milestones of progress toward target/goal and improving quality and efficiency were chosen because the first will determine whether or not our process improvement efforts are effective and potential improvement in LOS and cost/case are surrogates of improving efficiency. Again, targets/goals will be set after Y2 when we have established baselines.

Outcome Measure Valuation:

- **Approach/Methodology:** The outcome measure is a stand alone measure and as stated in the project narrative it is very difficult for us to determine what the reduction in mortality will be by implementing the sepsis resuscitation bundle since we have worked on improving our sepsis care and have order sets that have the bundle embedded in them. We also have a mortality rate that is lower than the national average. However, we have never measured that we actually implement the entire bundle; neither have we measured whether or not we complete our interventions in severe sepsis or septic shock within 6
hours. Therefore, our methodology is to ensure that we do consistently implement the entire bundle within 6 hours of identification of sepsis in a patient and then measure the subsequent mortality rate.

- **Rationale/Justification:** Given that our community is aging and elderly patients have a greater risk of infection and then sepsis, it is of community benefit to decrease the morbidity and mortality due to sepsis by ensuring full implementation of evidence-based practices that have clearly been shown to decrease mortality.

Year 2 Estimated Outcome Amount: $11,316

Total Estimated Incentive Payments for 4-Year Period: $94,092
Title of Outcome Measure (Improvement Target): IT-4.9 Average Length of Stay (Sepsis)

Unique RHP outcome identification number(s): 109574702.3.3
Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
- **Outcome Measure IT-4.9 – Average Length of Stay (Sepsis):** The average length of hospital stay for Huguley’s patients hospitalized for septicemia or sepsis.
- **Process Milestones:** In DY2, the program plan for the project will include stakeholder engagement, assessing for resources, establishing a timeline, and creating an implementation plan (P-1). As well, in DY2, we will re-evaluate current baseline sepsis average length of stay for accuracy (P-2). In DY3, conduct a Plan Do Study Act and disseminate findings to stakeholders (P-4, P-5).
- **Improvement Target:** The outcome measure is to reduce average length of stay (LOS) in patients with sepsis through the consistent, timely implementation of an evidence-based sepsis resuscitation bundle. Estimated current LOS is 8.9 days. The improvement target will decrease from DY2 to DY5 by a total of .6 days (0.2 days per year). Thus, projected improvement targets are 8.7 days, 8.5 days, and 8.3 days in DY3, DY4, and DY5 respectively.

**Rationale:**
Establishing a plan is essential to any successful implementation of a plan/project. Determining the current baseline rate will allow for benchmarking. This information can then be used for decision making, programmatic changes and to assess the program success(P-2) The Plan Do Study Act (P-4) process will be a useful tool to document changes in current practice and ongoing implementation. The diffusion of the results and findings through appropriate communication channels will continue the adaption of the sepsis resuscitation bundle (P-5). The targets established are based on a sample of medical sepsis patient from 2011.

**Outcome Measure Valuation:**
Approach/Methodology: For each day reduced for sepsis admissions, $2,412 in cost is saved by the health care system.[1] The average length of stay per inpatient admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

**Rationale/Justification:** Sepsis inpatient admission outcome improvement targets are dependent on the hospital’s current average length of stay per patient, target population being served and size (e.g., if a hospital is at maximum capacity, rates can only decrease. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes and lost sales tax.
Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

$19,134

**Year 5 Estimated Outcome Amount:**
$45,755

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD**
(add outcome amounts over DYs 2-5): $94,092
**Title of Outcome Measure (Improvement Target):** Primary Care and Chronic Disease Management: Diabetes care: HbA1c poor control (>9.0%)

**Unique RHP outcome identification number(s):** 120726804.3.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Southwest Ft. Worth / 120726804

**Outcome Measure Description:**
By the end of the Waiver, our goal is to decrease the number of outpatient diabetes participants whose HbA1c is > 9.0 by 15%. Our milestones include the following:

**Process Milestones:**
The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run diabetes clinic, expanding on the existing diabetes self-management education service currently provided to our patients. In DY2, we will also develop a mechanism for identifying and tracking high-risk diabetic patients and monitoring effectiveness of interventions (enhanced education, self-management coaching, closer monitoring of medical condition, post discharge telephonic case management,…) to begin analysis of our information and determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

**Outcome Improvement Targets for each year:**
In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Rationale:**
We selected the milestone Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans in order to create a cohesive program based on evidence-based practices. Milestone 2, train staff in the care model, was determined due to the need to train the core staff. In DY3, we will train added staff and current staff on evidence-based protocols and begin the implementation process of those protocols in order to begin to work to improve outcomes. Outcome improvement targets were chosen based on the potential intervention population and that approximately 10% of patients will participate in offered programs. We will strive to push that to 15% in DY5.

**Outcome Measure Valuation:**
• **Approach/Methodology:** For every inpatient admission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $9,640 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

• **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost in payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $ 15,150
**Title of Outcome Measure (Improvement Target):** Potentially Preventable Readmissions - 30 Day Readmission Rates (PPRs) – IT.3.3 Diabetes 30-day readmission rate

**Unique RHP outcome identification number(s):** 120726804.3.2

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Southwest Fort Worth / 120726804

**Outcome Measure Description:**
IT.3.3 Diabetes 30-day readmission rate

By the end of the Waiver, our goal is to decrease 30-day readmission (all-cause) for diabetes patients by 5%. Our milestones include the following:

**Process Milestones:**
DY2, we will:
- Develop and test reporting and monitoring process to evaluate
- Establish baseline rates for the outcome improvement target

DY3, our goal is to train staff and implement evidence-based protocols and implement evidenced-based protocols

**Outcome Improvement Targets for each year:**
Beginning in DY3 and continuing on to DY4 and DY5, diabetes patient readmissions will be reduced by 5, 10, and 1%, respectively.

**Rationale:**
The goal of this program is to establish an outpatient diabetes education and management program to assist all clients identified with diabetes the opportunity to be empowered to make informed decisions and develop self-management skills. Relying on an empirically validated, evidence-based self-management educational and clinical support approach, our goal is to improve the health outcomes and self-management competency of the THSW community. The proposed program will help low income and uninsured clients with diabetes to better self-manage their disease through disease education and provide them with appropriate access to chronic care management support resources.

- Partner with hospitalists to utilize protocols: A1C>8, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education.
- Create the role of an inpatient diabetes educator to identify patients with the same criteria as above, and/or who do not currently have a medical home, and/or have not received diabetes education within the last five years, and any others appropriate for education.
- Develop a comprehensive care management program.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a comprehensive care management program including the program...
development and training of staff. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient education program which includes a self-management portion.

In DY3, using the ED Nurse navigator, we will develop a mechanism for identifying and tracking diabetic patients to begin to establish a baseline and begin the implementation of evidence-based protocols.

In DY4, we will begin the implementation of an APN/Care Coordinator role to follow inpatient diabetics through discharge and follow up in the Outpatient Care Management and Education Program. Using the Plan, Do, Study, Act method, we will begin the evaluation of the new program.

In DY5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient readmission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $9,253 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g., aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Title of Outcome Measure (Improvement Target):** IT-4.8 Sepsis mortality

**Unique RHP outcome identification number(s):** 120726804.3.3

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest (THSW) / 120726804

**Outcome Measure Description:**
IT-4.8 – Sepsis Mortality Rate: The rate of mortality for THFW patients hospitalized for septicemia or sepsis. The goal is to reduce mortality by up to 25% by implementation of evidenced-based protocols and processes

**Process Milestones:**
- P-2: Establish baseline rates—Establist baseline rates consistent with evidenced-based literature and meeting quality goals for appropriate sepsis care to include measurements for door to fluid resuscitation, amount of fluid resuscitation, door to antibiotic and average length of Stay (ALOS).
- P-3: Develop and test data systems—Developing of data systems to track measure and report metrics allowing a reduction manual extraction of data and analysis as well providing ability to rapidly detect changes in practice and trends.
- P-5: Determine findings, including lessons learned and best practices—Analysis and distribution of key indicators to stakeholders to aid in process improvement and better outcomes

**Outcome Improvement Targets for each year:**
- The outcome measure is to reduce mortality in patients with severe sepsis or septic shock through the consistent, timely, implementation of an evidence-based sepsis resuscitation bundle/protocol.

The measure itself measures the number of patients with diagnosis of sepsis, severe sepsis or septic shock expiring during a given time period against the same number of patients with the same inclusion criteria who don’t expire.

**Rationale:**
According to the Center for Disease Control and Prevention (CDC)\(^{353}\) 2007 statistics, septicemia is the 10th leading cause of death in the United States. There have been many focused initiatives to decrease mortality and morbidity in the past decade for other top causes of death of influenza and pneumonia. Proving evidence-based initiatives put in place can reduce mortality; implementing initiatives for sepsis follow these plans. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. Each year mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

\(^{353}\) CDC Footnote here
Thus, process milestones include identifying and setting targets for each part of the resuscitation protocol; defining data elements; and developing the internal data base. Other process milestones include developing an internal database which will be utilized in data analysis in order to target opportunities for improvement not only in reducing sepsis mortality but also in looking at the change in ALOS. A quality dashboard which can be used for dissemination of data and participation in learning and improvement meetings are the additional process milestones. The goal of each process milestone is to complete the task (i.e., develop a dashboard, internal database, etc.).

**Outcome Measure Valuation:**

- **Approach/Methodology:** Decreased mortality rate does not bring any direct health care cost savings. Lives saved are utilized to calculate individual and community costs. The total valuation is calculated by summing up individual and community costs.

- **Rationale/Justification:** Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $167,798
Title of Outcome Measure (Improvement Target): IT-4.9 Average length of stay (Sepsis)

Unique RHP outcome identification number(s): 120726804.3.4

Performing Provider Name/TPI: Texas Health Harris Methodist Southwest (THSW) / 120726804

Outcome Measure Description:
IT-4.9 Average length of stay (Sepsis)

The measure itself measures the number of patients with diagnosis of sepsis, severe sepsis or septic shock expiring during a given time period against the same number of patients with the same inclusion criteria who don’t expire.

Process milestones include identifying and setting targets for each part of the resuscitation protocol; defining data elements; and developing the internal data base. Other process milestones include developing an internal database which will be utilized in data analysis in order to target opportunities for improvement not only in reducing sepsis mortality but also in looking at the change in ALOS. A quality dashboard which can be used for dissemination of data and participation in learning and improvement meetings are the additional process milestones. The goal of each process milestone is to complete the task (i.e., develop a dashboard, internal database, etc.).

Process Milestones:

- **P-2** Establish baseline rates – Establish baseline rates consistent with evidence-based literature and meeting quality goals for appropriate sepsis care to include measurements for door to IV, door to fluid resuscitation, amount of fluid resuscitation, door to antibiotic and average length of Stay (ALOS).
- **P-3** Develop and test data systems – Developing of data systems to track measure and report metrics allowing a reduction manual extraction of data and analysis as well providing ability to rapidly detect changes in practice and trends.
- **P-5** Determine findings, including lessons learned and best practices – Analysis and distribution of key indicators to stakeholders to aid in process improvement and better outcomes

Outcome Improvement Targets for each year:

- **IT-4.8** Average length of stay – reduction of average length of stay by 0.6 days each year staring in DY3.

Rationale:

Process milestones were chosen based on previously identified need through internal quality and evidence-based literature review. Creation of data tracking tools, analysis reporting and information dissemination platforms and clinical process improvement goals are all aimed at the goal of reducing bad outcomes for the identified patient population.
Outcome Measure Valuation:

- **Approach/Methodology:** Decreased mortality rate does not bring any direct health care cost savings. Lives saved are utilized to calculate individual and community costs. The total valuation is calculated by summing up individual and community costs.

- **Rationale/Justification:** Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $167,798
**Title of Outcome Measure (Improvement Target):** Right Care, Right Setting – IT-9.2 – ED appropriate utilization

**Unique RHP outcome identification number(s):** 120726804.3.5

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Hospital / 120726804

**Outcome Measure Description:**
The outcome measure is provided in the table below:
By the end of the Waiver, our goal is to improve appropriate ED utilization for the targeted populations by 12%. Our milestones include the following:

**Process Milestones:**
In DY2, we will:
- Complete project planning including identification and hiring/training of necessary staff, development of policies/procedures and processes
- Develop/test reporting and monitoring process to evaluate effectiveness of program
- Develop or identify database for capturing information on targeted populations to understand needs in order to develop interventions to effective meet their needs. This includes creating strategies with other community health care providers (skilled nursing facilities, nursing homes, home health agencies, primary care physicians, outpatient clinics and other resources in the community) to facilitate transition of at-risk populations to a medical home.
- Establish the baseline

In DY3, we will conduct performance improvement projects to work toward further reductions and disseminate information to key stakeholders regarding our progress
- Reduce ED utilization for the targeted populations by 5% from baseline

**Outcome Improvement Targets for each year:**
In DY4 we will:
- Conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress.
- Reduce ED utilization for the targeted populations by 8% from baseline

In DY5 we will:
- Reduce ED utilization for the targeted populations by 12% from baseline

**Rationale:**
For 2012, an estimated 61,991 THSW ED visits will occur. Of this total, 20% of the ED admissions meet the identified population criteria (unfunded/Medicaid) yielding an estimated total of 12,386 potential EDCM clients for 2012. More than half of identified population had diagnoses that did not require emergency care, including conditions such as chronic back pain, prescription refills, follow-up exams, requesting medical supplies, and seeking narcotics. Additional diagnoses, such as altered mental status, urinary tract infections, and sickle cell pain
could potentially have been managed at a lower level of care. This EDCM program will provide patients utilizing the ED for non-emergent care needs with a trained Navigator to assist them in locating appropriate resources. The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include: In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

- Establishment of a baseline rate for measuring effectiveness in future project years and completion of planning for the project key components.
- Finalization of plans and implementation of a process for hiring and training staff, identifying individuals who are frequent users of the ED or who are utilizing the ED for services that might be provided at a lower level of care and developing a process to navigate the individuals to more appropriate health care venues.
- Development of a data base for tracking patients, monitoring the effectiveness of interventions and follow up monitoring to ensure compliance with the plan of care. Analysis of data obtained will be completed to determine potential improvement opportunities.

In DY3 performance improvement initiatives will be implemented based on opportunities identified and the reporting mechanisms developed to disseminate information regarding the project. In DY4 and 5, we will continue to monitor our effectiveness to achieve targeted outcomes and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $380 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

---

Region 10 RHP Plan  Page 1449
Title of Outcome Measure (Improvement Target): Potentially Preventable Admissions – IT-2.1 Congestive Heart Failure Admission rate (CHF) - PQI #8

Unique RHP outcome identification number(s): 120726804.3.6

Performing Provider Name/TPI: Texas Health Harris Methodist Southwest – North Texas Specialty Physicians & Texas Health Physician’s Group / 120726804

Outcome Measure Description:
By the end of the Waiver, our goal is to decrease 30-day readmission (all-cause) for heart failure patients by 15% Our milestones include the following:

Process Milestones:
In DY2, we will:
• Establish the baseline rate for this measure. An initial data pull from our database shows that the baseline rate may be as high as 20%;
• Process milestone 1-Establish baseline rate for this measure.
In DY3, our goal is to reduce this rate by 5%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress.
• Process milestone 2-Conduct PDSA improvement cycles and document evidence of process improvement; (quantitative and qualitative) description and results.
• Outcome metric 1-Reduce CHF admission rate by 5 % from baseline.

Outcome Improvement Targets for each year:
In DY4, our goal is to reduce HF patient admissions by 10% from baseline.
• Outcome metric 2-Reduce CHF admission rate by 10% from baseline.
In DY5, our goal is to reduce HF patient admissions by 15% from baseline.
• Outcome metric 3-Reduce CHF admission rate by 15% from baseline.

Rationale:
The target population includes individuals with heart failure diagnosis who are at risk for hospital admission due to inadequate treatment, monitoring or self-management of their chronic disease, specifically, HF patients within our Extensivist clinics service area who are underserved, unfunded and government-funded insurance populations.

* Tarrant County Public Health Department Behavioral Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, CHF, and high blood pressure
In DY3, we will conduct PDSA improvement cycles to improve data collection and intervention strategies for target population.

- Process milestone 2-Documents demonstrating completion of the performance improvement activities.
- Outcome improvement target 1: Reduction of CHF admission rate of 5% from baseline based on PDSA improvements.

In DY4, based on implementation of care management interventions we will achieve:

- Outcomes improvement target 2: 10% reduction of CHF admission rates from baseline rate in DY2.

In DY5 based on continuous improvements with interventions, we will achieve:

- Outcomes improvement target 3: 15% reduction of CHF admission rates from baseline rate in DY2.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system.\(^{354}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $266,438**
**Title of Outcome Measure (Improvement Target):** Potentially Preventable Complications – IT-3.2 Congestive Heart Failure (CHF) 30-day readmission rate

**Unique RHP outcome identification number(s):** 120726804.3.7

**Performing Provider Name/TPI:** Texas Health Harris Methodists Southwest – North Texas Specialty Physicians & Texas Health Physician’s Group / 120726804

**Outcome Measure Description:**
IT-3.2 Congestive Heart Failure (CHF) 30-day readmission rate
By the end of the Waiver, our goal is to decrease 30-day readmission (all-cause) for heart failure patients by 20%. Our milestones include the following:

**Process Milestones:**
In DY2, we will:
- P-2: Establish the baseline rate for this measure. An initial data pull form CMS claims indicates that the baseline rate may be as high as 20%

In DY3, we will conduct performance improvement strategies using the PDSA cycles to work toward further reductions and disseminate information to key stakeholders regarding our progress.
- P-4: Documentation (qualitative and quantitative) describing process milestone as evidence PDSA cycles completed.
- IT-3.2: Reduce 30-day readmission rate for CHF (<5% from baseline).

**Outcome Improvement Targets for each year:**
In DY4 our goal is to reduce HF patient readmissions by 10% from baseline.
- IT-3.2: Reduce 30-day readmission rate for CHF

In DY5, our goal is to reduce HF patient readmissions by 20% from baseline.
- IT-3.2: Reduce 30-day readmission rate for CHF.

**Rationale:**
The target population includes individuals identified for care within our Extensivist Clinics Medical Home with diagnosis of with heart failure who are at risk for readmission to the hospital within 30 days of an index admission. The target population will include HF patients who are underserved, unfunded and/or a beneficiary of government-funded insurance populations.

In DY3, we will conduct PDSA improvement cycles to improve data collection and intervention strategies for target population.
- Process milestone 2-Documents demonstrating completion of the performance improvement activities.
- Outcome improvement target 1: Reduction of CHF readmission rate of 5 % from baseline based on PDSA improvements.
In DY 4, based on implementation of evidence-based care coordination and interventions we will achieve:

- Outcomes improvement target 2: 10% reduction of CHF readmission rates from baseline rate in DY2.

In DY5 based on continuous improvements with interventions, we will achieve:

- Outcomes improvement target 3: 20% reduction of CHF readmission rates from baseline rate in DY2.

