Section II. Executive Overview of RHP Plan
Section II. Executive Overview of RHP Plan

The Region 10 Regional Healthcare Partnership (RHP) is the result of a shared commitment by the Region’s providers to a community-oriented, Regional health care delivery system focused on the triple aims of improving the experience of care for patients and their families, improving the health of the Region, and reducing the cost of care without compromising quality. Region 10’s Delivery System Reform Incentive Program (DSRIP) plan is the essential blueprint for improved individual and population health at a lower cost, delivered more efficiently. Because our plan has been enriched by and reflects the input and work of all Regional stakeholders and providers, we are confident that it will be an effective and meaningful tool for coordinated health care planning and delivering improved Regional health outcomes at lower cost.

Region 10 Vision and Goals for Delivery System Transformation

Our shared vision is a transformed Regional delivery system that actively collaborates across all nine counties to provide integrated and coordinated care. Region 10 RHP will achieve this goal by operating at all times in a manner that is:

- **Transparent:** Decision-making process takes place in the public eye and processes are clear to participants;
- **Collaborative:** Developing the RHP plan and making decisions through a collaborative process that reflects the needs of the Region’s communities and input of stakeholders; and
- **Accountable:** Holding all stakeholders to common performance standards, deliverables and timelines.

Our governance approach fosters the health care provider buy-in necessary for lasting delivery system change. By coming together as a Region to improve individual and population health outcomes, Region 10 RHP participating providers have made the first critical steps toward a health care delivery system that is:

- **Patient-Centered:** Improving patient care and experience through a more efficient, patient-centered and coordinated system; and
- **Value-driven:** Increasing the value of care delivered to patients, community, payers and other stakeholders by improving individual and population health.

Region 10 RHP conducted stakeholder surveys, assessed provider readiness, collected and analyzed relevant data about the Region, and engaged in exploratory conversations with a wide range of Regional stakeholders to inform its decision-making activities. The Region 10 RHP synthesized this information into a community health needs assessment shared with all RHP participants and the public through open-access committee meetings, online postings, webinars, and County Visioning sessions. These findings resulted in Region 10 RHP’s delivery reform objectives:

- Connect providers across the Region for improved coordination and communication;
- Empower individuals and families to manage and improve their health;
- Provide a robust and comprehensive set of services improving the physical health, behavioral health and general well-being of Region 10 residents at an affordable cost;
Expand access to primary care and ambulatory care to serve more patients, particularly through medical homes offering ongoing routine care in a timely manner; and,

Expand access to behavioral health services.

The Region 10 Healthcare Environment

More than two million people (2.4m) lived in Region 10 in 2011. Nearly two-thirds of these individuals (62%) are working-age adults. Of the remainder, 11% are elderly and 28% are children. Regional growth over the Waiver period is projected at nearly 10% (9.4) to 2.7 million residents regionally. Tarrant County, which includes Fort Worth Metropolitan Statistical Area, serves as the Region’s urban center and will see the most significant growth in population on an absolute basis. Region 10 is predominantly White (58%), Hispanic (24%), and African-American (12%) – less diverse than the state overall, but more diverse than the nation. Region 10 also has a slightly more educated population than the state overall, but a less educated population than the national average. An estimated 13% of the Region’s residents live at or below the federal poverty level, lower than both the rate for Texas (17%) and for the nation (14%).

While Region 10 has some of Texas’ strongest and most highly regarded provider systems, it also has a historically fragmented Regional delivery system with significant gaps in capacity, primary care access, behavioral health services and specialty care access. These health care access problems disproportionately impact the Region’s socioeconomically disadvantaged, underserved, uninsured and rural residents. Across the Region, there are 46 acute care hospitals (most are private) and 3,721 physicians (1,512 primary care providers and 2,209 specialty providers). The Region has 6,491 acute care licensed beds and 170 psychiatric care licensed beds. Region 10 also has four community mental health centers (CMHCs) and one federally qualified health center (FQHC).

Provider distribution mirrors overall population density, with the majority of providers located in Tarrant County’s major urban center, Fort Worth. The Region’s wide geographic footprint (7,221 square miles) combined with unevenly distributed providers and health care resources make the system’s endemic access problems even more serious and profound for individuals in outlying rural counties, particularly those who are low-income and uninsured.

Key Health Challenges in Region 10

Region 10 residents face many health challenges, including high rates of one or more chronic conditions and behavioral health issues; gaps in ability to manage communicable diseases; lack of access to healthy foods; lack of patient education on self-managing their health conditions; and lack of ongoing relationships with health care providers. Further, Region 10’s population, particularly its low-income, elderly, pediatric, disabled, and rural residents, struggle with major health care access barriers caused by very limited public transportation availability.

Low-income and uninsured residents who lack the financial wherewithal to pay for preventive and routine health care often defer medical care at earlier stages in a disease process and instead present later in the course of the disease with more acute health care needs. These financially driven barriers have also created a shortage of specialists in high-demand specialties, and overuse of emergency departments for routine health care needs more appropriately addressed in
lower cost primary care settings. These inefficiencies can lead to avoidable negative outcomes experienced by individuals and families in the Region. In summary, the Region’s residents are sicker and experience many more adverse events that cost more to treat than they would in a more organized delivery system.

**Developing Projects for Systems Transformation**

Region 10 RHP was developed through an intentional and collaborative process of organizing, learning, assessment and planning inclusive of all participants and the public, including elected officials. The RHP Anchor (Tarrant County Hospital District d/b/a JPS Health Network) worked with all stakeholders to create a governance structure that ensured all perspectives were incorporated into plan development and prioritization decisions. The planning team reached out to performing providers and other knowledgeable stakeholders at every step in the process. Our commitment is demonstrated by our attendance at all Texas Health and Human Services Commission (HHSC) forums including Anchor calls, Executive Waiver Committee meetings, and the Waiver Summit, and ongoing direct participation and engagement with HHSC.

Region 10 RHP shared the community health needs assessment with all Regional performing providers to encourage them to develop projects tailored to address their communities’ needs. Additionally, guidance was provided to performing providers in terms of the partnership’s collective mission and the transformative overarching goals of DSRIP. Direct and individual technical assistance was provided to each performing provider through office hours, individual and group meetings, and by phone and email, throughout the project planning process. The RHP Anchor has offered all of the Region’s performing providers multiple opportunities to submit projects to ensure they had adequate time for revisions after receiving feedback. Dedicated financial expertise has been provided for UC tool completion and DSRIP project valuation. The Anchor has also disseminated all protocols and information from the Texas HHSC (CMS), including timely updates about revised or additional guidance, to all performing providers on a routine and timely basis. Numerous tools – such as valuation principles and methodologies, crosswalks and summary tables – were provided to help providers with project development. Updates were provided frequently to ensure their accuracy.

The Region selected Pass 1 projects through a three-step process: first, holding an initial dialogue between each interested performing provider and their IGT entity; secondly, direct interaction with performing providers and IGT entities to foster and enhance DSRIP project and funding protocol understanding as CMS and HHSC developed program content and requirements; thirdly, holding a final discussion that included a review of each project’s adherence to the Anchor Checklist items and helped identify various types of collaborative opportunities for participating providers. The Region welcomed Pass 2 as a second opportunity for both existing and new providers, including Region 10 medical groups not affiliated with the University of North Texas, to develop additional high-impact projects that contribute to our Region’s delivery system improvement. The large number of Region 10 participants brought into the RHP has yielded a set of projects that significantly exceeds the required minimum number project threshold for a Tier 2 Region. In summary, this plan is the culmination of a lengthy and inclusive system transformation planning process and represents our Region’s firm commitment to significantly improved access to the right services, in the right setting, at the right time and at lower cost for all residents.

Section III. Community Needs Assessment
Section III. Community Health Needs Assessment

Region 10 RHP’s Community Health Needs Assessment (CHNA) offers Regional data and related county-specific health needs information to inform the selection of the delivery system reform projects that will effectively transform the health care experiences of our Region’s residents by addressing unmet needs and contributing to overall population health improvements. This section summarizes Region 10’s most pressing community health needs and the societal and market contexts in which they have developed. It also underscores the connections between the projects proposed by the participating providers listed in Section II and the Region’s most serious community health needs, which are: (1) access to primary and specialty care, particularly in underserved areas of the Region and for low-income residents; (2) access to behavioral health resources and integration of behavioral and physical health care services; (3) improved primary care management and self-management of chronic care conditions; and (4) better overall coordination and service integration across the Region’s providers.

Methodology

Region 10 RHP’s CHNA includes both qualitative and quantitative data. Our primary data collection activities included stakeholder surveys and provider readiness assessments. Additionally, the RHP plan team reviewed and incorporated relevant and appropriate prior existing sub-Regional community health needs assessments. We also collected secondary data from national and state sources to create a full community profile that includes birth and death characteristics, indicators of health care access, chronic disease prevalence rates, as well as demographic variables affecting Regional health such as insurance status, socioeconomic status and educational attainment level. Some data is presented in this section with comparisons to state and national data, framing the scope of an issue as it relates to individual counties and the Region. (Please see Appendix D for all supplemental materials related to this Community Health Needs Assessment.)

COMMUNITY PROFILE

Region 10 consists of nine contiguous counties in north central Texas. It is characterized by one urban center surrounded by a number of rural and suburban communities. This Region has a significant geographic footprint, spanning 7,221 square miles. Region 10’s nine counties are: Ellis, Erath, Hood, Johnson, Navarro, Parker, Somervell, Tarrant and Wise. (See Appendix D-1.1 for a map of Region 10. Additional count-specific information can also be found in Appendix D-4.)

Demographics: Population by Age Cohort

Region 10 had a population of 2,444,642 in 2011. The majority of Region 10 residents are working-age adults (62% ages 18-64). The remaining population is made up of seniors (11% of total Regional population) and children (28% of Regional total population). Region 10 is similar to the rest of Texas in terms of its 18-and-under proportion of total residents with the exception of Hood, Somervell and Navarro Counties. Hood County trends significantly older, with a larger proportion of seniors (20.1%), offset by a smaller adult population (57.8%) and child population (22.1%). Both Somervell and Navarro also have higher proportions of elderly residents than the
rest of the Region, but lower than that for Hood County. In Somervell, the senior population is 15.5% of the total population, with a smaller proportion of working-age adults (58.3%) and a child population similar to the Region (26.2%). Navarro’s proportion of elderly residents is similar to Somervell’s with seniors representing 14.0% of its population; working-age adults and children represent 59.1% and 26.9% of the county respectively. Tarrant and Ellis Counties have slightly higher proportions of children as a percentage of their total county population (28.4% and 29.4%, respectively) than the rest of the Region.

By 2016, the Region is projected to see its population grow by an estimated 9.4% to a Regional total of 2,674,022 people (60.7% adults ages 18-64; 27.8% children ages 0-18; and 11.5% seniors ages 65 and older). This projected growth is unevenly spread across the counties: Ellis and Parker counties will see the greatest population growth (13.9% and 11.2%, respectively). Erath and Navarro will see a much lower rate of growth than the rest of the Region (3.9% and 4.3%, respectively). The other five counties in Region 10 are projected to have population growth similar to that of the Region as a whole.

Overall, Region 10’s elderly population (65 and older) is anticipated to grow more rapidly as a percentage of total population than its working-age adults and children (Figure 1). The highest percentages of elderly are projected for Ellis and Parker counties at a rate of 32% for both counties, compared with the Region-wide estimate of 26%. In contrast, Erath and Navarro counties’ elderly populations as a percentage of total county population will grow much less than the rest of the Region (12% and 13%). (Please see Appendix D-1.2, 1.3 and 1.4 for summary data tables of Region 10’s population, including projected population growth.)

**Figure 1: Age Distribution of Region 10 Counties in 2011**

Source: Thomson Reuters 2011

**Demographics: Population by Race and Ethnicity**

Region 10’s population is predominantly White (57.9%), Hispanic (24.4%), and African-American (11.9%). The Region is less diverse than the state, but more diverse than the nation. Region 10 also has a smaller proportion of Hispanic residents than the state (24.4% versus 40%), but the Region’s Hispanic population is still a significantly larger proportion of total population than nationally. Hispanics and other minorities are projected to have higher population growth rates over time. Much of Region 10’s racial diversity is concentrated in Ellis, Navarro and
Tarrant counties. Of Region 10’s remaining six counties, Hood and Parker counties are the least diverse at 87.1% and 85.3% White, respectively (Figure 2).

**Figure 2: Race/Ethnicity Distribution of Region 10 Counties in 2010**

Source: Thomson Reuters, 2011

Demographics: Household Income
Region 10 has a higher per capita income than Texas or the nation with a median household income of $52,839 per year, compared to $48,615 median state income and $50,046 national median income (Figure 3). The wealthiest counties in Region 10 are Ellis and Parker, which have higher median household incomes of $60,877 and $61,340, respectively. Conversely, Erath and Navarro are the Region’s least affluent counties with median household incomes of $39,200 and $41,654, respectively.
Demographics: Population Living in Poverty

Poverty is highly correlated with poorer health status and poorer health outcomes. Empirical research has demonstrated conclusively that people living on limited incomes are likely to forego visits to the doctor in order to meet their more pressing financial responsibilities, such as food and housing. Low-income wage earners are less likely to be covered by an employer’s health insurance program, and even if they are covered, they are often less able to pay for premiums or out-of-pocket expenses.

Analysis of the Regional and county populations at or below the federal poverty level (FPL) mirrors the findings of the median household income analysis above (Figure 4). Overall, Region 10 has fewer people living in poverty than the rest of Texas and the nation as a percentage of the total Regional population. However, the poorest Region 10 residents tend to be concentrated in a few counties and specific communities within the remainder of the Region. Erath and Navarro counties contain the highest relative percentage of population living in poverty with almost 20% of each county’s population at or below 100% of the federal poverty level.
Demographics: Education Level

Educational attainment level is another demographic variable that correlates strongly with overall health status as well as poverty level. Low levels of formal education are often cited as a major indicator of poor health. Lack of education is a formidable barrier to securing living-wage and higher-wage jobs, and further increases an individual’s probability of living in poverty, being uninsured and having children who grow up in poverty.

Those with low levels of formal education and literacy are less likely to understand how personal behavior and lifestyle can affect health status and health outcomes. Educational attainment level is also related to a person’s ability to understand medical information and recognize early symptoms of disease. While Region 10 has a smaller percentage of adults without a high school diploma (16.9%) than the rest of Texas, the proportion of the Region’s population without a diploma is higher than the national rate of 14.4% (Figure 5). Reflecting the correlations that exist between poverty level and education, Navarro and Erath counties contain the highest percentages of population that did not complete a high school education (23.6% and 20.5%, respectively), while the most affluent counties – Hood, Parker and Somervell – have the smallest proportions of residents without a high school diploma (13.8%, 12.6% and 12.7%, respectively).
Demographics: Employment

Generally, the Region has a higher rate of employed residents than the rest of the state and the nation (4.5% unemployment in Region 10 versus 7.2% and 8.3% unemployment for Texas and U.S., respectively) (Figure 6). Tarrant and Wise counties have the Region’s highest unemployment rates at (6.8% and 6.9%, respectively). Somervell has a significantly lower unemployment rate (0.8%) than the rest of Region 10.

Insurance Status

Being uninsured is a major barrier to accessing primary and preventive care in Region 10. People without insurance tend to be working-age adults with less secure employment, lower wage levels, and pre-existing conditions. When individuals defer care because of cost concerns they are more likely to seek care when symptoms have become more severe and receive care in more expensive, acute and emergent care settings. Individuals who defer care also have a greater likelihood of poor long-term outcomes.
Put simply, uninsured patients tend to use hospital emergency departments and urgent care centers as a last resort, rather than managing their health through more cost-effective primary care clinics and physician offices. This unmanaged, episodic and health-event driven approach to seeking care has both serious financial cost implications at the county, Regional and national levels as well as potentially devastating health consequences for individuals.\textsuperscript{iv}

Region 10’s 2010 uninsured rate of 18% is closer to the national uninsured rate of 15.5% than Texas’ statewide rate of 23.7% (Figure 7). More of Region 10’s residents have private insurance than the rest of Texas (51.2%) or the nation (54%). The Region’s public coverage rates are 11% for Medicaid, 8.9% for Medicare and 1.4% for the dually enrolled. The highest rates of uninsured residents are found Erath and Navarro Counties (30.2% and 28.0%, respectively) commensurate with the counties’ higher rates of poverty and lower median household incomes than the rest of Region 10.

Source: U.S. Census Bureau, Thompson Reuters 2011

The proportion of Region 10 residents who remain uninsured in 2016 is projected to drop to 11.3%. Of those who will be newly insured, an estimated 58.1% will be covered by direct or employer-sponsored private insurance, while an estimated additional 15.7% of Region 10 residents will receive coverage through Medicaid and 10.2% through Medicare. These projections, however, are highly dependent on various federal and state policy and market factors, including availability and affordability of insurance products offered in the local market, impact of any potential state or federal health insurance exchange, and whether or not the state moves forward with a Medicaid expansion.
HEALTH CARE INFRASTRUCTURE AND ENVIRONMENT
(See Appendix D-2 for additional information regarding Region 10’s health care infrastructure.)

Facilities and Health Care Workforce
Region 10’s health care infrastructure consists of 46 acute care hospitals (the majority of which are privately owned), two psychiatric hospitals and 3,726 physicians (Figure 8). The Region has a total of 6,491 acute care licensed beds and 170 psychiatric care licensed beds. The Region’s provider options also include four MHMRs and one FQHC. (See Appendix D-5 for a list of health care facilities by county.)

Providers are most concentrated within Tarrant County and particularly in Fort Worth, Region 10’s major urban center. The vast geographic expanse of Region 10 and the high level of provider concentration within Tarrant County combine to create serious specialty and primary care access barriers for many individuals in the Region’s rural counties.

Source: Health Resources County Comparison Tool, Health Indicators Warehouse, Texas Department of State Health Services

The most frequent inpatient services for Region 10 in 2011 were obstetrics, internal medicine, cardiology, pulmonology, general surgery and orthopedics, according to Thomson Reuters. The Region’s top outpatient services were laboratory services, internal medicine, physical therapy, diagnostic radiation, psychiatry and pulmonology.

Overall Regional physician demand is projected to increase by 30% over the five-year Waiver period. Demand for various specialties and types of providers is projected to increase anywhere from 22% to 36%, according to Thomson Reuters. The greatest demand increases are expected for obstetrics/gynecology, vascular medicine, cardiology, oncology/hematology and nephrology (See Appendix D-2.1: for a table of Provider Supply and Demand by Specialty).

Medically Underserved Areas and Health Professional Shortage Areas
Five of Region 10’s counties – including Tarrant County, the Region’s most populous county – are at least partially designated by the U.S. Health and Human Services Agency as Medically
Underserved Areas (MUAs). Ellis, Erath, Johnson and Navarro are the Region’s other MUA counties.

Four of Region 10’s nine counties are also designated as partial primary care Health Professional Shortage Areas (HPSAs). Additionally, Tarrant, Wise and Ellis Counties are federal dental health professional shortage areas. Perhaps most alarming, all but one of Region 10’s counties are federally designated mental health provider shortage areas (only Johnson County is not a MHPSA). These findings correlate with the Stakeholder Surveys and Providers Readiness Assessments Region 10 conducted as part of RHP plan development (Figure 9).

Source: Region 10 Stakeholder Survey, Health Professional Shortage Areas

**Health Care Infrastructure: Performing Provider Readiness Assessment**

Region 10 RHP created and fielded a readiness assessment tool to assess current health care delivery competencies, capabilities and gaps with relation to integrated care delivery and population health management for all major providers within each county and across the Region. All providers participating in the DSRIP program completed this assessment. Region 10 also asked major health care providers and stakeholders in each Region 10 county not actively participating in DSRIP (e.g., hospitals, MHMRs, medical groups, independent physician associations, public health clinics and ambulance companies) to complete the assessment. Survey respondents assessed and specified gaps and needs in the Region’s health care infrastructure across five domains:

1) Population health management,
2) Provider capacity,
3) Functional patient care teams,
4) Use of health information technology (HIT), and
5) Care coordination abilities.

Figure 10 shows respondents’ assessment of system gaps and needs in each Region 10 County. ("Yes" indicates a gap exists.) We received a total of 15 responses, representing the majority of the Region 10 RHP performing providers.

**Figure 10: Delivery Gaps Identified by the Performing Provider Readiness Assessments, 2012**

Stakeholder Surveys
Region 10 RHP also conducted a stakeholder survey. The stakeholder survey collected qualitative data and feedback on the following:

1) Access to care,
2) Care coordination and
3) Community health.

The Region collected surveys over a period of one month via a Web-based survey tool for a total of 191 stakeholder responses. (See Appendix D-2.2 for a PowerPoint Discussion of Stakeholder Responses and Results).

Access to Care
Most survey respondents agreed that routine hospital services, routine primary/preventive care and routine specialty care were “difficult” to access. Mental/behavioral health care services were identified as the most difficult for low-income patients to access, while emergency services were consistently noted as the least difficult to access. The same access barriers were identified for all types of care:

- Lack of coverage/financial hardship (consistently the most frequently cited barrier);
- Difficulty navigating system/lack of awareness of available resources; and
- Lack of provider capacity.

Care Coordination
Top barriers to effective care coordination (between providers and systems) cited by survey respondents were the complexity of coordination, lack of staff, lack of financial integration, fragmented service systems and practice norms that allow providers to work in silos. Most respondents said they did not believe that low-income patients could:

- Choose and establish a relationship with a primary care provider;
- Access private primary care providers;
- Access community health centers, free clinics or public clinics; and
- Access behavioral/mental health providers.

Community Health
Region 10’s most prevalent conditions are diabetes, obesity, hypertension, heart failure and chronic obstructive pulmonary disease (COPD), survey respondents reported. Survey respondents also reported that the conditions contributing most to preventable hospitalizations in Region 10 are hypertension, uncontrolled diabetes, COPD, congestive heart failure and diabetes short-term complications (in decreasing order of importance). Respondents reported that behavioral health, substance abuse and insufficient access to care were the top issues to target for population health improvement. Respondents reported that Region 10 residents were most likely to get their health education and health information from friends and family, the Internet and their doctor.

**Key Survey Takeaways**
Respondents overwhelmingly listed a lack of coverage and/or financial hardship as the most significant barrier to care for low-income patients. Survey respondent write-in comments also cited an overuse of emergency department services and patient inability to access primary and preventive care (due to difficulty navigating the system and a lack of capacity). Most respondents also indicated that the Region’s primary care providers, hospitals and specialists were not coordinating care effectively.

**Other Major Delivery System Reform Initiatives**
We have identified several federal initiatives in which Region 10 providers participate. The majority of these are related to diabetes, cancer and infectious diseases. One of our participating providers, Baylor Health Systems, collaborates with AHRQ, NCI, and the National Institute of Allergy and Infectious Diseases on vaccine research, and diabetes and health care quality initiatives. Another Region 10 participating provider, The University of North Texas Health Science Center, works with several federal agencies on Alzheimer’s, education and health disparities research. Another Region 10 participating provider, Tarrant County Department of Public Health, is a consortium member of the North Texas Accountable Healthcare Partnership, a recipient of HITECH funds awarded to 12 Regional HIEs in the state of Texas. We will provide in our final and complete RHP Plan submission a comprehensive listing of all participating providers’ federal initiative involvement based on the list specified in the DSRIP Companion Document issued on October 15, 2012. *(See Appendix D-6 for the draft survey questionnaire sent to all Region 10 participating providers to develop a complete list of each provider’s federal initiative participation activities.)*

**KEY HEALTH CHALLENGES**
Population health statistics for Region 10 residents reveal important trends and opportunities for delivery system improvement. The most important of these statistical trends are summarized below. *(See Appendix D-3 for additional information, including summary data tables.)*

**Region 10 RHP Pregnancy and Birth-Related Statistics**
Teen pregnancy increases the risk of poor health outcomes for both young mothers and their children. Pregnancy and delivery negatively impact a teenager’s health both directly and indirectly and often result in long-term negative consequences including increased risk of poverty and low socioeconomic status. Babies born to teen mothers are more likely to be born preterm and/or low birth weight; much of this increased risk is attributable to delayed onset of
prenatal care. For this reason, Healthy People 2020 stresses the importance of responsible sexual behavior to reduce unintended pregnancies and the number of births to adolescent females.

Region 10 fares slightly better than the state overall in its teen pregnancy rate (4.3% versus 4.9%) and the incidence of low birth weight babies (7.2% versus 8.4%). However, Region 10 has a slightly lower rate of early (first trimester) prenatal care than the state overall (58.1% versus 60.1%). Navarro and Somervell Counties have Region 10’s highest teen pregnancy rates (6.2% and 5.4% compared with the Regional average of 4.3%). Navarro and Tarrant Counties have the Region’s highest percentages of low birth weight babies and its lowest rates of early prenatal care.