Improving care management of chronic conditions requires a coordinated care approach with a focus on primary, secondary and tertiary strategies for reducing disease associated complications and negative health effects. Conducting quality improvement cycles during DY3 will provide organized approach to determining root causes for hospitalization and rehospitalization of patients with diagnosis CHF and AMI and ensure rapid cycle improvements related to care, treatment and interventions.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system.\(^{355}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

\(^{355}\) Texas Department of State Health Services with a 30% ccr assumption.

### Year 2 (10/1/2012 – 9/30/2013)

**Process Milestone 1 [P-1]:** Establish baseline 30-day CHF readmission rates in target population.

- Data Source: Claims data files from CMS for reporting period.

**Process Milestone 1 Estimated Incentive Payment:** $32,043

### Year 3 (10/1/2013 – 9/30/2014)

**Process Milestone 2 [P-4]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities in target population.

- Data Source: Documentation describing process milestone as evidence PDSA cycles completed.

**Process Milestone 2 Estimated Incentive Payment:** $25324

**Outcome Improvement Target 1**

- [IT-3.2] CHF 30-day readmission rate
- Improvement Target: 5% (4 admits) reduction from baseline.
- Data Source: CMS Claims data

**Outcome Improvement Target 1 Estimated Incentive Payment:** $25324

### Year 4 (10/1/2014 – 9/30/2015)

**Outcome Improvement Target 2**

- [IT-3.2]: CHF 30-day readmission rate
- Improvement Target: 10% (9 admits) reduction from baseline.
- Data Source: Claims data from CMS

**Outcome Improvement Target 2 Estimated Incentive Payment:** $54,182

### Year 5 (10/1/2015 – 9/30/2016)

**Outcome Improvement Target 3**

- [IT-3.2]: CHF 30-day readmission rate
- Improvement Target: 20% (12 admits) reduction from baseline.
- Data Source: Claims data from CMS

**Outcome Improvement Target 3 Estimated Incentive Payment:** $129,565

### Year 2 Estimated Outcome Amount:

(Add incentive payments amounts from each milestone/outcome improvement target): $32,043

### Year 3 Estimated Outcome Amount:

$50,648

### Year 4 Estimated Outcome Amount:

$54,182

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $266,438
Title of Outcome Measure (Improvement Target): Potentially Preventable Complications – IT-3.5 Acute Myocardial Infarction (AMI) 30-day readmission rate

Unique RHP outcome identification number(s): 120726804.3.8

Performing Provider Name/TPI: Texas Health Harris Methodists Southwest – North Texas Specialty Physicians / 120726804

Outcome Measure Description:
IT-3.5 Acute Myocardial Infarction (AMI) 30-day readmission rate
By the end of the Waiver, our goal is to decrease 30-day readmission (all-cause) for AMI by 20%. Our milestones include the following:

Process Milestones:
In DY2, we will:
- Establish the baseline for this rate. An initial data pull from our database shows that the baseline rate may be as high as 24.5%;
- Process milestone 1 - Establish the baseline of 30-day AMI readmission rates for at risk population.

In DY3, we will conduct performance improvement projects using the PDSA cycles to work towards further reductions and disseminate information to key stakeholders regarding our progress.
- Process milestone 2 - Conduct PDSA cycles to improve data collection and intervention activities.
- Outcome metric 1 – Reduce baseline rate by 5% in DY3

Outcome Improvement Targets for each year:
In DY4, our goal is to reduce AMI patient readmissions by 10% from baseline.
- Outcome metric 2 – Reduce 30-day readmission rate for AMI by 10%.

In DY5, our goal is to reduce AMI patient readmissions by 20% from baseline.
- Outcome metric 3 – Reduce 30-day readmission rate for AMI by 20%.

Rationale:
In DY2, our process milestone is to establish the baseline AMI Readmission rate to reflect the current state of performance and set targets for the future state.

The target population includes patients in our service area with diagnosis of acute myocardial infarction who are at risk for readmission to the hospital within 30 days of an index admission due to inadequate monitoring or management of their condition. Tarrant County Public Health Department Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as one of the leading causes of death for both men and women.
In DY3, we will conduct PDSA improvement cycles to improve data collection and intervention activities for target population.

- Process milestone 2 – Documents demonstrating completion of the performance improvement activities.
- Outcome improvement target 1: Reduction of AMI readmission rate of 5% from baseline based on PDSA improvements.

In DY4, based on implementation of evidence-based care coordination and interventions, we will achieve:

- Outcomes improvement target 2: 10% reduction of AMI readmission rates from baseline rate in DY2.

In DY5, based on continuous improvements with interventions, we will achieve:

- Outcomes improvement target 3: 20% reduction of AMI readmission rates from baseline rate in DY2.

Outcome Measure Valuation:

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system.\(^{356}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Title of Outcome Measure (Improvement Target):** IT-1.10 Diabetes care: HbA1c poor control (> 9.0%)

**Unique RHP outcome identification number(s):** 121794503.3.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Stephenville / 121794503

**Outcome Measure Description:**
IT-1.10 Diabetes care: HbA1c poor control (> 9.0%)

**Process Milestones:**

**DY2:**
- (P-1) Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- (P-2) Establish baseline rates
- (P-7) Train appropriate staff on evidence-based clinical protocols

**DY3:**
- (P-4) Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

**Outcome Improvement Targets for each year:**
Reduce the number of patients with A1C > 9.0% by 10% over the baseline in DY4 and 15% over the baseline in DY5

**Rationale:**
The identified process milestones will assist our organization in developing and implementing the structure needed to coordinate care for these patients. Process milestones identified in DY2 include (P-1) project planning involving the establishment of a comprehensive care management program and formalization of the multidisciplinary Diabetes CARE team to link these patients to a medical home and resources / self-management education. In DY3, conducting Plan Do Study Act (PDSA) cycles (P-4) will allow us to implement performance improvement initiatives based on opportunities identified. In addition, a reporting mechanism will be developed to disseminate information regarding the project.

89% of medically managed patients who enrolled in a similar outpatient diabetes self-management training program at THFW achieved HbA1c <7% by program completion. Using this comparison for this higher-risk, economically disadvantaged population of people with diabetes, we conservatively project a goal of decreasing by 15% the number of diabetes program participants whose HbA1c is >9% by DY5.

**Outcome Measure Valuation:**
• **Approach/Methodology:** For every diabetes inpatient admission avoided, $8,297\textsuperscript{357} in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals positively affected. The average length of stay per admission is multiplied by the number of avoided admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale/Justification:** The valuation for each outcome is dependent on the outcome improvement targets. Outcome improvement targets are set, taking into consideration the following factors:
  
  o Volume capacity of the proposed program, which defines the baseline/intervention population
  
  o Clinical literature or historical performance that provide a comparison for expected improvement as a result of the program

The valuation model computes separate values for impacts on the health care system, the individual and the community. Community benefits were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

\textsuperscript{357} Assumes a cost-to-revenue of 30%. Texas Department of State Health Services. http://www.dshs.state.tx.us/ph/county.shtm.

- (P-4) Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

**Outcome Improvement Targets for each year:**
Reduce the number of patients readmitted to the hospital within 30 days by 5% over baseline in year DY3, then by 10% over baseline in DY4 and 15% over the baseline by DY5

**Rationale:**
The identified process milestones will assist our organization in developing and implementing the structure needed to coordinate care for these patients. Process milestones identified in DY2 include (P-1) project planning involving the establishment of a comprehensive care management program and formalization of the multidisciplinary Diabetes CARE team to link these patients to a medical home and resources / self-management education. In DY3, conducting Plan Do Study Act (PDSA) cycles (P-4) will allow us to implement performance improvement initiatives based on opportunities identified. In addition, a reporting mechanism will be developed to disseminate information regarding the project.

Eighty-nine percent of medically managed patients who enrolled in a similar outpatient diabetes self-management training program at THFW achieved HbA1c <7% by program completion. Using this comparison for this higher-risk, economically disadvantaged population of people with diabetes, we conservatively project a goal of decreasing by 15% the number of diabetes program participants whose HbA1c is >9% by DY5.

**Outcome Measure Valuation:**
• **Approach/Methodology:** For every diabetes inpatient admission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals positively affected. The average length of stay per admission is multiplied by the number of avoided admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale/Justification:** The valuation for each outcome is dependent on the outcome improvement targets. Outcome improvement targets are set, taking into consideration the following factors:
  - Volume capacity of the proposed program, which defines the baseline/intervention population
  - Clinical literature or historical performance that provide a comparison for expected improvement as a result of the program

The valuation model then computes separate values for program impacts on the health care system, the individual and the community. Community benefits took into account the following factors: lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits considered these factors: lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $11,763
**Title of Outcome Measure (Improvement Target):** IT-9.2 ED appropriate utilization (Stand-alone measure)

**Unique RHP outcome identification number(s):** 121822403.3.1

**Performing Provider Name/TPI:** Ennis Regional Medical Center/121822403

**Outcome Measure Description:**

ERMC overall goal is to decrease non-emergent use of ED 15% by DY5. All patients who present to the Emergency Department of the hospital will have a medical necessity screening. The patients who do not meet medical necessity for emergency services will be advised on seeking the appropriate level of care and re-directed for appropriate treatment with a list of available local physician clinics. By DY5, we will decrease the number of low-acuity patients who present in our ED by 10%. To do this, we must implement a Nurse Triage system and develop and test our data systems in DY2-DY4. We will establish a baseline number of low-acuity patients in DY2. ERCM Emergency Department will consistently and proficiently use Emergency Severity Index Triage Screening developed by the Emergency Nurses Association and supported by the Agency of Healthcare Research and Quality to evaluate medical necessity. For all patients discharged rather than treated in the emergency department ERMC will provide written information on location, contact information and hours of operation for all clinics in the Ennis Regional Medical Center Primary Care Service Area. The patients will also receive information verbally and in writing on the importance of having a primary care physician and seeking the appropriate level of care and services.

**Rationale:**

In 2012, 16,867 patients presented to the Emergency Department at ERMC. Of these, 9,823 patients, or 58%, were designated as triage level 4 and 5, ERMC Stats, (2012). using the Emergency Severity Index standard for triaging, Emergency Severity Index (ESI) Implementation Handbook, (2012 Edition). Level 4 and 5 patients are considered non-emergent according to this standard. Of the 9,823 patients screened as non-emergent, 3,123 were treated at the lowest charge levels of 1 and 2 (scale range 1-5 plus Critical Care). Level 1 and 2 patients require little to no treatment or diagnostics. Further, of the 3,123 patients, 2,242 were Medicaid, Managed Medicaid or Indigent. This figure represents the baseline used for our ED appropriate utilization improvement Category 3 outcomes. We have targeted a 15% overall improvement in availability of access to primary care in DY4 and DY5 which will impact 112 patients by DY 4 and a total of 336 Medicaid/Managed Medicaid and indigent patients.

The goal of this project is to increase the general population’s access to primary care across all payor sources. Increasing the ability for patients to seek and find primary care will improve utilization of primary care services rather than the hospital emergency department for non-emergent services. The expansion approach will include two facets: 1) expanding existing
primary care base through assisting growing practices in recruitment efforts and 2) further expanding relationships (and clinic sites) with existing Federally Qualified Health Clinics and developing new clinics focused on treating Medicare, Medicaid, and Medically Indigent Patients. This project will positively impact quality of life, health outcomes, preventable admissions, and emergency department utilization.

**Outcome Measure Valuation:**
We propose a community-based expansion of Primary Care capacity in the Ennis Regional Medical Center Primary Service Area (PCSA).

Year 2 Estimated Outcome Amount: $26,011

Year 3 Estimated Outcome Amount: $45,226

Year 4 Estimated Outcome Amount: $48,381

Year 5 Estimated Outcome Amount: $115,693

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $235,311
Title of Outcome Measure (Improvement Target): Percent improvement over baseline of patient satisfaction scores measuring patient’s overall health status/functional status. (3.IT-6.1)

Unique RHP outcome identification number(s): 121988304.3.1
Performing Provider Name/TPI: Lakes Regional MHMR Center / 121988304
Outcome Measure Description:
The project will implement outcome measure IT-6.1 to measure improvement over baseline of patient satisfaction scores regarding patient’s overall health status/functional status.

Process Milestones:
- In DY3, we will establish the baseline for patient satisfaction with overall health status/functional status.

Outcome Improvement Targets for each year:
- In DY4, Improvement Target-6.1 is to achieve 15% improvement over baseline of patient satisfaction scores measuring patient’s overall health status/functional status. Percentage will be measured by percent improvement in targeted patient satisfaction domain (numerator) over number of patients who were administered the survey (denominator).
- In DY5, Improvement Target-6.1 is to achieve 25% improvement over satisfaction scores in DY4 measuring patient’s overall health status/functional status by end of Waiver. Percentage will be measured by percent improvement in targeted patient satisfaction domain (numerator) over number of patients who were administered the survey (denominator).

By the end of the Waiver, our goal is to achieve 40% improvement over baseline of patient satisfaction scores regarding satisfaction with patient’s overall health status/functional status.

Rationale:
Research has shown that there is a much greater instance of health problems in the IDD population. The program staff will monitor mental and physical health status and outcomes to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population. Research has shown that the use of Intensive Case Management reduced the number, confidence interval and duration of inpatient admissions, reducing the number of reported needs and increasing patient satisfaction, as well as the cost of care borne by the health sector. The CGCAHPS survey produces “. . . comparable data on the patient’s perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers”.

Sharing survey results with other agencies and providers in the

361 RHP Planning Protocol, Category 3 Quality Improvements, 398.
Region regarding consumer satisfaction with overall health and functional status will bring about improvements in the overall health system for individuals with IDD/ASD/MH, since “[p]ublic reporting of the survey results is designed to create incentives for institutions to improve their quality of care.” 362 Sharing survey results with stakeholders will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and improved follow-up to care.

Lakes Regional has the data to evaluate patient satisfaction with overall health status/functional status at this time. We will establish a baseline to measure satisfaction by implementing the CG-CAHPS, a standardized survey instrument and data collection methodology for measuring patients’ perspectives on health care. Working collaboratively with the target population to highlight the importance of implementing evidence-based approaches to care tailored to individual needs will involve the target population in being accountable for participation in consistent self-monitoring. Better control over physical and psychiatric symptoms has shown to lead to greater consumer and family member satisfaction, as noted above.

Additionally, Lakes Regional will collaborate with 39 other MHMR centers across the state to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of data through shared data sources in local communities; centers are currently in the process of engaging a consultant to provide leadership and consultation for the project.

**Outcome Measure Valuation:**

The valuation for this project was based on an established economic evaluation model and extensive literature review conducted by professionals in the field and at the University of Houston School of Public Health and University of Texas at Austin Center for Social Work Research.

Outcome measures will be valued by assessing community needs identified for Region 10 addressed through the RHP plan, such as the need for more care coordination and overuse of emergency department services. When patients experience a fragmented service system between behavioral health and primary care, as well as a lack of access to coordinated care, they experience lack of satisfaction and inability to self-monitor and manage symptoms effectively as a result. Supporting individuals in the community at a lesser cost than hospital or institutional care, and avoiding costs in emergency departments and psychiatric hospitals is a predictor to overall improvement in coordinated care in the community, and greater quality of life satisfaction. 363

362 ibid
DY2 – There is no process milestone in DY2; the focus of Quality Improvement will be on activities in DY2 in the related project (1.13.1) involving gathering input from stakeholder meetings, conducting mapping and gap analyses regarding Community Need in the project area, and defining project requirements. (Outcome valuation payment/process milestone are not required in DY2 for this project.)

DY3 – Process Milestone (P-6) to establish baseline for improvement in patient satisfaction with overall health/functional status. The need to measure improvement in this domain will be accomplished by hiring part-time Quality Assurance staff to survey the target population to achieve a baseline for outcome measure 3IT-6.1. Participants will be surveyed to assess their experience in the current service system as it relates to meeting their needs.

DY4 – Improvement Target 6.1 to establish 15% improvement over baseline of patient satisfaction scores in selected domain. Nursing staff will administer surveys to measure improvement over baseline in the selected domain. It is expected that service recipients will experience improved overall satisfaction with services due to improved quality of life; improved satisfaction is expected to lead to a decrease in overuse of emergency department services and other barriers to access to care in the community for the target population, as well as improved ability to successfully and consistently self-manage symptoms in the community.

DY5 – Improvement Target 6.1 to establish 25% improvement over DY4 and 40% improvement over baseline of patient satisfaction scores in selected domain: see approach/methodology for IT-6.1 for DY4.

3IT-6.1 Percent improvement over baseline of patient satisfaction scores. A process milestone in Year 3 will establish baseline for improvement in patient satisfaction with overall health/functional status; Improvement targets in DYs 4 and 5 will establish percent improvement over baseline in patient satisfaction scores, ending Year 5 with a 40% improvement over baseline in patient satisfaction scores.

Size – The project will involve hiring one nursing staff and one part-time Quality Assurance staff to administer surveys, provide monitoring and follow-up and documentation of responses, and collection and maintenance of data on potentially and approximately 250 respondents receiving care at the Crisis Respite/Wraparound program.

Project Scope – The proposed project is projected to measure satisfaction with improvement in overall health status/functional status in approximately 250 individuals (children and adults) who are dually diagnosed in Ellis and Navarro counties.

Population Served – The population targeted to be served are individuals dually diagnosed with IDD/ASD/MH (one or all of those diagnoses).

Community Benefit and Cost Avoidance – As noted above, improved satisfaction with overall health outcomes will lead to improved self-maintenance of physical and psychiatric health outcomes, as well as less frequent need for hospital visits and stays that result from crisis/exacerbation of symptoms. Consistently implementing monitoring and follow-up in the approach to care will lead to cost avoidance in that patients will no longer require the support of more expensive settings for symptom maintenance. Research has shown that the use of Intensive Case Management reduced the number, confidence interval and duration of inpatient admissions, reducing the number of reported
needs and increasing patient satisfaction, as well as the cost of care borne by the health sector. Sharing evidence-based data with other providers on patient satisfaction in this area will serve to “enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment”.

**Addressing Priority Community Need** – Currently there is no crisis respite/wraparound program in the targeted area to serve the needs of the target population when in crisis, resulting in the frequent use of more restrictive and expensive settings for care, such as psychiatric hospitals and institutional settings.

**Estimated Local Funding** – (see table)

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $778,583
**Title of Outcome Measure (Improvement Target):** Percent improvement over baseline of patient satisfaction scores, measuring patient’s overall health status/functional status.

**Unique RHP outcome identification number(s):** 121988304.3.2  
**Performing Provider Name/TPI:** Lakes Regional MHMR Center / 121988304

**Outcome Measure Description:**  
IT-6.1 Percent improvement over baseline of patient satisfaction scores by (5) patient’s overall health status/functional status

**Process Milestones:**  
- In DY3, we will develop and test data systems related to measuring patient satisfaction.

**Outcome Improvement Targets for each year:**  
- In DY4, Improvement Target-6.1 is to achieve 10% improvement over baseline of patient satisfaction scores measuring patient’s overall health status/functional status.  
- In DY5, Improvement Target-6.1 is to achieve 20% improvement over satisfaction scores in DY4 measuring patient’s overall health status/functional status by end of Waiver. Percentage will be measured by percent improvement in targeted patient satisfaction domain (numerator) over number of patients who were administered the survey (denominator).