**Morbidity and Mortality**

Cancer and obesity are Region 10’s most common morbidity factors. Hood and Navarro Counties have the Region’s highest cancer rates. Obesity rates are statistically the same across all nine counties in Region 10 at around 26 to 29 persons per 100,000. Johnson County has the Region’s highest rate of diabetes at 10.0 per 100,000. Tarrant County has the Region’s highest HIV rate, though small sample sizes reduce the precision of county-level HIV statistics across the Region.

Cardiovascular disease is the number one killer in Region 10 (4,931 deaths in 2011). Cancer is Region 10’s second most frequent cause of death (3,668 deaths in 2011). These two causes of death are also the two highest for Texas overall.

**Preventable Hospitalization**

Region 10’s preventable hospitalization rate of 931 per 100,000 persons is lower both than the state’s average of 5,923 per 100,000 and the national average of 1,433 per 100,000. Navarro County’s preventable hospitalization rate is the Region’s highest (17 per 1,000 population), followed by Johnson County (14 per 1,000 population). Region 10’s most prevalent cause of preventable hospitalization is congestive heart failure (195 per 1,000 Medicare enrollees), closely followed by anginas without procedures (190 per 1,000 Medicare enrollees).

**Access to Care**

County Health Ranking surveys place difficulties in accessing care due to lack of insurance coverage at the top of health care problems. Although the county-level information is difficult to interpret with certainty because of variations in county response levels, it appears that Johnson and Ellis Counties reported the greatest access problems throughout the Region (Figure 11).

Overall Region 10 performs at or slightly better than the rest of the state in providing diabetes and mammography screenings. Within the Region, Wise County and Navarro County have the lowest screening levels for diabetes and mammography and are below both state and national average screening rates. Wise County’s diabetes screening rate is 76%, compared with the statewide and national rates of 84% and 80%, respectively. Navarro County has the Region’s lowest mammography screening rate at 55%, compared with statewide and national rates of 60% and 59%, respectively.

*Figure 11: Utilization of Health Services, 2011*
Communicable Diseases

In general, Region 10 has lower rates of communicable disease than the rest of the state, although prevalence rates for Region 10’s Somervell County are statistically questionable because of its small population size. Specifically, Region 10 has lower AIDS rates (3.4), tuberculosis rates (2.3) and whooping cough rates (10.3) than the state. However, Region 10 has a much higher rate for chicken pox infections (26.3%) versus the overall rate in Texas of 17.9%. Tarrant County has the Region’s highest TB infection rate. Johnson, Navarro and Tarrant Counties have the Region’s highest rates of AIDS infections (6.1, 7.9 and 6.1, respectively). Hood County had the Region’s highest chicken pox and whooping cough infections.

Sexually Transmitted Diseases

Region 10 generally has lower reported sexually transmitted disease rates (STDs) than the overall state rates. Region 10 has lower rates of syphilis (2.7 versus 4.9 per 100,000) and gonorrhea (99.0 versus 504.1 per 100,000) than the state overall. Conversely, Region 10 has a higher rate of chlamydia infections than the state overall (533.7 versus 467.3 per 100,000).

Ellis County had the Region’s highest infection rates for syphilis, gonorrhea and chlamydia. Ellis and Tarrant Counties had the Region’s highest syphilis infection rates (10 and 8.3 respectively). However, these rates are still significantly lower than the national average. Ellis, Navarro and Tarrant Counties have the Region’s highest gonorrhea infection rates (504.1, 141.4 and 139.0, respectively). Ellis County also had a chlamydia infection rate roughly five times higher than the rest of the Region.

Health Outcomes

As previously noted, county-specific health outcomes are difficult to assess because of small sample sizes in a few counties (Somervell and Navarro). However, the County Health Rankings data set indicates that Region 10’s population self-reported having fewer poor or fair health days than the rest of the state (17% versus 19%). Johnson County has the Region’s highest percentage of respondents reporting poor or fair health and the highest reported levels of poor mental health days. Hood County respondents have the Region’s highest reported number of poor physical health days.
Health Behaviors
The Region’s top identified health behaviors negatively impacting and influencing health outcomes are adult obesity (30%) and physical inactivity (28%). These behaviors are followed by smoking (19%) and excessive drinking (15%). Counties appeared to have fairly comparable levels for these behaviors. Johnson County had the Region’s highest rates for nearly all harmful health behaviors: adult smoking, adult obesity, physical inactivity and excessive drinking. Navarro, Parker and Wise also had slightly higher adult obesity rates than the state (See County Health Rankings).

Access to Healthy Foods
The Region fares slightly better than the state overall in terms of access to healthy foods in poor communities (10% versus 12%). Residents in Ellis and Johnson counties have the worst access to healthy foods in poor communities, but their rates are still significantly better than the statewide average. Overall Region 10 has fast food restaurant access rates similar to the statewide average. Johnson County has the Region’s highest percentage of fast food restaurants at 60%.

Conclusions
While on average Region 10 fares as well as or slightly better than the rest of the state on many health need indicators, the poorest and most vulnerable residents of Region 10 live in communities struggling with very significant levels of unmet health care need. Through DSRIP, Region 10 RHP is committed to a revitalized community-oriented Regional health care delivery system focused on the triple aims of improving the experience of care for all patients and their families, improving the health of the Region’s population, and reducing the cost of care without compromising quality with a particular focus on the community health needs of our most vulnerable residents.

SUMMARY TABLE OF COMMUNITY NEEDS
The table below provides a concise summary of the community needs we have outlined in Section III. (See Appendix D for additional detail and contextual data). The DSRIP projects proposed by Region 10 RHP participating providers have been selected to address many of the health care challenges outlined in this CHNA and highlighted in the summary table below.

Section IV. Stakeholder Engagement
SECTION IV. STAKEHOLDER ENGAGEMENT

Region 10 created a two-pronged planning, development and engagement outreach effort for the entire nine-county area. Ongoing collaborative communication between the RHP Anchor, county governments, other IGT entities, and all participating providers was the first major stakeholder engagement focus. This included the development of a formal governance structure, regular meetings, a weekly newsletter, webinars and additional communications as needed. Through this process, unparalleled in the history of the Region, providers and county leaders were able to work as a team to identify, define and develop transformative projects that mesh and collectively address Regional needs. The second major Regional engagement focus was to include and seek input from all Regional stakeholders, including those not directly involved in Regional health care delivery but possessing valuable knowledge and Regional insight to help identify our Region’s highest priority areas of unmet health care need and how best to meet them.

RHP PARTICIPANT ENGAGEMENT

Region 10’s Plan is a blueprint for a transformed population health-oriented Regional health care delivery system in which committed performing providers collaborate more effectively to address pressing Regional health care needs. Our engagement process, facilitated and led by Regional Anchor facility JPS Health Network (JPS), has laid the groundwork for the open communication channels and spirit of collaboration necessary for a modern and coordinated health care delivery system capable of delivering better care at lower cost to all of the Region’s residents, regardless of their ethnicity, income level or insurance status. The Anchor’s RHP team has worked tirelessly to include all Regional providers and ensure that they understand the purpose of the Waiver, as well as the Delivery System Reform Incentive Program (DSRIP), and how they could engage with other county government, other IGT entities and providers to create a cohesive set of DSRIP projects that truly address the Region’s community health needs and overall population health objectives.

Our Region 10 Anchor facility, JPS, is a public hospital authority subject to the Open Meetings Act as well as the Texas Public Information Act. Thus, all RHP activities and committee meetings are by definition open to the public and publicly posted. Additionally, JPS has adapted its own culture of inclusiveness and provider engagement to its role as Anchor entity for the Regional DSRIP program engagement process by ensuring ease of participation for remotely located Regional stakeholders through a standard phone attendance option and the frequent use of online/phone webinars. All RHP information is publicly posted and Web-accessible.1

RHP Governance

Region 10 RHP’s governance structure ensures all stakeholders are part of the plan development process under the leadership of the Anchor entity’s RHP committee chairs. This structure, combined with an unbiased, data-driven assessment of the Region’s health care needs, capacity and capabilities, has allowed stakeholders to gain a clear understanding of the Regional health care system’s strengths and weaknesses rather than focusing only on those of individual provider

1 Texas Government Code Chapter 552
systems. Figure 12 below lists each of the five RHP 10 Committees and the Chairs for each. Figure 13 below is a summary table showing Regional stakeholder representation on each committee as well as the roles of each committee. (See Appendix E-1 for additional relevant committees detail and meeting materials, as well as a calendar listing of all meetings.)

</table>
All Region 10 stakeholders – performing providers, social and health care advocates, and elected officials – were warmly invited and encouraged to attend Region 10’s inaugural RHP meeting in April 2012. The RHP Anchor also reached out individually to leadership at each of the Region’s performing providers and county judges to secure their participation and make them aware of the purposes of DSRIP. During the initial meeting, and all subsequent meetings, Region 10’s RHP team presented stakeholders with detailed presentations of information pertaining to the development of the RHP and DSRIP projects. For stakeholders unable to attend meetings either in person or electronically, the Anchor made all information available through biweekly Finance, Planning and Clinical Quality committee meeting email updates, as well as weekly RHP newsletters.

In addition to these formalized outreach and engagement processes, RHP 10 also provided ongoing individual technical assistance (TA) to performing providers to ensure each performing provider was fully supported in their DSRIP project development efforts. This TA consisted of multiple rounds of electronic and face-to-face feedback on each provider’s projects submitted to the RHP, as well as one-on-one sessions with each provider’s project development team. This extra level of support has been crucial in ensuring that all providers’ projects met specific and evolving Waiver requirements set forth by CMS and HHSC. It also allowed for the provision of extra support to smaller providers with fewer internal project development resources and minimal or no experience in interpreting and responding to federal and state guidance.

In spite of our outreach and engagement efforts, a small number of Region 10 providers have opted out of DSRIP participation. Nonetheless, our planning efforts have been enriched with their input. (See Appendix E-2 for a list of Region 10 providers who have opted not to participate in DSRIP.)

**RHP Steering Committee:**

Region 10 RHP’s steering committee provides leadership and shapes the development of the RHP. Inclusion of leadership from participating performing provider was critical to ensure the commitment of the Region’s major providers. This committee’s responsibilities include educating and informing all stakeholders on the purpose, intent and consequences related to the development and implementation of the RHP plan.

**RHP Elected Officials Committee:**

Region 10’s Elected Officials Committee’s roles and responsibilities are to educate and inform constituencies and stakeholders on the purpose, intent and consequences related to the development and implementation of the Waiver, and facilitate coordination and collaboration among Region 10 stakeholders.

RHP Finance Committee:

The Finance Committee’s roles and responsibilities were to build a detailed, structurally sound and internally consistent budget (for fiscal years 2013 through 2016 of the initial term of the Waiver) that supports the Region 10 RHP plan. Secondarily, the Committee works to educate members on financial aspects of Waiver development, communicate informational requirements, develop consensus on Regional financial principles, and solicit feedback for development of position papers on Waiver financing.

RHP Planning Committee:

In particular, this committee is responsible for providing technical assistance and support to performing providers during project development. Members of this Committee take lead responsibility for coordination with all other Region 10 committees.

RHP Clinical & Quality Committee:

The Clinical Quality Committee’s primary role and responsibility is to ensure that all DSRIP projects meet quality objective standards, are linked to patient-focused outcomes, and fully comply with Waiver quality requirements.

Learning Collaboratives
Region 10 RHP’s ongoing engagement of RHP participants throughout the Waiver extends to our efforts to promote sharing of information, best practices and lessons learned through the development and implementation of learning collaboratives. Many projects in our RHP plan test innovative models of care that move away from episodic treatment toward a more integrated and coordinated approach centered on the patient’s whole-person needs and health outcomes. As the Region’s providers implement improvements, it is important that they learn from each other’s successes and challenges, as well as identify best practices that can be widely replicated. In this way, our collective learning can accelerate transformation. We include a brief mention here in Section IV because we see the learning collaboratives as another form of ongoing stakeholder engagement and inclusion to help bring about realization of the DSRIP program’s objectives.

PUBLIC ENGAGEMENT
Regional Healthcare Partnership

Region 10 RHP engaged the Region beyond its provider community at every step of the RHP development plan process, connecting with each county’s elected officials through emails, phone calls and in-person meetings to ensure they had a firm grasp of the purpose of DSRIP and our process of Regional engagement. County Visioning Sessions open to the general public were conducted for six of the Region’s counties (Ellis, Erath, Somervell, Hood, Navarro, Johnson) to encourage local discourse regarding local health needs and DSRIP project development.

The general public has had an excellent opportunity to be fully engaged in Region 10’s RHP plan development process due to the RHP’s inclusionary policies and processes. Further, the proposed Region 10 Plan and all RHP materials will be posted for public comment and reviewed via a well-advertised public webinar to encourage public discourse and approval.

**Building Local Support**
Region 10’s County Visioning Sessions brought together local leadership, stakeholders and performing providers to discuss local health care needs, resources and gaps in the current delivery system, develop a local vision and goals for health care delivery, and identify potential opportunities for county and Regional collaboration. County elected officials and their staff were asked to support planning and logistics, including identifying a venue, local stakeholders, and providers. The sessions, all of which took place during July 2012, included presentations of data about the county’s needs, delivery system resources and gaps, including findings from the Stakeholder Surveys, the County Community Health Needs Assessment, and the Performing Provider Readiness Assessments. These sessions also included facilitated discussions to identify county-specific health care delivery system visions.

**Public Review of the RHP Plan**
The Planning Committee released the Region 10 RHP Pass 1 plan for public comment on November 2, 2012. The final RHP plan was posted online on December 6, 2012. Both plans were made publicly available on the Anchor’s website for a week and were shared via email with all of Region 10’s county elected officials, other participating IGT entities and performing providers.

Region 10 also conducted two public webinars on November 7, 2012 and December 12, 2012 to provide the public with an opportunity to engage in a dialogue around the RHP plan. These webinars included an overview of the 1115 Waiver, a description of the RHP development process and a presentation of projects with their associated outcomes. Public comments were accepted until December 14, 2012 and incorporated into the final plan.

**Ongoing Stakeholder and Public Engagement**
The Region 10 RHP Committees will continue to convene formally on at least a quarterly basis throughout the Waiver period to discuss updates and issues in Waiver implementation, in addition to engaging providers through other activities such as Learning Collaboratives. The RHP team will also send out weekly or monthly newsletters and quarterly reports to all Regional stakeholders (including performing providers and their affiliates, county officials, IGT entities, consumer advocates, and all other interested community members).
Section V. DSRIP Projects
SECTION V. DSRIP PROJECTS

A. RHP PLAN DEVELOPMENT

Region 10 RHP’S approach to developing DSRIP projects incorporated all guidance from HHSC and CMS. Specifically, our approach consisted of:

1. Identifying community needs by engaging all Regional stakeholders and developing Regional goals that focused on Regional transformation through integration and provider collaboration;
2. Sharing this information with performing providers to ensure they proposed and developed projects based on Regional needs and goals, with a particular focus on Medicaid and indigent population needs;
3. Working with performing providers to ensure that all projects were selected from the options provided in the RHP Planning Protocol;
4. Confirming that performing providers integrated each of the project categories in their efforts and valued each project based on their linked Category 3 outcome(s) and the value those outcomes have for the community (see Subsection B on Project Valuation);
5. Ensuring all projects chosen by performing providers and their respective IGT entities were properly compiled into the RHP plan; and,
6. Ensuring each project was evaluated for Pass 1 inclusion consistent with the guidance of Section IV of the Program Funding and Mechanics Protocol (including successfully completed electronic workbooks).

This process continues to be refined iteratively as the RHP receives further guidance from HHSC and CMS.

Identifying Community Needs and Developing Regional Goals

Region 10 RHP identified community health needs for the Region and specific counties in the Region through extensive primary and secondary data collection efforts (described in more detail in the Methodology subsection of Section III). We organized the findings into a Community Health Needs Assessment that enabled providers to select from among the identified community need priorities and develop projects designed to address those needs. (Please see Section III for more information about the Region’s health needs, including a Summary Table of Community Health Needs for Region 10.)

Region 10 RHP’s Pass 1, 2 and 3 projects address four different types of community needs: Capacity, Access, Delivery Transformation, and Population Health (Figure 14).

1. **Capacity Needs.** Critical Regional needs in this category are to expand access to primary care, high demand specialty care, and behavioral health services.
This includes projects that allow entities to have more providers, reach out to more patients and ensure more available services.

2. **Access Needs.** Critical Regional access needs hinge on developing access to a comprehensive set of services that improves the physical, mental and social health of all the population in Region 10, regardless of insurance status, ethnicity, and income.

   - This includes developing strategies to address geographic barriers, including strategies focused on integrating mental health care into primary care settings.

3. **Delivery Transformation Needs.** System transformation will require ongoing engagement of providers across the Region to ensure improved coordination and communication to better serve patients and families.

   - This category includes projects that enable providers to work together creatively across the Region to achieve an integrated Regional care delivery system.

4. **Population Health Needs.** Addressing population health needs will require health education programs that target and appropriately engage Region 10’s residents.

   - This includes creating policies and programs to engage and educate all persons living in Region 10 about how health behavior and lifestyle choices affect health status, and the role each individual plays in managing and improving their health and that of their children.

**Figure 14: Categories of Identified Community Health Need**

- **Capacity**
  - Needs related to increasing the Region’s delivery capacity to serve more patients more quickly

- **Access**
  - Needs related to reducing or eliminating geographic barriers to access

- **Delivery Transformation**
  - Needs related to implementing new processes, care transition pathways and evidence-based practices

- **Population Health**
  - Public health needs requiring a Regional commitment beyond the scope of any single clinical provider
To engage all stakeholders in developing these Regional goals and the subsequent Regional plan, the RHP shared the Community Health Needs Assessment findings with performing providers, IGT entities, stakeholders and the public through RHP committee meetings, posting online, and County Visioning Sessions held in participating counties (Please refer to Section IV for additional detail).

**Developing and Valuing Region 10 projects**
Region 10 RHP used an iterative, hands-on approach to support performing providers and IGT entities in developing and valuing Region 10 DSRIP projects. This effort included the dissemination of information, development of shared tools and templates, and ongoing one-on-one assistance to performing providers and their project teams. (See Appendix F for a timeline of actions taken by Region 10 RHP to support DSRIP project development).

Region 10 developed and shared a number of tools, including sample projects and project templates, to assist providers in developing appropriately targeted and valuable projects. The RHP team also provided numerous tools, such as crosswalks and summary tables of the DSRIP Planning protocol, to make it easy for providers to select project options and the appropriate related milestones and metrics. (Section III provides a more detailed description of tools developed for providers to assist them in identifying community needs and understanding project options).

The RHP team worked with providers one on one as requested through office hours, by phone and via email, serving as a central point to disseminate state protocols and information to all providers on a rolling basis. This ensured that all providers and stakeholders remain engaged in the process and received up-to-date guidance from HHSC and CMS. During the Pass 1, 2 and 3 project finalization phases, the RHP team provided another round of review and technical assistance for editing, formatting and collating projects and assisting with electronic workbook completion.

**DSRIP Project Selection and Compilation**
DSRIP projects were evaluated multiple times by the Region to ensure adherence to Section VI of the Program Funding and Mechanics Protocol. Given the large number of participants in Region 10, the number of projects exceeded the requirements of projects and allowed the Region 10 RHP to give providers flexibility in their valuation and how many projects they wanted to pursue.

Region 10 RHP recognized that each IGT entity had autonomy over the decision of whether or not to fund eligible projects. Therefore, the RHP worked to guide IGT entities and performing providers to select projects that met DSRIP guidance but did not interfere with IGT decision-making. Rather, the RHP encouraged each IGT entity to take the following factors into account:

- **High value for patients.** Does this project improve the patient experience, quality of care and outcomes for your patient population?

- **Meet the triple aim.** What is the project’s relative impact on health care services in Region 10 and does it meet CMS’s triple aim objectives?
• **Increase access to underserved populations.** What is the project’s impact on various underserved populations, particularly the medically indigent and/or Medicaid populations?

• **Project design.** Is the project well-conceived and are the following components well-defined?
  - Population
  - Reasonableness of outcome
  - Specified core components
  - Is Continuous quality improvement
  - Project significance
  - Project effort level
  - Resource adequacy
  - Relevance to achieving Regional transformation goals
  - Previous funding through another federal initiative

• **Meets an identified Region 10 community health need.** Does the project address an identified priority community health need?

• **Return on investment.** In areas with more projects than available IGT, consider:
  - The relative impact of IGT commitment compared with other potential projects; and,
  - The per capita amount of IGT required (population impacted/IGT required).

• **Other considerations.** IGT entities and performing providers were also urged to consider other aspects of project eligibility:
  - Would this project be undertaken even without DSRIP dollars?
  - Size of facility/resources available to performing provider – are there stretch goals in the proposed outcomes?
  - Perceived public opinion/need for this project in your community?

Providers worked with their IGT entities to select Pass 1, 2 and 3 projects. Projects that were chosen were then compiled and incorporated into the RHP plan. Projects not chosen that were incomplete or not fully developed were sent back to performing providers. As part of the RHP’s ongoing commitment to engagement and transparency, the RHP developed a draft plan which included Pass 1 projects that was publicly posted on the Anchor website from November 2 through 9, 2012, as well as widely disseminated to RHP participants. Written comments from both the public and from RHP participants were highly encouraged. In addition, the RHP held a webinar on November 7, 2012, open to the public, to share the draft plan and to collect further feedback. This webinar was recorded and the recording made publicly available online. All comments received were reviewed and incorporated into the RHP plan as appropriate.

Pass 2 and 3 allowed the providers to develop and have projects funded that were not ready or chosen during Pass 1. It also allowed the IGT entity to allocate funds to providers who were not
eligible during Pass 1. Pass 2 and 3 projects were developed, valued and final selection made using the same processes described above.

Pass 3b was offered to participating providers of Region 10 in response to the identification of three potential collaboration projects. In addition, providers were allowed to resubmit projects previously proposed but not selected due to a lack of interest, support, or IGT funding. No additional projects were proposed; the three collaborative projects were resubmitted as non-collaborative projects and funding in pass 3b.

**Category 4 Exemptions in Region 10**
Region 10 does not have any hospital providers that fall under the exemption for Category 4 reporting specified in Attachment J, paragraph 11.f of the Program Funding and Mechanics Protocol. However, Wise Regional Hospital and Glen Rose Medical Center may be exempt from certain measures under various domains due to small sample sizes.

**Projects and Project Requirements for Region 10 (Tier 2)**
Region 10 RHP is a Tier 2 Region, and thus is required to have at least 12 Category 1 and 2 projects, with a minimum of six of those 12 projects falling under Category 2. The providers in this Region, after the extensive development and review process outlined above, fully developed and submitted - 112 Category 1 and 2 projects that are linked to 207 - Category 3 outcomes.

These -112 projects do not include the additional Category 1 and 2 projects that were considered by performing providers and their respective IGT entities, but not chosen. *(See Appendix B for a list of all projects, including those considered but not chosen.)*
PROJECT VALUATION (SECTION V.B)

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project.

As a start to developing the valuation process, the Region determined that outcome values should be based on an interpretation of the triple aim goals:

- Improving the experience of care
- Improving the health of populations
- Reducing per capita costs of health care

Therefore, Region 10 considered three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the health care system. For valuing the patient experience, a value was chosen and providers then rated how achieving the outcome would impact a patient’s experience in life. Providers were advised to consider factors such as earning potential, transportation requirements, emotional and financial burden on caregivers, and quality and length of life. From this, a patient experience valuation for achieving the outcome was computed in a model.

In order to value improving the health of populations, a model was built that employed a similar methodology to the one above in that it asked providers to rate how achieving the outcome would impact the community. Factors considered were lost productivity, including work absence and work participation, community safety, and reduction to societal burden (e.g., Medicaid, welfare). From this rating, a valuation of improvement to the community was computed for achieving the outcome.

The final component of the triple aim is reducing health care costs. A matrix was built that listed health care pricing factors for the outcomes chosen by performing providers and the matrix was populated with valuation numbers. For example, an inpatient admission was valued using data collected by the State of Texas. Providers multiplied the valuation amount by the number of lives impacted as a result of a successful outcome to compute the health care cost component of value.

In order to determine how to calculate the ultimate valuation, performing providers then considered the goals and structure of the Waiver. The Waiver’s stated goal is to transform Texas’ health care delivery system. To achieve a further goal of accelerating transformation, Region 10 concluded the Waiver was designed to create significant incentives over a relatively short time period. Accordingly, the Waiver was structured to reward providers for making investments in new/improved delivery systems through Categories 1 and 2 projects. Category 3 was ultimately structured to provide a bonus for achieving results through the investments made.

Performing providers determined an appropriate incentive for an accelerated reform process would involve a multiplier of the total annual value of the benefits provided to the patient, to the
community and to the health care system. Through discussions, performing providers also concluded the value provided by a project will usually extend beyond the population included in the direct activity of the project (the “halo effect”).

The model developed by Region 10 uses a valuation for each factor of the triple aim and aggregates the annual benefit related to each Category 3 outcome for each project. Performing providers decided a five-year multiplier was needed to provide a significant incentive. The Region also chose a general 30% impact related to the halo effect.

Once the Region 10 model calculates the value of Category 3 outcomes, it then assigns prices to the Category 1 or 2 project and to the related Category 3 outcome. It assigns prices for each year’s metrics, milestones, and performance outcomes based on the individual provider’s choice from the range of percentages assigned to each category by the Project Funding and Mechanics Protocol.

Because the model computes value as a result of the outcomes on a per patient basis, it automatically adjusts for the size of the provider and the population impacted by a project. Accordingly, while similar projects may have different values, the variation in many cases will be directly related to population differences.

Similar projects may also have different values based on the provider’s choice of the number of Category 3 outcomes, as well as the actual outcomes chosen. More Category 3 outcomes will result in additional value identified for the project, and different outcomes will have different associated values.

Finally, while similar projects may have similar values, they could still have different prices reported for DSRIP purposes. In some cases, valuations were larger than a provider’s DSRIP allocation. Providers then made decisions to “discount” the valuations to a reduced price in order to include the project in the Region’s plan.

While a model was developed by the Anchor for use by all providers, it was also possible for providers to compute a valuation with other models. Some larger providers employed health economists and created more complex computations. In order to simplify valuation, some providers may have decided not to use all possible value factors that could be applied to a given outcome. However, all Region 10 providers used the same general concept of economic value assigned to outcomes developed at the Regional level.
Category 1: Infrastructure Development
Project Summary

Project Option – 1.1.1 – Establish more primary care clinics (Develop one additional Cook Children’s pediatric neighborhood clinic in an identified area of need.)

Unique Project ID: 021184901.1.1
Performing Provider Name/TPI: Cook Children’s Medical Center / 021184901

Provider: Cook Children’s Health Care System is the country's leading integrated pediatric health care delivery network. Based in Fort Worth, Texas, the not-for-profit organization includes a Medical Center (448 beds), Physician Network (297 pediatric specialists), Northeast Hospital, Pediatric Surgery Center, Home Health company, Health Plan (105,000 Medicaid and CHIP covered lives) and Health Foundation. The System has a six-county primary service area that represents 86% of its total volume covering 4,711 miles². It also provides tertiary and quaternary pediatric medical care to 122 counties in west and north central Texas, covering 257,086 miles² and to out-of-state patients. The system has more than 1 million patient encounters per year across the continuum of pediatric care. Cook Children’s Health Plan covers 105,000 Medicaid and CHIP lives within the Tarrant Service Area. The System provided $3.1 million in true charity care in 2011. 57.4% of the System’s patient care is provided to Medicaid, Medicaid Managed Care and CHIP beneficiaries.

Intervention: This project establishes another pediatric primary care clinic in an area where 42% of the families are below 200% of the Federal Poverty Level – specifically to establish a pediatric medical home and provide an alternative to the use of inappropriate sites for primary pediatric care [e.g., ERs]. If approved, this expands the network of Cook Children’s pediatric neighborhood clinics by 1, from 5 sites to 6 sites.

Need for the project: Cook Children’s already self-funds five neighborhood pediatric clinics and zip code 76119 [Forest Hill section of SE Fort Worth] is demonstrably the next most needy / underserved area for pediatric primary care, that demonstrates the highest use of the ER for pediatric primary care services and has a large enough patient population to support an additional clinic. CMS funding would allow a sixth clinic to be built.

Target population: Children ages 0 – 14 who live in zip code 76119 – a total of 12,445 children expected to grow to 13,699 by 2016. The estimated number of children served over the course of the waiver is 6,220 – 6,850 who previously had no pediatric primary care medical home. This project increases a Medicaid / uninsured population of children’s access to pediatric primary care, reducing the use of the ER for primary care, lowering the cost of care and improving their overall health.

Expected patient benefits: Cook Children’s expects to build a new clinic building, hire and train physicians and staff to provide pediatric primary care to the children in zip code 76119. By establishing a pediatric medical home, these children’s families will reduce their use of the ER for pediatric primary care.
Project Option – 1.1.1 – Establish more primary care clinics (Develop one additional Cook Children’s pediatric neighborhood clinic in an identified area of need.)

**Unique Project ID:** 021184901.1.1  
**Performing Provider Name/TPI:** Cook Children’s Medical Center / 021184901

**Project Description:**
A Cook Children’s pediatric neighborhood clinic is a freestanding pediatric practice built in a neighborhood identified as having inadequate access to primary care for children. The practice is staffed with doctors and other clinical and support staff to help maintain health and promote healing for children from birth through the teen years, including well-child examinations, vaccines, sick visits, behavior problems and learning disorders. If a child has a chronic illness, the clinic provides a medical home to coordinate complex care among other Cook Children’s providers. Ninety-two percent of Cook Children’s Pediatric Neighborhood Clinic patients are Medicaid beneficiaries.\(^2\)

The specific geographic area of need has been identified in a separate analysis. ZIP code 76119 located in the Forest Hill section of Southeast Fort Worth (inside the 820 Loop) was identified as having the greatest quantifiable community need for improved access to primary care that also has sufficient population to support a new practice. Thus, the project begins with locating a site within that designated area and continuing through construction. The building’s design/development is based upon detailed construction documents and certificate of occupancy.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The purpose of this project is to expand primary care and medical home access to an identified population that is currently underserved and achieve the following goals:

1. Expand pediatric primary care capacity by constructing a new primary care clinic;  
2. Expand primary care providers by hiring physician, nursing and support staff; and,  
3. Reduce the burden of providing primary care in potentially inappropriate settings.

This project meets the following Regional goals:
This project meets a number of Regional goals which are aligned with the goals of the Waiver and CMS’ triple aim. Specifically, by adding one additional neighborhood clinic, this project will improve the health of children in the designated area, which in turn improves their quality of life and ability to reach their full potential in the community. In addition, providing appropriate

primary care in the appropriate setting will improve health outcomes while lowering health care cost for the Region due to decreased emergency department use for primary care.

**Challenges:**
Twelve percent of children in families whose household income falls below 200% of the federal poverty level and who live in five of the Region 10 counties do not have a primary care doctor. That makes them 3.0 times less likely to have a medical home. Nineteen percent of these parents report it is 2.1 times more difficult to access primary care services than the general population. This produces a population of children who are 2.4 times less likely to have seen a doctor or health care professional in the past year and 4.3 times less likely to have received all the medical care needed.³ There is a clearly defined need for improved access to primary care for these children.

**5-Year Expected Outcome for Provider and Patients:**
Expand pediatric primary care capacity and providers for an estimated 26,480 pediatric primary care visits over three years through a new pediatric clinic facility constructed in an identified underserved area. There will be a demonstrable decrease in the use of Cook Children’s Medical Center Emergency Department for primary care by patients who reside within this underserved area. This is based upon Cook Children’s experience between 2005 and 2011 where the ratio of ED visits and pediatric neighborhood clinic [NHC] visits was 80% ED and 20% NHC in 2005. With five pediatric NHCs operational in 2011 that ratio is now 56% ED and 44% NHC.

**Starting Point/Baseline:**
Establishing a new pediatric primary care practice site begins with locating a site within that designated area, constructing the clinic building, staffing and opening the clinic and sustaining operations.

To operationalize the clinic, new providers and support staff will be hired and trained prior to opening in order to successfully sustain operations. The average Cook Children’s pediatric neighborhood clinic is staffed by four providers, eight clinical support staff and six nonclinical support staff – 18 total staff members.

Based upon historical data of the first 12 months of operation and subsequent growth from five-previous pediatric neighborhood clinic operations in demographically similar neighborhoods identified based on need, internal quarterly operations reports: once open, the pediatric neighborhood clinic should see approximately 8,000 patient visits in its first 12 months of

---

³*Comparative Health Access Issues for Children 0 – 14
Denton, Hood, Johnson, Parker, Tarrant and Wise Counties Texas*

Community-wide Children's Health Assessment and Planning Survey [CCHAPS]: “2008 Parent Survey Report.”
operation, grow at a rate of 10% per year and peak at 9,680 patient visits in the last year of the Waiver period.

**Rationale:**
Cook Children’s has more than seven years of experience starting and sustaining pediatric neighborhood clinics, presently operating five locations inside the 820 Loop in Fort Worth, Texas. A specific study of was conducted in February, 2012 to quantitatively identify the zip code with the greatest community need for improved primary care access. The criteria used were: the ZIP codes with the greatest population of families with children, whose median household income was at or below 100% of the federal poverty level, and whose use of the emergency department for primary care was the greatest. Sociocultural factors were also examined. ZIP code 76119, located in the Forest Hill section of Southeast Fort Worth (inside the 820 Loop), was identified as having the greatest quantifiable community need for improved access to primary care that also has sufficient population to support a new practice. ZIP code 76119 has an ages 0-14 aged population of 12,445 and is expected to grow to 13,699 by 2016 (a 9.8% growth rate over five years). In 24.6% of the households, the an annual income is below $15,000. In 17.6% of households income is between $15,000 and $25,000 – compared to the U.S. averages of 12.9% and 10.8%, respectively. Depending upon family size, this suggests that 42.0% of these families are below 200% of the federal poverty level. Demographically, 46.1% of the population is Black – Non-Hispanic and 38.7% Hispanic.

A significant portion of the population ages 0-14 years will make the Cook Children’s pediatric neighborhood clinic their medical home, improving their access to primary and preventive care, increasing the likelihood a child will see a pediatrician every 12 months, receiving the medical care needed, and reducing their dependence on the emergency department as a source of primary care.

**Project Components:**
While no core components are required, the core activities for the project include (1) construction, (2) hiring and training provider and support staff, (3) incrementally increasing the number of pediatric primary care visit in the selected area and (4) reducing the burden on hospital emergency departments to provide pediatric primary care.
By adding a new primary care practice within a neighborhood that has an identified need, the number of pediatric primary care clinic is expanded by one, the number of primary care providers are increased by 4 (3 pediatric, primary care physicians and 1 pediatric nurse practitioner, plus an additional 14 non-physician staff, providing jobs within the neighborhood served, increasing the number of pediatric primary care visits in an appropriate setting by an

5 Thomson Reuters – Claritas Demographic Expert 2.7.
estimated 10,000 visits annually and reducing the burden of providing primary care in otherwise potentially inappropriate sites of care.

Unique community need identification numbers the project addresses:
- CN.1 – Lack of provider capacity
- CN.10 – Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The concept of the medical home has evolved since introduction of the terminology by the American Academy of Pediatrics in 1967, which was envisioned at the time as a central source for all the medical information about a child. That evolution has placed the medical home model as the universally acknowledged best practice for improving access to primary and preventive care for children, both of which will be expanded and enhanced by this project.

Related Category 3 Outcome Measures:
IT-9.2 ED appropriate utilization.

Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:
The new pediatric neighborhood primary care clinic will provide a primary care medical home for children ages 0-14 who live in ZIP 76119 reducing the number of inappropriate visits to the Cook Children’s Medical Center emergency department.

Numerator: The number of visits to the Cook Children’s pediatric neighborhood clinic whose residents have a 76119 ZIP code.
Denominator: The number of visits to the Cook Children’s ED with a triage level of 4 or 5, i.e., primary care for children ages 0 -14 who live in ZIP code 76119.

Improvement target: The ratio of NHC visits to ED visit for primary care will show a ratio>1.0 which improves by 10% per year for each demonstration year

Relationship to Other Projects:
RHP Project ID: 021184901.1.2 Establish more primary care clinics (Develop one additional pediatric urgent care center to provide after-hours care)
RHP Project ID: 021184901.1.3 Establish more primary care clinics (Develop a new pediatric dental clinic)

Beyond a pediatric primary care practice, there are other related primary care services that can complement that practice such as after-hours urgent care and dental care.

Related Category 4 Population-focused improvements:

1. Potentially preventable admissions,
   a. Bacterial pneumonia immunization – pediatric primary care is the best site to assure children receive immunization appropriate for their age.
   b. Influenza immunization – pediatric primary care is the best site to assure children receive immunization appropriate for their age.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Valuation assumes the NHC will enroll 6,000 pediatric patients in the 76119 ZIP code that are at high-risk for lack of primary care services. The project forecasts an inverse relationship between ED visits and primary care visits, with a forecasted 10% decrease in ED visits per year from 76119, once the clinic is established. Annual pediatric emergency department visits from 76119 are 1,700 visits per year. The result of the decrease in ED visits also assumes a corresponding decrease in Medicaid and/or other governmental funding sources for high-cost services in the ED. The cost per ED visit, established by the Region 10 Anchor hospital, is $1,200 per visit. The project also assumes that increased access to primary care results in decreased hospital admissions. Cook Children’s currently experiences an 11.4% ED admit rate. On average, a Cook Children’s pediatric admission costs $28,475.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $9,858,155
**Project Summary**

**Project Option 1.1.1** – Expand Primary Care Capacity [Develop one additional Cook Children’s pediatric urgent care clinic]

**Unique Project ID:** 021184901.1.2  
**Performing Provider Name/TPI:** Cook Children’s Medical Center / 021184901

**Provider:** Cook Children's Health Care System is the country's leading integrated pediatric health care delivery network. Based in Fort Worth, Texas, the not-for-profit organization includes a Medical Center (448 beds), Physician Network (297 pediatric specialists), Northeast Hospital, Pediatric Surgery Center, Home Health company, Health Plan (105,000 Medicaid and CHIP covered lives) and Health Foundation. The System has a six-county primary service area that represents 86% of its total volume covering 4,711 miles². It also provides tertiary and quaternary pediatric medical care to 122 counties in west and north central Texas, covering 257,086 miles² and to out-of-state patients. The system has more than 1 million patient encounters per year across the continuum of pediatric care. Cook Children’s Health Plan covers 105,000 Medicaid and CHIP lives within the Tarrant Service Area. The System provided $3.1 million in true charity care in 2011. 57.4% of the System’s patient care is provided to Medicaid, Medicaid Managed Care and CHIP beneficiaries.

**Intervention:** This project establishes another pediatric urgent care clinic in an area where 14% of the families, regardless of household income rate access to urgent care as “difficult.” At the same time 40% of visits to the Cook Children’s Medical Center ER have an initial care assessment of non-emergent or urgent. This project seeks to reduce the use of inappropriate, and arguably more costly, sites of care for pediatric urgent care [e.g., ERs]. If approved, this expands the network of Cook Children’s urgent care clinics by 1, from 2 sites to 3 sites.

**Need for the project:** Cook Children’s already self-funds two pediatric urgent care clinics. A specific location will be determined from a demonstrated need in combination with the highest use of the ER for pediatric urgent care services to be conducted in demonstration year 2. CMS funding would allow a third urgent care clinic to be built.

**Target population:** Children ages 0 – 14 who live in some yet to be determined part of Tarrant County where the population is 424,416 children and is expected to grow to 4664,102 by 2016. The estimated number of children served over the course of the waiver is reflected by and estimated 16,800 patient visits in demonstration years 4 and 5. This project increases a Medicaid / uninsured population of children’s access to pediatric urgent care, reducing the use of the ER for urgent care, lowering the cost of care and improving their overall health.

**Expected patient benefit:** Cook Children’s expects to build a new clinic building, hire and train physicians and staff to provide pediatric urgent care to the children in a yet to be determined part of Tarrant County so children’s families will reduce their use of the ER for pediatric urgent care.
Project Option 1.1.1 – Expand Primary Care Capacity [Develop one additional Cook Children’s pediatric urgent care clinic]

**Unique Project ID:** 021184901.1.2  
**Performing Provider Name/TPI:** Cook Children’s Medical Center / 021184901

**Project Description:**  
Cook Children’s currently operates two pediatric urgent care clinics which are freestanding pediatric practices that see children with one-time urgent needs when their regular doctor isn’t available. Urgent care services include: tummy ache, fever, bone fractures, sprains, burns, cuts, sports injury, minor accidents, rash, insect bites, minor animal bites or scratches, asthma, allergy, bronchitis, croup, colds, flu, sore throat, strep throat, foreign object removal (marbles, peas, beans and other interesting things), anything that makes mom or dad worry.

A third Cook Children’s pediatric urgent care clinic will be built in an area yet to be determined based upon the need defined by that area’s use of the Cook Children’s ED as a source of primary and urgent care after regular physician offices are closed or otherwise inaccessible. In addition to the underserved, the designated target population will include children whose families are Medicaid and CHIP eligible.

**Goals and Relationship to Regional Goals:**

**Project Goals:**  
Based upon the findings of the 2008 Community-wide Children’s Health Assessment and Planning Survey, parents rate access to pediatric urgent care services the next highest priority behind pediatric primary and preventive care.7

The purpose of this project is to expand pediatric urgent care access to a population that is currently underserved and achieve the following goals:

- Expand pediatric urgent care capacity by constructing a new urgent care clinic;
- Expand urgent care providers by hiring physician, nursing and support staff; and,
- Reduce the burden of providing urgent care in potentially inappropriate settings.

This project meets the following Regional goals:
This project meets a number of Regional goals, which are aligned with the goals of the Waiver and CMS’ triple aim. Specifically, by adding one additional urgent care clinic, this project will improve the health of children in the designated area, which in turn improves their quality of life and ability to reach their full potential in the community. In addition, providing appropriate

---

urgent care in the appropriate setting will improve health outcomes while lowering health care cost for the Region due to decreased emergency department use for urgent care.

By adding a new pediatric urgent care clinic within an area that has an identified need, the number of primary care/urgent care medical providers is increased – including non-physician staff, providing jobs within the neighborhood served, and reducing the burden of providing urgent care in otherwise potentially inappropriate sites of care.

**Challenges:**
Regardless of household income, 14% of children in families who live in five of the Region 10 counties rank access to urgent care as difficult.\(^8\) At the same time, 40% of the visits to the Cook Children’s Medical Center emergency department have an initial care assessment of non-emergent or urgent.\(^9\) These care levels suggest that a more appropriate site of care is a pediatric primary care office or a pediatric urgent care clinic.

**5-Year Expected Outcome for Provider and Patients:**
The pediatric urgent care clinic is in the early phase of design development. It still requires site selection, property acquisition and construction which will not be completed until the latter part of demonstration year 2. As totally new construction, the pediatric urgent care will not begin seeing its first patients until demonstration year 4.

**Starting Point/Baseline:**
Based upon historical data of the first 12 months of operation and subsequent growth from previous pediatric urgent care clinics, the new pediatric urgent care clinic is expected to follow the same growth in patient visits as other UCCs in the Cook System—approximately 8,000 patient visits in the first 12 months of operation and growth rate of 10% per year for a total of 16,800 urgent care visits in the last two years of the Waiver period.

**Rationale:**
Cook Children’s has more than seven years of experience starting and sustaining pediatric urgent care centers, presently operating two within Tarrant County.

Tarrant County is identified as having the greatest quantifiable community need for improved access to pediatric urgent care that also has sufficient population to support additional and new Service. Tarrant County has an ages 0-14 population of 424,416 which is expected to grow to 464,102 by 2016 (a 9.4% growth rate over five years). Twenty-four percent of the households have an annual income below $25,000 and another 17.6% between $15,000 and $25,000 –

\(^8\) "Comparative Health Access Issues for Children 0 -14 Denton, Hood, Johnson, Parker, Tarrant and Wise Counties Texas"
\(^9\) Community-wide Children’s Health Assessment and Planning Survey [CCHAPS]: “2008 Parent Survey Report.”
compared to the U.S. averages of 12.9% and 10.8% respectively. Depending upon family size, this suggests that 42.0% of these families are below 200% of the federal poverty level. Demographically, 13.6% of the population is Black – Non-Hispanic and 29.6% Hispanic.\textsuperscript{10}

Those seeking pediatric urgent care approximate the same payer mix as those seeking care in the Cook Children’s Medical Center emergency department – 64.7% government payer, which is overwhelmingly Medicaid.\textsuperscript{11}

**Project Components:**
While no core components are required, the core activities for the project include (1) construction, (2) hiring and training provider and support staff, (3) incrementally increasing the number of pediatric urgent care visit in Tarrant County and (4) reducing the burden on hospital emergency departments to provide pediatric urgent care.

By adding a new pediatric urgent care practice in an area that has an identified need, the number of pediatric urgent care clinics is expanded by one, the number of urgent care providers are increased by seven pediatric, urgent care physicians, plus an additional 21 non-physician staff, providing jobs within the area served, increasing the number of pediatric urgent care visits in an appropriate setting by an estimated 10,000 visits annually and reducing the burden of providing urgent care in otherwise potentially inappropriate sites of care.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.10 – Overuse of emergency department (ED) services

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The proliferation of freestanding urgent care centers speaks to the concept’s universal acceptance as a best-practice. By applying this standard to children’s urgent care access for children will improve.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

\textit{IT-9.2 ED appropriate utilization.}

\textsuperscript{10} Thomson Reuters – Claritas Demographic Expert 2.7 and the North Texas Council of Government Tarrant 2010 Report.

\textsuperscript{11} Cook Children’s internal document: “CCMC Payer Mix by Patient Type, calendar year to date at June 30, 2012.”
The new pediatric urgent care clinic will provide a service for children ages 0-14 when their regular physician is not available thereby reducing the number of inappropriate visits to the Cook Children’s Medical Center emergency department.

Numerator: The number of visits to the Cook Children’s pediatric urgent care clinic whose residence is in the identified service area – to be determined in DY2.
Denominator: The number of visits to the Cook Children’s ED with a triage level of 4 or 5, i.e., primary care for children ages 0-14 who live in that identified service area.
Improvement target: The ratio of Urgent Care visits to ED visits for urgent care will show a ratio >1.0 which improves by 10% per year for each demonstration year.

**Relationship to Other Projects:**
*RHP Project ID: 021184901.1.1 Establish more primary care clinics (Develop one additional Cook Children’s pediatric neighborhood clinic in an identified area of need.)*

Beyond a pediatric urgent care practice, another related pediatric primary care clinic can complement the urgent care practice by serving as a referral destination for pediatric urgent care patients who need a pediatric primary care medical home.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Valuation assumes the urgent care clinic will treat 8,000 pediatric patients per year in the 76119 ZIP code that are at high risk for lack of urgent care and/or primary care services. The plan projects a 10% decrease in ED visits per year, once the clinic is established. Annual pediatric emergency department visits from 76119 are 1,700 visits per year. The result of the decrease in ED visits also assumes a corresponding decrease in Medicaid and/or other governmental funding sources for high-cost services in the ED. The cost per ED visit, established by the Region 10 Anchor hospital, is $1,200 per visit. We estimate a decrease of 170 ED visits per year from the 76119 ZIP code. The project also assumes that increased access to Urgent Care services will result in decreased hospital admissions. Cook Children’s currently experiences an 11.4% ED admit rate. We estimate a decrease of 19 inpatient admissions from the 76119 ZIP code. On average, a Cook Children’s pediatric admission costs $28,475. Note: the 76119 ZIP code is used in this analysis for modeling purposes, since there is a demonstrated community need in that
area. The urgent care center will likely have a wider geographic base and Cook Children’s plans
to locate this center in an area that is most likely to meet the underserved needs of the broader
Tarrant County area.

Region 10 RHP Plan
Project Summary

Project Option – 1.8.6 – Increase, Expand and Enhance Oral Health Services (Establish one new Cook Children’s Pediatric Dental Clinic.)

Unique Project ID: 021184901.1.3
Performing Provider Name/TPI: Cook Children’s Medical Center / 021184901

Provider: Children's Health Care System is the country’s leading integrated pediatric health care delivery network. Based in Fort Worth, Texas, the not-for-profit organization includes a Medical Center (448 beds), Physician Network (297 pediatric specialists), Northeast Hospital, Pediatric Surgery Center, Home Health company, Health Plan (105,000 Medicaid and CHIP covered lives) and Health Foundation. The System has a six-county primary service area that represents 86% of its total volume covering 4,711 miles². It also provides tertiary and quaternary pediatric medical care to 122 counties in west and north central Texas, covering 257,086 miles² and to out-of-state patients. The system has more than 1 million patient encounters per year across the continuum of pediatric care. Cook Children’s Health Plan covers 105,000 Medicaid and CHIP lives within the Tarrant Service Area. The System provided $3.1 million in true charity care in 2011. 57.4% of the System’s patient care is provided to Medicaid, Medicaid Managed Care and CHIP beneficiaries.

Intervention: This project establishes a pediatric dental clinic in an area where the families ranked access to pediatric dental care as one of the top five priorities. 42% of the Tarrant County population is below 200% of the Federal poverty level. Tarrant County is the only site in the region that has both the need and the population base to support a full-time (5 day per week) dental clinic. This project seeks to reduce the use of inappropriate, and arguably more costly, sites of care for pediatric dental care [e.g., operating rooms]. If approved, this the first dental clinic provided by Cook Children’s.

Need for the project: A specific location will be determined from a demonstrated need in combination with the highest use of the OR for pediatric services to be conducted in demonstration year 2. CMS funding would allow a first ever pediatric dental clinic to be built.

Target population: Children ages 0 – 14 who live in some yet to be determined part of Tarrant County where the population is 424,416 children and is expected to grow to 4664,102 99 by 2016. The estimated number of children served over the course of the waiver is estimated to be 5,000 to 5,500 in demonstration years 4 and 5. project increases a Medicaid / Uninsured population of children’s access to pediatric dental care, reducing the use of the OR for dental care, lowering the cost of care and improving their overall health.