By the end of the Waiver, our goal is to achieve 20% improvement over baseline of patient satisfaction scores regarding satisfaction with patient’s overall health status/functional status.

**Rationale:**  
Our telemedicine/telehealth program will develop and incorporate data systems to provide information and feedback with technical and clinical processes. This data will be used to help us manage the expansion of the program and ensure that we are continuously improving the quality of the services we provide to ensure patient satisfaction. Although this Telemedicine/Telehealth Introduction/Expansion Project will enable services from multiple provider specialties, it will share significant focus with the Lakes Regional Crisis Respite – Behavioral Support Wraparound Program Project. Within the IDD population, research has shown that there is a much greater instance of health problems. With the help of telemedicine/telehealth technology, program staff will monitor mental and physical health status and outcomes to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population.

The specific ACT model planned for the program will result in better control of psychiatric symptoms, better quality of life overall, and greater consumer and family member satisfaction. The projected outcomes relate to an improvement in access to care, the quality of care and health

---

outcomes, as well as an overall improvement in health for the target population. The CGCAHPS survey produced comparable data on the patient’s perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers.\textsuperscript{369} The sharing of consumer satisfaction data (overall health survey results) between agencies (IFF, SDF, MH) and providers in the Region regarding consumer satisfaction, will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and follow-up to care. Identified within the Crisis Respite Project there is significant data analysis planned with encounter based assessments to show and measure improvement in customer satisfaction in health/functional status.

Lakes Regional has the data to evaluate patient satisfaction with overall health status/functional status at this time. Additionally, Lakes Regional will collaborate with 39 other MHMR centers across the state to develop and select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of data through shared data sources in local communities; centers are currently in the process of engaging a consultant to provide leadership and consultation for the project.

**Outcome Measure Valuation:**

- **DY2** – There is no process milestone in DY2; the focus of Quality Improvement will be on activities in DY2 in a related telemedicine project (1.7.1) involving gathering input from stakeholder meetings, conducting mapping and gap analyses regarding Community Need in the project area, and defining project requirements. (Outcome valuation payment/process milestone are not required in DY2 for this project.)
- **DY3** – Process Milestone (P-3) will involve developing and testing data systems related to measuring patient satisfaction to establish a methodology for measuring patient satisfaction in Years 4 and 5.
- **DY4** – Improvement Target 6.1 will establish 10% improvement over baseline of patient satisfaction scores in the selected domain:
- **DY5** – Improvement Target 6.1 will establish 20% improvement over baseline of patient satisfaction scores in the selected domain:

Our telemedicine/telehealth project will provide flexibility for the type of services and where the connections between providers can be established. With the rural nature of Ellis and Navarro counties, the Internet cloud based implementation planned for the project will open up the area for video communication between doctors’ offices, schools, hospitals, jails, behavioral health clinics, and just about anywhere that there is broadband access (providers working out of their homes). The possibilities for expansion of this program are numerous and the services provided will result in overall cost reductions for the Region.

This project was valued based on studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: “Valuing Access to Timely Services through Telemedicine.” These studies were completed through a contract with Center for Health Care Services. These valuation studies used cost-utility analysis which measure program cost in

\textsuperscript{369} RHP Planning Protocol, page 398
dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency department visits that are avoided).

**Outcome Measure:** 3IT-6.1 Percent improvement over baseline of patient satisfaction scores. A process milestone in Year 3 will establish baseline for improvement in patient satisfaction with overall health/functional status; Improvement targets in DYs 4 and 5 will establish percent improvement over baseline in patient satisfaction scores, ending Year 5 with a 20% improvement over baseline in patient satisfaction scores.

**Size** – In providing the new technology to clinical programs in the Region, the telemedicine program will require all of the needed infrastructure and support operations. This includes the implementation of data line enhancements, Internet-cloud private network connectivity (VPN), and server based audio/video processing and session management. The program will involve collection and maintenance of data on potentially 210 clients over the course of the Waiver period.

**Project Scope** – The proposed project is projected to measure satisfaction with improvement in overall health status/functional status for those receiving telemedicine/telehealth during the Waiver period. It is estimated the potential client base could reach 210 individuals over the Waiver period in Ellis and Navarro counties.

**Population Served** – The population targeted to be served are individuals with a primary behavioral health and/or dually diagnosed with IDD/ASD/MH (one or all of those diagnoses).

**Community Benefit and Cost Avoidance** – Improved satisfaction with overall health outcomes will lead to improved self-maintenance of physical and psychiatric health outcomes, as well as less frequent need for hospital visits and stays that result from crisis/exacerbation of symptoms. Consistently implementing monitoring and follow-up in the approach to care will lead to cost avoidance in that patients will no longer require the support of more expensive settings for symptom maintenance. Sharing evidence-based data with other providers on patient satisfaction in this area will serve to “enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment”370.

**Addressing Priority Community Need** – Currently there is no telemedicine/telehealth program to support routine access to specialty care or for crisis respite/wraparound services in these two rural counties. This results in the frequent use of more restrictive and expensive settings for care, such as psychiatric hospitals, emergency departments and institutional settings.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $214,261
Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life (Stand-alone Measure)

Unique RHP outcome identification number(s): 121988304.3.3 (Pass 2)
Performing Provider Name/TPI: Lakes Regional MHMR Center / 121988304

Outcome Measure Description:

Process Milestones:
In DY3: Process Measure (P-3) Develop and test data systems;

Improvement Target-10.1: Demonstrate 10% improvement in quality of life (QOL) scores measured by evidence-based and validated assessment tools for individuals.

Outcome Improvement Targets:
DY 4: Improvement Target-10.1 – Demonstrate 10% improvement in quality of life (QOL) scores measured by evidence-based and validated assessment tool for individuals.
DY5: Improvement Target-10.1 – Demonstrate 10% improvement in quality of life (QOL) scores as measured by evidence-based and validated assessment tool for individuals.

Rationale:
Process Milestone P-3 DY3 for Lakes Regional Mental Health Mental Retardation Center (LRMHMRC) in Region 10 will involve developing and testing data systems for administration of the QOL validation assessment tool, to ensure accuracy and efficiency in project-related data collection and management. Improvement Targets 10-1 in DYs 4 and 5 will involve administration of the QOL assessment tool to project participants (target population) and determining percentage of improvement in QOL scores. According to the RHP Protocol, two essential components of health-related quality of life are specific to improvement in symptoms and functioning. The RHP Protocol says, “. . .the best way to measure symptoms and functional status is by direct patient survey,” and “effective quality improvement requires relentless focus on the patient outcomes” (RHP Protocol, p. 406). Measuring improvement in quality of life will allow project staff to work collaboratively with the target population to highlight the importance of implementing evidence-based approaches to care tailored to individual needs.

In addition, measuring improvement in QOL status will involve the target population in (1) being accountable for participation in consistent self-monitoring, and (2) exhibiting increased ability to manage challenging behaviors and symptoms, leading to greater quality of life satisfaction. Sharing survey results with other agencies and providers in the Region in a semiannual face-to-face learning collaborative regarding improvement in QOL status for the target population will pave the way for other service providers to make improvements in their approaches to the
provision of health care, leading to improved patient outcomes. Other providers in the Region will be made aware of the specialty needs of the target population and of efficacious, research-based approaches to provision of care that avert unnecessary placement in more restrictive settings. As baseline data is established in DY2, refinement of gross estimates of improvement target yearly percentages is expected through the PDSA process.

**Outcome Measure Valuation:**
The project will implement outcome measure 3-IT-10.1 to measure improvement of Quality of Life (QOL) scores. In keeping with the Waiver Program Funding and Mechanics (PFM) Protocol for the DSRIP pool, the approach to valuation followed the formula prescribed on page 27 of the document for Non-Hospital Performing Providers for Category 3 allowing DY2 5%, DY3 10%, DY4 10%, and DY5 20%. The project coordinator will ensure the protocol as set forth the SF-36 manuals will be followed for administering the QOL measure. This outcome measure will be valued by assessing community needs identified for Region 10 addressed through the RHP Plan, such as the need to address preventable acute care admissions and a need for additional health care providers who can address the specialty needs of the target population in a setting that is accessible. When patients do not have adequate supports and services in the community, they are more likely to utilize the ED and psychiatric hospital settings to manage crises, which escalate due to inability to access the right level of services at the right time. This affects the target populations’ overall perception of quality of life factors and leads to a cycle of ineffective coping and inability to manage behaviors in the community. Supporting individuals in the community at a lesser cost than hospital or institutional care, and avoiding costs in emergency departments and psychiatric hospitals is a predictor of overall improvement in coordinated care in the community, and greater QOL satisfaction.

DY3 – Process Milestone (P-3) will involve existing Information Technology and Quality Management staff to select and install data systems for electronic medical record, scheduling and system data collection connected to Lakes Regional MHMR Center (LRMHMRC) parent data system. The pre- and postapplication of the survey and analysis of the data per individual will continue through DY5 to inform PDSA cycles.

DY4 – Improvement Target 10.1 is to establish an aggregate 10% improvement over individual entry baseline in QOL scores. Opening of services in DY3 will see the inclusion of the QOL instrument SF-36 at intake and the close of treatment beyond screening or crisis stabilization services for each individual participant of the Depression Trauma Counseling Center. Pre- and post-scores considered on the same instrument in the individual’s data will provide the outcome for individuals as well as across the services rendered. This QOL measure will be repeated for all treatment clients through FY5. It is expected that service recipients will experience improved overall satisfaction with services due to improved quality of life; improved satisfaction is
expected to lead to a decrease in ED -, as well as improved ability to successfully and consistently self-manage challenging behaviors and symptoms in the community.

DY5 – Improvement Target 10.1 to maintain the aggregate 10% improvement in QOL scores. Since average length of stay is anticipated to be 7-10 weeks- with 70 unique individual participants in the DY3 start-up and the clinic growth at 20% = 84 in DY4 and 30%=109 in DY5, the aggregate pool should grow beyond the minimum 263 unique individuals: See approach/methodology for IT-10.1 for DY4.

Outcome Measures
3IT-10.1 Quality of Life. The quality of life measure SP-36 includes 36 items categorized into eight scales that measure physical health and mental health. It has established validity, and the MH scales have been shown to be useful in screening for psychiatric disorders.

Size: The project staff will administer QOL surveys; provide monitoring, follow-up and documentation of responses, and collection and maintenance of data on minimally 263 respondents - receiving care in the project.

Project Scope: The proposed project is projected to demonstrate 10% improvement in quality of life factors as measured by a validated assessment tool by DY5 in approximately 100 individuals per year utilizing the services in LRMHMRC RHP 10 counties.

Population Served: The population targeted is - individuals who have depression or trauma-related symptoms and do not qualify for State-supported services to the SMI population. This includes individuals referred by hospitals, police and other sources due to lack of ability to afford private care.

Community Benefit and Cost Avoidance: Improved satisfaction with quality of life factors will lead to improved self-management of psychiatric health outcomes, as well as less frequent need for hospital visits and stays that result from crisis/exacerbation of symptoms. Consistently implementing monitoring and follow-up in the approach to care will lead to cost avoidance, in that patients will no longer require the support of more expensive settings for symptom maintenance. Sharing evidence-based data with other providers on patient satisfaction in this area will serve to “enhance public accountability in health care by increasing the transparency of the quality of institutional care provided in return for the public investment” (RHP Protocol, p. 398).

Addressing Priority Community Need: Currently there is no accessible safety net program in the targeted area to serve the needs of the target population when in crisis, resulting in the frequent use of more restrictive and expensive settings for care, such as psychiatric hospitals and
institutional settings. The project relates to the Region 10 CN. 4 Lack of access to mental health services and CN. 10 Overuse of emergency department (ED) services.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $333,010
**Title of Outcome Measure (Improvement Target):** IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 057620 (Stand-alone measure)

**Unique RHP outcome identification number(s):** 126675104.3.1

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**

This measure assesses the percentage of discharges for members 6 years of age and older who were hospitalized for treatment of selected mental health disorders and who had an outpatient visit, an intensive outpatient encounter or partial hospitalization with a mental health practitioner. Two rates are reported. Rate 1 is the percentage of members who received follow-up within 30 days of discharge. Rate 2 is the percentage of members who received follow-up within 7 days of discharge. In DY2, there are 2 process milestones established. The first is for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is the development and testing of data systems. In DY3, there are 2 process milestones established. The first is to establish the baseline rates of follow-Up After Hospitalization for Mental Illness. The second milestone is the completion of PDSA cycles to improve data collection and intervention activities. The final process milestone is the establishment of the outcome targets for IT-1.18 Rate 1 and Rate 2. There are two milestones related to managing the data systems to prepare for reporting related to the seven- and 30-day follow-up rates. There are two process milestones related to establishing the current benchmark related to seven and 30-day follow-up rates. In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to improve both seven- and 30-day follow-up rates by a percentage to be determined in DY3.

**Rationale:**

This outcome measure was selected because improved follow-up rates for adherence to outpatient visits for patients discharging from behavioral health hospitals reduces 30-day behavioral health readmission rates. The process milestones in DY2 and DY3 were selected to enable the provider to be able to accurately identify and report the rate of follow-up care. Currently, this is not accurately monitored so process steps are required for successful reporting and documentation of the impact of the project. The target rate of improvement will be selected based on multiple factors. Particularly, the patients’ level of engagement and commitment to on-going care is critical. Additionally, many patients hospitalized in Trinity Springs Pavilion will receive follow-up care with MHMR of Tarrant County or other behavioral health providers with whom we cannot guarantee appointment availability. For those who do follow-up within JPS Health Network, their internal commitment to on-going care is further complicated by the high percentage of involuntary psychiatric admissions experienced in our system.
**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**Title of Outcome Measure (Improvement Target):** IT-9.2 ED appropriate utilization – Reduce Emergency Department visits for behavioral health/substance abuse

**Unique RHP outcome identification number(s):** 126675104.3.2
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
This measure assesses ED appropriate utilization. Specifically, the reduction in Emergency Department visits for target conditions – Behavioral Health/Substance Abuse.

**Process Milestones:**
- In DY2, there a milestone is established for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- In DY3, there are 2 process milestones established. The first is to establish the baseline rate of PEC utilization after discharge. The second milestone is the completion of the establishment of the outcome targets for IT-9.2.

**Outcome Improvement Targets for each year:**
- In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to reduce the emergency department visits for those discharged from Trinity Springs Pavilion by a percentage to be determined in DY3.

**Rationale:**
This outcome measure was selected because JPS Health Network experiences over 24,000 Psychiatric Emergency Center (ED) visits per year. The expanded outpatient hours and days of service will ensure patients have greater opportunity to engage in services outside of the emergency system. This measure also directly impacts our identified community needs. There overuse of the emergency department services (CN.10). Additional outpatient services will result in reduced utilization of the emergency services because patients will remain more stable in community-based services.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost.
savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-3.1 – All-cause 30-Day Readmission Rate

Unique RHP outcome identification number(s): 126675104.3.3
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
By the end of the Waiver, our goal is to reduce all-cause 30-day readmission rates by 15% to achieve < 1502 readmissions with a current unverified baseline of 1767 all cause readmissions for FY2011.

Process Milestones:
Our milestones include the following:
- In DY2, the baseline will be verified and data systems validated.

Outcome Improvement Targets for each year:
- In DY3, our goal is reduce all cause 30 day readmission rates by 5% with a goal of <1678 readmissions. Ongoing analysis and process improvement efforts will be employed to assist in reaching goals.
- In DY4, our goal is to reduce all cause readmission rates by 10% with a goal of <1590.

Rationale:
The implementation of a centralized call center with nurse advice available 24/7 will reduce potentially preventable admissions and readmissions by directing patients to the right place for care. The high cost of emergency department care will be reduced as patients are directed back to their medical home for care or other appropriate community resources. The overutilization of the ED has been identified by the Community Needs Assessment as an opportunity for intervention. A nurse advice line has been shown to be an effective strategy in the reduction of preventable ED admissions.³⁷¹,³⁷²

Patients who receive regular care in the ED often lack care continuity and use costlier services than those folks who are provided urgent care in their primary medical home.³⁷³ This same study also found that non-emergent ED visits are especially common in low income populations where primary care capacity is limited or not responsive to the needs of the patient population.

³ Minott J. Reducing Hospital Readmissions. Reviewed www.academyhealth.org
Both Health and Human Services (HHS) and the National Quality Forum have endorsed measures that address reducing all-cause readmission rates. Readmission rates have been attributed to many factors but have been shown to impact the low income population with more severity as the availability of social support can be limited in these populations. Additionally, a lack of coordinated care and poor system communication has been shown to impact readmission rates. This same study compilation reported that some health plans had focused on decreasing the inappropriate use of 911 as an effective measure to reduce readmissions. The implementation of the 24/7 nurse advice team will assist with directing patients to appropriate care. The best method to reduce readmission is to prevent the initial admission. Keeping patients connected to their Medical Home is foundational to improving this outcome.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT 9.2 – Reduce Emergency Department Visits for Targeted Conditions in the Medical Home Population

Unique RHP outcome identification number(s): 126675104.3.4

Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
By the end of the Waiver, our goal is to reduce avoidable ED admissions by - 10% or 2100 visits.

Process Milestone:
- In DY2, we will validate and verify our initial data and identify gaps in care.

Outcome Improvement Targets for Each Year:
- In DY3, a system of referral coordination and risk stratification will assist in meeting the goal of reducing admissions by - 2% and reduce avoidable admissions by 420 visits.
- In DY4, our goal is to reduce avoidable admissions by - 5% or 1050 avoidable admissions.
- Ongoing gap analysis and process improvement efforts will be employed throughout the Waiver years to reach improvement targets. Current baseline for the targeted population is 21,000 potentially preventable ED visits. DY5 will see a reduction to <18,900 potentially preventable ED visits.

Rationale:
The addition of a 24/7 nurse advice team and centralized call center will provide timely medical advice and/or direct access to the appropriate place for care (either medical home, ED, Urgent Care or other community resources). Data will need to be validated in DY2 to determine magnitude of potential preventable admissions, determine level or risk due to care gaps, engage system stakeholders in process changes JPS Health Network will use the NYU ED algorithm to validate potentially preventable admissions.374 In a briefing released by the Commonwealth Fund based on ED use in New York City, care provided in the ED was determined to be generally costlier than providing the same care in a medical home.375 Recommendations from the study included expanding primary care capacity and linkages to medical homes. This project is closely tied to the development of the Patient-centered Medical Home project that is also under consideration.

Outcome Measure Valuation:

374http://wagner.nyu.edu/faculty/billings/nyued-background.php
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Title of Outcome Measure (Improvement Target): IT-1.12 Diabetes Care: Retinal eye exam

Unique RHP outcome identification number(s): 126675104.3.5
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
By the end of the Waiver, our goal is to improve compliance with retinal eye exam to 60% over baseline of our eligible medical home population (total of 8,597 patients will have received routine eye exam). Our milestones include the following:

Process Milestones:
- In DY2, we will verify and test the baseline rate for this data. An initial pull from our EMR shows a compliance rate of 32% for our eligible population. This data is taken from FY2011.