Expected patient benefit: Cook Children’s expects to build a new clinic building, hire and train a dentist and staff to provide pediatric dental care to the children in a yet to be determined part of Tarrant County and reduce the use of the OR for pediatric dental care.
Project Option – 1.8.6 – Increase, Expand and Enhance Oral Health Services (Establish one new Cook Children’s Pediatric Dental Clinic.)

Unique Project ID: 021184901.1.3  
Performing Provider Name/TPI: Cook Children’s Medical Center / 021184901

Project Description:
Cook Children’s has never had a pediatric dental clinic; however, the need is clearly defined. Based upon the findings of the 2008 Community-wide Children’s Health Assessment and Planning Survey, parents rate access to pediatric dental care in the top five access priorities. Dental care has a large impact upon children’s general health. Instead of performing dental surgery on children, it would be preferable to address children’s preventive dental care. Based on the success of Cook Children’s led community collaborations – Children’s Oral Health Coalition and Save a Smile – and coupled with the CHNA results and the Cook Children’s Promise, it is time to begin to become more directly involved in dental care for children.

Early design elements for a pediatric dental clinic include four dental treatment rooms staffed by a pediatric dentist with dental and supportive staff to provide routine preventive examinations and restorative dental care. The pediatric dental clinic is expected to provide a different service to a population of children ages 0-14 in a yet to be defined geographic area. That definition will specifically include patients whose families are Medicaid- or CHIP eligible and demonstrable underserved.

Goals and Relationship to Regional Goals:

Project Goals:
The purpose of this project is to expand pediatric dental care access to a population that is currently underserved and achieve the following goals:

- Expand pediatric dental care capacity by constructing a new dental clinic.
- Expand dental care providers by hiring a dentist and support staff.
- Reduce the burden of providing dental care in potentially inappropriate settings, i.e., outpatient surgery.

This project meets the following Regional goals:
This project meets a number of Regional goals, which are aligned with the goals of the Waiver and CMS’ triple aim. Specifically, by adding a new pediatric dental clinic, this project will improve the health of children in the designated area, which in turn improves their quality of life and ability to reach their full potential in the community. In addition, providing appropriate

---

dental care in the appropriate setting will improve health outcomes while lowering health care cost for the Region due to decreased operating room use for dental care.

By adding a new pediatric dental care clinic within an area that has an identified need, the number of pediatric dental providers is increased – including non-dentist staff – providing jobs within the neighborhood served, reducing the burden of providing dental care in otherwise potentially inappropriate sites of care, and specifically targeting children who otherwise would not see a dentist.

**Challenges:**
Seventeen percent of the parents of children in families whose household income is below 200% of the federal poverty level rank access to dental care as difficult – twice that of all other families. When that is viewed in the context of an average of 34.8% of children ages 2-8 enrolled in Medicaid not receiving at least one dental checkup during fiscal year 2010, there is a clearly defined need for improved access to both pediatric urgent care and pediatric dental care for these children.

**5-Year Expected Outcome for Provider and Patients:**
Cook Children’s has never had a freestanding pediatric dental clinic; however, the need is clearly defined. Early design elements for a pediatric dental clinic include four dental treatment rooms staffed by a pediatric dentist with dental and supportive staff to provide routine preventive examinations and restorative dental care. The pediatric dental clinic is expected to provide a different service to the same population as pediatric primary care clinics.

The pediatric dental clinic is in design development. It requires site selection, acquisition and construction that will not be completed until the latter part of demonstration year 2. As a totally new construction, the pediatric dental clinic will not begin seeing its first patients until demonstration year 4. It is expected that these patients’ dental needs are not being adequately met within the present scope of community dental services.

**Starting Point/Baseline:**
As a new service, Cook Children’s current dental patient visit baseline is zero. Establishing a new pediatric dental care site begins with locating a site within a specifically identified area of need, constructing the clinic building, staffing and opening the clinic and sustaining operations. A preliminary pro forma estimates that the pediatric dental clinic would see approximately 5,500

dental visits in its first 12 months of operation – demonstration year 4. It will grow at a 10% rate the following year for a two year total of 11,550 pediatric dental visits in the last two years of the Waiver period.

**Rationale:**
Dental care has a large impact upon children’s general health. Instead of performing dental surgery on children, it would be preferable to address children’s preventive dental care. Based on the success of Cook Children’s-led community collaborations – Children’s Oral Health Coalition and Save a Smile – and coupled with the CHNA results and the Cook Children’s Promise, it is time to begin to become more directly involved in dental care for children.

Based upon the findings of the 2008 Community-wide Children’s Health Assessment and Planning Survey, parents rate access to pediatric dental care in the top five access priorities.\(^{15}\)

Tarrant County is identified as having the greatest quantifiable community need for improved access to pediatric urgent care that also has sufficient population to support additional a new dental service. Tarrant County an ages 0-14 population of 424,416, which is expected to grow to 464,102 by 2016 (a 9.4% growth rate over five years). In 24% of the households, annual income is below $25,000 and in another 17.6%, between $15,000 and $25,000 – compared to the U.S. averages of 12.9% and 10.8% respectively. Depending upon family size, this suggests that 42.0% of these families are below 200% of the federal poverty level. Demographically, 13.6% of the population is Black – Non-Hispanic and 29.6% Hispanic.\(^{16}\)

**Project Components:**
While no core components are required, the core activities for the project include (1) construction, (2) hiring and training provider and support staff, (3) incrementally increasing the number of pediatric dental care visit in Tarrant County and (4) reducing the burden on hospital operating rooms to provide pediatric dental care.

Dental care has always been provided by freestanding dentists, which must be considered a best-practice. By applying this standard to children’s dental care access for children will improve.

By adding a new pediatric dental practice in an area that has an identified need, the number of pediatric dental clinics is expanded by one, the number of dental providers are increased by one pediatric dentist – plus an additional 10.5 non-physician staff, providing jobs within the area served, increasing the number of pediatric dental visits in an appropriate setting by an estimated 6,000 visits annually, and reducing the burden of providing dental care in otherwise potentially

\(^{16}\) Thomson Reuters – Claritas Demographic Expert 2.7 and the North Texas Council of Government Tarrant 2010 Report.
inappropriate sites of care.

**Unique community need identification numbers the project addresses:**
- CN.6 – Lack of access to dental care.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

By creating a new pediatric dental clinic within an area that has an identified need, the number of dental providers is increased – including non-dentist staff – providing jobs within the neighborhood served, and reducing the burden of providing dental care in otherwise potentially inappropriate sites of care.

By creating a pediatric dental care clinic, access to dental care for children will measurably improve. Providing early preventive dental care will reduce the need for restorative and emergency dental care will be reduced, decreasing caries-related treatment costs.\(^\text{17}\)

**Related Category 3 Outcome Measures:**

*IT-7.2 Cavities: Percentage of children with untreated dental caries*

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
The new pediatric dental care clinic will provide a service for children ages 0-14 thereby reducing the number of children with untreated dental caries.

Numerator: The number of visits to the Cook Children’s pediatric dental clinic for treatment of dental caries whose residence is in the identified service area – to be determined in DY2.
Denominator: The population of children ages 0-14 in the dental clinic’s service area.
Improvement target: The percentage of children treated for dental caries in the defined population will show a reduction of 10% per year from baseline for each subsequent demonstration year.

**Relationship to Other Projects:**
Potentially, admissions for dental surgery – while not specifically described in the Category 4 reporting measures, the number one outpatient surgery performed at Cook Children’s Medical Center is for dental procedures. A pediatric dental clinic will dramatically decrease the cost of dental care, as the higher cost of surgical dental intervention is avoided by prophylaxis or early intervention in a freestanding, lower cost dental services model.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Project valuation assumes 5,400 pediatric dental visits annually beginning DY 4. Population is comprised primarily of pediatrics with little or no access to dental care. As a result, we assume that a sizable portion of the population has untreated dental caries (30% or 1,620 pediatrics), with the project expecting to impact 10% or 162 of these patients with caries in year one and a 10% reduction per year thereafter in the ZIP code where the clinic is located. In addition, the increased access to dental treatments is projected to reduce ambulatory dental surgeries by 10% per year for the corresponding ZIP codes where the clinic is located. Both the reduction in treatment for dental caries and ambulatory surgeries is expected to reduce governmental program costs by at least $201 and $2,741 per case, respectively.

Project Summary

Project Option: 1.10.4 – Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE)

Unique Project ID: 022817305.1.1

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Tarrant County Public Health – 420 FTEs, 20 sites, serving 1.9 million people in Tarrant County

Tarrant County Public Health serves as the public health entity for a county of 1.9 million people. The purpose of the Region 10 RHP Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE) is to facilitate Tarrant County Public Health and other performing provider’s use and analysis of the data housed therein in order to identify health conditions and disease state “hot spots” and/or disproportionately-affected groups within their populations or sub-segments of their populations and in turn, to direct resources appropriately, meaning in ways that are specific to and will best address each provider’s findings and needs.

The project is a new initiative for Tarrant County Public Health.

The project was designed to facilitate TCPH’s ability to use electronic information in order to achieve public health goals while also addressing the problems of limited health information infrastructure and interoperability which leads to poor and ineffective care coordination and in turn, increased and unnecessary expenses.

Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE) is designed to serve all those who seek health care services in Region 10.

The Region 10 RHP will benefit specific at-risk populations because there will be an emphasis on care coordination, chronic disease treatment, early detection, patient self-management and participation and health promotion and prevention. The project will also benefit the disproportionately medically disadvantaged/disenfranchised populations by allowing for the implementation of a system to stratify outcomes and quality measures by REAL (race, ethnicity and language) demographic information in order to identify potential health disparities and develop strategies to ensure equitable outcomes.

The expected project benefit is to assist all participating Region 10 RHP Performing Providers in demonstrating improved cost savings in care delivery and per episode cost of care through use of health information exchange and sharing of best practices. Use of health information exchange will help to decrease the above-referenced costs through enhancing efficient and effective use of resources in the hospital setting by eliminating duplicate radiology and laboratory testing performed as a result of the data not being accessible when needed due to limited interoperability of information sharing among providers.
Project Option -1.10.4 – Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE)

Unique Project ID: -022817305.1.1

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Description:
- The Tarrant County Public Health (TCPH) project named “Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using Health Information Exchange (HIE)” details TCPH’s innovative use of data in a regional HIE to identify problem areas and allocate resources where the most benefit may be achieved. The project involves a two-way flow of data between TCPH and the North Texas Accountable Healthcare Partnership’s (NTAHP) regional HIE which will be used to analyze, assess and impact population health covering various health conditions and/or chronic diseases. Population health refers to the status of the entire population, not just those hospitalized or at risk of that. Health conditions/disease states include notifiable/reportable disease such as sexually transmitted infections or tuberculosis as well as pregnancy or chronic diseases such as obesity, diabetes, hypertension, congestive heart failure and asthma. This data will be analyzed to characterize the conditions in special populations (e.g., racial/ethnic groups or groups based on primary language or health literacy status).

An HIE with public health participation is innovative; it maximizes electronic health information sharing to accomplish public health tasks such as monitoring of population health trends and investigation of health threats. TCPH developed and maintains a syndromic surveillance reporting network featuring aggregate, de-identified data that soon will be more robust as additional providers send data to the regional HIE to obtain incentives for achieving Meaningful Use (MU) requirements. TCPH and providers will use this data (and individual, private health data on reportable conditions that TCPH maintains) to identify health conditions and disease state “hot spots” and/or disproportionately-affected groups and to direct resources appropriately, meaning in ways that are specific to and will best address each participant’s populations, findings and needs. Resources include education related to health promotion and disease prevention, as well as interventions related to case management and evidence-based treatment in both the outpatient and inpatient settings. Ongoing analyses of the data and programs will suggest improvement opportunities. The project yields economies of scale in technology and staffing. Participating providers will be able to lower their per-episode cost of care by eliminating unnecessary or duplicate testing. The project also will reduce avoidable hospitalization and readmission rates, improve cost efficiencies, both internal and external to the hospital environment, and increase patient safety and patient satisfaction.

Goals and Relationship to Regional Goals:

Region 10 RHP Plan
Project Goals:
-This project will improve population health through more effective use of e-health information, including use of syndromic surveillance related to chronic and communicable diseases, use of Electronic Lab Reports (ELR) for notifiable/reportable disease monitoring, and the use of immunization data for preventive outreach. Because of the project, a standardized, interoperable model of care that is patient-centric, trusted, scalable, sustainable, and reliable will emerge. This model and the data store that supports it will facilitate the adoption of best practices that will improve the quality of care, increase patient safety, and reduce healthcare costs. Enhanced and expanded use of shared information will give TCPH and other Region 10 RHP performing providers necessary data to develop case management and treatment or prevention programs specific to the needs of their unique populations and sub-segmented populations. It will also improve point-of-care efficiency and cost effectiveness by eliminating duplication attributable to limited health IT infrastructure and interoperability. This project will further engage participants to identify needs for registry-driven data derived from the HIE and to develop use-case definitions for such data that, when leveraged fully, will assist with improved patient care (e.g., by connecting with state-supported prescription drug monitoring databases to identify persons with possible drug-seeking behaviors, etc.) and enhanced patient safety (e.g., access to medication lists from a wider set of providers, etc.).

This project meets the following Regional goals:
-This project is aligned with Region 10’s triple aim of raising and maintaining the health of the community, improving health care delivery and lowering health care costs. Enhanced and expanded use of shared information will expand opportunities for targeted interventions and collaborations with the results being a healthier community, improved health care delivery and lower health care costs. Moreover, the participation of public health in this exchange is innovative; it sets a precedent for valuable collaboration between public health and the medical community. While such interaction has been focused primarily on notifiable/reportable diseases in the past, this project more fully accommodates public health’s ability to share its unique insights on health promotion and disease prevention, which offers tremendous potential to improve the health of individuals in the community and beyond. For example, the impact of a reduction in obesity (based on educational and other programs led by public health) would have far-reaching positive effects on health.

Challenges:
Enhanced information sharing will work at mitigating/eliminating the silos that can exist across and among health care, mental/behavioral health and public health entities. With silos eliminated, opportunities for expanded collaborations and teamed solutions/approaches among all entities will be increased.

5-Year Expected Outcome for Provider and Patients:
-
The five-year expected outcome is that TCPH and other Region 10 RHP participants will use the shared information to pinpoint issues and then efficiently and effectively allocate education, preventive and/or management resources to those concerns. Continual reassessment using the data will further highlight additional modes and areas for improvement and refinement. Region 10 performing providers’ abilities to communicate with each other regarding individual private health information will also be positively impacted, thus resulting in improved patient safety and satisfaction and decreased health care delivery costs. The project will benefit specific at-risk populations because there will be an emphasis on using the data and subsequent analyses and assessments to facilitate intervention and program development (which may include interventions or programs designed to address care coordination, chronic disease treatment, patient self-management, and/or health promotion and prevention) that is specific to and will best address the needs of these special populations. The project also benefits the disproportionately medically disadvantaged/disenfranchised populations by setting the foundation for a system to stratify outcomes and quality measures by Race, Ethnicity And Language (REAL) demographic information to identify health disparities and develop strategies to ensure equitable outcomes.

**Starting Point/Baseline:**

TCPH is working with the NTAHP HIE in initial stages of developing data use agreements for public health reporting of syndromic surveillance and use of ELR data for notifiable/reportable diseases. TCPH is the public health entity that maintains syndromic surveillance systems for the North Texas region; as such, it will receive data that meets Meaningful Use criteria, whether for Stage 1, Stage 2, or eventually Stage 3 (see [www.cdc.gov/ehrmeaningfuluse](http://www.cdc.gov/ehrmeaningfuluse)). One Region 10 RHP performing provider (Cook Children’s Healthcare System) is now participating in the NTAHP HIE as a data-sharing partner, with participation limited to the Phase One “Go-Live” Pilot. The NTAHP is queuing interested entities for connection, and in 2013, connection to the HIE should be generally available to the North Central Texas medical community. Once TCPH’s Electronic Medical Record (EMR) system is fully implemented in all of its clinics, TCPH will also begin to participate in the HIE as a data-sharing partner and will benefit from individual-specific data regarding point-of-care efficiency and patient safety and satisfaction.

**Rationale:**

- Access to electronically shared information, whether patient-specific or in aggregate, will enable TCPH and other public health entities to maximize use of limited human and fiscal capital within their organizations. Resources currently devoted to chasing down information can better be used to analyze and act on the information automatically and electronically obtained and stored in an HIE. For example, use of ELR data and access to associated specific patient information would eliminate the need for public health staff to contact infection control professionals and/or treating physicians for basic information required in an epidemiological investigation, which subsequently, when indicated, initiates and directs a public health response.
As described, situations would be resolved in a more timely fashion, which translates into less disease burden in the community and, ultimately, a healthier population. Furthermore, more rapid analysis of data (due to decreased reporting lag time and more complete and consistent availability of required variables) would occur and be used to identify health conditions/disease state “hot spots” and/or disproportionately-affected groups who could be targeted for treatment, education, and preventive resources. It is well established that patients nationwide (and thus in Tarrant County and across Region 10) seek health care in many different settings and receive care from many different providers, including mental/behavioral health professionals. Results of the Regenstrief study in Indiana demonstrate that health care facilities are likely to benefit from an HIE and discount the notion that “all health care is local.” The study also states that “improved care quality results from informed decisions made via immediate access to relevant health care information.” Although the study looked at these issues in emergency department patients, TCPH believes these challenges apply to patients in all health care settings.

**Project Components:**

- A customizable project intervention was selected because the project is designed to enhance performance improvement and reporting capacity in an innovative manner not described in the other options (related to people, technology and systems.) The selected project intervention did not include any required core project components. The selected milestones and metrics will measure the progress of TCPH’s use of electronic health information and increasing opportunities for collaborative efforts supporting interventions and programs aimed at improving patient safety and satisfaction and decreasing costs through enhancing efficient/effective use of resources.

**Unique community need identification numbers the project addresses:**

- CN.22 – Inadequate health IT infrastructure and limited interoperability to support information sharing among providers

According to the June 2012 Regional Stakeholder Survey Summary Region 10 RHP Community Health Needs Assessment, one of the top four reasons cited as “barriers to effective overall care coordination in counties” was “limited health IT infrastructure and interoperability.”

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

The project is a new initiative. TCPH staff responsible for project implementation did not receive any HITECH or other federal funding to perform the tasks described. TCPH will contract with the NTAHP HIE to develop capabilities (research tools and registries) to complete the project successfully and accomplish important public health goals. Any funds paid to NTAHP through this project would be funding additional capabilities not included in the basic infrastructure of the HIE.
The NTAHP was formed and funded in 2010 to develop a regional health information exchange to solve the problem of limited health information infrastructure and interoperability leading to poor and ineffective care coordination and, in turn, increased and unnecessary expenses. NTAHP is a recipient of HITECH funds awarded to the state of Texas and then to NTAHP as one of 12 regional HIEs. NTAHP was awarded a grant in the amount of $4.9 million and approximately half of the grant funds have been received. These grant funds and additional private funds collected have been spent in the effort to stand up the HIE (which means pulling together the community to establish consensus on policies, procedures, technology, standards, functionality and limitations) in accordance with the business and operational plan submitted to the State of Texas. All federal funds will be expended in NTAHP’s Phase One efforts to stand up the HIE and connect as many health care entities as possible because the community determined initial capabilities would focus on individual patient care.

This project facilitates a two-way flow of data among public health, NTAHP, and participating providers. Syndromic surveillance systems housed at TCPH have already proven useful to hospitals in identifying and monitoring emerging community health trends and isolating specific health threats. The project can be expected to make these capabilities more readily apparent and useful to hospitals, as well as to introduce use of the data for monitoring population health trends and even for discovery and response to potentially preventable concerns such nosocomial complications. Greater medical community use of the analytical capabilities these systems offer, along with continued public health use, can be expected to yield improved health outcomes and alleviate community health problems.

**Related Category 3 Outcome Measures:**

**Outcome Measures**

- IT-5.1 Improved Cost savings: Demonstrate cost savings in care delivery – ED visits
- IT-5.2 Improved Cost savings: Demonstrate cost savings per episode cost of care – reduced radiology testing cost
- IT-5.3 Improved Cost savings: Demonstrate cost savings per episode cost of care – reduced laboratory testing cost

**Reasons/rationale for selecting the outcome measures:**

By the end of the Waiver Period, because of their use of the data within the HIE, Region 10 RHP performing providers will be able to demonstrate cost savings related to care delivery and per-episode cost of care by eliminating unnecessary or duplicate testing. The collective end results of the project will be decreased potentially avoidable hospitalization and readmission rates and improved cost efficiency, both internal and external to the hospital environment. Participating Region 10 RHP performing providers will establish their own baselines for cost of care delivery and per-episode cost of care, and, at the end of the Waiver Period, they will be able to demonstrate a decrease from their individual baselines.
**Relationship to Other Projects:**

The “Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE)” project is vital to other TCPH DSRIP projects. TCPH will use the data to pinpoint areas and populations for health promotion and chronic disease prevention via Community Health Educators. TCPH will also be able to target areas for acute disease management or mitigation related to sexually transmitted infections, communicable disease and outbreak intervention. The “Enhance Performance Improvement and Reporting Capacity - Public Health Surveillance using health information exchange (HIE)” project will dovetail with nearly every other initiative in the Region 10 RHP DSRIP program, as it assists to transform processes to be successful in an electronic health information environment.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative. Though this project does not fit into the two learning collaboratives, over time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

TCPH defined the population directly impacted by the project as Emergency Department (ED) patients who visit facilities participating in the HIE. ED visits totaled 791,926 with a daily average of 2,170 in 2011. According to the National Hospital Ambulatory Medical Care Survey 2006 Emergency Department Summary,” 38.2% of ED visits resulted in orders for laboratory testing and 44.2% for radiological studies. The percentage of the Tarrant County population expected to be positively impacted by the project is 0.5% of DY5 ED visits as compared to baseline ED visits. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. A cost savings of $29 per visit times 3,960 ED visits (3,960 is the number of 0.5% ED visits with a cost decreases in DY5) equals $114,829. [“The Business Case for Payer Support of a Community-Based
Health Information Exchange” by Tzeel, Lawnicki and Pemble] This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. An average cost savings per episode of care of $214 per radiology test X 1,000 (based on an overall 2% reduction in radiology tests performed equaling a decrease of 1,000 tests) is $$214,000. [Hospital Costs Index by Cleverly & Associates 2007] This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. An average cost savings per episode of care of $363 per laboratory test times 2,000 (based on an overall 2% reduction in laboratory tests performed equaling a decrease of 2,000 tests) is $726,000. [Hospital Costs Index by Cleverly & Associates 2007]. This value is multiplied by individual impact of 3 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project value. The actual HIE total project valuation for 5 years equals $16,455,337. However, due to DSRIP Public Health funding available the project value was discounted by 57.8% to $6,947,507.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because the reduction in tests will save patient time, pain, diagnostic time and money.

To determine the value to the community - impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because it will save the community resources and money by reducing duplicative radiology and lab tests.
### ENHANCE PERFORMANCE IMPROVEMENT AND REPORTING CAPACITY – PUBLIC HEALTH SURVEILLANCE USING HEALTH INFORMATION EXCHANGE (HIE)

Project Summary Template to be completed for each Category 1 and 2 project

- Project Option: 1.1.2 Expansion of Primary Care Capacity-TB Clinic Expansion

Unique Project ID: 022817305.1.2 (Pass 2)

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Provider: Tarrant County Public Health has 420 FTEs, 20 sites, and provides public health services to 1.9 million in Tarrant County. The provider’s role is to provide access to Tuberculosis Treatment to all citizens of Tarrant Co with or without the ability to pay.

Intervention: The primary purpose for this project is to provide non-traditional service hours to improve compliance of treatment of latent TB infection, reducing active TB in the pop. The project is an expansion to current TB Clinic.

Need for the project: The primary regional need addressed by this project is CN21-The high tuberculosis prevalence and low treatment completion rates of latent TB infection targeting the underserved clients generally at risk for TB disease development.

Target population: The targeted population is the estimated 900 patients diagnosed with latent TB infection who need access to service times that do not interfere with work/school.

Expected patient benefits: The project’s benefit for these groups is twofold: By providing convenient access to the medication/treatment after work hours, patients are successful at completing treatment & less likely to go on to develop active disease which is expensive to treat. Secondly the improved completion rates make the community safer from TB and decrease economic and health hardships of the underserved. In review, the indigent and Medicaid population is served with extended evening hours to prevent financial impact to families and individuals who lose paid work time to attend clinical hours that conflict with their financial sources.

Category 1 or 2 expected patient benefit: The Category 1 milestones selected are to hire and train staff in DY2, Provide 9 expanded clinic evening hours in DY3 and to increase access to primary care capacity by 10% in DY4 and by 20% in DY5. These milestones support the project’s primary purpose of expanded service times by providing for the support staff and hours to provide preventive TB treatment. Supporting the citizenry with non-traditional clinic hours facilitates their access and time investment to be a healthy population.

Category 3 outcomes: The category 3 outcomes are: Improved treatment access and healthcare cost savings. These outcomes will demonstrate that the utilization of non-traditional clinic support hours and staff can improve patient treatment compliance and reduce healthcare costs by spending those dollars on the treatment of latent TB infection instead of the long term costs of treating active TB disease.

- Project Option: 1.1.2 Expansion of Primary Care Capacity-TB Clinic Expansion
Unique Project ID: 022817305.1.2 (Pass 2)
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Description:
Expand Primary Care Hours and Expand Primary Care Staff–TB Clinic Expansion
This project involves the expansion of tuberculosis clinical hours for Tarrant County into the evening for specific service lines (i.e., medication distribution, screening services, LTBI case management and TB case reporting) on Monday, Wednesday, and Friday from 5 p.m. to 8 p.m. for improvement in patient access during nontraditional hours to provide less interference with work and school schedules. It takes 8100 visits per year to service 900 patients through 9 months of Latent Tuberculosis treatment. Currently the clinic provides 4 evening hours out of the total of 31 hours used to service these clients. This reflects 13% of the overall clinic time to be in the evening. By adding an additional 9 evening hours, the overall clinic time that is available in the evening is increased to 33%. This allows for the nursing staff to provide case management, reminder notifications of pending need of medication refills to facilitate the treatment completion, and continued education to occur so that we can increase the LTBI completion rates by 10% and 20% in DY4 and DY5 respectively. The total number of patients diagnosed is not expected to significantly change but the completion rates are expected to increase due to case management, increased staff, and non traditional clinical hours.

Goals and Relationship to Regional Goals:
Project Goals:
The project purpose is to provide nontraditional service hours to improve latent tuberculosis treatment access and patient compliance and follow-up throughout the course of therapy, thereby improving patients’ completion of therapy.
This project is related to Regional goals.
The Vision. Better Care: CMS aims to improve the overall quality of the U.S. health system by making health care more patient-centered, reliable, accessible, and safe. Better Health: CMS aims to improve the health of the U.S. population by supporting proven interventions to address behavioral and social determinants of health, and enhancing the quality of care delivered. Lower Costs: CMS aims to reduce the cost of the improved care delivery for individuals, families, employers, and the government.

Challenges:
A significant challenge for the provider is having enough hours outside work and school hours for patient convenience and staff to provide follow-up for the diagnosed cases of latent tuberculosis infection (LTBI). This group of patients often needs encouragement to maintain the therapy course that is nine months long, and convenience is often a factor in their completion rates, which run about 24% (subgroups of this general population run completion rates up to 55% when supervised delivery of medication is ordered).
5-Year Expected Outcome for Provider and Patients:
The five-year outcome expected is a 20% improvement in LTBI completion rates. The expected outcomes for individual patients is assistance in taking advantage of the LTBI treatment program offered in Tarrant County and decreased potential transmission of TB within families from incomplete treatment.

Starting Point/Baseline:
The tuberculosis division currently services between 990-1,100 clients per year diagnosed with latent tuberculosis infection in Tarrant County and five other counties contracted for medical service in Tarrant County through DSHS. One provider currently provides services for 11 hours weekly to the tuberculosis clinic. The evening hours currently available are Tuesdays from 4:30 to 7:30 p.m., with three nursing staff to see the scheduled medical clinic patients (12 scheduled patients and as many as 15 to 20 walk-in patients). With limited physician time during the week and a full-time nursing staff that already staffs 43 clinical hours, the additional clinic hours staffed with part-time staff will give patients access on days that may be more conducive to compliance and hours that are nontraditional for a specialty clinic.

Rationale:
The number of patients identified by smear positive tuberculosis cases fluctuates from year to year. Some cases have larger families and significant community contact points that must be evaluated. Others do not live with anyone and may be employed in areas with limited contact with others. In a five-year retrospective look at completion rates, the trend in Tarrant County is below the targeted number set by the CDC as described in Healthy People 2020. The milestones were chosen to identify a starting point and provide staff training to work toward improving Tarrant County completion of therapy rates in this group. The improvement targets were designed to set an attainable goal toward the overall national objectives set forth in 2010 of 79-85% completion of therapy rates. (CDC MMWR-Guidelines for the Investigation of Contacts of Persons with Infectious Tuberculosis, Dec 16, 2005/Vol. 54/No. RR-15, pp. 1-37.)

TCPCH is required to provide statistics on patients seen for tuberculosis treatment to state DSHS. Those numbers have not met the baseline that the state and CDC have set for goal improvement. The CDC has put a focus on getting patients who are identified and start treatment to complete that treatment plan. This project plan was selected to provide manpower and access points to make that easier for patients to complete.

Project Components:
The increase in staffing and the increase in evening clinic hours are selected to attain the goals of increased patient access and improved patient completion rates. The component of additional clinical sites was not feasible for improving completion without duplication of services. The
overall number of patients diagnosed with LTBI cannot be increased by additional sites; however, the improvement of access of hours and personnel can provide case management that will assist in improving overall compliance and completion. Shook, Morgan, Transportation Barriers and Health Access for Patient Attending a Community Health Center- A field study (Portland State University, School of Urban Studies and Planning. June 10, 2005.

The risk factors that make a person more likely to develop active tuberculosis after being offered treatment for latent TB infection (LTBI) include inner city dwellers, the poor/indigent, those with comorbidities, and those who live in congregate settings. Races with higher rates of low income also show a proportionately higher rate of TB when compared to other races. These groups of patients often have difficulty accessing services for basic health care needs, and especially those services that require access during normal business hours, which affects their livelihood or care of family members. For these reasons the milestones and metrics were chosen to provide additional service times and improve the patient’s ability to have control over their own disease progression.

**Unique community need identification number the project addresses:**

CN.3 and CN.7 Tarrant County Public Health supplies medical management for five surrounding counties for their active TB cases. As TB is an infectious disease with specific protocols, Tarrant County Public Health provides specialty care within this clinic setting. (Shook M. Transportation barriers and health access for patient attending a community health center: a field study (Portland State University, School of Urban Studies and Planning 2005).

CN. 21 – (High Tuberculosis prevalence and low treatment completion rates of LTBI) Tarrant County Public Health provides the Tuberculosis Elimination Clinic and follows the trends and statistics for the county about incidence of TB, treatment within the county, and completion rates of patients who are started on preventive medication. Those rates are currently below the targeted rates.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** This project is an expansion of clinical hours and staffing for those additional hours. The current TB clinic hours are not directly supported by any federal funding.

**Related Category 3 Outcome Measures:**

*Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:*

**Outcome Measure 1: 3.IT-12.6**

**Other Treatment Completion for Patients with Latent TB Infection:**
Clinical follow-up visits play a critical role in the completion of LTBI medication treatment. The target improvements for this outcome measure are in DY4 to improve the number of patients seen for follow-up visits by 10% over DY2. In DY5, the target is to improve the number of patients seen for follow-up by 20% over DY2. These improvements are evidenced in the Healthy People 2020 document that targets an overall national improvement in LTBI completions rates, as a goal to continue to decrease overall tuberculosis disease in the U.S. This goal set by the federal government suggests that the RHP set the same goal for the local population to attain regional tuberculosis disease and prevention measures. Studies have shown an economic benefit of $4,000 for each client who completes LTBI treatment.

Outcome Measure 2: 3.IT-5.1
Cost of Care
The Healthy People 2020 goals suggest evidence for the strategies set forth locally to combat tuberculosis on the community level. The targeted improvements for this outcome measure include in DY4 the 10% increase in LTBI completion rates seen over DY2 baseline. In DY5 the goal is a 20% increase in LTBI completion rates over DY2 baseline. Of the estimated 198 additional LTBI clients seen, 66% are expected to complete treatment or approximately 91 clients. By the end of DY5, 10% of those 91 additional LTBI clients completing treatment would have been expected to convert to active TB had they not completed LTBI treatment. Holland et al. indicate in their study, “Costs and cost-effectiveness of four treatment regimens for latent tuberculosis infection,” that the LTBI cost is $205, compared to the treatment cost of active TB at $12,512. Therefore LTBI treatment saves $12,307 in treatment costs.

For the outcomes targeted, both increases in patients utilizing the clinic times and the increase in completion rates, the health of low-income patient populations will be impacted. Providing improved access through additional evening hours and supportive clinic staff improves patient completion of preventive treatment before disease treatment is required.

The Category 1 increase in staff and clinic hours outside of standard physician hours support the above goals and improvement goals set by the Category 3 outcome measures.

Outcome Measure 3: 3.IT 2.14
Other Admission Rate-Decrease in Tuberculosis hospital admissions with improved LTBI treatment access and case management.
As stated in the previous 2 outcome measures, the therapy completion of identified LTBI clients that accept treatment decreases the burden of active TB cases in the community and also decreases the admissions over time for patients with TB like symptoms in the hospitals of Tarrant County. This measure will show that by providing the improved access times and case management that assist patients with successful completion of therapy, the overall case rate will
Regional Healthcare Partnership  Region 10

decrease by 1% yearly over the DY2 baseline as reported by the hospitals to the Health Department. In DY5 the overall case rate will decrease by 3% over the DY2 baseline.

**Relationship to Other Projects:**

**Related Project:**
022817305.2.5 – Implementation Evidence-based Disease Prevention Program–TB medication management. This related project focuses on a targeted subset of LTBI diagnosed patients who qualify for specific treatment plans that include directly observed therapy (DOT) with rifapentine. The targeted subsets are contacts to active TB cases, homeless shelter residents, and refugees. The TB clinic expansion project provides additional hours for DOT and self-supervised drug dispensing to all LTBI diagnosed clients who elect to take treatment.

**Related Category 4 population-focused improvements:** N/A

**Relationship to Other Performing Providers’ Projects in the RHP.**

No other performing providers have TB clinic expansion projects. However, Tarrant County Public Health will participate in regional information sharing of innovative project implementations.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Tarrant County Public Health defined the population that will be directly impacted by the project as LTBI clients seen in DY5 compared to the number seen in 2011. A 20% increase in the LTBI clients completing treatment is a positive impact of the project. A second positive impact is 10% of those 91 LTBI clients completing treatment would have been expected to convert to active
TB; therefore those 91 will be positively impacted. The third positive impact is a 3% decrease in the annual hospital reported TB cases. Based on HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.26% of the total project valuation was allocated to Category 1 and 2. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

**Outcome Measure 1: 3.IT-12.6** $4,000 economic benefit for the 20% increase in LTBI client seen by the TB Clinic expansion with 66% of those clients expected to complete LTBI or 91 additional LTBI clients completing treatment ($4,000 X 91=$364,000). $364,000 is multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-12.6 actual total outcome valuation of $5,205,200.

**Outcome Measure 2: 3.IT-5.1** 91 additional clients are expected to complete LTBI treatment of those 91 clients 10% would have been expected to convert to active time without LTBI treatment completion or 9. At least $12,307 is saved for each of the 9 LTBI treatment completion clients ($12,307 X 9 = $110,763. $110,763 is multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-1.20 actual total outcome valuation of $1,583,911.

**Outcome Measure 3: 2.14** Based on a 10 year average 59 TB cases per year are hospital reported cases. There is a savings of $20,100 per potentially preventable TB hospital admissions for the 3% decrease in hospital reported TB cases ($20,100 X 2 = $40,200). $40,200 is then multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-2.14 actual total outcome valuation of $574,860. The TB Clinic Expansion actual total project valuation is $7,363,972 but due to Public Health DSRIP funding availability the project was discounted 7.8% for a total project valuation of $6,789,112. The completion of LTBI medication treatment provides the client with a lifelong health benefit with the prevention of the conversion to an active case of TB. Without the LTBI medication completion a conversion to active TB could occur anytime within the individuals lifetime. In addition to the clients health benefits LTBI medication treatment completion also protects and provides benefits to the clients family members and other close connect individuals.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment it is possible for latent TB to convert to active TB. Once converted to active TB, the individual’s health is affected. Active TB can result in long-term negative health effects and, in some cases, death. If the medication treatment is partially completed there is greater likelihood of developing a drug-resistant strain of TB. Usually treated with IV therapy, drug-resistant TB is more serious and costly.
To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment it is possible for latent TB to convert to active TB. Once converted to active TB, it is possible to infect other individuals.

Project Option 1.12 .2 – Enhance Service Availability (i.e., hours, locations, transportation, mobile clinics) of appropriate levels of behavioral health care-- Expand the number of community based settings where behavioral health services may be delivered in underserved areas

Unique Project ID: 081599501.1.1
Performing Provider Name/TPI: MHMR of Tarrant County (MHMRTC) / 081599501

Provider: MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities services, serving an 897 square mile area and a population of approximately 1.8 million residents. As the Texas DSHS designated Local Mental Health Authority, MHMRTC functions as a safety net and is mandated to plan, develop policy, coordinate, and allocate and develop resources for mental health services in Contractor’s Local Service Area (LSA).

Intervention: This initiative will expand MHMRTC’s number of community-based settings (clinics) by one and extend hours in existing clinics. The initiative also requires hiring 21 staff.

Need for Project: Access to Behavioral Health services is rated as one of the highest community needs in the region. Tarrant County is recognized as a health professions shortage area for mental health providers as indicated in the RHP-10 Community Health Needs Assessment. CN.4. It usually takes 6 months for people in need to obtain mental health services. People with mental illness who are unable to access appropriate services incur huge costs to themselves, the health care system and the community. One study by the Integrated Care Collaboration, co-authored by Ziebell identified 9 patients using the ER over a 6 year period whose treatment cost $3 million.

Target Population: Individuals with behavioral health conditions needing psychiatric care who are on MHMRTC’s wait list for services. The current wait list consists of 844 uninsured people in need of services. Other entry points also exist to fill any capacity generated by this project, e.g. emergency departments. Further, because our current case load exceeds our capacity, this expansion will also result in the provision of more and more effective services to those already in treatment, i.e. the 5,900 already being served at a reduced level.

Category 1 or 2 milestones expected benefit: The project seeks to provide increased access to psychiatric care to 200 consumers in DY3, 450 additional consumers in DY4 and -500- more in DY5, for a total of 1,150 new patients over the course of the waiver.

Category 3 outcomes: IT-9.2 Emergency Department appropriate utilization (standalone measure); we will demonstrate increased access to care for underserved individuals with an expanding provider base and clinic settings, which will result in a reduction of Emergency Department visits for behavioral health conditions.
Project Option 1.12. - 2 – Enhance Service Availability (i.e., hours, locations, transportation, mobile clinics) of appropriate levels of behavioral health care-- Expand the number of community based settings where behavioral health services may be delivered in underserved areas

**Unique Project ID:** 081599501.1.1
**Performing Provider Name/TPI:** MHMR of Tarrant County (MHMRTC) / 081599501

**Project Description:**
We propose to establish behavioral health services in a new community-based setting in an underserved area; we will add one clinic and hire 21 new full-time behavioral health providers and staff to ensure individuals have timely access to services. With the addition of a new location and new staff, MHMRTC plans to expand capacity and reorganize the provision of services within all of its clinics to be more efficient so that current clients are served better. Additional hours are also being added to existing clinics to accomplish these goals.

The location of the additional clinic will be identified in DY2. The 21 additional staff will consist of:

- Eight qualified mental health professionals (QMHP). These staff will provide curriculum-based psychosocial rehabilitation, medication training and support, skills training, routine case management, crisis services and group sessions in the community and in individuals’ home or work site. QMHP’s also complete assessments and treatment plans and provide supported employment and supported housing services.

- Two consumer benefits staff. These staff assist individuals with benefit acquisition (SSI, SSDI, Medicaid, Medicare, food stamps, TANF, FAFSA, medication vouchers and medications through Prescription Assistance Program).

- One assistant director. This position will provide leadership and oversight to the project and coordinate and collaborate with key stakeholders.

- Two customer service associates. These positions provide clerical support, including filing medical records, billing, data entry, scheduling, registration, and front desk duties.

- One nurse. This position will provide injections, nursing services, complete medication calls and provide support to clinic psychiatrist.

- Five peer specialists. These positions will provide face-to-face peer services and function on clinic treatment teams. Peers will go into the community and provide follow-up services to individuals between their clinic appointments and report back to the treatment team.

- Two psychiatrist/psychiatric nurse practitioners. The physicians will provide psychiatric evaluation and medication management services.
Because patients served by MHMRTC tend to be severely and persistently mentally ill, the average intensity and volume of services required is significant. Data shows that we deliver a volume of 3 to 5 services per month to clients with the intensity ranging from very high case management and counseling to lower outpatients services such as medication refills. The duration of care provided to our patients by MHMRTC can normally last years if not for the lifetime of the patient.

Goals and Relationship to Regional Goals:

Project Goals:
This project’s goal is to increase MHMRTC’S ability to provide “the right care at the right time in the right setting, resulting in more patients being treated in the behavioral care outpatient clinic setting rather than emergency departments and inpatient settings. - By adding a clinic and increasing the number of psychiatrists and behavioral health staff available to provide services, we expect this project to reduce or eliminate - our wait list for behavioral health services and provide immediate access to services and supports for a larger number of individuals with behavioral health conditions such as severe and persistent mental illness, individuals with co-occurring substance use disorders and mental illness and individuals dually diagnosed with intellectual developmental disorders and mental illness.

- Our current staffing capacity for adult mental health services is 5,553 individuals. We are serving 5,900 individuals, which is already 347 over our capacity. Reorganization of services and expansion of capacity will also result in more effective services being provided to the current case load. - Another goal is to - reduce wait times for regularly scheduled medical visits through smaller medical caseloads.

This project meets the following Regional goals:
Access to Behavioral Health services is rated as one of the highest community needs in the Region.

Challenges:
-Our most significant challenge in accomplishing the goals of this project will be identifying and hiring qualified professionals.

5-Year Expected Outcome for Provider and Patients:
-The expected outcome for MHMRTC as the provider is the ability to meet more of the needs present in Tarrant County. Patients will experience care in the right place and at the right time, increasing their quality of life.

Starting Point/Baseline:
Our current behavioral health clinics numbers 9 service settings and our current staffing capacity for adult mental Health services is 5,553 individuals. We are serving 5,900 individuals, which is already 347 over our capacity. The goal of this project is to serve the 844 people currently on the wait list and to increase capacity to add service for more of the population that never gets to our wait list, bring the served population to 7,050.

**Rationale:**
Access to Behavioral Health services is rated as one of the highest community needs in the region. The costs of untreated mental illness include lost productivity, reliance on more costly care, including emergency room services, and increased incarceration and homelessness. One study by the Integrated Care Collaboration, co-authored by Ziebell identified 9 patients using the ER over a 6 year period cost $3 million to treat.

Currently, individuals on the wait list can wait 6 months or more for an appointment with a mental health professional. Even those already being served often must wait for appointments because our resources are strained beyond capacity. If these people can be seen in a more timely fashion, outcomes for the patient, for the community and for the health care system will all be improved.

**Project Components:**
- There are no required project components. However the success of the project requires:
  
  - Identification of a location for the new clinic
  - Hiring of health care professionals and support staff

-Continuous quality improvement initiatives will be to participate in face-to-face learning (meetings) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
- CN.4. Lack of access to mental health services.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
With respect to behavioral health services, a key element of reform is increased access to services. This initiative represents an extension of MHMRTC services to a broader population of needy individuals.

**Related Category 3 Outcome Measures:**
*Outcome Measure 1: IT-9.2 ED appropriate utilization (Stand-alone measure)*

**Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:**
One in 8 visits to the emergency room is related to mental illness. Without access to appropriate treatment, people with mental illnesses are more likely to experience crises that lead
them to utilize costly emergency room services.1

**Relationship to Other Projects:**
All of MHMRTC’s projects address the expansion of behavioral health services and/or the integration of services to better serve a co-morbid population. It is expected that as the projects progress, we will refine each of the projects to better serve populations. It is also expected that efficiencies will be identified that will enhance our ability to serve a larger percentage of the population that currently is unable to find appropriate care. In particular, the projects that will have an impact on this project are:
(1) 081599501.2.4 SUD Outpatient Navigation
(2) 081599501.2.1 Expand Detox Capacity
(3) 081599501.2.3 RN Care Management.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
- **127373205.1.1** Helen Farabee Centers (the MHMR Local Mental Health Authority in Wise County) proposes to establish a substance abuse services division in a different part of the Region (Wise County) than the area MHMR of Tarrant County is designated to serve (Tarrant County). Additionally, the population that Helen Farabee is proposing to serve primarily focuses on the substance use disorder population while, MHMR of Tarrant County targets individuals with severe and persistent mental illness. There may be some individuals with co-occurring substance use and psychiatric disorders in the Tarrant County targeted group, but there would not be overlap with the services provided in Wise County.
- **126675104.1.1** JPS Health Network proposes to “Increase 1,000 additional patient visits, increase days and hours of operation, and establish urgent outpatient consult service” for mental illness patients. MHMR of Tarrant County’s project to expand behavioral health capacity proposes an alternative provider choice for specialized psychiatric and psychosocial Medicaid services. This project addresses the needs of uninsured clients who have chosen MHMR of Tarrant County as their provider and are waiting for services. Both JPS and MHMRTC have as missions the underserved populations in Tarrant County and both have wait lists for services. These 2 expansions will serve a larger number of the population, but neither entity has the resources, to see all individuals with a need. Further, professionals needed to provide services are in short supply. The 2 projects will serve different people, but will still not be able to hire the resources that would be necessary to expand to all of the needy population.

This project will participate in the Region’s Learning Collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives, along with a list of participating provider projects for each.) MHMR of Tarrant County will also be working with...

other Community Centers in learning collaborative to select a small amount of outcome measures for category 3, based on the valuation studies conducted by health care economists at the UT Austin and UT Houston. The collaborative will develop a strategy for collection of that data through HEIs or other shared data sources in local communities. The Community Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project.

**Project Valuation:**

**Approach:**
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system.

In order to set an appropriate incentive RHP 10 agreed that a multiplier of 5 should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the annual value of a single successful intervention at full implementation and multiplying that value by 5. The multiplier of 5 was decided with much discussion by performing providers. The rationale was that to overcome resistance to change, both in the delivery system and the payment system, 5 years of benefits were needed. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

The incentive element of the Region 10 valuation methodology is relevant to all Texas transformation efforts. However, it is particularly relevant to transformation of the mental health care system, where patient experience, population health and costs have previously not received any focus, and where services tend to be provided primarily in emergency situations. Texas ranks 50th in the country in per capita funding for mental health services. Only one-third of the more than 480,000 adults in Texas with serious and persistent mental illness received services through the community mental health system. Therefore, the most important transformation that can occur in mental health is increased access to services. Until the advent of the waiver, the
system has not had funds to experiment with the types of interventions that are being made possible through waiver funding. Incentives for effective implementation and outcomes are important to allow for the identification of successful interventions and the ultimate sustained transformation of the system.

Rationale:
The calculation of the value of successful interventions for this project included values for the patient experience and health care cost elements of the triple aim. For purposes of the patient experience, the performing provider used an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The QALY value results in significant values related to mental health interventions. These patients are intensive users of the health care system and are most often not functional in society. Incremental improvements in their status have an enormous impact on all three elements of the triple aim.

#### Milestone 1 [P-6]: Establish behavioral health services in new community-based settings in underserved areas

**Metric [P-6.1]: Number of new community-based settings where behavioral health services are delivered**

- Goal: add one (1) additional community-based setting

Milestone 1 Estimated Incentive Payment: $4,391,180

#### Milestone 2 [P-4]: Hire and train staff to operate and manage projects

**Metric [P-5.1]: Number of staff secured and trained.**

- Goal = hire 10 additional Behavioral Health staff
- Data Source: HR records

Milestone 2 Estimated Incentive Payment: $1,526,985

#### Milestone 3 [I-X]: Milestone: Increased utilization of community behavioral health care (Increase behavioral health clinic volume of visits)

**Metric [I-X.1]: Target population reached**

- Goal: see an additional 200 unique patients
- Data Source: Patient registry, and/or EHR,

Milestone 3 Estimated Incentive Payment: $1,526,985

- **Milestone 4 [P-10]: Participate in face-to-face learning at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance.) Each participating provider should publicly commit to implementing these improvements.**

**Metric [P-10.1]: Participate in semi-

- **Milestone 5 [I-X]: Increased utilization of community behavioral health care (Increase behavioral health clinic volume of visits)**

**Metric [I-X.1]: Target population reached**

- Goal: see an additional 450 unique patients
- Data Source: Registry and/or EHR.

Milestone 5 Estimated Incentive Payment: $2,450,278

- **Milestone 6 [P-10]: Participate in face-to-face learning at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance.) Each participating provider should publicly commit to implementing these improvements.**

**Metric [P-10.1]: Participate in semi-

- **Milestone 7 [I-X]: Increase behavioral health clinic volume of visits and evidence of improved access for patients seeking services.**

**Metric [I-X.1]: Target population reached**

- Goal: see an additional 500 unique patients
- Data Source: Registry and/or EHR.