Outcome Improvement Targets for each year:
- In DY3, our goal is to reach 25% compliance over baseline. This goal will impact the 17,000 diabetic patients in our Medical Home that require an annual eye exam. A 25% improvement rate will mean that 6,716 diabetic patients will have an annual eye exam.
- In DY4, our goal is to reach 50% compliance over baseline of the eligible population. This goal will impact the 17,000 diabetic patients in our Medical Home that require an annual eye exam. A 50% improvement rate will mean that 8,059 diabetic patients will have an annual eye exam.

Rationale:
The rate of diabetes types 1 and 2 in the JPS Health Network medical home population is 25%, a rate much higher than the county or state. In a sample population of our highest utilizers (users who have been admitted in the ED or inpatient area with potentially preventable diagnoses) diabetes is identified as a predictor of ED utilization. Routine eye exams for diabetic patients can reduce the severity of eye disease and may prevent blindness.

Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome.
over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add outcome amounts over DYs 2-5)*: $2,867,988
Title of Outcome Measure (Improvement Target): IT-5.3 Other: reduce cost of care of patients with a primary or secondary diagnosis of pressure ulcer (707.xx)

Unique RHP outcome identification number(s): 126675104.3.6
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
By the end of the Waiver, our goal is to reduce the cost of inpatient care for patients with a primary or secondary diagnosis of pressure ulcer (707.xx) by 30%.

Process Milestones:
- In DY2, the baseline data will be verified and validated. Data reported for FY2011 shows a baseline of 794 admissions with an average cost per stay of $21,422.36 based on the overall cost to charge ratio.

Outcome Improvement Targets for each year:
- In DY3, our goal is to reduce the cost of inpatient care for patients with a primary or secondary diagnosis of pressure ulcer (707.xx) by 10%. This measure will impact the approximately 794 annual admissions with the diagnosis.
- In DY4, our goal is to reduce the cost of inpatient care for patients with a primary or secondary diagnosis of pressure ulcer (707.xx) by 20%. This measure will impact the approximately 794 annual admissions with the diagnosis.

Rationale:
A comprehensive wound program will provide many advantages to the JPS Health Network. There is currently no program, only 2 wound care nurses and a tech serving a patient population that has not been quantified as yet. There is some coordination from hospital to home for those patients who are prescribed a wound vacuum but we have not tracked the patients who are readmitted or seen in the ED for care of wounds or postsurgical infections. A program plan will have to be developed, vetted and a medical director hired with expertise in wound care. A multidisciplinary team will be brought together to care for patients across the network.

There have been several studies showing the relationship between pressure ulcers and length of stay. In both studies, the median excess length of stay was over 4 days when a patient developed a pressure ulcer. Even when adjusted for admission severity of illness, the cost of care remained significantly greater according to the Allman study.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Year 2 Estimated Outcome Amount:
(Add incentive payments amounts from each milestone/outcome improvement target): $15,198

Year 3 Estimated Outcome Amount: $26,425

Year 4 Estimated Outcome Amount: $28,269

Year 5 Estimated Outcome Amount: $67,600

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $137,493
Title of Outcome Measure (Improvement Target): IT-1.18 Follow-Up After Hospitalization for Mental Illness- NQF 057620 (Stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.7
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
This measure assesses the percentage of discharges for members 6 years of age and older who were hospitalized for treatment of selected mental health disorders and who had an outpatient visit, an intensive outpatient encounter or partial hospitalization with a mental health practitioner. Two rates are reported. Rate 1 is the percentage of members who received follow-up within 30 days of discharge. Rate 2 is the percentage of members who received follow-up within 7 days of discharge.

Process Milestones:
- In DY2, there are 2 process milestones established. The first is for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is the development and testing of data systems.
- In DY3, there are 2 process milestones established. The first is to establish the baseline rates of follow-Up After Hospitalization for Mental Illness. The second milestone is the completion of PDSA cycles to improve data collection and intervention activities. The final process milestone is the establishment of the outcome targets for IT-1.18 Rate 1 and Rate 2. There are two milestones related to managing the data systems to prepare for reporting related to the seven and 30-day follow-up rates. There are two process milestones related to establishing the current benchmark related to seven and 30-day follow-up rates.

Outcome Improvement Targets for each year:
- In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to improve both seven and 30-day follow-up rates by a percentage to be determined in DY3.

Rationale:
This outcome measure was selected because improved follow-up rates for adherence to outpatient visits for patients discharging from behavioral health hospitals reduces 30-day behavioral health readmission rates. The process milestones in DY2 and DY3 were selected to enable the provider to be able to accurately identify and report the rate of follow-up care. Currently, this is not accurately monitored so process steps are required for successful reporting and documentation of the impact of the project. The target rate of improvement will be selected...
based on multiple factors. Particularly, the patients’ level of engagement and commitment to on-going care is critical. Additionally, many patients hospitalized in Trinity Springs Pavilion will receive follow-up care with MHMR of Tarrant County or other behavioral health providers with whom we cannot guarantee appointment availability. For those who do follow-up within JPS Health Network, their internal commitment to on-going care is further complicated by the high percentage of involuntary psychiatric admissions experienced in our system.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health/Substance Abuse 30-day readmission rate (Stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.8
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
This measure identifies the behavioral health, all-cause readmission within 30 days of hospital discharge after an index admission for patients ages 18 and older.

Process Milestones:
- In DY2, there are 2 process milestones established. The first is for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is the development and testing of data systems.
- In DY3, there are 2 process milestones established. The first is to establish the baseline rates of behavioral health 30-day readmission rate. The second milestone is the completion of PDSA cycles to improve data collection and intervention activities. The final process milestone is the establishment of the outcome targets for IT-3.8.

Outcome Improvement Targets for each year:
- In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to improve behavioral health 30-day readmission rates by a percentage to be determined in DY3.

Rationale:
The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the initial hospital stay. Given data limitations, only readmissions to the same facility will be included as part of each hospital’s rates. The process outcome selected was a required building block to accurately identify the baseline rates of patients who readmit within 30 days. The process measure related to identifying the baseline rates is a critical step that must be accomplished before improvement targets for increasing rates of depression remission can be compared. Improvement targets for DY4 and DY5 will result in a total reduction of all-cause psychiatric readmissions by a percentage established in DY3. A reduction amount will be selected with consideration being given to the significant complexity of those who receive services in Trinity Springs Pavilion.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $213,597
Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization – Reduce Emergency Department visits for behavioral health/substance abuse

Unique RHP outcome identification number(s): 126675104.3.9
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

This measure assesses ED appropriate utilization. Specifically, the reduction in Emergency Department visits for target conditions – Behavioral Health/Substance Abuse.

Process Milestones:

- In DY2, there a milestone is established for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
- In DY3, there are 2 process milestones established. The first is to establish the baseline rate of PEC utilization after discharge. The second milestone is the completion of the establishment of the outcome targets for IT-9.2.

Outcome Improvement Targets for each year:

- In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to reduce the emergency department visits for those discharged from Trinity Springs Pavilion by a percentage to be determined in DY3.

Rationale:

This outcome measure was selected because JPS Health Network experiences over 24,000 Psychiatric Emergency Center (ED) visits per year. The increased outpatient locations will ensure patients engage in their individualized care plan enhancing stabilization and service utilization outside of the emergency system. This measure also directly impacts our identified community needs. There overuse of the emergency department services (CN.10). Improve transition management will result in reduced utilization of the emergency services because patients will remain more stable in community-based services.

Outcome Measure Valuation:

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these
metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

</table>
**Title of Outcome Measure (Improvement Target):** IT-1.10 Diabetes Care: Hemoglobin A1C poor control (>9.0%) in type 1 and type 2 JPS Health Network Medical Home patients

**Unique RHP outcome identification number(s):** 126675104.3.10  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**  
IT-1.10 HbA1c poor control (>9.0)  
JPS Health Network has 17,041 diabetic patients who are part of our medical home. 19% of these patients do not have good glycemic control. By the end of the project, we will have reduced the patients with poor glycemic control (HbA1C >9) by 20%.

**Process Milestones:**

**DY2**
- Validate baseline data and analyze results
- Plan with stakeholders to determine a process for improvement

**DY3**
- Develop and test data systems - diabetes registry, EMR
- Conduct Plan Do Study Act cycles in a pilot to improve diabetes data collection of patient interventions, care results and team strategies. Spread the learning to three other clinics
- Disseminate findings to stakeholders

**Outcome Improvement Targets for each year:**

**DY3**
- Reduce the number of JPS Health Network Medical Home diabetic patients with poor glycemic control (hemoglobin A1C > 9.0%) 319 patients or 10% from the index number of 3189.

**DY4**
- Reduce the number of JPS Health Network Medical Home diabetic patients with poor glycemic control (hemoglobin A1C > 9.0%) 478 patients or 15% from the index number of 3189.

**DY5**
- Reduce the number of JPS Health Network Medical Home diabetic patients with poor glycemic control (hemoglobin A1C > 9.0%) by 638 patients or 20% from the index number of 3189.

**Rationale:**
Because glucose control in diabetes impacts many physiologic systems causing complications, it is important that diabetic patients maintain reasonable control of their glucose levels.
through self-management skills and pharmaceutical treatment. The hemoglobin A1C also plays a role in feedback for the health care provider and the patient so that plans can be adjusted. A strong chronic disease management program with registry capabilities can impact the patient’s glucose control through targeted intervention, education, and multiple touches from the medical home team, thereby reducing the number of patients with poor control of their diabetes.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $1,017,407
**Title of Outcome Measure (Improvement Target):** IT-1.11 Diabetes Care: BP control (<140/80)

**Unique RHP outcome identification number(s):** 126675104.3.11

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**

IT-1.11 Diabetes Care: BP control (<140/80) – JPS Health Network has never been able to evaluate Blood pressure on a population basis and any individual review would be through paper chart audit. Our new electronic medical record now allows us to evaluate our current BP control status. In a recent sample of our diabetic patients who have presented for care in our clinics, we have noted that 17% of the 5373 diabetic patients who we have seen have a blood pressure greater than 140/80. At the end of our 5-year project, we will decrease the number of patients with a BP>140/80 by 60% of the baseline number, 907. This number may change as we validate our numbers in DY2.

**Process Milestones:**

**DY2**
- Plan with stakeholders to determine a process for improvement
- Validate and analyze baseline data

**DY3**
- Develop and test data systems- diabetes registry, EMR
- Conduct Plan Do Study Act cycles in a pilot clinic to improve diabetes-related data collection of patient interventions, BP results and communication between the patient care team. Spread the learning to 3 other clinics and implement the new process
- Disseminate findings to stakeholders

**Outcome Improvement Targets for each year:**

**DY4**
- Reduce the number of JPS Health Network Medical Home type 1 and type 2 diabetic patients with BP >140/80 by 20% from the baseline determined in DY2.

**DY5**
- Reduce the number of JPS Health Network Medical Home type 1 and type 2 diabetic patients with BP >140/80 by 30% from the baseline determined in DY2.

**Rationale:**

Control of BP in the diabetic patient has been determined to be the strongest risk factor for coronary artery disease in diabetic patients, even a stronger factor than glucose control.
Aggressive management will be needed in many patients to bring the BP down to this goal. Our diabetes registry will help identify patients with further need for BP control intervention.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $5,463,880*
**Title of Outcome Measure (Improvement Target):** IT-1.13 Diabetes Care: Foot exam in type 1 and type 2 Diabetic JPS Health Network Medical Home patients

**Unique RHP outcome identification number(s):** 126675104.3.12  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**  
IT: 1.13 Foot exam: We would like to prevent foot infection and amputation for our diabetes patients. By the end of our 5-year project, we would like to increase foot exams 50% over the baseline documented in DY2.

**Process Milestones:**

**DY2**
- Validate baseline data and analyze  
- Plan with stakeholders to determine a process for improvement

**DY3**
- Develop and test data systems - diabetes registry, EMR  
- Conduct Plan Do Study Act cycles in a pilot clinic to improve diabetes data collection of patient interventions, registry use, care results and training staff for foot exams and communication with the team for patient care coordination. Spread the learning to 3 more clinics and implement.  
- Disseminate findings to stakeholders

**Outcome Improvement Targets for each year:**

**DY3**
- Increase the number of JPS Health Network Medical Home diabetic patients with yearly foot exams 20% from baseline determined in DY2

**DY4**
- Increase the number of JPS Health Network Medical Home diabetic patients with yearly foot exams 40% from baseline determined in DY2.

**DY5**
- Increase the number of JPS Health Network Medical Home diabetic patients with yearly foot exam 50% from baseline determined in DY2.

**Rationale:**

25% of diabetic patients will develop a foot ulcer. The economic cost of a diabetic foot ulcer is thought to be between U.S. $7,000-10,000 and where amputation is required; the cost may increase to as much as U.S. $65,000 per person. Amputation has physical and psychological...
implications and impacts quality of life. A yearly foot exam looking for vascular, neurologic and foot abnormalities can result in early intervention to prevent a foot ulcer.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** ($add outcome amounts over DYs 2-5): $1,057,437
**Title of Outcome Measure (Improvement Target):** IT-2.12 Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions

**Unique RHP outcome identification number(s):** 126675104.3.13  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**

By the end of the Waiver, we expect to reduce PQI admissions rates by 20% for the Medical Home population under 75 years of age. The baseline for our waiver period is currently 1104 admissions. Reducing by 20% will provide a target of < 875 admissions for DY5. Our milestones are as follows:

**Process Milestones:**

- In DY2, project will begin by engaging stakeholders, developing a project plan and testing our data systems to determine reliability of baseline data. A system for referral to the medical home will be established and implemented.
- In DY3, emphasis will be placed on tracking systems and care coordination to measure time from admission to medical home and link to appropriate resources.

**Outcome Improvement Targets for each year:**

- In DY3, a targeted improvement of 5% reduction in admissions has been established. The goal will be to have no more than 1049 PQI admissions.
- In DY4, we expect to reduce PQI composite admissions by 15% or reduce admissions to no more than 950 admissions.
- In DY5, we expect to reduce PQI composite admissions by 20% or reduce admissions to no more than 875 admissions.

**Rationale:**

In a data extraction from FY2011 claims data, JPS Health Network has identified 2291 ambulatory care sensitive admissions based on PQI composite data. Of those, 1104 admissions have been attributed to the patients enrolled in our Connection program. Improvement targets have been determined based on this data although the data has not been audited or verified. Data testing and verification is planned for DY2.

Ambulatory Care Sensitive Condition admissions have been correlated to the quality of primary care delivered in the community.\(^\text{378}\) The implementation of the PCMH will increase the quality of care received, the timeliness of that care and provide a new focus on coordinated preventive care. As overall health is improved, the ambulatory care sensitive conditions will be reduced.

---

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $1,188,481
Title of Outcome Measure (Improvement Target): IT-12.1 Breast Cancer Screening (HEDIS 2012) (Non-stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.14
Performing Provider Name/TPI: JPS Health Network/ 126675104

Outcome Measure Description:
By the end of the Waiver, our goal is to increase compliance for breast cancer screening so that the percentage of eligible females with a screening mammogram is at 50%. An initial pull from our EMR shows that 37% of our eligible Medical Home patients have had their breast cancer screening in FY2012. Baseline data shows that 22,628 eligible females are currently enrolled in our medical homes. Our milestones include the following:

Process Milestones:
- In DY2, we will verify the baseline data the test our reporting system for reliability; data and goals will be shared with clinical care teams to engage these teams in improvement efforts designed to meet the goal;

Outcome Improvement Targets for each year:
- In DY3, our goal is to increase compliance by 10% of the baseline or >9209 eligible females.
- In DY4, our goal is to increase compliance by 20% of the baseline or > 10,046 eligible females.
- In DY5, our goal is to increase compliance by 40% of the baseline so that the percentage of females 40-69 will be 50% or 11,720 eligible females.

Rationale:
JPS Health Network has implemented an EMR in May of 2012. We have started pulling data for this metric and do have a baseline but would like to spend a year confirming the data for reliability. Improvement targets have been established.

According to the National Cancer Institute (NCI), one in eight women living today will be diagnosed with breast cancer. Age, obesity and lack of physical activity can contribute to the development of breast cancer. Screening mammography can reduce the number of deaths from breast cancer in women from ages 40-70.379

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total

379 http://www.cancer.gov
potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $1,419,024
**Title of Outcome Measure (Improvement Target):** IT-12.2 Cervical Cancer Screening

**Unique RHP outcome identification number(s):** 126675104.3.15

**Performing Provider Name/TPI:** JPS Health Network/ 126675104

**Outcome Measure Description:**
By the end of the Waiver, our goal is to increase compliance with cervical cancer screening to > 30% over baseline of females ages 21-64. An initial pull from our EMR shows that 27% of our eligible Medical Home patients have had their cervical cancer screening in FY2012. The current number of eligible females in this age group is 15,603.

**Process Milestones:**
- In DY2, we will verify the baseline data and test our reporting system for reliability; data and goals will be shared with clinical care teams to engage these teams in improvement efforts designed to meet the goal;

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to increase compliance by 10% of the baseline or >4,637 eligible females will be compliant with this outcome.
- In DY4, our goal is to increase compliance by 25% of the baseline or > 5,266 eligible females will be compliant with this outcome.
- In DY5, our goal is to increase compliance by 50% of the baseline so the percentage of female patients between 21 and 64 years of age will improve to a total of 40% of our eligible population or >6300 eligible females will be compliant with this outcome.

**Rationale:**
JPS Health Network has implemented an EMR in May of 2012. We have started pulling data for this metric and do have a baseline but would like to spend a year confirming the data for reliability. Improvement targets have been established.

According to the National Cancer Institute, cervical cancer is largely preventable or curable if detected early by routine Pap smears.  

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into

account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction
### Related Category 1 or 2 Projects:

126675104.2.2: Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards.

### Starting Point/Baseline:

**Target Population:** JPS Medical Home Females Between the Ages of 21 - 64  
**Specific Number:** 15603  
**Description of Population:** Patients that had at least one primary care visit in FY2011  
**Baseline data:** Baseline compliance for Medical Home patients with cervical screening is 27% or 4,213  
If no baseline data, please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

#### Year 2 (10/1/2012 – 9/30/2013)

**Process Milestone 1 [P-1]:** Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans  
**Baseline/Goal:** Develop and implement project plan  
**Data Source:** Documented project plan, meeting minutes  
**Process Milestone 1 Estimated Incentive Payment:** $161,838

**Process Milestone 2 [P-2]:** Establish baseline rates  
**Baseline/Goal:** 15, 603 eligible females in DY2011, verify for 2012

Region 10 RHP Plan

Page 1552
**Title of Outcome Measure (Improvement Target):** IT-1.10 Diabetes Care: HbA1c poor control

**Unique RHP outcome identification number(s):** 126675104.3.16

**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**
IT-1.10 Diabetes Care: HbA1c poor control

**Process Milestones:**
- **DY2:** Process milestone: Establish baseline rate. JPS Health Network will engage stakeholders such as homeless shelters, supportive housing and primary care clinics serving the homeless to determine volume of diabetic patients and establish baseline HbA1c rates for this target population.
- **DY3:** Process milestone-Plan-Do-Study-Act Cycle will be utilized to identify appropriate frequency of HbA1c monitoring and effective coordination of care.

**Outcome Improvement Targets for each year:**
- **DY4:** Improvement milestones-Reduce baseline number of homeless individuals identified as diabetic that have HbA1c poor control (>9.0%) by 10%.
- **DY5:** Improvement milestones-Reduce baseline number of homeless individuals identified as diabetic that have HbA1c poor control (>9.0%) by 15%.

**Rationale:**

The identified population, the homeless, is medically underserved. They have long been identified as insufficiently accessing preventive, primary or secondary medical services, to comply with medication schedules, or to consistently obtain prescribed medications. They are also known to utilize emergency departments at a greater rate than the average population, and require admission to hospitals at higher rates. The combination of homelessness and diabetes bodes poorly for the health and welfare of individuals affected by both, and presents a formidable toll to each affected person and to society on the whole, in social service demands, medical costs, and in marked increases in disability. Diabetes affects a significant portion of the population. The incidence of diabetes is higher in the south, and particularly within certain subpopulations. The homeless population is inhabited with a disproportional number of these subpopulations: Hispanic, African-Americans, and American Indians.
**Race and ethnic differences in prevalence of diagnosed diabetes:** After adjusting for population age differences, 2007-2009 national survey data for people diagnosed with diabetes, ages 20 years or older include the following prevalence by race/ethnicity:

- 7.1% of non-Hispanic whites
- 12.6% of non-Hispanic blacks
- 11.8% of Hispanics

Various medical and social interventions for both homelessness and for diabetes have proven to successfully improve outcomes for this targeted population. Medical literature has long established that medical interventions – that includes education, medication compliance, screening for medical complications, and treatments for specific systems (e.g., cardiovascular, lipids, and renal) – serve to reduce the morbidity, complications, costs and mortality from diabetes.

Since diabetes is a systemic disease and its complications affect many parts of the body, leading to serious complications such as blindness, kidney damage, arterial disease, nerve damage, heart disease, and lower-limb amputations, to name a few. Working together, people with diabetes, their support network, and their health care providers can reduce the occurrence of these and other diabetes complications by controlling the levels of blood glucose, blood pressure, and blood lipids, and by receiving other preventive care practices and social services in a timely manner.

**Glucose control**

- Studies in the United States and abroad have found that improved glycemic control benefits people with either type 1 or type 2 diabetes. In general, every percentage point drop in A1c blood test results (e.g.,, from 8.0% to 7.0%) can reduce the risk of microvascular complications (eye, kidney, and nerve diseases) by 40%. The absolute difference in risk may vary for certain subgroups of people.

- In patients with type 1 diabetes, intensive insulin therapy has long-term beneficial effects on the risk of cardiovascular disease.

The 2011 point-in-time count of the homeless was 2,169 and the “annualized” HUD estimate of people experiencing homelessness was 4,847. In FY 2011, JPS Health Network identified 233 homeless who are frequent hospital utilizers, having four or more encounters per year in the emergency department and/or as inpatient admissions. These homeless patients incurred charges totaling $10,174,589. Of this group, 35 patients were identified as having diabetes; this subset incurred charges totally $2,311,858.

---

382 Tarrant County Homeless Coalition, 2011; Annualized estimates are derived by the application of a HUD-proscribed algorithm to point-in-time count data: [http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx](http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx)
Under the Care Connections for the Homeless program, we intend to identify and care for this vulnerable and costly population in an attempt to provide timely and appropriate transitional care that would result in:

- Appropriate identification of medical and social needs,
- Timely provision of vital medications,
- The provision for blood sugar and blood pressure monitoring,
- Timely referral to primary care for establishing a medical home,
- Appropriate referral to specialty care,
- Adequate support for transportation, translation, and for obtaining medications.

Ultimately these initiatives will result in improved diabetic management and care, expanded general medical care, and improved quality of life for homeless patients along with a reduction of preventable readmissions, ED utilization, emergency medical services utilization, and costly secondary medical complications.383

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

---

383 Data from the 2011 National Diabetes Fact Sheet (released Jan. 26, 2011):

Total prevalence of diabetes
Total: 25.8 million children and adults in the United States—8.3% of the population—have diabetes.
Diagnosed: 18.8 million people
Undiagnosed: 7.0 million people
Pre-diabetes: 79 million people*
New Cases: 1.9 million new cases of diabetes are diagnosed in people aged 20 years and older in 2010.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $139,047
**Title of Outcome Measure (Improvement Target):** IT-1.18 Follow-Up After Hospitalization for Mental Illness

**Unique RHP outcome identification number(s):** 126675104.3.17

**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**

IT-1.18 Follow-Up After Hospitalization for Mental Illness

**Process Milestones:**

- **DY-2:**
  - Process milestone 1: Partner with identified agencies serving the mental health needs of the homeless community for project planning purposes for – identifying communication plan and resource needs; develop protocols to ensure appropriate access for mental health follow-up services
  - Process milestone 2: Partner with identified agencies serving the mental health needs of the homeless community in order determine baseline rates.

- **DY-3:**
  - Process milestone 3 – Plan-Do-Study-Act Cycle will be utilized to identify the optimal location and hours for the effective delivery of mental health crisis intervention.

**Outcome Improvement Targets for each year:**

- **DY4:**
  - IT-1.18 – Improvement milestones-Increase access to follow up after hospitalization for mental illness (NQF0576) by 20% from established baseline.

- **DY5:**
  - IT-1.18 – Improvement milestones-Increase access to follow up after hospitalization for mental illness (NQF0576) by 25% from established baseline

**Rationale:**

The identified population, the homeless, has long been identified as insufficiently accessing primary or secondary mental health services, to comply with medication schedules, or to consistently obtain prescribed medications. They are also known to utilize emergency departments at a greater rate than the average population.

Homeless persons suffer from mental illnesses and drug or ethanol use problems at a rate disproportional and significantly higher than the average population:

- 38% report alcohol use problems
- 26% report other drug use problems
• 39% report some form of mental health problems (20-25% meet criteria for serious mental illness)
• 66% report either substance use and/or mental health problems. 384

The 2011 point-in-time count of the homeless was 2,169 and the “annualized” HUD estimate of people experiencing homelessness was 4,847. 385 TCHC has identified in a point of time analysis a percentage of patients who were considered Severely Mentally Ill (15%) and Chronic Substance Abuse (16%).

In FY 2011, JPS Health Network identified 233 homeless who are frequent hospital utilizers, having four or more encounters per year in the emergency department and/or as inpatient admissions. These homeless patients incurred charges totaling $10,174,589. Of this group, 214 were diagnosed with a mental illness (including drug and alcohol abuse) and the charges totaled $9,583,258.

JPS Health Network also collected data and identified patients with mental illness that were homeless and had at least one ED or Inpatient visit during FY 2011, that number totaled 937.

The Care Connections for the Homeless program will identify and contact all partnering mental health agencies serving the homeless community to determine baseline rates and to develop and test data systems to ensure data reliability. Upon establishment of this baseline, the DSRIP project will develop a staffing and implementation plan to provide transitional and on-going mental health services to the homeless population. The homeless populations served will be to those who are emergency sheltered, unsheltered, or tenants in permanent supportive housing. Identification of mental health patients discharged from JPS Health Network Inpatient and ED will be followed and tracked upon discharge to then determine immediate and intermediate follow up needs.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost

---

385 Tarrant County Homeless Coalition, 2011; Annualized estimates are derived by the application of a HUD-proscribed algorithm to point-in-time count data: http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx
savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.
**Follow-Up After Hospitalization for Mental Illness**

**Starting Point/Baseline:**

**Target Population:**

- **Specific Number:** It is anticipated that ED/inpatient visits requiring follow-up will be approximately 700 annually.
- **Description of Population:** Mental health services will be focused on providing services to the three homeless populations: those who are unsheltered, emergency sheltered, or tenants are permanent supportive housing.
- **Baseline data:** If no baseline data, please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $400,104
**Title of Outcome Measure (Improvement Target):** IT-9.2 ED appropriate utilization

**Unique RHP outcome identification number(s):** 126675104.3.18

**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**
IT-9.2 ED appropriate utilization

**Process Milestones:**

**DY2-**
Process milestone 1: Partner with identified agencies serving the health care needs of the homeless community for project planning purposes for identifying communication plan, and plans for health information sharing to best serve the health care needs of the homeless with goal of reducing ED visits.

Process milestone 2: Partner with identified agencies serving the homeless community to develop and test data systems (for information sharing) specific to the homeless population.

**DY3-**
Process Mileston-3: Plan-Do-Study-Act Cycle will be utilized to identify innovative strategies to reduce ED admissions in the homeless population.

**Outcome Improvement Targets for each year:**

**DY4-**
Improvement Milestones: Reduce all ED visits form the baseline by 10% for the homeless population.

**DY5-**
Improvement Milestones: Reduce all ED visits form the baseline by 15% for the homeless population.

**Rationale:**
The identified population, the homeless, is medically underserved. This group of individuals has long been identified as insufficiently accessing preventive, primary or secondary medical services; poorly adhering to medication schedules or consumption, including the consistent obtaining and retaining of prescribed medications. Often these people have delayed treatment or deferred chronic disease management. Homelessness is also strongly associated with abuse of alcohol and street drugs, and a variety of psychosocial problems and psychiatric symptoms.
The vulnerability of this population regarding consistent medication and plan of care compliance has been clearly identified in the transition post hospital discharge.

Many homeless patients do have government insurance under state or federal programs.

Patients who are homeless tend to be readmitted regularly for a number of reasons:
  o homeless patients may visit multiple hospitals in the community as there is typically no tracking from institution to institution
  o homeless patients typically have chronic diseases that require extensive and comprehensive follow-up care
  o being homeless and exposed to the elements, lack of sleep, street crime, and substance abuse from living on the street exacerbates these chronic illnesses
  o Since there is no place for patients to rest, follow-up care is infrequent, if it is obtained at all, for patients who are discharged back to the street. 386

The homeless are known to utilize EDs 387 and require admissions and readmissions to hospitals at higher rates than the average population. Various medical and social interventions for both homelessness and for interventions for chronic diseases have proven to successfully improve outcomes for this targeted population. 388 Medical interventions - that includes education, medication compliance, screening for medical complications, and treatments for specific systems (e.g., Cardiovascular, lipids, and renal) – serve to reduce the morbidity, complications, costs and mortality in this vulnerable population.

The 2011 point-in-time count of the homeless was 2,169 and the “annualized” HUD estimate of people experiencing homelessness was 4,847. 389 JPS Health Network has identified a cohort of the homeless who are frequent hospital utilizers (four or more encounters per year). This data is FY 2011. The total number of JPS Connect patients who alone fit into this category was 232 persons at a cost of care for this group totaling $10,174,589. 390

The Care Connections for the Homeless program, we intend to identify and care for this vulnerable and costly population in an attempt to provide timely and appropriate transitional care that would result in:
  o Appropriate identification of medical and social needs,

---

386 Cardarelli, K; Carlson, E; Jackson, R; Ward, K; A Plan for the Delivery of Health Care to the Homeless: A report prepared for Tarrant County Commissioner Roy Brooks by The Blue Ribbon Task Force on Health Care for the Homeless; Center for Community Health University of North Texas Health Science Center, 2008.

387 Homeless adults visit emergency departments (EDs) nearly four times more often than the general population and are among the highest repeat visitors.( Readmission Strategies for Homeless Patients” January 12, 2012, http://www.pepperlaw.com/publications_update.aspx?ArticleKey=2274

388 In a cohort of supportive housing tenants, post-housing service reductions “were largest for urgent care (64%), psychiatric ER (50%), and medical ER (45%).” Petrovich, J. and Spence-Almaguer, E., Evaluation of Directions Home Supportive Housing and the Use of Critical Service Systems: Preliminary Results; August 10, 2010; http://www.DirectionsHome.org

389 Tarrant County Homeless Coalition, 2011; Annualized estimates are derived by the application of a HUD-proscribed algorithm to point-in-time count data: http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx

390 Tarrant County Hospital District, internal data base
- Timely provision or support in obtaining vital medications upon discharge and for an interim,
- The provision for blood sugar and blood pressure monitoring and other possible DME,
- Timely referral to primary care for establishing a medical home,
- Appropriate referral to specialty care,
- Patient support for transportation, translation, and other social services.

Ultimately these measures will result in improved post hospital medical management and care, general medical care, and a reduction of preventable rehospitalizations and ED utilization.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $89,330
**Title of Outcome Measure (Improvement Target):** IT-3.2 Congestive Heart Failure 30-Day readmission rate

**Unique RHP outcome identification number(s):** 126675104.3.19

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
By the end of the Waiver, our goal is to reduce CHF readmissions for all patients to the hospital district by 5%.

**Process Milestones:**
- In DY2, we will establish the baseline for this rate. An initial data pull from our financial records indicate that the baseline may be as high as 18%.

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to reduce this rate by 2%.
- In DY4, our goal is to reduce this rate by 5%.
- In DY5, our goal is to reduce this rate by 7%.

**Rationale:**
Our rationale for this outcome improvement target is that CHF is a major health epidemic and a large portion of CHF expenditure is due to readmissions. In addition to the cost of readmission which can be reduced and prevented in some cases, CHF admissions increase the risk of survival as symptomatic patients have a 20% mortality rate at one year. In 2010, CHF was approximately 2% of all health care expenditures at a total cost of over $39 billion dollars. We feel that our facility can impact our CHF patient population with a focused well developed plan that includes our primary care physicians, our partners in the community and our emergency department.

**Outcome Measure Valuation:**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $246,827
Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores

Unique RHP outcome identification number(s): 126675104.3.20
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
By the end of the Waiver, we expect to improve our patient satisfaction for our CHF population by 15%.

Process Milestones:
- In DY2, we will establish a baseline. We are not certain of our current rate.
- In DY3, we will implement the patient satisfaction program.

Outcome Improvement Targets for each year:
- In DY4, we will continue to monitor and establish action plans as needed to improve our rates.
- In DY5, we will continue to monitor and refine action plans.

Rationale:
Our rationale for selecting this outcome improvement target is that we believe patient satisfaction directly impacts patient compliance for the CHF regimen including medication management. Patients who have an opportunity to discuss issues and concerns with their medical team along with the ability to understand their disease (including their families) have a better chance for their personal outcomes. We will not know how effective our program will be unless we monitor patient satisfaction and actively develop action plans that meet the needs of our patients.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. **TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $37,055
Title of Outcome Measure (Improvement Target): IT-3.1 All-cause 30-day readmission rate

Unique RHP outcome identification number(s): 126675104.3.21
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:
Outcome measure description: All-cause 30-day readmission rate

By the end of the five-year period, we will reduce the rate of all-cause 30-day readmission by 15%. The milestones for the project include the following:

In DY2, project planning will be completed. We will validate the baseline and include stakeholders for program input.

In DY3, we will develop and test data systems (EMR reports, registries) and conduct plan-do-study act cycles to improve data collection and to implement effective change of interventions and continuously move toward goal attainment. Information and lessons learned will be shared through meetings and electronic communication with interdisciplinary teams within the organization and with community-linked partners.

Outcome Improvement Targets for each year:
In DY4, the goal is to reduce the all-cause 30-day re-admission by 10%.

Rationale:
Readmission rates for hospitals have been brought to the forefront recently. Patient-centeredness also compels us to improve our management of transitions from the hospital, care coordination, and outside support for the patient in their community setting. But complex community/hospital relationships and financial implications for hospitals make this issue demand thoughtful intervention. This outcome measure was chosen because JPS Health Network does not have a systematic process to reduce the risk for potentially preventable hospital readmissions. The readmission rate in 2011 for JPS Connection patients was 13%. The chosen milestones and improvement targets will afford us the opportunity to plan and subsequently report progress within the project. Engaging internal and external stakeholders will help us to develop a cross-continuum team to work together to improve care. Our improvement targets were chosen that reflect the organizational commitment to providing health care that will lead to a safe discharge, provide coordination of care and communication within and across health care settings to avoid readmissions.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**Year 2 Estimated Outcome Amount:**

(add incentive payments amounts from each milestone/outcome improvement target): $183,458

**Year 3 Estimated Outcome Amount:**

$318,977

**Year 4 Estimated Outcome Amount:**

$341,231

**Year 5 Estimated Outcome Amount:**

$815,987

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $1,659,653
Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization

Unique RHP outcome identification number(s): 126675104.3.22
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:
Outcome measure description: ED Appropriate Utilization

By the end of the 5-year period, we will have reduced ED inappropriate utilization/increase appropriate ED utilization by 10% over baseline. The milestones for the project include the following:

In DY2, project planning will be completed. We will determine the baseline and include stakeholders for program input.

In DY3, we will develop and test data systems (EMR reports, registries) and conduct plan-do-study act cycles to improve data collection and to implement effective change of interventions and continuously move toward goal attainment. Information and lessons learned will be shared through meetings and electronic communication with interdisciplinary teams within the organization and with community-linked partners.

Outcome Improvement Targets for each year:
In DY4, ED appropriate utilization will have increased by 5% over baseline.

In DY5, ED appropriate utilization will have increased by 10% over baseline.

Rationale:
Inappropriate utilization for hospital emergency departments have been brought to the forefront recently. Patient-centeredness also compels us to improve our management of transitions from the hospital, care coordination, and outside support for the patient in their community setting. But complex community/hospital relationships and financial implications for hospitals make this issue demand thoughtful intervention. This outcome measure was chosen because JPS Health Network does not have a systematic process to ensure that their patients are utilizing the ED appropriately and effectively. The chosen milestones and improvement targets will afford us the opportunity to plan and subsequently report progress within the project. Engaging internal and external stakeholders will help us to develop a cross-continuum team to work together to improve care. Our improvement targets were chosen that reflect the organizational commitment to providing health care that will lead to a safe discharge, provide coordination of care and communication within and across health care settings to reduce inappropriate ED usage.
Outcome Measure Valuation:

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.
### Related Category 1 or 2 Projects:

126675104.2.5: Implement/Expand Care Transitions Programs – Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions

### Starting Point/Baseline:

**Target Population:** 10,000

**Specific Number:** - 4,000

**Description of Population:** JPS Connection patients in the ED

**Baseline data:** Plan to validate baseline data in DY2

If no baseline data, please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

### Year 2

*(10/1/2012 – 9/30/2013)*

**Process Milestone 1 [P-1]: Project planning**

The Care Transitions Program using Coleman model-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

**Data Source:** stakeholder interviews and meetings, EMR, registries, project plans and timelines, reports

**Process Milestone 1 Estimated Incentive Payment:** $31,397

### Year 3

*(10/1/2013 – 9/30/2014)*

**Process Milestone 3 [P-3]: Develop and test data systems**

**Data Source:** EPIC EMR, registries, risk stratification reports

**Process Milestone 3 Estimated Incentive Payment:** $36,393

**Process Milestone 4 [P-4]: Conduct Plan Do Study Act cycles to improve data collection, patient interventions and hand off communication for patient care transitions**

**Data Source:** PI meeting minutes, reports, observation tools, etc.

**Process Milestone 4 Estimated Incentive Payment:** $36,393

### Year 4

*(10/1/2014 – 9/30/2015)*

**Outcome Improvement Target 1 [IT-9.2]: ED Appropriate Utilization**

**Improvement Target:** 5% decrease in ED utilization over baseline.

**Data Source:** EMR, claims data

**Outcome Improvement Target 1 Estimated Incentive Payment:** $116,796

### Year 5

*(10/1/2015 – 9/30/2016)*

**Process Milestone 5 [P-5]: Disseminate findings, including lessons learned internally and to**

**Outcome Improvement Target 2 [IT-9.2]: Reduce inappropriate ED utilization**

**Improvement Target:** 10% decrease in ED utilization - over baseline.

**Data Source:** EMR, claims data

**Outcome Improvement Target 2 Estimated Incentive Payment:** $279,294

**Title of Outcome Measure (Improvement Target):** IT-1.8 – Depression management: Screening and Treatment Plan for Clinical Depression

**Unique RHP outcome identification number(s):** 126675104.3.23

**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**

IT-1.8 – Depression management: Screening and Treatment Plan for Clinical Depression

This measure assesses the percentage of patients receiving treatment from the integrated care project who have been screened for clinical depression using a standardized tool and a follow-up plan is documented.