Milestone 7 Estimated Incentive Payment: $2,367,418

- **Milestone 8 [P-10]: Participate in face-to-face learning at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance.) Each participating provider should publicly commit to implementing these improvements.**

**Metric [P-10.1]: Participate in semi-

Project Option - 1.13.1 - Development of behavioral health crisis stabilization services as alternatives to hospitalization. Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system.

**Unique Project ID:** 081599501.1.2 (Pass 3)

**Performing Provider Name/TPI:** MHMR of Tarrant County / 081599501

**Provider:** MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities services, serving an 897 square mile area and a population of approximately 1.8 million residents. As the Department of Aging and Disability Services (DADS) designated local Intellectual and Developmental Disability (IDD) authority for the local service area (LSA) consisting of Tarrant county, MHMR of Tarrant County is delegated by DADS to function as a safety net and be responsible for planning, policy development, coordination, including coordination with criminal justice entities, resource allocation, and resource development for and oversight of intellectual and developmental disability (IDD) services in the most appropriate and available setting to meet individual needs in the LSA.

**Intervention:** This project will implement the Systemic Therapeutic Assessment, Respite, and Treatment (START) model in order to provide behavioral health crisis prevention and intervention services for individuals with intellectual/developmental disability (IDD) and/or autism spectrum disorder (ASD) with co-occurring behavioral and/or medical problems. Services will include a 24 hour/7 days a week crisis response capability; a therapeutic emergency respite facility to provide short term planned and emergency respite services; psychological/behavioral support services, and; intensive service coordination.

**Need for project:** Patients with IDD/ASD with co-occurring behavioral health issues have trouble accessing services in the appropriate setting. Providers in the current service environment are ill-equipped to deal with the unique needs of this population. Moreover, the mental health system is much more likely to use emergency services in any case, and with the lack of training in IDD/ASD issues almost always resorts to emergency services.

Finally, IDD/ASD patients with co-occurring medical conditions may also devolve into crisis as a result of communication or other problems related to their disorder. Currently, there are no specialized crisis stabilization programs for people with IDD/ASD in Tarrant County, leading to costly institutional placements.

**Target population:** 3% of the general population has an IDD or ASD. Of that population, approximately 30% has a co-occurring mental illness. In Tarrant County, that equates to approximately 15,000 people with co-occurring diagnosis and many others also at risk for crisis. MHMRTC currently services 2,900 IDD/ASD patients. Presumably, 900 of those have a co-occurring mental illness. 80% of the MHMRTC population has Medicaid coverage and the remainder is typically uninsured.

**Category 1 or 2 milestones expected benefit:** The project seeks to provide START services to 350 unique individuals in DY4 and additional 350 unique individual in DY5.

**Category 3 outcomes:**
IT-6.1 Patient satisfaction. By the end of the waiver, our goal is to achieve 20% improvement over baseline of patient satisfaction scores regarding satisfaction with patient’s overall health status/functional status.
IT-9.2 ED appropriate utilization. By the end of the waiver, our goal is to reduce ED visits by 40%.
IT-2.13 Other admissions rate (psychiatric inpatient admissions for IDD clients in crisis stabilization project) Our goal is to reduce psychiatric inpatient admissions by 40%.

**Project Option - 1.13.1 - Development of behavioral health crisis stabilization services as alternatives to hospitalization.** Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system.
Unique Project ID: 081599501.1.2 (Pass 3)
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Project Description:
This project will implement the systemic, therapeutic, assessment, respite, and treatment (START) model in order to provide behavioral health crisis prevention and intervention services for individuals with IDD and/or ASD with co-occurring behavioral and medical problems. The components of the proposed project include:

- 24/7 crisis response capability
- A therapeutic emergency (and planned) respite facility
- Psychological/behavioral support services
- Intensive service coordination
- Other community services needed to provide crisis stabilization

In addition, linking and technical support will be provided to existing service providers and family members to strengthen the service system and natural supports. Psychiatric and medical services will be coordinated. Staff will provide comprehensive assessments to determine appropriate services and provide those services when they are needed.

We anticipate a number of entry points into the program:

1. MHMRTC current clients which will be identified as at-risk of crisis based on their history
2. Work with JPS, other hospitals, and providers in our region to obtain referrals of patients in crisis
3. Advocacy groups

Goals and Relationship to Regional Goals:
Project Goals:

1. To provide crisis stabilization services to the target population, resulting in reduced inpatient hospitalization, placement in institutional settings (e.g., nursing homes, hospitals, and intermediate care facilities), and use of emergency department (ED).

2. Enhance the existing service system and natural supports through technical assistance, education, and support in order to prevent crises. To reduce or eliminate the constant stress experienced by the patient and caregivers allowing patients to continue living in preferred living environments.

3. To improve access and coordination of crisis stabilization and support services through intensive service coordination. Service coordinators will provide linking, service planning, monitoring, and coordination activities to assist the consumer in navigating the system.

This project meets the following regional goals:
This project relates to the Region 10 goals to improve access to behavioral health services and to reduce the unnecessary use of Emergency Department (ED) services. The project relates to improving access to care and improving overall quality of care for the targeted safety net population and lowering cost of care by decreasing ED services.

**Challenges:**

The most significant challenge for this project is bringing together all of the service providers and stakeholders to develop a plan for coordinating services for the success of the project over the period of the waiver. For DY2 we have scheduled activities to develop the strategic plan for implementation of the projects. Specifically, we have planned:

- 3 strategic planning forums with engaged stakeholders in Tarrant County
- Establishment of task based subcommittees
- Development of a gap analysis of local/county/state resources
- Development of a set of action plans that detail steps to be taken, identification or roles and responsibilities and timelines to address identified gaps

**5-Year Expected outcome for Provider and Patients:**

The 5 year expected outcomes of this project for the provider is that the services provided to IDD/ASD patients are more efficient and effective, allowing for additional patients to be served. Patients’ lives should be improved as the result of better management of conditions so they do not have to experience crises and resulting life limiting environments. Caregivers’ lives will also be positively impacted by not needing to continually manage the crises of their charges.

**Starting Point/Baseline:**

Currently, there are no crisis stabilization services in Tarrant County for people with IDD/ASD, so typically crises are handled through emergency based services. There are currently approximately 2,900 people being served by MHMRTC’s IDD service coordination units, approximately 900 of which can be assumed to have co-occurring mental health or other medical conditions. The baseline to be established is the number of those patients that will benefit from the START model. We will also work with other service providers to determine the population that will benefit.

**Rationale:**

According to the RHP Protocol, “when a consumer lacks appropriate behavioral health crisis resolution mechanisms, first responders are often limited in their options to resolve the situation, sometimes the choice comes down to the ER, jail, or an inpatient hospital bed. Crisis stabilization services can be developed that create alternatives to these less desirable settings” Numerous national reports have been published to examine the problems associated with poor mental health service delivery for people with IDD/ASD over the last 25 years. There have been articles and books written that describe model programs. Recommendations include examination of local levels to evaluate the current services and promote positive outcomes, with a strong emphasis on cross-system collaboration on all levels of service provision. In 1999, the U.S. Department of Health and Human Services Report to the Surgeon General of the United States on Mental Health, described the system as “multifaceted and complex, made up of public and
private providers, multiple agencies and disciplines” (p.8).² The report acknowledged that the system does not function in a coordinated manner, creating problems especially for people with complex needs.

In February 2002, in A Report of the Surgeon General’s Conference on Health Disparities and Mental Retardation, mental health services for people with IDD were described as a “pressing unmet health need and disparity” in the current system. The START model was cited in the Surgeon General’s Report as a model program for this population.

Model programs were designed in some locations, and a study in Massachusetts found a significant decrease in the use of emergency services over a four-year period when services were provided based upon a comprehensive, coordinated approach. Research has identified the following trends related to the current service system.³

- **Staff training and development:** In spite of advances in procedures, there remains a tendency to overlook MH issues in people with IDD.
- **Cross-systems crisis prevention and intervention services:** Although there were a number of providers that had internal crisis intervention systems, access for people with IDD was difficult. Many reported they used the police department as an alternative to address crises. Behavior plans did not utilize cross-systems crisis planning. Crisis stabilization beds were not used effectively.
- **Community mental health services:** Few people with IDD benefit from generic community mental health services.
- **Day and vocational services:** Better services needed to provide wraparound day services.
- **Case management:** Case managers were relied upon to provide service linkage and advocacy system, but claimed that the caseload size prohibited sufficient time to respond to crises, provide service linkages, and follow-up on referrals.

**Project Components:**

- The project involves these core components:
  a. Convening community stakeholders who can support the development of crisis stabilization services to conduct a gap analysis of the current community crisis system, and develop a specific action plan that identifies specific crisis stabilization services to address -identified gaps. **MHMRTC will work with several existing stakeholder groups including the IDD Needs Council of Tarrant County, the Mental Health Connection, and the Aging and Disabilities Resource Center Advisory Committee to review current services and identify gaps. The MHMRTC IDD Advisory Committee (comprised of at least 50% consumers) will also provide input. Stakeholder groups will also determine barriers/obstacles to effective service delivery.**

---

b. Analyze the current system of crisis stabilization services available in the community including capacity of each service, current utilization patterns, eligibility criteria and discharge criteria for each service.

c. Assess the behavioral health needs of patients currently receiving crisis services in the jails, EDs, or psychiatric hospitals. Determine the types and volume of services needed to resolve crises in community-based settings. Then conduct a gap analysis that will result in a data-driven plan to develop specific community-based crisis stabilization alternatives that will meet the behavioral health needs of the patients. The community stakeholders, along with MHMRTC will be involved in assessing the behavioral health needs of the target population with IDD and autism currently receiving crisis services in a variety of settings to: (a) determine the types and volume of services needed to resolve crisis in community-based settings; and (b) conduct a gap analysis that will result in a data-driven plan to tailor community-based crisis stabilization alternative services to the behavioral health needs of the target population.

d. Explore potential crisis alternative service models and determine acceptable and feasible models for implementation. MHMRTC has identified the START services model and will pursue using this model. The START model offers provision of clinical assessment and support by using the following methods: training and empowerment for families and caregivers; effective positive behavior support approaches; therapeutic tools developed in collaboration with medical, allied health and mental health professionals; a residential therapeutic respite facility; and optimal utilization of existing resources through system linkages.

e. Review the intervention(s) impact on access to and quality of behavioral health crisis stabilization services and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations. The project will also involve sharing and disseminating findings to other agency providers and stakeholders. A milestone has been included for purposes of ensuring CQI efforts.

Unique community need identification numbers the project addresses:
- CN.4-Lack of access to mental health services
- CN.10-Overuse of emergency department (ED) services
- CN11-Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding.

Related Category 3 Outcome Measures Related Category 3 Outcome Measure(s):

Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:

\textit{IT-6.1} Percent improvement over baseline of patient satisfaction scores. (stand-alone)

Assuming this project is successful, people who currently have needs that cannot be met in the community and therefore must rely on emergency services will be able to manage their
conditions more successfully. The goal is to avoid crises and the resulting stress on patients and their caregivers. Thus, success at meeting our goals will mean that patients are more satisfied with the services they are receiving.

**IT-9.2 ED appropriate utilization.** 1 in 8 emergency department visits is for mentally ill patients. IDD/ASD patients with mental illness present unique problems and are even more likely to use emergency mental health services that other forms of community mental health care. This intervention is designed to fill the gaps in the community system that cause the overuse of the emergency system.

**IT-2.13 Other admissions rate.** A similar START intervention developed in North Carolina noted 43% of the patients referred had a psychiatric inpatient stay in the year prior to involvement in START. Most of these hospitalizations could have been avoided had appropriate alternatives been present. Meeting the goals of this intervention would show decreases in the need for inpatient care in the IDD/ASD population.

**Relationship to Other Projects:**

- 081599501.2.3 RN Care coordination
- 081599501.2.2 Integrate primary and behavioral health
- 081599201.1.1 Expand behavioral health

The project will coordinate with the RN care management for assessing people who are involved in crisis stabilization services. Expanded behavioral health within MHMRTC will be accessed by people utilizing crisis stabilization services-When needed, integrated primary care services will also be available for this population

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Lakes Regional MHMR is proposing a similar project to target the IDD population using the wraparound model and Pecan Valley MHMR is also providing crisis respite as an aspect of a project in collaboration with their internal behavioral health provider. MHMRTC is exploring using the START model and will collaborate with other MHMR providers in the RHP 10 to share resources and best practices surrounding this expansion and will propose to continue this collaboration in some capacity pending project funding and implementation. MHMRTC target population does not overlap with any of the other projects. The target population will be those living in MHMRTC’s service area (Tarrant County). Pecan Valley and Lakes Regional MHMR Centers provide services to different populations in their unique service areas. This project will participate in the Region’s learning collaborative activities. *(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)*

MHMR of Tarrant County will also be working with other Community Centers in learning collaborative to select a small amount of outcome measures for category 3, based on the valuation studies conducted by health care economists at the UT Austin and UT Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data
sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project.

**Project Valuation:**

**Approach:**
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system.

In order to set an appropriate incentive RHP 10 agreed that a multiplier of 5 should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the annual value of a single successful intervention at full implementation and multiplying that value by 5. The multiplier of 5 was decided with much discussion by performing providers. The rationale was that to overcome resistance to change, both in the delivery system and the payment system, 5 years of benefits were needed. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

The incentive element of the Region 10 valuation methodology is relevant to all Texas transformation efforts. However, it is particularly relevant to transformation of the mental health care system, where patient experience, population health and costs have previously not received any focus, and where services tend to be provided primarily in emergency situations. Texas ranks 50th in the country in per capita funding for mental health services. Only one-third of the more than 480,000 adults in Texas with serious and persistent mental illness received services through the community mental health system. Therefore, the most important transformation that can occur in mental health is increased access to services. Until the advent of the waiver, the system has not had funds to experiment with the types of interventions that are being made possible through waiver funding. Incentives for effective implementation and outcomes are

---

3 Hogg Foundation for Mental Health, presentation at Waiver summit on August 8, 2012
important to allow for the identification of successful interventions and the ultimate sustained transformation of the system.

Rationale:
The calculation of the value of successful interventions was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying all of our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The QALY value results in significant values related to mental health interventions. These patients are intensive users of the health care system and are most often not functional in society. Incremental improvements in their status have an enormous impact on all three elements of the triple aim.

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.1.1 – Expand Primary Care Capacity –

Unique Project ID: 121822403.1.1
Performing Provider Name/TPI: Ennis Regional Medical Center/121822403

Provider: ERMC is a 60-bed Acute Care General Hospital with a Primary Service Area serving approximately 44,750 residents of portions of Ellis County, Texas and including areas of Dallas County and Navarro Counties. ERMC provides general hospital and outpatient services for all ages and all income levels.

Intervention: The project’s intention is to improve right care at the right setting. The project is a new initiative.

Need for the project: There is an identified need to improve right care at the right setting based on ERMC’s research of the current use of the Emergency Department services compared with published national averages. ERMC research also indicates a relevant deficit in Primary Care capacity which forces patients to use costly and inappropriate services. Ellis County’s population in 2009 was 151,352 residents. Of these residents 22,569 residents had Medicaid and 16,347 residents were living below poverty level. (Texas Department of State Health Services Health Currents Report, 2009)

Target population: All persons (all ages, all incomes) utilizing the Emergency Department for non-emergent services due to lack of Primary Care availability. Estimated number of patients to be served over course of waiver period: The essential benefit is realized when the patients who present to an Emergency Department without an emergent healthcare need have been redirected to and accepted by a Primary Care Clinic or Physician to be seen for their healthcare needs. ERMC has evaluated that 1,343 residents or 3% of the ERMC Primary Care Service Area could experience this benefit during combined DY4 and DY5 by increasing the number of clinic hours and off hour’s availability thereby creating the capacity for increasing clinic visits 10% by DY5. The project benefit will be increased access to Primary Care and reducing the cost of care by providing the right care at the right setting.

Category 1 or 2 expected patient benefits: DY 4 and 5 combined will experience a 10% increase in clinic visits over baseline. How do they tie into project’s purpose? The Milestones selected include expanding Primary Care Capacity by having more healthcare providers and clinics, increasing the capacity of clinic hours specifically for Medicaid, Medicare and medically indigent patients as well as expanding the hours that services are available on weekends and after hours. The Milestones will evaluate the impact and progress of the project elements by studying both the use of Emergency Department for non-emergent services and the increased number of available hours of clinic to direct identified patients for care. Increasing the availability of the clinic hours will increase the capacity available for patients needing primary care who currently utilize emergency services for clinic type illnesses and complaints.

Category 3 outcomes: ED appropriate utilization improvement by 15% overall in DY4 and DY5. How does this tie back to the project’s purpose? The Category 3 outcome selected is a decrease in the utilization of the Emergency Department for non-emergent healthcare needs. The Regional Community Health Needs Assessment as well as Primary Service area research
indicated a serious lack of availability of Primary Care access which drives patients to the Emergency Department of the hospital seeking costly treatment for non-emergent healthcare needs. Without increasing the capacity of Primary Care, so that persons of all income levels can receive right care in the right setting, the identification and redirection of these patients presenting to the Emergency Department setting cannot occur.

**Project Option 1.1.1 – Expand Primary Care Capacity –**

**Unique Project ID:** 121822403.1.1  
**Performing Provider Name/TPI:** Ennis Regional Medical Center/121822403

**Project Description:**
We propose a community-based expansion of primary care capacity in the Ennis Regional Medical Center Primary Service Area (PCSA). Ennis Regional Medical Center (ERMC) Primary Service Area currently encompasses the inhabitants of the following communities: Ennis, Palmer, and Italy in Ellis County; Ferris part Ellis and part southern Dallas County; and Italy in Navarro County, and many other citizens secondarily. Currently over 7,400 patients per year fail to meet criteria for an emergent visit to the emergency department at ERMC.

The goal of this project is to increase the general population’s access to primary care across all payor sources. Increasing the ability for patients to seek and find primary care will improve utilization of primary care services rather than the hospital emergency department for non-emergent services. The expansion approach will include three facets: (1) expanding existing primary care base and expanding clinic hours and off-hours through assisting growing practices in recruitment efforts; (2) further expanding relationships (and clinic sites) with existing Federally Qualified Health Clinics, and (3) partner with established clinics and physician offices to educate and encourage the public on right care, right service. This project will positively impact quality of life, health outcomes, preventable admissions, and emergency department utilization.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goals of this project are: (1) to increase access to ongoing, community-based primary care services for the target population, (2) increase awareness of the availability of primary care and importance of seeking timely and appropriate level of services, and (3) improve right care at the right setting.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by focusing on a key population. Lack of access to primary care leads to frustrations for the community when disparities and lack of resources for health care prevent their attempts to proactively manage their health care. Our advancements in health care for the community must increasingly be a partnership aimed at improving the patient experience, improving the population health, and reducing the cost of health care.

**Challenges:**
Recruitment of providers to care for Medicare, Medicaid, and medically indigent patients can be challenging given the low reimbursement associated with this care. However, providing adequate care to these populations is imperative to improving the health of our community and assuring proper care in the proper setting.

The emergency department of the hospital is open 24/7/365. This availability and accessibility is a habit-formed one-stop shop for health care requiring a paradigm change in the community to develop the self-discipline of proactively forming relationships with a primary care physician and seeking early treatment and other preventive health activities. But those services have to be made available first. Our advancements in health care for the community must increasingly be a partnership aimed at improving the patient experience, improving the population health and reducing the cost of health care.

**5-Year Expected Outcome for Provider and Patients:**
Expanded capacity and access to primary care providers will lead to a reduced number of patients seeking primary care in the emergency department. The specific goal of the project is to establish more primary care clinic hours from 7,191 clinic hours per year to a goal of 14,000 per year, including an increase in off hours and weekend hours in DY2 and DY3 from 1,173 per year to 1,760 per year in order to be able to increase clinic visits 10% during DYs 4 and 5, which should reduce inappropriate utilization of the emergency department by 15% per year.

**Starting Point/Baseline:**
The current clinic patient hours per year are 7,191 with an additional baseline of 1,173 hours per year for off-hour and weekend availability.

**Rationale:**
According to Cost of Emergency Care, (2012) the national average of patients presenting to a hospital emergency department for a non-emergent condition is 12.5%. Currently the ERMC’s emergency department serves 43% more non-emergent patients than this national average for a total of 55.6% per year. A phone survey of the PCSA by E. Henry (personal communication, October 16, 2012) revealed physicians and mid-level practitioners supply only 23 hours per week
for off hours or weekends, and 564 hours per regular hour week to serve a total population of 25,735 persons as calculated from 2010 Census Data, (2012). The average wait time for a new patient appointment is currently nine days. These private physician offices and clinics provide clinic hours to serve approximately 7,191 patients per year with each patient seen only once in the year. Murray et al. state the average number of clinic visits is 3.19 per person. The project is designed to increase clinic hours and off-hours availability an additional total of 7,396 clinic hours by DY 4 to accommodate the targeted population of 3% of the total Medicaid and indigent in Ellis County, 1,343 persons, (Texas Department of State Health Services Health Currents Report, 2009) by the end of DY 5. The emergency department is a costly location for care for any type of patient. With reductions in reimbursement for Medicaid patients receiving non-emergent care in a hospital emergency department, proper utilization is even more important. Further, the Community Health Needs Assessment points to access to primary care as an issue within our county. It also establishes an aging population, and as primary care physicians become increasingly fewer and harder to find in rural areas, it is important for our facility to provide the right care at the right time in the right setting, as well as encourage education regarding the importance of proper utilization of emergency services and supporting local physician and primary care services.

**Project Components:**
There is one core component for the project in expanding primary care capacity: to establish more primary care clinics. The needs for expanding primary care capacity are threefold: (1) Attracting additional primary care physicians to the area, (2) establishing more primary care clinics as well as supporting clinics for Medicaid, Medicare, and medically indigent patients, and (3) assisting in the design of daily operations to include convenient hours for the working public.

**Unique community need identification numbers the project addresses:**
- CN-2 – Lack of provider capacity

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

IT-9.2: ED Appropriate Utilization Improvement Target: DY2-DY5: 10% Improvement in Emergency Department appropriate utilization over baseline.

**Relationship to Other Projects:**
There are no related projects.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
RD-2 30-day readmissions will be positively impacted by the 10% increase in clinic volume hours of availability. Patients must have a ready access to a physician in order to comply with expected ongoing and proactive health care, especially after a recent hospitalization. RD-5 emergency department domain will be affected by the 10% overall improvement of ED appropriate utilization over baseline. The effect will be in improved utilization of all services and diagnostics in the emergency department to focus on patient treatment at the emergent level rather than clinic level.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Ennis Regional Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Ennis Regional Medical Center defined the population that will be directly impacted by the project as patients currently seeking care in the emergency department when a primary care setting would be more appropriate. The percentage of the population expected to be positively impacted by the project is 3% of the Primary Care Service area or 1,343 persons which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome resulting from our project.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 2 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, a primary care visit provides a better patient experience, less time is lost from work, and this results in preventive care.
To determine the value to the community of each individual positively impacted, we concluded that the value of this project is a 2 on a scale of 1 to 5; we believe this to be the correct number because when a person is positively impacted, the emergency department is better able to serve patients with true emergent conditions.

Project Option 1.13.1 – Development of behavioral health crisis stabilization services as alternatives to hospitalization; Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system; (Crisis Respite Behavioral Support Wraparound Program)

Unique Project ID: 121988304.1.1
Performing Provider Name/TPI: Lakes Regional MHMR Center / 121988304

Provider: Lakes Regional MHMR Center’s service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. Our service area crosses four Regional Healthcare Partnership (RHP) areas and is mostly rural. Lakes Regional’s community programs serve over 9,500 individuals each year. Over 95% of our consumers are either Medicaid eligible or indigent. This specific project will target individuals in Ellis and Navarro counties. Ellis County has a population of 149,610 with a span of 952 square miles; Navarro county has a population of 47,735 with a span of 1,086 square miles. Lakes Regional provides community-based, out-patient services to adults with serious mental illness, chemical dependency; to children and adolescents with serious mental illness or emotional disorders; to persons with autism, pervasive developmental disorders or intellectual disabilities; and to infants and toddlers with developmental delays. Over 95% of our consumers served are Medicaid eligible or indigent.

Intervention: Lakes Regional will develop a behavioral health crisis stabilization service for dually diagnosed individuals as an alternative to hospitalization which will include a crisis respite facility, and wraparound services to serve Ellis and Navarro counties in RHP 10. This project intervention is new; there is no other alternative crisis stabilization service or wraparound services for the targeted population in the proposed service area.

Need for the project: The project relates to the Region 10 goals: to improve access to behavioral health services and to reduce the unnecessary use of Emergency Department services (CN.4, CN.10) The project relates to improving access to care and improving overall quality of care for the targeted safety net population, and lowering cost of care by decreasing Emergency Department services.

Target population: Medicaid eligible and indigent individuals with intellectual and developmental disabilities who are dually diagnosed with a mental health diagnosis. We estimate serving 250 clients over the waiver period. Medicaid and indigent individuals with IDD and/or a Mental Health diagnosis will benefit from the array of services and supports in this project during crisis situations. Ellis and Navarro counties are designated as Mental Health Professional Shortage areas.