**Process Milestones:**

In DY2, there are 2 process milestones established. The first is related to Project planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is related to develop and testing data systems necessary to establish baseline and improvement targets. In DY3, there is three process milestones established. One is related to conducting Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.

**Outcome Improvement Targets for each year:**

The other two are related to establishing the baseline and improvement rates for DY4 and DY5 of patients screened for depression with a follow-up plan. In DY4 and 5 there is one outcome target for each year to improve baseline number of patients who are screened and have a follow-up plan for clinical depression by a percentage to be established in DY3.

**Rationale:**

The process outcomes selected were required building blocks to accurately identify the baseline rates of depression screening and treatment plans. The process measure related to identifying the baseline rates is a critical step that must be accomplished before improvement targets can be established. Improvement targets will be established in DY3 for implement in DY4 and DY5.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these
metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (*add outcome amounts over DYs 2-5*): $3,752,336
Title of Outcome Measure (Improvement Target): IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (Stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.24
Performing Provider Name/TPI: JPS Health Network / 126675104

Outcome Measure Description:
IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059

This measure identifies the percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.

Process Milestones:
- In DY2, there is one process milestone related to project planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. A second process milestone is related to developing and testing data systems to prepare report indicating baseline percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
- In DY3, there are three process milestones. The first is to establish the baseline percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%. The second milestone is to conduct PDSA cycles to improve data collection and intervention activities.

Outcome Improvement Targets for each year:
DY4 and DY5 have an outcome Improvement target to improve the baseline percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0% by a percentage by determined in DY3

Rationale:
The process milestone selected for DY2 is a required building block to accurately identify the baseline rates of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%. The DY3 process milestone related to identifying the baseline rates is a critical step that must be accomplished before improvement targets can be established for increasing the percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%. Outcome improvement targets will be established in DY3 for DY4 and DY5.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. **Title of Outcome Measure (Improvement Target):** IT-1.11 Diabetes care: BP control (<140/80mm Hg) – NQF 0061 (Stand-alone measure)

**Unique RHP outcome identification number(s):** 126675104.3.25

**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**
IT-1.11 Diabetes care: BP control (<140/80mm Hg)
This measure identifies the percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg.

**Process Milestones:**
In DY2, there is one process milestones established to manage data systems to prepare report indicating baseline percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg. In DY3, there are two process milestones. The first is to establish the baseline percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg.

**Outcome Improvement Targets for each year:**
The second is to establish outcome improvement targets for DY4 and DY5 related to the improvement in percentage of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg. DY4 and DY5 have an outcome Improvement target (determined in DY3) to improve the baseline percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg by a percentage to be determined in DY3.

**Rationale:**
The process milestone selected for DY2 is a required building block to accurately identify the baseline rates of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg. The DY3 process milestone related to identifying the baseline rates is a critical step that must be accomplished before improvement targets can be established for increasing the percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg. Outcome improvement targets will be established in DY3 for DY4 and DY5.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus...
received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health / Substance Abuse 30-day readmission rate (Stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.26
Performing Provider Name/TPI: JPS Health Network / 126675104

Outcome Measure Description:
IT-3.8 Behavioral Health /Substance Abuse 30-day readmission rate (Stand-alone measure)
This measure identifies the behavioral health, all-cause readmission within 30 days of hospital discharge after an index admission for patients ages 18 and older.

Process Milestones:
In DY2, there are 2 process milestones established. The first is for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is the development and testing of data systems. In DY3, there are 2 process milestones established. The first is to establish the baseline rates of behavioral health 30-day readmission rate. The second milestone is the completion of PDSA cycles to improve data collection and intervention activities. The final process milestone is the establishment of the outcome targets for IT-3.8.

Outcome Improvement Targets for each year:
The final process milestone is the establishment of the outcome targets for IT-3.8. In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to improve behavioral health 30-day readmission rates by a percentage to be determined in DY3.

Rationale:
The relationship between hospital readmission rates and quality of care is well-documented, and is driven by a general consensus that readmissions may result from circumstances surrounding the initial hospital stay. Given data limitations, only readmissions to the same facility will be included as part of each hospital’s rates. The process outcome selected was a required building blocks to accurately identify the baseline rates of patients who readmit within 30 days. The process measure related to identifying the baseline rates is a critical step that must be accomplished before improvement targets for increasing rates of depression remission can be compared. Improvement targets for DY4 and DY5 will result in a total reduction of all-cause psychiatric readmissions by a percentage established in DY3. A reduction amount will be selected with consideration being given to the significant complexity of those who receive services in Trinity Springs Pavilion.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of
milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**Title of Outcome Measure (Improvement Target):** IT-9.1 Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons

**Unique RHP outcome identification number(s):** 126675104.3.27  
**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Outcome Measure Description:**
This measure assesses the decrease admission and readmission to criminal justice settings such as jails and prisons.

**Process Milestones:**
In DY2, there a milestone is established for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. In DY3, there are 2 process milestones established. The first is to establish the baseline rate of admissions and readmissions to criminal justice settings such as jails and prisons. The second milestone is the completion of the establishment of the outcome targets for IT-9.1.

**Outcome Improvement Targets for each year:**
In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to reduce the rates of admission and readmission to criminal justice settings by a percentage to be determined in DY3.

**Rationale:**
This outcome measure was selected because admission and readmission to criminal justice settings such as jails and prisons is disruptive and deleterious to recovery from behavioral health disorders. Studies of recidivistic criminal justice patients in Texas and other states have demonstrated poorer physical health status, increased incidence of homelessness, increased propensity to use emergency department, and inpatient services. Interventions that can prevent individuals from cycling through the criminal justice system can help avert poor health and mental health outcomes, reduce long term medical costs and improve functioning. Currently, there is no determination of the criminal justice system involvement following treatment nor is there a transition management focus on intentionally reducing the rate of criminal justice involvement. The target rate of improvement will be selected based on the unique factors of this patient population and the current rates of criminal justice involvement after discharge.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total
potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-9.2 ED appropriate utilization – Reduce Emergency Department visits for behavioral health/substance abuse

Unique RHP outcome identification number(s): 126675104.3.28
Performing Provider Name/TPI: JPS Health Network / 126675104

Outcome Measure Description:
IT-9.2 ED appropriate utilization – Reduce Emergency Department visits for behavioral health/substance abuse
This measure assesses ED appropriate utilization. Specifically, the reduction in Emergency Department visits for target conditions – Behavioral Health/Substance Abuse.

Process Milestones:
In DY2, there a milestone is established for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. In DY3, there are 2 process milestones established. The first is to establish the baseline rate of PEC utilization after discharge. The second milestone is the completion of the establishment of the outcome targets for IT-9.2.

Outcome Improvement Targets for each year:
In DY4 and DY5 there is one outcome target for each rate in each year. The improvement target is to reduce the emergency department visits for those discharged from Trinity Springs Pavilion by a percentage to be determined in DY3.

Rationale:
This outcome measure was selected because JPS Health Network experiences over 24,000 Psychiatric Emergency Center (ED) visits per year. The transition management program will ensure patients engage in their individualized care plan enhancing stabilization and service utilization outside of the emergency system. This measure also directly impacts our identified community needs. There overuse of the emergency department services (CN.10). Improve transition management will result in reduced utilization of the emergency services because patients will remain more stable in community-based services.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these...
metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Process Milestones:

DY2:

Process Milestones 1:
P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
Partner with JPS Health Network Cardiology and Case Management staff to develop process for identification of patients at risk for a 30-day PPR and assess the capacity of CHF treatment resources in the community.

Process Milestone 2-
P-2: Establish Baseline Rates – Work with stakeholder group above to establish baseline rates of PPR for CHF.

Process Milestone 3:
P-3: Develop and test data systems –
Review process for tracking enrolled patients and EMR linkages for sharing patient assessment and treatment data.

DY3:

Process milestones 4:
P-4: Conduct Plan-Do-Study-Act (PDSA) cycles to improve data collection and intervention activities.
A Plan-Do-Study-Act Cycle will be utilized to identify the innovative strategies to reduce PPR for CHF patients and disseminate findings to internal and external stakeholders.

Outcome Improvement Targets for each year:

Outcome Improvement Target 1:
IT-3.2: 25 of these patients (50% of the 50 enrollees) will experience no PPR during the 30-day post discharge time frame.

DY4:

Outcome Improvement Target 2:
IT-3.2: 38 of these patients (50% of the 75 enrollees) will experience no PPR during the 30-day post discharge time frame.

DY5:
Outcome Improvement Target 3:
IT-3.2: 50 of these patients (50% of the 100 enrollees) will experience no PPR during the 30-day post discharge time frame.

Rationale:
Congestive Heart Failure Program:
The average charge for a CHF admission is $54,000 and the community readmission rate for CHF is 17%. Under this DSRIP program, patients at risk for a CHF readmission are referred to MedStar for in-home education and non-emergent care during the 30-day readmission risk corridor. In a limited pilot project started in June 2012, 10 CHF patients at risk for readmission have been referred to the program with no CHF-related readmissions. The program expansion proposed here will allow an additional 225 patients to be referred to the program at significant improvement in health status and reduction in costs. During DY2, we will determine the use data for CHF readmit patients, and the costs associated with this use.

We will then determine the processes necessary to achieve the Improvement Milestones, implement the programs and measure the change in use patterns of the target population. The baseline costs of prior use will then be compared to the actual costs of the target population’s use of health care services, along with a tool to measure the patient’s perception of their health status.

Once established, we will apply currently measured data metric to the expanded population as described above.

The milestones and metrics for this program has been based on actual experiences of JPS Health Network and MedStar conducting limited enrollment pilot projects in each of these areas, tracking the actual data as described and measuring results.

This CHF program significantly expands already operating, proven programs the impact larger number of patients. This increase in patient populations will allow for a more robust analysis of the impact to the patient and the costs of care for possible replication in other areas.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources,
time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**Starting Point/Baseline:**

**Target Population:**

- **Specific Number:** All identified CHF patients at risk for PPA/PPR-225 enrollees
- **Description of Population:** This project will be focused on providing in-home management of CHF patients at-risk for PPR for CHF Dx. The goals will be achieved by providing in-home patient and patient family education on disease process, medication compliance, weight monitoring compliance, 3 times a week home visits by community health paramedics, non-emergency access to a 24/7 community paramedic for episodic issues, and coordination with patient’s PCP for in-home diuresis if necessary to prevent PPR for 30 days post discharge.

**Baseline data:**

If no baseline data, please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $609,418**
Title of Outcome Measure (Improvement Target): IT-1.8 - Depression management: Screening and Treatment Plan for Clinical Depression

Unique RHP outcome identification number(s): 126675104.3.31
Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
This measure assesses the percentage of patients receiving treatment from participating primary care providers within the virtual psychiatric and clinical guidance project who have been screened for clinical depression using a standardized tool and a follow-up plan is documented. In DY2, there are 2 process milestones established. The first is related to Project planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is related to develop and testing data systems necessary to establish baseline and improvement targets. In DY 3, there is three process milestones established. One is related to conducting Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities. The other two are related to establishing the baseline and improvement rates for DY4 and DY5 of patients screened for depression with a follow-up plan. In DY 4 and 5 there is one outcome target for each year to improve baseline number of patients who are screened and have a follow-up plan for clinical depression by a percentage to be established in DY 3.

Rationale:
The process outcomes selected were required building blocks to accurately identify the baseline rates of depression screening and treatment plans. The process measure related to identifying the baseline rates is a critical step that must be accomplished before improvement targets can be established. Improvement targets will be established in DY 3 for implement in DY 4 and DY5.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.
Starting Point/Baseline: 1,802 primary care physicians in Region 10 who will potentially address behavioral health issues in primary care settings for 489,000 patients who will see assistance with behavioral health problems from their primary care physician. Primary care physicians in Region 10 who will address behavioral health issues in primary care settings for 9,047 patients (DY2 = 452, DY3 = 1810, DY4 = 2940, DY5 = 3845).

Description of Population: This project targets the 489,000 people in Region 10 who have a diagnosable mental disorder but do not seek services in the mental health system. It is reported 28% of the population have a diagnosable mental disorder in any year. Only 8% of the population have a diagnosable mental disorder and receive services in the mental health system each year. The target population includes those who have a diagnosable mental illness who do not receive care in the mental health system. The number was calculated as: (Region 10 population of 2,444,642 x 28%) – (Region 10 population of 2,444,642 x 8%) = 489,000.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $7,333,094
Title of Outcome Measure (Improvement Target): IT-1.9 Depression management: Depression Remission at Twelve Months (NQF# 0710) (Stand-alone measure)

Unique RHP outcome identification number(s): 126675104.3.X (NEW- not in workbook)

Outcome Measure Description:
This outcome measures adult patients age 18 and older with major depression or dysthymia and an initial PHQ-9 score > 9 who demonstrate remission at twelve months defined as a PHQ-9 score less than 5. In DY2, there are 2 process milestones established. The first is for project planning where we will engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. The second is the development and testing of data systems. In DY3, there are 3 process milestones established. The first is to establish the baseline rates of adult patients age 18 and older with major depression or dysthymia and an initial PHQ-9 score > 9 who demonstrate remission at twelve months defined as a PHQ-9 score less than 5. The second milestone is the completion of PDSA cycles to improve data collection and intervention activities. The final process milestone is the establishment of the outcome targets for IT-1.9. In DY4 and DY5 there is one outcome target in each year. The improvement target is to improve adult patients age 18 and older with major depression or dysthymia and an initial PHQ-9 score > 9 who demonstrate remission at twelve months defined as a PHQ-9 score less than 5 by a percentage to be determined in DY3.

Rationale:
The Patient Health Questionnaire (PHQ-9) tool is a widely accepted, standardized tool that is completed by the patient, ideally at each visit, and utilized by the provider to monitor treatment progress. This measure additionally promotes ongoing contact between the patient and provider as patients who do not have a follow-up PHQ-9 score at twelve months (+/- 30 days) are also included in the denominator. The process outcomes selected were required building blocks to accurately identify the baseline rates of patients who have depression remission at 12 months. The process measure related to identifying the baseline rates is a critical step that must be accomplished before improvement targets for increasing rates of depression remission can be established. Improvement targets will be established in DY 3 for implement in DY 4 and DY5.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. **Starting Point/Baseline:**

**Target Population:**

Specific Number: 1,802 primary care physicians in Region 10 who will potentially address behavioral health issues in primary care settings for 489,000 patients who will see assistance with behavioral health problems from their primary care physician. Primary care physicians in Region 10 who will address behavioral health issues in primary care settings for 9,047 patients (DY2 = 452, DY3 = 1810, DY4 = 2940, DY5 = 3845)

**Description of Population:** This project targets the 489,000 people in Region 10 who have a diagnosable mental disorder but do not seek services in the mental health system. It is reported 28% of the population have a diagnosable mental disorder in any year. Only 8% of the population have a diagnosable mental disorder and receive services in the mental health system each year. The target population includes those who have a diagnosable mental illness who do not receive care in the mental health system. The number was calculated as: (Region 10 population of 2,444,642 x 28%) – (Region 10 population of 2,444,642 x 8%) = 489,000.

**Baseline data:** No baseline – This is a new initiative

Region 10 RHP Plan  Page 1622
### Starting Point/Baseline:

**Target Population:**

**Specific Number:** 1,802 primary care physicians in Region 10 who will potentially address behavioral health issues in primary care settings for 489,000 patients who will see assistance with behavioral health problems from their primary care physician. Primary care physicians in Region 10 who will address behavioral health issues in primary care settings for 9,047 patients (DY2 = 452, DY3 = 1810, DY4 = 2940, DY5 = 3845)

**Description of Population:** This project targets the 489,000 people in Region 10 who have a diagnosable mental disorder but do not seek services in the mental health system. It is reported 28% of the population have a diagnosable mental disorder in any year. Only 8% of the population have a diagnosable mental disorder and receive services in the mental health system each year. The target population includes those who have a diagnosable mental illness who do not receive care in the mental health system. The number was calculated as: (Region 10 population of 2,444,642 x 28%) – (Region 10 population of 2,444,642 x 8%) = 489,000.

**Baseline data:** No baseline – This is a new initiative

### Year 2 (10/1/2012 – 9/30/2013)

- Year 2 Estimated Outcome Amount: $0

### Year 3 (10/1/2013 – 9/30/2014)

- Year 3 Estimated Outcome Amount: $0

### Year 4 (10/1/2014 – 9/30/2015)

- Year 4 Estimated Outcome Amount: $0

### Year 5 (10/1/2015 – 9/30/2016)

- Year 5 Estimated Outcome Amount: $0

### TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $0
Title of Outcome Measure (Improvement Target): IT 1.10 Diabetes Care: HbA1c poor control

Unique RHP outcome identification number(s): 126675104.3.32
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:
- DY2-Process milestones: Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans for reducing patients with HbA1c >9.0%
- DY2-Process Milestones: Establish baseline rates
- DY3- Process milestone: Plan-Do-Study-Act Cycle will be utilized to identify appropriate frequency of HbA1c monitoring and effective coordination of care, the PDSA cycle will be performed to evaluate changes

Outcome Improvement Targets for each year:
- DY4-5-Improvement milestones-Reduce baseline number of low income, uninsured individuals identified as diabetic that have HbA1c >9.0% by 10% in DY4 and 15% in DY5.

Rationale:

Our ultimate goal is to improve the health of the low income, uninsured through patient engagement, acute interventions and posthospitalization encounters, and care that is coordinated and focused on prevention, primary and secondary care, and social and community-based services. This project has adopted HEDIS, AHRQ Quality indicators and PQI as guiding criteria to measure the outcome of diabetic follow-up: HbA1c Poor Control: “Percentage of patients 18-75 years of age with diabetes whose most recent HbA1c level during the measurement year is >9.0%. Patient-centered Medical Home to care for their chronic conditions such as HbA1c (listed as top contributors for frequent emergency department visits and admissions which can be preventable when managed by a primary care physician on a regular basis) will lead to improved quality outcomes reducing frequent emergency department visits and preventable admissions to the hospital, therefore, reducing the overall health care costs to the community.