Category 1 or 2 expected patient benefits: The benefits include improved patient outcomes such as reducing recidivism and unnecessary ED visits. Wrap Around Behavioral Support Services will involve multi-disciplinary treatment team model geared to increase the individual’s ability to deescalate during crisis and in many cases more rapidly; particularly when crisis services are provided in the natural environment. The expected patient benefit will reduce the use of services that have limited or no abilities to provide Dual Diagnosis (IDD/MH) treatment. Process milestones listed for the project are designed to establish baseline need for a crisis services alternative in the region, to gather data on the current community crisis system and to
 Regional Healthcare Partnership  Region 10  
design a program that is tailored to the needs of the target population with IDD/ASD/MH, prior to implementing services in DY4 and DY5.

**Category 3 outcome:** IT-6.1 The project goal is to achieve a 40% improvement by DY5 in patient satisfaction with health status/functional status related to improving access to care, quality of care, and health outcomes, as well as improving overall health for the target population.

**Project Option 1.13.1** – Development of behavioral health crisis stabilization services as alternatives to hospitalization; Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system; (Crisis Respite Behavioral Support Wraparound Program)

**Unique Project ID:** 121988304.1.1

**Performing Provider Name/TPI:** Lakes Regional MHMR Center / 121988304

**Project Description:**
Lakes Regional will develop a behavioral health crisis stabilization service as an alternative to hospitalization by establishing a community-based program to provide a continuum of services, including a crisis respite facility, and wraparound services to serve Ellis and Navarro counties in RHP 10. The program will include an intensive and interdisciplinary behavioral response team to provide comprehensive wraparound services and interventions to high-risk clients who are dually diagnosed with intellectual and developmental disabilities/autism spectrum disorder and mental health diagnosis (IDD/ASD/MH), or have other co-occurring disorders and/or medical needs. The intervention will involve developing and implementing crisis stabilization services to address the identified gaps in the current community crisis system. By expanding crisis residential treatment, individuals in crisis will receive appropriate, cost-effective care at the right time and the right place by specialty behavioral health providers. Based on assessed levels of need and risk, the team would provide in-home consultation, specialty psychiatric services/telemedicine, skills training, family education, treatment planning, monitoring and referrals to needed services to ensure that high-risk individuals remain in the least restrictive environment in the community. In addition, a crisis respite/short-term treatment site would be established to stabilize referred individuals in crisis or in danger of out-of-home placement and/or psychiatric hospitalization. A key component of this project is the extensive ongoing training in applied behavioral analysis to team members/caregivers and significant others to avoid acute crisis events and assist in stabilizing individuals in their home. The team will receive training in providing culturally competent care, and interpretation services would be available, as well as transportation, as needed.

**Goals and Relationship to Regional Goals:**
The five-year goals of this project are to improve access to appropriate crisis alternatives by providing a crisis stabilization program with wraparound services, including the availability of translation and transportation services; and to improve patient satisfaction through early interventions and intensive wraparound services.

**This project meets the following Regional goals:**
The project relates to the Region 10 goals to improve access to behavioral health services and to reduce the unnecessary use of emergency department services (CN.4, CN.10). The project relates to improving access to care and improving overall quality of care for the targeted safety net population, and lowering cost of care by decreasing emergency department services.

Challenges:
Based on a recent Stakeholder meeting, input for Region 10 notes a significant and costly delay in moving individuals from the State Psychiatric Hospital into the community. Additional feedback indicates that individuals who are dually diagnosed experience barriers to care in more structured settings due to the status of being dually diagnosed with IDD/MH. Reportedly there is a significant and costly delay in the time it takes for an individual in crisis to be assessed by behavioral health crisis teams, and in some circumstances, not being assessed at all due to their dually diagnosed status. In this geographic rural area crisis teams are not always available on a timely basis. The Stakeholders also identified a huge barrier to access of services is the lack of availability of care before 8am and after 5pm.

The 2010 Annual Survey of Hospital Tracking Data for Ellis and Navarro Counties listed 58,567 and 21,450 emergency department visits respectively. A number of these ED visits may have included the specialty population targeted by this project. Both Ellis and Navarro counties are designated as official Mental Health Professional Shortage Areas. The Region lacks key community-based alternatives to costly and unnecessary emergency commitments and ED visits for the target population, while 24% of the population in the Region reports having had a mental health occurrence related to stress or depression lasting longer than five days, and 40% making less than $25,000 per year in the Region. The project will direct IDD/ASD/MH individuals to a community-based crisis alternative service at half the cost of hospitalization or institutionalization. Stakeholders also identified post-jail care is not available or delayed which increases the rate of recidivism.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome of this project is to provide an increase in utilization of appropriate crisis alternatives in DY5 by 250. The expected result will be a significant decrease in preventable behavioral health events that typically result in hospitalization, incarceration and institutional care for individuals with IDD by deescalating crises in the natural environment with Wrap Around Behavior Support Services. The patient benefit is the promotion of self-management of challenging behaviors for the target population in the community, and significant reductions in the overall cost of care by utilizing a seamless system of care. The availability of nursing services within the crisis-respite team will facilitate integrated care to address fragmentation and discontinuity of health care, improvement of patient satisfaction and outcomes. Research has shown that the use of intensive case management reduced the number,
confidence interval and duration of inpatient admissions, reducing the number of reported needs and increasing patient satisfaction, as well as the cost of care borne by the health sector. The outcome will be improvement in overall life satisfaction and ability to live independently for the target population/service recipients.

Projected patient impact by DY is as follows:
DY2 – Stakeholders will benefit from availability of an analysis of community needs for crisis services with identified gaps in the current system.
DY3 – Stakeholders will benefit from a program designed to tailor to the crisis needs of the identified population in the local community.
DY4 – 100 individuals will have access to utilization of appropriate crisis alternatives in the community.
DY5 – 150 additional individuals will have access to utilization of appropriate crisis alternatives in the community.

Starting Point/Baseline:
The baseline for the project is to be established, since it will be a new program. The target population includes children and adults in Ellis and Navarro counties with IDD and co-occurring, mental and behavioral disorders. There are currently approximately 900 individuals being served in these counties by the public MH provider and by the IDD local authority. Currently there is no crisis respite/wraparound program in the Region 10 area. Thirty to thirty-five percent of IDD individuals are estimated to have a psychiatric disorder, with a projection of 200 IDD individuals served by private Waiver providers in the target area creates a sizable potential target population for the project. With the addition of referrals from school districts and community resource coordination groups (CRCGs), the number of targeted individuals to be served potentially in the program is 250 for the various program interventions within the project scope over the waiver period. Lakes Regional data indicates that approximately 65% IDD/ASD-diagnosed clients in these counties have a psychiatric diagnosis, or receive psychotropic medication for psychiatric symptoms. Currently we have one provider trained in the project; a board certified behavior analyst (BCBA). The project calls for 12 additional professional staff to be hired.

Rationale:
Consumers lacking appropriate behavioral health crisis resolution mechanisms often end up resolving the situation in the ED, jail or inpatient hospital bed. For the IDD/ASD/MH population, this problem is intensified due to an even greater limitation on settings that are available and appropriate for managing crises. Ellis and Navarro counties are designated as official Mental Health Professional Shortage Areas, and MHMR Centers are lacking provider capacity, as well as staff trained in providing culturally competent care with over 40% of the population in the Region being African-American or Hispanic. Due to this project, the target population will:

- Receive behavioral health management interventions through the provision of comprehensive wraparound services;

---

• Have access to a community-based interdisciplinary intensive behavior supports response team hired and trained in cultural competence to decrease barriers to care;
• Have access to nursing services within the crisis/respite team in addition to a psychiatrist, improving physical and mental health outcomes;
• Have access to early intervention and crisis services, enabling them to be better equipped for crisis situations, thus avoiding unnecessary and costly ED visits and inpatient treatment.

Project Components:
Currently there is no community-based crisis alternative service in this Region. To determine the need and appropriateness of the intervention, the project involves these core components:

a. Convening community stakeholders to conduct a gap analysis of the current community crisis system, and to develop a specific action plan to address the identified gaps this will allow the project to establish a baseline of need.

b. Analysis of the current system of crisis stabilization services available in the community – this will allow the project to establish a baseline of need and design of a program that fits the needs of the target population in the local area.

c. Assessing the behavioral health needs of the target population with IDD/ASD/MH currently receiving crisis services in a variety of settings to: (1) Determine the types and volume of services needed to resolve crises in community-based settings; (2) Conduct a gap analysis that will result in a data-driven plan to tailor community-based crisis stabilization alternative services to the behavioral health needs of the target population.

d. The project has identified the community-based crisis respite model with wraparound services, including telepsychiatry, nursing services, BCBA services, service coordination, community supports/skills training, short-term day habilitation, assertive community treatment (ACT) and intensive case management, which is an evidence-based practice that ensures medication and treatment adherence, and links the patient with resources.

The wraparound crisis and ACT model is a highly researched evidenced-based approach for delivering behavioral health services; it is listed in the Texas Administrative Code, Community Standards, and Best Practices.

e. The project will also involve sharing and disseminating findings to other agencies, providers and stakeholders in the Region.

Process milestones listed for the project are designed to establish baseline need for a crisis services alternative in the Region, to gather data on the current community crisis system and to design a program tailored to the needs of the target population with IDD/ASD/MH. Process milestones also encompass hiring of staff and creation of policies and procedures prior to program implementation. Improvement milestones address measurement of an incremental

increase in utilization of the program in DYs 4 and 5. Metrics in DYs 4 and 5 will measure an increase in utilization of the program by 250 individuals at the completion of DY5.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.4 – Lack of access to mental health services
- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

**IT-6.1 Percent improvement over baseline of patient satisfaction scores measuring patient’s overall health status/functional status (stand-alone).**

The program staff will monitor mental and physical health status and outcomes to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population.25

Research has shown that the use of intensive case management reduced the number, confidence interval and duration of inpatient admissions, reducing the number of reported needs and increasing patient satisfaction, as well as the cost of care borne by the health sector.26 The CGCAHPS survey produces “… comparable data on the patient’s perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers.”27 Sharing survey results with other agencies and providers in the Region regarding consumer satisfaction with overall health and functional status will bring about improvements in the overall health system for individuals with IDD/ASD/MH; sharing survey results with stakeholders will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and follow-up to care.

**Relationship to Other Projects:**

1.7.1 Telemedicine Project
The Lakes Regional telemedicine project will allow access to remote provider services, psychiatric counseling and primary care services. Telemedicine technology will be utilized as an integral focus of the provision of care proposed in the Crisis Stabilization project.

27 RHP Planning Protocol, Attachment 1, 398.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
Tarrant County MHMR is proposing a similar project to the same target population for Crisis Avoidance; Pecan Valley MHMR is also providing crisis respite as an aspect of a project in collaboration with their internal behavioral health provider. Lakes Regional has been participating in collaborative teleconference calls with the other MHMR providers in the RHP 10 to share resources and best practices surrounding this expansion, and will propose to continue this collaboration in some capacity pending project funding and implementation.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaborative along with a list of participating provider projects for each.)

Project Valuation:
Rationale/Justification: Currently, there is no community-based alternative crisis service for the dually diagnosed IDD/ASD/MH target population (children and adults) in Ellis and Navarro counties. The goals described in this project will be accomplished via the collaborative involvement of providers in the public behavioral health system, private Waiver providers, physical health and the developmental disabilities service system, resulting in a potentially significant decrease in preventable behavioral health events that typically result in hospitalization, incarceration and institutional care for the target population. The anticipated valuation addresses a priority need in the community that allows for cost avoidance, supporting individuals in the community at a lesser cost than institutional care, avoiding costs in emergency departments, psychiatric hospitals and the criminal justice system. The project also addresses the barrier to care related to lack of transportation in a large, primarily rural geographic area by providing access to transportation to critical community resources. Size factor: There are currently approximately 900 individuals with IDD being served in these counties by the public MH provider and by the IDD local authority. Currently there is no crisis respite alternative program in the Region 10 area. With 30 to 35% of IDD individuals estimated to have a psychiatric disorder and with the projection of 200 IDD individuals being served by private Waiver providers in the target area, the number of targeted individuals to be served potentially in the program would be approximately 250 over the waiver period.

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Lakes Regional MHMR has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
In addition, this project was valued based on studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: “Valuing the Program to Create an Assertive Community Treatment (ACT) Team for People with Intellectual and Developmental Disabilities (IDD)” and “Valuing the Crisis Respite for Children Program.” These studies were completed through a contract with Center for Health Care Services. These valuation studies used cost-utility analysis, which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency department visits that are avoided). The proposed program’s value is based on a monetary value of $50,000 per QALY gained due to the intervention multiplied by number of participants. Complete write-up of project research is available at performing provider site.

Total Five-Year Valuation: $6,421,291

Project Option 1.7.1 – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the Region (Lakes Regional Ellis/Navarro Telemedicine/Telehealth Project)

**Unique Project ID:** 121988304.1.2  
**Performing Provider Name/TPI:** Lakes Regional MHMR Center / 121988304

**Provider:** Lakes Regional MHMR Center’s service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. This project will target individuals in Ellis and Navarro counties. Ellis County has a population of 149,610 with a span of 952 square miles; Navarro county has a population of 47,735 with a span of 1,086 square. Lakes Regional’s community programs serve over 9,500 individuals each year. Over 95% of our consumers are either Medicaid eligible or indigent.

**Intervention:** This project will implement telemedicine and telehealth services to provide consultations and increase capacity for behavioral health and other specialty provider services to the Medicaid and indigent target population. This is a new project intervention for Lakes Regional in Ellis and Navarro Counties.

**Need for the project:** There is a lack of provider capacity to serve the Medicaid and indigent population for these behavioral health and other specialty services. Both counties targeted by this project have been designated as behavioral health occupations shortage areas. The project will improve provider capacity and access to services (specialists) for remote populations/communities.

**Target population:** The target population is our clients needing specialty consultations. Approximately 95% of our patients are either Medicaid eligible or indigent, so we expect they will benefit from the majority of the consults. We estimate that Lakes Regional will serve 210 patients over the course of the waiver period. This project will provide access to services (specialists) for remote populations/communities in these counties and is specifically targeting these services to Medicaid and indigent clients in rural areas of Ellis and Navarro Counties.

**Category 1 or 2 Expected Benefit:** The project seeks to provide for a minimum of 210 individuals for telemedicine e-consultations with a specialist over the course of the waiver and to maintain an annual increase trend of 40% (over baseline) for the numbers of patients served.

**Category 3 outcomes:** The project goal is to achieve a 30% improvement by DY5 in patient satisfaction with health status/functional status related to improving access to care, quality of care, and health outcomes, as well as improving overall health for the target population.
Project Option 1.7.1 – Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the Region (Lakes Regional Ellis/Navarro Telemedicine/Telehealth Project)

Unique Project ID: 121988304.1.2
Performing Provider Name/TPI: Lakes Regional MHMR Center / 121988304

Project Description:
There currently exists a significant gap in behavioral health (psychiatric specialist referral services) and health and wellness services in many Texas counties, including Ellis and Navarro in Region 10, which have been federally designated as Mental Health Professional Shortage Areas. Lakes Regional MHMR Center proposes to improve patient access to these services in Ellis and Navarro counties through telemedicine/telehealth technology. This approach is a cost-effective alternative to face-to-face communication, especially for individuals in remote/rural areas where access is difficult and/or unavailable. The planned telemedicine/network technology for this project will include the deployment of high-definition video/audio equipment, virtual private network (VPN) Internet cloud-based connectivity and server-based video session management technology, allowing for the management of multiple client/specialist sessions across many different provider sites and mobile devices. Successful implementation of this technology will ensure more flexible and timely delivery of needed health care and specialist services to individuals in rural areas of Ellis and Navarro counties.

Goals and Relationship to Regional Goals:
Specific goals for this project include:
1. Successful planning and implementation of a telemedicine/telehealth infrastructure program to provide and enable expansion of behavioral health services (including psychiatric specialist referral services, and health and wellness services with improved, flexible, and cost-effective access to these services needed in Ellis and Navarro counties.
2. Continuous program of monitoring and analysis of the delivery system performance (use of the technology).
3. Measurable and continuing improvement in the expansion of access to specialty services, improvement in clinical outcomes, increasing patient satisfaction with the services they receive, and a 40% annual increase trend (over baseline) for the number of individuals seeing a specialist through the telemedicine program.

28 U.S. Department of Health and Human Services Shortage Designation Branch (http://bhpr.hrsa.gov/shortage/)
This project meets the following Regional goals:

The Region is looking for ways to feasibly and effectively improve provider capacity and access to services (specialists) for remote populations/communities. By improving expanded access to mental health services, the Region anticipates improvements in patient outcomes and quality; a reduction in emergency department utilization; and an overall cost savings. Our telemedicine/telehealth project will implement a means to move past current barriers toward helping the Region achieve these goals. The application of this technology is very flexible, and will allow connectivity between all kinds of service providers, including doctors’ offices, hospitals, specialty clinics, law enforcement and crisis care providers such as respite clinics with wraparound services for IDD (another Lakes Regional implementation project). According to several studies, there have been upwards of 50 different medical subspecialties successfully served via telemedicine and the number is growing. These new services will help to reduce emergency department visits and the need for hospitalization by getting crucial/crisis care and preventive care where needed in the Region.

Challenges:
The use of telemedicine/telehealth technology for the expansion of behavioral health services (including psychiatric specialists), and health and wellness services has not yet been fully explored by Lakes Regional in Ellis and Navarro counties. The number of individuals in need of specialist psychiatric and other services in the penetration area around current Lakes Regional offices has not been established. A thorough needs assessment/services gap will be conducted to provide the information necessary to determine infrastructure requirements and the appropriate level and types of services needed from the telemedicine/telehealth start-up and expansion program. Access to specialty services in Ellis and Navarro counties are limited by funding and travel time, and the technology for the data lines currently deployed for the Lakes Regional core network into these counties have very limited bandwidth (T1 level and below). The data transfer speeds between sites and is slow and very limited for an effective deployment of high-definition, Internet cloud and server-based telemedicine technology. Successful implementation of the telemedicine/telehealth technology will require infrastructure improvements including the latest advancements in technology for telemedicine/telehealth hardware and server based software. Data network improvements will include high speed data transmission through the deployment of VPN internet cloud capabilities and mobility options. Completion of the necessary analysis and implementation of the required improvements will insure our success with being able to meet the clinical and technological challenges for this project.

5-Year Expected Outcome for Provider and Patients:
Through the implementation of this telemedicine/telehealth project, Lakes Regional expects five-year outcomes to include: 1) Expanded access to behavioral health services (including

29 American Telemedicine Association (http://www.americantelemed.org/i4a/pages/index.cfm?pageid=3333)
psychiatric specialist referral services), and health and wellness services for the target population (low-income, rural areas of Ellis and Navarro counties). The projected outcome for the second half of DY-5 is an 80% improvement in the number of individuals over baseline (established in the second half of DY-3) in the target population gaining access to a specialist/ specialist services. 2) Continuous quality improvement effort in the technical and clinical processes with documented improvement in the satisfaction of individuals receiving services over baseline/start-up results.

Starting Point/Baseline:
Lakes Regional has experience with providing services through telemedicine; however, we have not implemented or expanded the program into Ellis and Navarro counties. Providing these telemedicine/ telehealth services in the Region will be a start-up program and baseline data for the quality of services and the expansion of the kinds of services provided and the number of individuals served will need to be established. We will begin providing specialist services via telemedicine during the 2nd half of DY-3 and are setting our baseline at a minimum of 30 individuals/e-consultations with a specialist during that period. As soon as our implementation and assessment phase is completed, we will begin data collection to capture ongoing data in many areas of the program. After the first six months of providing specialist services, we will have actual numbers from which quality improvement metrics will be measured against.

Rationale:
One of the biggest challenges facing the U.S. health care system is to provide quality care to the areas currently underserved and lacking access to specialty physicians due to geographic and socioeconomic conditions. With the implementation of a telemedicine/telehealth infrastructure /program, we are certain that Lakes Regional MHMR Center will be able to close a significant gap in behavioral health and health and wellness services for individuals in the rural areas of Ellis and Navarro counties. The time frames for implementation and management of the new telemedicine/telehealth program are well within our capabilities. The project milestones and metrics are based on the telemedicine program infrastructure deployment, the introduction of new and specialty services and the corresponding growth and continuous improvement in the quality of those services (technically and clinically). With successful implementation of the telemedicine/telehealth program, we plan to reach and exceed the goals we have set for the introduction of new services, service locations, and improvement in the quality of our services and the number of individuals served. The technology will provide the needed flexibility in how and where we provide services. This flexibility will contribute to a significant projected growth rate every year for the number of telemedicine/telehealth e-consultations/visits, while continuously improving the quality of the program. We expect the growth to be significant with an increase of 80% over baseline numbers for the 2nd six months of DY5 for the number of Telemedicine/ Telehealth specialist e-consultations/visits for individuals. Along with our growth, our daily monitoring of the program will enable us to continuously improving the management and quality of the services we provide.

Project Components:
Core project components:
A. Provide patient consultations by medical and surgical specialists as well as other types of health professionals using telecommunications.
B. Conduct quality improvements using methods such as rapid cycle improvement, including but not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population, identifying key challenges associated with expansion of the project including special considerations for safety net populations.

The selected project components are in line with the five-year goals we have set and are achievable within planned time frames. The project will provide access to psychiatric specialty services using telecommunication, and includes the use of quality improvement methodologies involving identification of project impacts, lessons learned, key challenges associated with project expansion, and opportunities to scale all or part of the project from dually diagnosed individuals to the broader safety net population.

Project milestones and metrics are based on our experience with telemedicine program infrastructure deployment, the introduction of new and specialty services, and planned growth and continuous improvement in the quality of services, technically and clinically. Successful implementation of the telemedicine/telehealth project plan will enable Lakes Regional to reach and exceed the goals we have set for the introduction of new specialist services, new service locations, and improvement in the quality of our services and the number of individuals served (210 at the completion of DY5).

Unique community need identification numbers the project addresses:
- CN.1 – Lack of provider capacity
- CN.3 – Shortage of specialty care
- CN.4 – Lack of Access to mental health services
- CN.7 – Need to address geographic barriers that impede access to care
- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Lakes Regional is currently providing services through telemedicine at some of our larger clinics, but we have not implemented or expanded the program into Ellis and Navarro counties. Providing these telemedicine/telehealth services is a new initiative for us in this Region, and will be a start-up program that will significantly enhance our existing service delivery system, enabling flexible delivery of care and improved delivery times for services. Lakes Regional will
be able to set up multiple connections to include private physicians, hospitals, other MHMR Centers, and other providers or resources in the community wherever they may be located.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

*IT-6.1 Percent improvement over baseline of patient satisfaction scores measuring patient’s overall health status/functional status.*

Although this Telemedicine/Telehealth Introduction/Expansion Project will enable services from multiple provider specialties, it will share significant focus with the Lakes Regional Crisis Respite – Behavioral Support Wraparound Program Project. Within the IDD population, research has shown that there is a much greater instance of health problems.\(^{30}\) With the help of telemedicine/telehealth technology, program staff will monitor mental and physical health status and outcomes to facilitate integrated care, improvement of patient satisfaction and outcomes for the target population.\(^{31}\) The specific ACT model planned for the program will result in better control of psychiatric symptoms, better quality of life overall, and greater consumer and family member satisfaction.\(^{32}\) The projected outcomes relate to an improvement in access to care, the quality of care and health outcomes, as well as an overall improvement in health for the target population. The CGCAHPS survey produced comparable data on the patient’s perspective on care that allows objective and meaningful comparisons between institutions on domains that are important to consumers\(^{33}\) The sharing of consumer satisfaction data (overall health survey results) between agencies (IFF, SDF, MH) and providers in the Region regarding consumer satisfaction, will result in a greater awareness of the efficacy of the crisis respite wraparound model in improving life satisfaction, following better self-management skills and follow up to care.

**Relationship to Other Projects:**

121988304.1.1 – Develop and implement crisis stabilization services to address the identified gaps in the current community crisis system, Crisis Respite – Behavioral Support Wraparound Program. Telemedicine technology will be utilized as an integral focus of the provision of care proposed in the respite project.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project is related to the JPS Health Network Virtual Psychiatry Project, which will provide virtual support to primary care physicians specifically to support screening, diagnosis and treatment of depression.

\(^{30}\) Journal of Intellectual Disability Research 48 (2): 93-102, 2004  
\(^{32}\) Phillips et al, 2001… Teague et al, 1995  
\(^{33}\) RHP Planning Protocol, page 398
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Lakes Regional MHMR has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

In addition, the project intervention was valued based on studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research: “Valuing Access to Timely Services Through Telemedicine.” These studies were completed through a contract with Center for Health Care Services. These valuation studies used cost-utility analysis, which measure program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency department visits that are avoided). The proposed program’s value is based on a monetary value of $50,000 per QALY gained due to the intervention multiplied by number of participants. The reviewed research cited Hollinghurst et al. (2010), among others, which yielded a QALY gain equal to 264,000 per 100 patients served for a similar project population. Utilizing this formula of QALY with an estimation of 700 clients over the course of this Waiver project yielded the total valuation of **$1,782,072.** Complete write-up of project research are available at the performing provider site. Additional cost effectiveness savings can also be assumed through avoidance of higher cost crisis emergency-based services and transportation costs resulting from increased access due to this project.