There are various organizations, including JPS Health Network, dedicated to serving the uninsured population in Tarrant County. However, our limited resources contribute to fragmented care and a lack of patient follow-up care. Improving chronic care for the low income, uninsured population will contribute to a reduction in ED visits and admission to JPS Health Network.

In DY2, the baseline and improvement targets will be determined based on information from the FQHC and identified agencies serving the targeted. JPS Health Network will also develop and test data systems to ensure data reliability. In DY3, JPS Health Network will...
develop and implement a plan to provide primary and specialty care, along with supportive health services, to the underserved population.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Region 10 RHP Plan Page 1627
Title of Outcome Measure (Improvement Target): IT 9.2 ED appropriate utilization

Unique RHP outcome identification number(s): 126675104.3.33

Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
Process Milestones:
- DY2-Process Milestone 1: (P-1) Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans)
- Process Milestone 2 (P-2)-Establish baseline rates for ED appropriate utilization for this target population.
- DY3-Process milestones (P-4): Conduct Plan Do Study Act (PDSA) cycles to improve data collection intervention activities (Plan-Do-Study-Act will be utilized to identify the innovative strategies to reduce ED admissions in the low income, uninsured population

Outcome Improvement Targets for each year:
- DY4-5 Improvement milestones (IT 9.2): Reduce all ED visits for the underserved population from the baseline by 10% (DY4) and 15% (DY5).

Rationale:
JPS Health Network and their collaborative partners are dedicated to serving the uninsured population in Tarrant County. However, our limited resources contribute to fragmented and uncoordinated care, adding unnecessary risks and costs, and duplicating services. JPS and the FQHC will partner with Project Access to identify patients who will benefit the most from care coordination to intervene and help reduce frequent visits to the costly ED. With the projected growth in the underserved population of Tarrant County and current capacity issues, the FQHC is planning to adding 2 physicians and 3 mid-levels by DY5. The additional providers will be able to serve more patients through coordinated primary and specialty care.

The baseline will be established in DY2 from information provided by Project Access of Tarrant County on their transitional management for patients seeking primary and specialty care at the FQHC. Improvement can be determined through data provided by Project Access and the FQHC to establish and validate the baseline for underserved patients requiring transitional management to navigate through their health care needs.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into
account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-6.1 Patient Satisfaction

Unique RHP outcome identification number(s): 126675104.3.34
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:
By the end of the Waiver, our goal to increase our top box patient perception of care percentage points by 10% over the baseline determined in DY2.

In DY2, a nationally recognized CAHPS vendor will be selected and the CAHPS tool implemented across the organization as appropriate. There is currently no data for the CGCAHPS tool as it only been piloted in our larger clinics. Our current patient satisfaction tool is showing overall perception of patient care < the 10th percentile across our ambulatory clinics. Additionally, a patient experience plan will be developed and disseminated throughout the district to align patient experience goals and projects.

In DY3, Patient Experience Teams will be deployed to areas of low performance in a targeted effort to increase patient satisfaction scores with implementation of process improvement initiatives using LEAN tools, methods and assessment principles. All initiatives will use the Plan-Do-Study-Act (PDSA) model of improvement to verify that changes are appropriate and sustainable.

Outcome Improvement Targets for each year:

In DY4, the organization expects a 5% improvement over topbox baseline for the domains selected.

In DY5, the organization expects a 10% improvement over topbox baseline for the domains selected.

Rationale:
With overall patient perception lingering at less than the 10th percentile for patients visiting our outpatient clinics, JPS Health Network will take a more strategic approach to improving patient satisfaction across our network. More than half of the unique patients visiting JPS Health Network in the hospital fiscal year 2011 had a visit to one of our outpatient clinics. The clinic is a significant entry point to the JPS Health Network for our community. There are many case studies published about transformational improvement in both operational and patient experience using LEAN and PDSA as tools to leverage cooperation and collaboration. In a report of health care CEO surveys produced by the Beryl Institute, it is noted that organizations having a

distinct patient experience leader with definitive time commitment will have more success with improving patient experience scores.\textsuperscript{394} The report also notes that competing priorities is ranked as the third most prevalent reason for reducing emphasis on the patient experience. The greatest difficulty for most institutions in redesigning the patient experience is an inability to spread or execute strategic improvement initiatives across the organization.\textsuperscript{395,396} In designing the improvement approach for JPS Health Network, the lessons learned and reported by these recognized health care leaders have been incorporated into the plan.

The achievement of the goal to increase patient satisfaction over the Waiver period is tied to several other projects including the implementation of the patient and family centered medical, enhancing urgent medical advice and improving care transitions. By starting with the appointment of a patient experience leader, aligning disconnected projects and committees and developing a strategic plan, JPS Health Network expects to meet or exceed our project goals for this category.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

### Starting Point/Baseline:

**Target Population:** All patients and the family members that participate in care in the outpatient areas
- **Specific Number:** 124,000 unique patients per year
- **Description of Population:** Patients receiving care in the JPS Health Network
- **Baseline data:** Will be developed in DY2 after selection of vendor tool
- **If no baseline data,** please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

### Year 2 (10/1/2012 – 9/30/2013)

- **Process Milestone 1 [P-1]:** Engage stakeholders, identify current capacity and resources needed, determine timelines, develop and document patient experience plan
- **Process Milestone 1 Estimated Incentive Payment:** $82,288

### Year 3 (10/1/2013 – 9/30/2014)

- **Process Milestone 2 [P-2]:** Select a CGCAHPS vendor and implement the survey tool across the medical practice sites.
  - **Data Source:** CAHPS tool
- **Process Milestone 2 Estimated Incentive Payment:** $-82,288

### Year 4 (10/1/2014 – 9/30/2015)

- **Process Milestone 3 [P-3]:** Disseminate baseline patient experience plan data to stakeholders. Implement baseline dashboard
  - **Data Source:** Dashboard
- **Process Milestone 4 Estimated Incentive Payment:** $429,225

### Year 5 (10/1/2015 – 9/30/2016)

- **Outcome Improvement Target 1 [IT-6.1]:** Percent improvement over baseline for selected questions.
  - **Improvement Target:** 5% of top box percentage points over baseline established in DY2
  - **Data Source:** CAHPS survey results
- **Outcome Improvement Target 1 Estimated Incentive Payment:** $459,170

- **Outcome Improvement Target 2 [IT-6.1]:** Percent improvement over baseline for selected questions.
  - **Improvement Target:** 10% of top box percentage points over baseline established in DY2
  - **Data Source:** CAHPS survey results
- **Outcome Improvement Target 2 Estimated Incentive Payment:** $1,098,016

**Title of Outcome Measure (Improvement Target):** IT-4.9 Sepsis Resuscitation and Management: Reduce Length of Stay (ICU)

**Unique RHP outcome identification number(s):** 126675104.3.35

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
Length of stay reductions will occur as a result of early identification and intervention encompassed within the sepsis resuscitation and management bundles. Early intervention will circumvent the development of organ failure and other complications which are the result of poorly managed sepsis. By avoiding these complications, treatment intensity, resources, and LOS in the ICU- are reduced.

**Process Milestones:**
Year 2 Process milestones: - Reactivating the Sepsis Response team for the purpose of project planning; - establishing baseline rates, developing data systems, redesigning processes and communicating results; Continuous quality improvement e.g., rapid cycle PDSA, Six Sigma, and Lean will be utilized to drive improvement and sustain the gains; - hiring the sepsis coordinator, a clinical analyst and 2.5 additional FTEs to expand the existing Medical Emergency Team and provide 24/7 Sepsis Response Team coverage. Expected achievements are achieving compliance with diagnosis to 50%(173 patients) and sepsis management to 50%(173 patients). Improvement Milestones associated with length of stay and mortality will be limited because of process standardization immaturity and re-calibration of baselines.

Year 3 Process Milestones- The team’s utilization of the tools for the rapid response to and the management of sepsis will improve compliance with diagnosis to 65%(224 of 345 patients) and sepsis management to 65%(224 of 345). Rapid cycle improvement and other process improvement tools will drive continued improvement in the management of these patients. Better management of sepsis and the avoidance of complications is expected to result in a reduction in ICU LOS.

**Outcome Improvement Targets for each year:**
Year 4 Process Milestones include the continuation of rapid cycle improvements will continue to refine the processes for identification and management, achieving compliance with diagnosis to 75%(259 patients) and sepsis management to 85%(293 patients) and ICU LOS reduction to 5% of the baseline or 4.2 days

Year 5 Process Milestones include achieving compliance with diagnosis to 85%(210 patients) and sepsis management at 95%(327 patients), and reducing ICU LOS to 10% of the baseline or 3.7 days.

JPS Health Network is proposing the erection of an Innovation and Transformation Center (Category 2) which will increase competencies in performance improvement and also support the
Network’s Measurement System. Secondly we also reactivating our Harm Avoidance teams for reducing Health Acquired Infections (CAUTI, CLABSI, SSI) which could result in reducing Sepsis acquired after admission.

**Rationale:**
By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate appropriate treatment early, which will decrease the patient’s development of complications and comorbid conditions which contribute to more intense treatment, and longer ICU length of stay.

The refinement of the data bases, dashboards and methods of disseminating reports along with, participation in - performance improvement (PI) meetings will provide feedback and further engage clinicians.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYPs 2-5): $8,463,761*
Title of Outcome Measure (Improvement Target): IT-4.2 Central Line-Associated Bloodstream Infection Prevention

Unique Project ID: 126675104.3.36 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
DY2/DY3 P-1[P-2] Identify/target metric to measure impact of process improvement methodology and establish CLABSI baseline. PI teams facilitated by individuals with advanced skill set in Lean, Six Sigma and rapid-cycle improvement will focus on CLABSI prevention processes/opportunities and related workflow in the inpatient hospital settings in a post EPIC-EMR implementation environment. The teams will redesign disrupted workflows, optimize documentation, validate central line numbers, enhance reporting capabilities and align with NHSN’s methodology to capture a valid CLABSI rate. The focus of improvement initiatives will include compliance with Central Line Insertion Practices (CLIP).

DY3: P-2 Develop a quality dashboard for sharing of results

Through the work of the Innovation and Transformation Center’s Decision Support infrastructure, the quality dashboard will be developed and include process and outcome measures which will link board measures through process level measures. This dashboard will provide near real-time feedback to physicians and other clinicians in order to impact CLABSI improvement.

The CLABSI team will participate in Hospital P-3[P-15] Engagement Network (HEN) for purposes of shared learning; gaining technical assistance; and validating adoption of evidence-based guidelines.

DY4: Outcome Improvement Target 1: IT 4.2 Central Line-Associated Blood Stream Infections (CLABSI) Rate reduction 50% of the DY2 Baseline. Measure progress toward NHSN benchmark. CLIP Practices at 90%; CLABSI hospital-wide rate at benchmark or p-value that is not significantly different.

DY5: Outcome Improvement Target 2: IT 4.2 Central Line-Associated Blood Stream Infections (CLABSI) Rate Goal is to achieve NHSN rate for at least six months within DY5.

Rationale:
JPS conversion in May 2012 to EPIC EMR disrupted many of the CLABSI Surveillance Program and electronic protocols. The conversion impacted JPS’ ability to optimize documentation; validate central line numbers; generate reports and align with National Health and Safety Network’s(NHSN) methodology for effectively capturing CLABSI rates.

The process milestones will assist us in gaining an understanding the variation in practices associated with line insertion, maintenance and discontinuation. With this knowledge the team will be positioned to design, implement and test new workflows with the EPIC-EMR,
which will in-turn serve as the foundation for the JPS House-wide CLABSI Surveillance Program.

**Outcome Measure Valuation:**
The approach to valuation is first to establish the true baseline for housewide CLABSI surveillance and apply the avoided CLABSI cost of $3,700 to $29,000 to the number of CLABSIIs identified post-EPIC workflow changes. The value is the avoided cost difference of the baseline CLABSI when compared to DY5 CLABSI rates.

An estimated 41,000 central line-associated bloodstream infections (CLABSI) occur in U.S. hospitals each year. These infections are usually serious infections typically causing a prolongation of hospital stay and increased cost and risk of mortality. CLABSI can be prevented through proper management of the central line. The CDC’s Healthcare Infection Control Practices Advisory Committee (CDC/HIPAC) Guidelines for the Prevention of Intravascular Catheter-Related Infections, 2011, addresses these preventive techniques. The NHSN CLIP practices align with these guidelines. The estimated cost of a central line infection ranges from $3,700 to $29,000 per episode. This project’s objectives enhance patient safety and promote better patient outcomes.

Title of Outcome Measure (Improvement Target): IT-4.3 Catheter Associated Urinary Tract Infection Prevention

Unique Project ID: 126675104.3.37 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
DY2/DY3 P-1 Identify/target metric to measure impact of process improvement methodology and establish CAUTI baseline. PI teams facilitated by individuals with advanced skill set in Lean, Six Sigma and rapid-cycle improvement will focus on CAUTI prevention processes/opportunities and related workflow opportunities in the inpatient hospital settings in a post-EPIC-EMR implementation environment. The team’s focus will be to build/verify electronic nurse-driven protocols in EPIC EMR to provide guidelines for insertion and removal of Foley catheters to decrease unnecessary utilization. Surgical protocols are evidence-based.

Success in this area will create the capability to transition from targeted to housewide CAUTI surveillance which will require a recalibration of the CAUTI baseline. The process will also provide the capabilities to monitor compliance with the integrated Foley catheter protocols, e.g., improve SCIP INF-9 compliance data (Foley catheter removal POD1 or POD 2 postoperative procedure) from 85% to 95%.

DY3: P-2 Develop a quality dashboard for sharing results

Through the work of the Innovation and Transformation Center’s Decision Support infrastructure, the quality dashboard will be developed and include process and outcome measures which will link board measures through process-level measures. This dashboard will provide near real-time feedback to physicians and other clinicians in order to impact CAUTI improvement. The CAUTI team will participate in Hospital P-3[P-15] Engagement Network (HEN) for purposes of shared learning; gaining technical assistance; and validating adoption of evidence-based guidelines.

DY4: Outcome Improvement Target 1: IT 4.3 Catheter Associated Urinary Tract Infection Rate by at least 25% of the DY2 Baseline. We will measure our progress with two process measures and one outcome measure: SCIP-9 metric (Foley catheter removal postop day 1 or 2); and the percentage of compliance with our Foley catheter protocol guidelines. During this time we -- expect that our CAUTI hospital-wide rate (CAUTIS per 1,000 device days) should be at benchmark pooled mean or p-value that is not significantly different.

DY5: Outcome Improvement Target 1: IT 4.3 CAUTI rate reduction by at least 75% of the DY2 Baseline. The goal is to achieve a sustained rate that is at or lower than NHSN benchmark. Numerator: The number of CAUTIs; Denominator: number of Foley catheter days; Multiplier: 1,000 to get the rate. A p-value will be established using the NHSN software for statistical
significance. Goal is to have six months of outcomes at NHSN benchmark or lower or not significantly different per p-value analysis.

**Rationale:**
Surveillance and reporting methods currently focus on the Intensive Care and Skilled Nursing Units (ICU and SNU). By expanding to a broader population, there is opportunity to reduce device risk and impact associated conditions resulting from Foley catheter use. Utilization of CDC guidelines and NHSN methodology allows opportunity to optimize reporting and rate comparison; standardize interventions; and align with best practice.

**Outcome Measure Valuation:**
Per CDC, the estimated cost per CAUTI event is approximately $758 per infection. The approach to valuation is first to establish the true baseline for housewide CLABSI surveillance and apply the avoided CAUTI cost of $758 to the number of CAUTIs identified post EPIC workflow changes. The value is the avoided cost difference of the baseline CAUTIs when compared to DY5 CAUTI rates.

CAUTI is the most common UTI HAI infection, accounting for 30% of infections reported by acute care hospitals. CAUTI can lead to such complications such as: cystitis; pyelonephritis, gram negative bacteremia; prostatitis, epididymitis; and orchitis in males and less commonly, endocarditis, vertebral osteomyelitis, septic arthritis, endophthalmitis, and meningitis in all patients. Complications associated with CAUTI cause discomfort to the patient, prolong hospital stay and increase cost and mortality. Each year more than 13,000 deaths are associated with UTIs. Reference: CDC/HIPAC document—Guideline for Prevention of Catheter Associated Urinary Tract Infection 2009.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5); $202,207
**Title of Outcome Measure (Improvement Target):** IT-4.4 Surgical Site Infection Prevention

**Unique Project ID:** 126675104.3.38 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
DY2/DY3 P-1 Identify/target metric to measure impact of process improvement methodology and establish SSI baseline. Current baseline is based on targeted surveillance; new baseline will be captured for the house-wide surveillance program made possible with PI efforts encompassed in this program.

PI teams facilitated by individuals with advanced skill set in Lean, Six Sigma and rapid-cycle improvement will focus on SSI prevention processes/opportunities related workflow opportunities in the inpatient hospital settings in a post-EPIC-EMR implementation environment. The team’s focus will be to build/verify electronic surgical protocols that are evidence-based.

Success in this area will create the capability to transition from targeted to housewide SSI surveillance which will require a recalibration of the SSI baseline.

DY3: P-2 Develop a quality dashboard for sharing results

Through the work of the Innovation and Transformation Center’s Decision Support infrastructure, the quality dashboard will be developed and include process and outcome measures that will link board measures through process-level measures. This dashboard will provide near real-time feedback to physicians and other clinicians in order to impact SSI improvement. The SSI team will participate in Hospital Engagement Network (HEN) for purposes of shared learning; gaining technical assistance; and validating adoption of evidence-based guidelines.

DY4: Outcome Improvement Target 1: IT 4.4 Surgical Site Infection rate reduction by at least 25% of the DY2 baseline. We will measure progress by achieving a SCIP-INF (1, 2, 3) composite score (perfect care score) at 90% or higher. SCIP INF 1: antibiotic within one hour of surgical incision; SCIP INF 2: Prophylactic Antibiotic Selection for surgical patient; SCIP-INF 3: Prophylactic antibiotic discontinued within 48 hours of surgery end time.

DY5: Outcome Improvement Target 1: IT 4.4 Surgical Site Infection rate reduction by at least 75% of the DY2 baseline. For at least six of 12 months we will achieve a perfect SCIP-INF score of 95% or higher for all procedures listed below; and a NHSN standardized infection ratio (SIR) that is <1 or not significantly different based on NHSN p-value analysis for at least six of eight of the following procedures:

- Cardiac bypass surgery
- Cardiac valve procedures
• Hip arthroplasty
• Knee arthroplasty
• C-sections
• Colons
• Vaginal hysterectomies
• Abdominal hysterectomies

**Rationale:**
Infection control surveillance was impacted by EMR implementation in May 2012. The accuracy of the data currently being extracted from EPIC combined with the absence of standardized procedure-specific protocols within EPIC has created manual workflows for ICPs and variation in antibiotic usage and timing. EPIC’s current capabilities for alerting infection control and caregivers have limited functionality.

**Outcome Measure Valuation:**
Reduction of SSI will be valued by computing the avoided cost associated with infections. The process milestones focus on designing tools and processes to ensure the clinicians are utilizing appropriate antibiotics, at optimal times, for the prescribed duration, ensuring evidence-based skin prep, temperature management, etc., and to monitor compliance with those processes. While advances have been made in infection control practices, including improved operating room ventilation, sterilization methods, barriers, surgical technique, and availability of antimicrobial prophylaxis, SSI remain a substantial cause of morbidity and mortality among hospitalized patients. In one study, among nearly 100,000 HAIs reported in one year, deaths were associated with SSIs in more than 8,000 cases. Reference: [www.cdc.gov/nhsn](http://www.cdc.gov/nhsn). The value will be determined by calculating avoided cost associated with cost which has been estimated to be $10,443 to $25,546 per infection. Reference: The Direct Medical Costs of Healthcare-Associated Infections in U.S. Hospitals and the Benefits of Prevention (March 2009). Division of HQPNC for Preparedness, Detection, and Control of Infectious Diseases Coordinating Center for Infectious Diseases Centers for Disease Control and Prevention.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $1,446,812
**Title of Outcome Measure (Improvement Target):** IT-4.5 Fall Prevention

**Unique Project ID:** 126675104.3.39 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
In 2011 JPS fall experience was: 468 falls; 3.18 falls/1,000 patient Days; 72 falls with injury and 0.49 falls/1,000 patient days with injuries. YTD (11/20) 2012 JPS fall experience was: 453 falls; 3.22 falls/1,000 patient days; 78 falls with injury and 0.55 falls/1,000 patient days with injuries. The Network projects an increase in falls and falls with injuries for 2012 as compared to 2011. In order to maximize the effectiveness of the JPS falls prevention program and team, the project will be led by an advanced nurse practitioner; the practitioner will acquire training in Lean, Six Sigma and rapid-cycle improvement or will be assigned a facilitator with those skills. The program will be restructured in order to accelerate falls prevention. The project will be built upon evidence-based strategies to reduce falls among hospitalized patients and include specific approaches to the current thinking on fall prevention. JPS will not only implement evidence-based strategies for fall prevention but will also foster a culture to promote accountability, safety awareness, and teamwork. The purpose of the falls prevention effort is injury prevention and safety.

By the end of the Waiver, our goal is to have fewer than 30% falls per 1,000 patient days. Our milestones include:

DY2: Enhance our falls prevention team/program and develop baseline data for completion of fall risk assessments and completion of fall interventions based on the fall risk assessments.

DY3: Fewer than 414 falls per 1000 patient days (20% reduction over 2011)

DY4: Fewer than 387 falls per 1,000 patient days (30% reduction over 2011)

**Rationale:**
Statistics indicate patient falls occur in approximately 1.9 to 3.0% of all acute care hospitalizations with anywhere from 2 – 15% of inpatients experiencing at least one fall. An estimated 30% of inpatient falls result in serious injury. According to the Institute of Healthcare Improvement (IHI), falls are a leading cause of death in people ages 65 years and older and 10% of fatal falls for the elderly occur in hospitals.

Preventing patient falls is a top priority for caregivers in the clinical setting. Staff across the continuum of care convenes to determine the best ways to identify patients at the highest risk for fall and to develop prevention strategies. Despite heightened attention to this issue, patient fall rates across the United States continue to escalate, putting patient at increasing risk. As patients continue to age and present with increasing vulnerability and comorbidities, their potential for harm increases. Falls are among the significant adverse events experienced in hospitals.
Implementing a more comprehensive falls prevention program ensures interventions can be applied to all patients at risk.

By identifying the presence of patients with falls risk, we have the opportunity to initiate fall prevention strategies and interventions

**Outcome Measure Valuation:**
Our approach is to increase the reliability of the falls program by assessment, communication, and risk factor intervention planning. Support systems will be in place to promote learning, ongoing evaluation, and improvement of the falls prevention program. By identifying those patients at risk for falls on admission, we have the opportunity to reliably execute a falls prevention program that will reduce inpatient falls.

Title of Outcome Measure (Improvement Target): IT-4.6 Thromboembolism (VTE) Prevention and Treatment Initiative

Unique Project ID: 126675104.3.40 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
A reduction in the prevalence of hospital acquired VTEs will be achieved by increasing the reliability in assessing patients’ risk for VTE and instituting appropriate prophylactic therapy for patients admitted to JPS. Three process metrics will be tracked across the term of the project. The metrics are:

a. The rate of patients who received VTE prophylaxis or have documentation why no VTE prophylaxis was given the day of or the day after hospital admission or surgery end date for surgeries that start the day of or the day after hospital admission
b. The rate of patients diagnosed with confirmed VTE who received an overlap of parenteral (intravenous [IV] or subcutaneous [SQ]) anticoagulation and warfarin therapy
c. The rate of patients diagnosed with confirmed VTE who are discharged to home, home care, court/law enforcement or home on hospice care on warfarin with written discharge instructions that address all four criteria: compliance issues, dietary advice, follow-up monitoring, and information about the potential for adverse drug reactions/interactions.

The milestones are:

DY2/DY3 P-1[P-2] Identify/target metric to measure impact of process improvement methodology and establish a valid VTE baseline. PI teams facilitated by individuals with advanced skill set in Lean, Six Sigma and rapid-cycle improvement will put into place VTE data collection and reporting tools; complete a gap analysis of current processes for the assessment and prophylactic treatment of VTE; develop and implement a treatment protocol based on AHRQ/CNEST; implement education on VTE prevention and treatment and report at least six months of data collection on the VTE process measures (a, b, c) for purposes of establishing the baseline and setting goals for the following years.

DY3: P-2 [P-10] Develop a quality dashboard for sharing results

Through the work of the Innovation and Transformation Center’s Decision Support infrastructure, the quality dashboard will be developed and include process and outcome measures that will link board measures through process-level measures. This dashboard will provide near real-time feedback to physicians and other clinicians in order to impact VTE improvement. The team will track the progress with the three established metrics; and initiate
rapid-cycle improvement to address variation; complete training for pertinent staff and share data of promising practices, and findings with TMF to foster shared learning and benchmarking across the Texas public hospitals.

The VTE team will participate in Hospital P-3 [P-15] Engagement Network (HEN) for purposes of shared learning; gaining technical assistance; and validating adoption of evidence-based guidelines.

DY4: Outcome Improvement Target 1: IT 4.6 Thromboembolism (VTE) Prevention and Treatment Initiative: Improved compliance with Metrics a, b, and c, and a reduction in the VTE incidence by 10% based on the validated baseline computed in DY2

DY5: Target 2: IT 4.6 Thromboembolism (VTE) Prevention and Treatment Initiative: Improved compliance with Metrics, a, b, and c and a reduction in the VTE incidence by 30% based on the validated baseline computed in DY2

**Rationale:**
Improving compliance with screening and prophylactic treatment of VTE has been demonstrated to reduce the occurrence of VTEs. Costs of VTE prevention initiatives can demonstrate a good return on investment through:
- Improved length of stay, readmission, morbidity, and mortality rates
- Improved documentation of patient acuity and related payment for acuity
- Income generated via incremental physician and allied health professional billing

**Outcome Measure Valuation:**
Our approach is to increase the reliability of VTE screening, treatment and patient education processes in order to prevent the development of VTEs.

Achieving optimal prevention of hospital-acquired VTE requires incremental monitoring, educational efforts, system change, and coordination of the services of many hospital divisions, all of which may incur incremental costs.

The incremental length of stay and costs of treating a case of a preventable VTE event are substantial. The Agency for Health care Research and Quality (AHRQ) Healthcare Cost and Utilization Projects’ estimates of incremental inpatient cost are $10,000 per DVT and $20,000 per PE. Complications associated with VTE increase resource utilization and length of stay. The value of this project can be computed by determining the cost avoided with the reduction of VTEs.

1. Pharmacologic prophylaxis reduces the incidence of asymptomatic and symptomatic DVT and PE by 50 to 65 percent.
2. Prevention of DVT also prevents PE and fatalities from PE.
3. Cost-effectiveness of VTE prophylaxis has been repeatedly demonstrated.
4. The chief concern of prophylaxis is bleeding, but bleeding risk secondary to pharmacologic prophylaxis is a rare event, based on abundant data from meta-analyses and placebo-controlled randomized controlled trials.
5. Overwhelming evidence reveals that pharmacologic VTE prophylaxis not only prevents adverse patient outcomes, it is also cost-effective.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $581,446
**Title of Outcome Measure (Improvement Target):** IT-13.1 Pain assessment (NQF-1637) (Non-stand-alone measure). Percentage of hospice or palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening.

**Unique Project ID:** 126675104.3.41 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
This measure identifies the percentage of hospice or palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. In DY2, there is a process milestone for project planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. A second process milestone is established to manage data systems to report baseline percentage of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. In DY3, there are two process milestones. The first is to establish the baseline percentage of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. The second is to establish outcome improvement targets for improvement in percentage of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening for DYs 4 and 5. DY4 and DY5 have an outcome improvement target to improve the baseline percent of palliative care patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening by a percentage determined in DY3.

**Rationale:**
The process milestone selected for DY2 is a required building block to accurately identify the baseline rates of patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. The DY3 process milestone related to identifying the baseline rates is a critical step that must be accomplished before improvement targets can be established for increasing the percent of patients who screened positive for pain and who received a clinical assessment of pain within 24 hours of screening. Outcome improvement targets will be established in DY3 for DYs 4 and 5.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these
metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery

Unique Project ID: 126675104.3.43 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
This measure identifies the cost minimization achieved as a result of implementing an inpatient palliative care consultation program. In DY2, there is a process milestone for project planning to engage stakeholders, identify current capacity, needed resources, determine timelines and document implementation plans. A second process milestone is established to manage data systems to report baseline costs for specific diagnoses that commonly warrant palliative care prior to implementing palliative care services. In DY3, there is a process milestone to establish the baseline cost of care for specific diagnoses. There is a second process milestone to establish the improvement targets for DYs 4 5. DY4 has an outcome improvement target to ensure a reduction by xx% of costs for those with specific diagnoses who receive a palliative care consultation. DY5 has an outcome improvement target to ensure a reduction by xx% of costs for those with specific diagnoses who receive a palliative care consultation.

Rationale:
This outcome measure was selected due to the wide body of evidence that suggests implementation of palliative care services reduces hospital costs. The process milestone selected for DY2 is a required building block to accurately identify the baseline costs of specific diagnoses that commonly warrant palliative care but have not had access to the service. The DY3 process measure related to identifying the baseline costs is a critical step that must be accomplished to compare improvement targets for palliative care patients. Outcome improvement targets for DY4 and DY5 will be established in DY3.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding

to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

### Improved cost savings: Demonstrate cost savings in care delivery (non-standalone measure)

**JPS Health Network**

**IT-5.1**

**Starting Point/Baseline:**

**Target Population:**
- **Specific Number:** DY3 = 269, DY4 = 403, DY5 = 537 (1208 total for DY3, DY4, and DY5)
- **Description of Population:** Patients who are terminally or chronically ill as approximated by the CAPC research of over 500 hospitals based on number of staffed beds.
- **Baseline data:** There is no palliative care program at JPS Health Network so there is no baseline data. There is no baseline data on the percent who screened positive for pain and who received clinical assessment within 24 hours. Baseline levels will be established in DY3.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYS 2-5): $1,084,634
**Title of Outcome Measure (Improvement Target):** IT 5.1 Improved cost savings: Demonstrate cost savings in care delivery

**Unique RHP Outcome Identification Number:** 126675104.3.44 (Pass 2)  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:** To demonstrate improved cost savings by 20% at the end of the Waiver period by increasing access to a medical provider to 50% of the enrolled Connections individuals.

**Process Milestones:**
In DY2, we will engage stakeholders to appropriately plan the resources and project. We will establish the baseline and collect and measure the required data.

In DY3, the group will do PDSA cycles to improve the data collection and analysis, and evaluate the baseline data.

**Rationale:**
Process milestones P-1 through P- 5 were chosen due to the lack of accurate reports or no information. Current resources and processes were not available to accurately measure and monitor data. The analysis tool will be implemented in DY3 with process reviews conducted in preparation for DY4 and DY5 outcome measures.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**Process Milestone 1 [P-1]:** Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.

(Develop an implementation plan to improve cost savings through cost benefit analysis and transition from fee for service to outcome based payment.)

- Baseline/Goal: Identification of process/steps to implement improvement target.
- Data Source: Documentation of stakeholder engagement, current reporting capacity, needed resources, and implementation plan.

**Process Milestone 1 Estimated Incentive Payment:** $165,195

**Process Milestone 2 [P-2]:** Establish baseline rates (Determine current baseline performance in target area.)

- Baseline/Goal: Establish baseline to determine improvement target.
- Data Source: Report of data analysis tools

**Process Milestone 2 Estimated Incentive Payment:** $165,195

**Outcome Improvement Target 1 [IT-5.1]:**

- Improved cost savings: Demonstrate cost savings in care delivery and transition from fee for service to outcome based payment.

- **a) Type of analysis to be determined by provider:** Cost Benefit Analysis and transition from fee for service to outcome based payment.

- **Baseline:** New process.
- **Goal:** Demonstrate 10% cost savings in care delivery.
- **Data Source:** TBD

**Outcome Improvement Target 1 Estimated Incentive Payment:** $921,785

**Process Milestone 3 [P-3]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities (Conduct performance improvement activities with PDSA model to ensure reliable interactions, data collection, analysis, and reporting)

- Baseline/Goal: Performance improvement to meet improved target.
- Data Source: Documentation/Report of PDSA cycle.

**Process Milestone 4 Estimated Incentive Payment:** $430,834

**Process Milestone 4 [P-4]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities (Conduct performance improvement activities with PDSA model to ensure reliable interactions, data collection, analysis, and reporting)

- Baseline/Goal: Performance improvement to meet improved target.
- Data Source: Documentation/Report of PDSA cycle.

**Process Milestone 5 [P-5]:** Disseminate findings, including lessons learned and best practices, to stakeholders. (Evaluate implementation plan, baseline rates, data collection and performance improvement activities in a report format and present to stakeholders.)

- Baseline/Goal: Educate stakeholders on quality outcome initiative/processes.
- Data Source: Documentation/Report of

**Process Milestone 5 Estimated Incentive Payment:** $2,204,268

**Outcomes Improvement Target 2 IT-5.1:**

- Improved cost savings: Demonstrate cost savings in care delivery and transition from fee for service to outcome based payment.

- **a) Type of analysis to be determined by provider:** Cost Benefit Analysis and transition from fee for service to outcome based payment.

- **Baseline:** New process.
- **Goal:** Demonstrate a 20% cost savings in care delivery.
- **Data Source:** TBD

**Outcomes Improvement Target 2 Estimated Incentive Payment:** $2,204,268

Title of Outcome Measure (Improvement Target): IT-8.1 Timeliness of Prenatal/Postnatal Care

Unique Project ID: 126675104.3.45 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:
The overall outcome measure will be to meet or exceed the national benchmarks for women receiving prenatal care in the first trimester and postnatal care between 21 and 56 days following delivery.

DY2:
Process Milestone 1-(P-1) – Partner with identified agencies for project planning to develop protocols/strategies for recruiting and retaining women in to care.
Process Milestone 2-(P-2) – Collaborate with identified partners/agencies (both internal and external) serving the prenatal community to determine baseline rates of the timeliness of prenatal and postnatal care.

Process Milestone 3-(P-3) – Develop and test data systems to ensure validity of information gathered on the timeliness of prenatal and postnatal care.

DY3:
Process Milestone 4-(P-4) – Conduct Plan, Do, Study, Act Cycles (rapid cycle improvement) to identify strategies with partnering agencies for ensuring timeliness of prenatal and postnatal care including effective documentation for receipt of services.

Process Milestone 5-(P-5) – Develop a system to disseminate findings and best practices to stakeholders, including identifying project impacts, “lessons learned”, and key challenges associated with expansion of the project. This will include special consideration for safety-net populations.

Outcome Improvement Targets:
DY4 and DY5- Outcome Improvement (IT -8.1) – Increase the number of patients receiving prenatal care in the first trimester and postnatal care in days 21 – 56 following delivery to 50% (DY4) and 75% (DY5) of the national HEDIS metrics.

Rationale:
In collaboration with the University of North Texas Health Science Center’s health provider group, UNT Health, and the JPS Health Provider Group (JPSPG), and support from local community groups, we propose to bring innovative prenatal care to 5,166 (92% of JPS live births received prenatal care in our JPS clinics in FY11) women over the life of the project. We are particularly interested in the Centering Pregnancy and Maternal Medical Home models of group
care because we believe it will address the social risk factors our patients often face and can reduce racial disparities in birth outcomes, a problem that Tarrant County has yet to resolve. The CenteringPregnancy model of care has already been implemented and accepted by Tarrant County women as seen at the University of North Texas Health Science Center and JPS Health Center for Women.

Since several JPS Community Clinics have only one obstetric nurse practitioner who provides women’s services, the CenteringPregnancy model is not the best practice. The number of patients in these clinics would not be large enough to create groups for CenteringPregnancy. Therefore, JPS proposes to use the Maternal Medical Home model. The Maternal Medical Home proposes to enhance prenatal care through the addition of supportive services that Texas Medicaid does not cover through improved coordination with existing JPS and community services. Patients will complete a medical and psychosocial assessment at their first visit, and be linked to services as warranted by the assessment findings. Services may include, but are not limited to, doula services, dental services, dietitian and nutritional services, and case management.

JPS has chosen the overall outcome of the timeliness of prenatal and postnatal visits because the JPS patients’ timeliness to prenatal care and postnatal care is below the national average, and because the JPS Health Network is the primary, if not only source of preconception and interconception care for low-income women in Tarrant County, an essential component of efforts to improve birth outcomes. In Tarrant County there is an inverse relationship between entrance into prenatal care and infant mortality. Women who did not receive prenatal care were 252% more likely to encounter an infant’s death, highlighting the importance of early, consistent and quality prenatal care. The Fetal Infant Mortality Review reported that 42% of the cases reviewed in 2008 reporting having access to care issues, and 48% of women giving birth in Tarrant County received late or no prenatal care.

Women with private insurance were more likely to receive postpartum care (82.8%) than women with Medicaid (62.7%). In Texas, even among women with commercial HMO insurance, only 48% of women received a postpartum visit on or before 21 days and 56 days after delivery. The postpartum care rate at JPS is estimated to be 40%, and the national average is 64.1%. Postpartum care is essential for women who have had a previous adverse outcome, such as preterm birth. For low-income women, the postpartum visit may be the source of medical care until they become pregnant again.

JPS will establish a baseline using data gathered in DY2 and will validate this data to compare to the national benchmark over the life of the Waiver. Also in DY2, JPS will partner with identified agencies for project planning to develop protocols/strategies for recruiting and retaining women in care.