**Project Option 1.12.2** – Expand number of community-based settings where behavioral health services may be delivered in underserved areas: (Lakes Regional Depression/Trauma Counseling Centers)

**Unique Project ID:** 121988304.1.3 (Pass 2)  
**Performing Provider Name/TPI:** Lakes Regional MHMR Center/121988304

**Provider:** Lakes Regional MHMR Center’s service area includes 12 Texas counties with a total population of 633,045 and spans an area of 6,762 square miles. Our service area crosses four Regional Healthcare Partnership (RHP) areas and is mostly rural. Lakes Regional’s community programs serve over 9,500 individuals each year. Over 95% of our consumers are either Medicaid eligible or indigent. This specific project will target individuals in Ellis and Navarro counties. Ellis County has a population of 149,610 with a span of 952 square miles; Navarro county has a population of 47,735 with a span of 1,086 square miles. Lakes Regional provides community-based, out-patient services to adults with serious mental illness, chemical dependency; to children and adolescents with serious mental illness or emotional disorders; to persons with autism, pervasive development disorders or intellectual disabilities; and to infants and toddlers with developmental delays. Over 95% of our consumers served are Medicaid eligible or indigent.

**Intervention:** This project will create a clinic for provision of evidence-based services for individuals who suffer from depression or trauma related disorders not meeting the state mandated diagnostic criteria for eligibility for state funded behavioral health services primarily residing in Ellis and Navarro counties in RHP 10. This project intervention is new; there is no such clinic in the area oriented to the targeted population of low income and Medicaid recipients in the proposed service area.

**Need for the project:** The project relates to the Region 10 goals: to improve access to behavioral health services and to reduce the unnecessary use of Emergency Department services (CN.4, CN.10). The project will improve access to care and - improve overall quality of care for the targeted safety net population, and lower the cost of care by decreasing demand on Emergency Department services.

**Target population:** The target population is low income and Medicaid eligible citizens (not meeting the state funded criteria) who have diagnosable symptoms or a behavioral health crisis. Estimated number of patients to be served over course of waiver period: a minimum of 263. Medicaid and indigent individuals and/or families will have access to evidence-based depression and trauma counseling services; Ellis and Navarro counties are designated as Mental Health Professional Shortage areas.

**Category 1 or 2 expected patient benefits:** Benefit milestones are to establish behavioral health services in a new community-based setting in an underserved area, increased utilization of community behavioral healthcare and improved consumer satisfaction with access. Access to behavioral health and satisfaction with care (indicative of improved ability to self-manage in the community) will improve life for participants, reduce their health related costs, and increase the likelihood of continued use or return to use of behavioral health as opposed to seeking Emergency Department services for emotional related concerns.

**Category 3 outcomes:** IT-10.1 Quality of Life/ Functional Status: - The goal is to achieve and maintain a mean 10% improvement as measured in a multi-dimensional standardized survey
consistent with the therapeutic goals of the project for the aggregate population in treatment services through the Waiver. Minimum unique participants per year will be: - DY-3=70, DY-4=84 and DY-5=109; totaling 263.

**Project Option 1.12.2** – Expand number of community-based settings where behavioral health services may be delivered in underserved areas: (Lakes Regional Depression/Trauma Counseling Centers)

**Unique Project ID:** 121988304.1.3 (Pass 2)
**Performing Provider Name/TPI:** Lakes Regional MHMR Center/121988304

**Project Description:**
Rural communities are underserved in behavioral health (Hogg Foundation, 2010). This is true for Navarro and Ellis counties where Lakes Regional Mental Health Mental Retardation Center (LRMHMRC) provides services to Intellectually Developmentally Delayed (IDD) individuals in RHP 10. The National Association of State Mental Health Program Directors (NASMHPD) estimated that states have cut $3.4 billion in mental health and IDD funding since FY 2009, while the demand for services has increased. Since FY 2009, demand for community-based services has increased by 56%, and the demand for emergency department (ED), state hospital, and emergency psychiatric care has climbed 18% (Womble 2012). Texas-funded services are restricted to the severely mentally ill (SMI) population by diagnostic code. Others in the community who do not meet the state criteria for supported services other than the local hospital emergency department (ED) need an appropriate place to obtain effective depression and trauma services to lower the overall cost of health care in the county by providing the proper care in the proper context.

LRMHMRC will develop and establish a behavioral health Depression/Trauma Clinic for individuals with a primary need for mental health (MH) screening and treatment for symptoms of depression and mental anguish or trauma. Members of the community similarly affected who do not meet State criteria for SMI services will be able to access the appropriate level of service without engaging the ED. The Screening – Brief Intervention Referral and Treatment (S-BIRT) evidence-based tools to screen and intervene for substance use disorder will be used as well. Screening services will be able to identify and link clients who present with comorbid substance use disorders for effective treatment. Evidence-based individual and group counseling services will be rendered by personnel prepared specifically for depression and trauma screening and interventions.

**Goals and Relationship to Regional Goals:**
Project Goals:
The goal for the citizens not eligible for State-supported behavioral health services due to diagnostic restrictions is to have an available clinic to provide evidence-based screening and/or treatment services for the array of depression, substance abuse and trauma-related anxiety concerns. Greater satisfaction with appropriate and effective services is a goal for all community participants. Greater personal sense of enhanced quality of life as an outcome will deter participants from use of higher levels of care and increase the likelihood of returning in moments personal crisis to appropriate services rather than ED use.

This project meets the following Regional goals:
The project relates to (CN.4) – Lack of access to mental health services. This contributes to inappropriate ED utilization and (CN.10) – Overuse of emergency department (ED) services.

Challenges:
Access to state-supported mental health services is restricted to those individuals with SMI and the service array narrow in scope around the restricted diagnostic criteria. Members of the broader community in mental and emotional distress due to symptoms related to moderate depression or trauma and who do not have financial resources for private care seek relief through the ED, increasing the overall cost of health services to the community (aside from the costs of other emergency and law enforcement services). Local hospitals seek a solution to the pressure on the ED to serve what are regarded as psychologically related, symptom-driven presentations. There is no apparent mental health trauma treatment available to indigent non-SMI populations in the Region as an alternative to the current pattern of ED usage. RHP 10 has recognized the communities-at-large dearth of MH service in the Community Needs Assessment (CNA) as (CN.4) – Lack of access to mental health services. This contributes to inappropriate ED utilization and (CN.10) – Overuse of emergency department (ED) services. Having a Depression Trauma Clinic as a referral source for the emergency, health and public services personnel in the region will be a valuable niche addition to the health services array.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome of the project is clinic resources in the rural underserved county providing outpatient evidence-based screening, counseling and group - services to at least 263 community members, thereby contributing to the overall health delivery system by appropriately and effectively addressing mental health concerns that contribute to inefficiencies, possibly preventable hospitalizations, inappropriate ED utilization, and increased costs. Services will start in DY3 with a minimum unique participant objective of 70 in that year. A 20% increase in DY4 of 84 new unique participants. A 30% increase in DY5 over DY4 will result in 109 unique new participants seen during that year; thus a 263 minimum clientele served over the course of the waiver. Individuals served will experience greater satisfaction and improved personal
efficacy from their state of entry into services. There will be measurable improvement in quality of life from program participation.

**Starting Point/Baseline:**
While the local hospital personnel in the communities served by LRMHMRC have urged the development of a referral resource for their ED patients who present with behavioral health-driven complaints, no such low-cost solution exists. Program development will require researching all aspects and creating an operational plan: community resources, selection parameters, protocols, evidence-based programming choices, location, hiring and training qualified staff. However, LRMHMRC is well familiar with the community and will be able to extend the services of the Information Technology (IT) and business departments to support accounting, reporting, quality improvement, electronic medical records and telemedicine to cover prescriber service access. Following these DY2 preparations and staffing selections, provider competence in the chosen intervention models will be trained and services initiated in DY3. Continuous improvement strategies will guide the refinement of operations and services from DY3 through DY5. LRMHMRC will seek to collaborate with primary care providers for more integration of care where possible.

**Rationale:**
Category 1.12, [Option 1.12.2 Expand the number of community-based settings [for] behavioral health services]. Rural communities need adequately trained resources to respond to the demand for care for trauma recovery and depression for populations where those services do not exist. LRMHMRC chose this project category and option due to the restrictions in state budgeted mental health services and the obvious access needs of the unserved populations in these RHP 10 counties. The vast majority of patients with behavioral health problems go without care, visit the ED in emotional/somatic crisis or visit primary care providers without behavioral health specialty care, either because the patient doesn’t meet entry criteria into the mental health system (limited to the severely mentally ill) or because the patient refuses behavioral health specialty care due to the stigma attached. The requirements of the State services are often viewed as cumbersome and private care is too costly. Adults with mental illnesses were more likely to use an ED or be hospitalized in the past year (at least one visit) than adults without mental illnesses. Compared with adults without mental illness, adults with SMI were more likely to use an ED (38.8 vs. 27.1%) in the past year and to be hospitalized (15.1 vs. 10.1%) (SAMHSA, 2012).

The milestones and metrics chosen for the introduction of a new clinic serving a niche unavailable in the current health delivery system are in keeping with the Community Needs Assessment (CN.4) – Lack of access to mental health services. Category 1.12, Option 1.12.2. Expand the number of community-based settings [where] behavioral health services also fit this project. The milestones chosen to inform and prepare the project are:
P-3. Process Milestone: Develop administrative protocols and clinical guidelines for projects selected (i.e., protocols and clinical guidelines).

P-4. Process Milestone: Hire and train staff to operate and manage projects selected.

Once services are initiated, expanded community presence and access milestones will be:

I-11 Improvement Milestone: Increased utilization of community behavioral health care

I-14 Improvement Milestone: Improved consumer satisfaction with access

Project Components:
Having a clinic in the community available with trained personnel in appropriate service delivery for these concerns will be a new addition to overall community health resources. Many primary care providers feel poorly equipped to handle significant behavioral health issues. “The impact of psychological interventions on the use of medical services was evaluated by examining the outcome of 91 studies published between 1967 and 1997 using meta-analytic techniques and percentage estimates. Results provided evidence for a medical cost-offset effect, specifically in the domain of behavioral medicine. Average savings resulting from implementing psychological interventions was estimated to be about 20%. About one-third of the articles demonstrated that dollar savings continued to be substantial even when the cost of providing the psychological intervention was subtracted from the savings.” (Chiles 1999).

LRHMRC currently serves individuals who receive only medication prescription services for their depressive symptoms and are not interested in other required services under State protocols for enrolled participants, accounting for a large portion of serial failed appointments and wasted professional staff time. Treatment in this type of clinic will allow greater satisfaction with the level of care desired by clients, and the existing SMI clinics to better serve individuals in need of more intense services.

Unique community need identification numbers the project addresses:
CN. 4 Lack of access to mental health services
CN. 10 Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
The Depression/Trauma Clinic provides a needed level of care in the continuum filling an important gap. The milestones and metrics chosen for the introduction of a new clinic serving a niche unavailable in the current health delivery system are in keeping with the Community Needs Assessment item “CN. 4 Lack of access to mental health services”, and to the degree
Related Category 3 Outcome Measures:
OD-10 LRMHMRC chose the outcome domain OD-10 Quality of Life/Functional Status and Improvement target IT-10.1 on the rationale that the sense of greater quality of life and identifiable improvements in functioning along with the satisfaction improvement measure will result in a greater likelihood of continued use of this appropriate level of care as a chosen alternative.

Relationship to Other Projects:
121988304.1.2 Introduce, Expand or Enhance Telemedicine/Telehealth
121988304.1.1 Crisis Respite Behavioral Support –WRAP Project

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
Other providers are proposing projects to reduce ED use for behavioral crisis, but in other counties. The target group for these other projects does not overlap with the area served by LRMHMRC. However, LRMHMRC will seek to share experiences in approach and lessons learned within the Region toward discovering best practices.

This project will participate in the Region’s learning collaborative. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative.

Additionally, Lakes Regional will collaborate with 39 other MHMR centers across the state to select a small set of outcome measures for Category 3, based on the valuation studies conducted by health care economists at the University of Texas and University of Houston. The collaborative will develop a strategy for collection of data through shared data sources in local communities; centers are currently in the process of engaging a consultant to provide leadership and consultation for the project.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Lakes Regional MHMR has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
Rural communities need adequately trained resources to respond to the demand for care for trauma recovery and depression for populations where those services do not exist. LRMHMRC chose this project category and option due to the restrictions in state budgeted mental health services and the obvious access needs of the unserved populations in the counties. The scope of this project could impact at least 100 patients per year, in a largely rural medically underserved geographic area.

In addition, this project was valued based upon three valuation research studies completed by the UT Houston School of Public Health and the UT Austin Center for Social Work Research:

- Valuing the Program to Expand Behavioral Health Outpatient Capacity (ATCIC) – Travis County Region 7, Central Health (2012)
- Valuing the Youth Counseling Program (BTCS) – Fayette County Region 7, Central Health (2012)
- Valuing the Substance Abuse Treatment Program (BTCS) – Guadalupe County Region 6, University Health System (2012)

These valuation studies used cost-utility analysis, which measures program cost in dollars and the health consequences in utility-weighted units called quality-adjusted life-years (QALYs). QALYS incorporate costs averted when known (e.g., emergency department visits avoided). The proposed program’s value is based on a monetary value of $50,000 per QALY gained due to the intervention multiplied by number of participants. A complete write-up of project will be available at performing provider site.

Total Five-Year Valuation: $2,768,495

**Milestone 1 [P-3]:** Develop administrative protocols and clinical guidelines for projects selected.

**Baseline/Goal:** Project Plan - Stakeholder survey data gathered. Data gathered on Treatment models. EMR reports for client transfer eligibility. Software options gathered. Location information for real estate/leasing agents gathered.

**Data Sources:** Program Plan and files. Survey data pool. HR records.

**Milestone 1 Estimated Incentive Payment:** $326,359

**Milestone 2 [P-4]:** Train existing staff to operate and manage project selected.

**Metric 1 [P-4.1]:** Number of staff secured and trained.

**Goal:** Support staff and management hired and trained in new employee orientation and state requirements.

**Data Source:** HR records

**Milestone 2 Estimated Incentive Payment:** $340,505

**Milestone 3 [P-4]:** Hire and train counseling staff.

**Metric 1 [P-4.1]:** Number of staff secured and trained.

**Goal:** Hire and train counseling staff in basic requirements of operational and clinical software. Clinicians are additionally trained in chosen evidence-based therapy models, screening and referral.

**Data Sources:** HR records, training certificates.

**Milestone 3 Estimated Incentive Payment:** $340,505

**Milestone 4 [P-6]:** Establish behavioral health services in new community-based setting in underserved area.

**Metric 1 [P-6.1]:** Number of new community-based settings where behavioral health services are delivered.

**Goal:** Open and provide services rendered. Enhanced professional training accomplished. Target number of clients served 70+. PDSA process cycles in place to inform project development, efficiency and effectiveness.

**Data Source:** Client records, schedules Reports of PDSA reviews.

**Milestone 4 Estimated Incentive Payment:** $364,860

**Milestone 5 [I-11]:** Increased utilization of community behavioral healthcare.

**Metric 1 [I-11.1]:** Percent utilization of community behavioral healthcare services.

**Goal:** Expansion of population target of 20% over DY3=84 new unique individuals served is met. PDSA cycle complete with report and improvement targets.

**Data Source:** Schedules, client rosters, chart reviews. PDSA document.

**Milestone 5 Estimated Incentive Payment:** $364,860

**Milestone 6 [I-14]:** Improved Consumer satisfaction with Access

**Metric 1 [I-14.1]:** >40% of people reporting satisfaction with access to care.

**Goal:** Satisfaction scores on participant surveys using the MHSIP instrument. PDSA cycle improvements.

**Data Source:** Participant surveys and reports. PDSA improvement reports.

**Milestone 6 Estimated Incentive Payment:** $364,861

**Milestone 7 [I-11]:** Increased utilization of community behavioral healthcare.

**Metric 1 [I-11.1]:** Percent utilization of community behavioral healthcare services.

**Goal:** Expansion of population target of -30% over DY4=109 new unique individuals served is met. PDSA cycle complete with report and improvement targets.

**Data Source:** Schedules, client rosters, chart reviews. PDSA document.

**Milestone 7 Estimated Incentive Payment:** $352,522

**Milestone 8 [I-14]:** Improved Consumer satisfaction with Access

**Metric 1 [I-14.1]:** >60% of people reporting satisfaction with access to care.

**Goal:** Satisfaction scores on participant surveys using the MHSIP instrument. PDSA cycle improvements.

**Data Source:** Participant surveys and reports. PDSA improvement reports.

**Milestone 8 Estimated Incentive Payment:** $352,522

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.12.1 – Establish extended operating hours at a select number of local mental health clinics or other community-based settings in areas of the Region where access to care is likely to be limited.

Unique Project ID: 126675104.1.1
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: JPS Health Network will design and develop the full continuum of behavioral health capacity to improve accessibility to appropriate levels of behavioral health services for population health needs. The project’s ultimate benefits and goals are to expand hours and services, provide a more patient-centered focus, manage more patients in an outpatient setting and avoid preventable inpatient admissions and readmissions and emergency department (ED) utilization. This project is a new initiative that will build upon the existing infrastructure of the currently established behavioral health clinics which will result in newly operational operating hours.

Need for the project: This project addresses the following community needs: a) CN.4 Lack of access to mental health services.

Target population: Additional patients accessing outpatient behavioral health services in expanded hours/services - 457 unique patients annually (1,371 unique patients for DY3, DY4, and DY5). This project will expand hours and services, provide a more patient-centered focus, reduce the “no-show rate, manage more patients in an outpatient setting and avoid preventable inpatient admissions and readmissions and emergency department (ED) utilization for the significant number of Medicaid and Uninsured psychiatric patients treated at JPS.

Category 1 or 2 expected benefit: Milestones P-2.1, P-3.1, P-4.1, P-5.1, P-7.1, I-1.1, - , I-13.1, I-40.1, and I-42.1 were selected. Each milestone selected was due to their natural progression to project implementation. The improvement milestones selected are all considered to be indicative of increased behavioral health service capacity.

Category 3 outcomes: Outcomes IT-1.18 and IT-9.2 were selected. There is an evidence base to suggest that increased capacity will have positive impact on each of these outcome areas.
Project Option 1.12.1 – Establish extended operating hours at a select number of local mental health clinics or other community-based settings in areas of the Region where access to care is likely to be limited.

Unique Project ID: 126675104.1.1
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
This project will serve a large group of mentally ill patients in Tarrant County through expanded outpatient services. Specifically, this project will offer a larger scope of behavioral health services with expanded hours, increased appointment availability, individual therapy, group therapy, local support groups, improved staffing for throughput and collaboration with primary medical care, enabling the adoption of a more cohesive and patient-centered approach to behavioral health care for 457 unique patients annually (1,371 unique patients for DY3, DY4, and DY5). This project will enhance behavioral health service availability by utilizing multiple evidence-based strategies that will result in expanded depth and breadth of outpatient behavioral health services, including:

- Expanding clinic capacity through enhanced scheduling and increased staffing;
- Increasing the days and hours of operation at existing behavioral health clinics to provide medication management and psychiatric evaluation services;
- Adding counseling/psychology services at selected locations to help with follow-up; provide resource identification and referral; transition groups from inpatient to outpatient services; deliver brief problem-focused cognitive behavioral therapy (CBT); conduct screening, brief intervention, and referral to treatment (SBIRT); and coordinate family and patient support groups; and
- Creating a therapy academy that incorporates licensed professional counselor (LPC) and licensed master social worker (LMSW) students from local universities and other appropriate clinical practicum sites to provide supervised, short-term counseling.

Goals and Relationship to Regional Goals:
Project Goals:
JPS Health Network will design and develop the full continuum of behavioral health capacity to improve access to appropriate levels of behavioral health services for population health needs. The project’s ultimate benefits and goals are to expand hours and services, provide a more patient-centered focus, manage more patients in an outpatient setting and avoid preventable inpatient admissions and readmissions and emergency department (ED) utilization.

This project meets the following Regional goals:
This project directly addresses Tarrant County’s critical behavioral health care access needs. Specifically, we propose to offer expanded outpatient behavioral health services and increased access to these services to Tarrant County residents struggling with mental illness.
Challenges:
JPS Health Network is located in Tarrant County, which accounts for 74% of the Region’s population. There are significant behavioral health needs within Tarrant County, particularly for the uninsured and socioeconomically disadvantaged. The Region’s community health needs assessment identified inadequate follow-up care as a major behavioral health need. Further, the assessment indicated that approximately 19% of Tarrant County residents experienced five or more “bad” mental health days in a 30-day period. It has also been established that on average one in four adults experiences a mental health disorder in a given year.34 There is currently a delay until next available behavioral health appointment for a new patient of over 120 days in some clinic locations. Patients in the MHMR system experience similar and, sometimes longer, waiting periods. The expansion of the existing location hours and services will allow us to reduce this time until next available appointment substantially.

JPS Health Network has emergency psychiatric services, inpatient psychiatric beds and behavioral health clinics that provide psychiatric medication management services, but lacks a fully developed continuum of care, particularly in the outpatient setting. Behavioral health clinics have limited hours of operation and availability for follow-up, limiting their focus to medication management, with no available outpatient therapeutic or counseling support offered at this time. As a result, most ongoing behavioral health issues are addressed in the inpatient setting, which is more costly and designed for more acute health needs. Further there are likely additional unidentified and unmet needs in Tarrant County. National data suggests that as many as two-thirds of those with a diagnosable mental health disorder do not currently receive treatment.35

5-Year Expected Outcome for Provider and Patients:
At the end of the Waiver, we expect a significant increase in the depth and breadth of behavioral health services we offer as outpatient services, resulting in a decrease in emergency department utilization and improved access to outpatient services for mentally ill patients.

Starting Point/Baseline:
Currently, behavioral health patients wait up to 90 days for follow-up and new patient appointment for medication management in the behavioral health clinics. There is no access to counseling or psychology-related services beyond those delivered while managing the patients’

medications. JPS Health Network operates outpatient behavioral health service at four locations for a combined count of 12 days each week (two clinics are open two days each weekend two clinics are open four days each week). In fiscal year 2011, these existing clinics served 8,224 unique patients with a total of 22,908 visits. There is no counseling or social work support available. The clinics do not utilize medical assistants to improve patient flow and throughput.

**Rationale:**
This project was selected due to the lack of access to mental health services in our Region (CN.4). All but one county in Region 10 are recognized as Health Professional Shortage Areas for mental health providers. The project’s therapy academy will allow for the training and development of additional behavioral health providers. Additionally, this project will enable JPS Health Network to take full advantage of internal opportunities related to improving access to behavioral health services. Finally, we selected the collection of strategies associated with this project because they are well-established best practices. The therapy resources will rely heavily upon motivational interviewing, SBIRT, CBT, cognitive behavioral social skills training, and Wellness Recovery Action Planning. All of these therapeutic approaches are recognized in SAMHSA’s National Registry of Evidence-Based Programs and Practices\(^{36,37}\). Increasing capacity through additional, more flexible hours and days of operation is clearly a best practice to create increased access and throughput. The utilization of supportive counseling is also a well-recognized approach to the treatment of mental illness.\(^{38,39}\)

**Project Components:**
Evaluating existing transportation programs was not a milestone, but the project’s core component will be accomplished in DY2 through the P-2 process milestone of identifying licenses, equipment requirements and other components needed to implement. We will fulfill the requirement to review the interventions’ impact on access to behavioral health services and identify lessons learned, opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety net populations through our ongoing department quality improvement processes.

We selected most of the recommended process milestones for this project. These will be utilized as significant markers along the project implementation timeline. We consider them a series of methodical measures of progress to successful project implementation. Selected milestones include identification of operational requirements and necessary administrative protocols, hiring and training of staff, establishment of additional hours, continuous improvement efforts, and increasing utilization of community behavioral health services while reducing unnecessary ED utilization.

Additionally, these milestones will enable us to specifically assess our progress in meeting the documented need for increased behavioral health services and access in our community (CN.4). Respondents to the Regional Stakeholder Survey identified accessing behavioral health services as “very difficult” with a very significant impact on overall population health.

**Unique community need identification numbers the project addresses:**
- CN.4 – Lack of access to mental health services. All but one county in Region 10 are recognized as Health Professional Shortage Areas for mental health providers.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This is a new initiative has not received any other federal funding.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
- **IT-1.18 Follow-Up After Hospitalization**
  - Follow-Up After Hospitalization for Mental Illness – NQF 057620 was selected because between 25 and 50% of patients who miss mental health appointments disengage from treatment entirely.\(^{40}\) Dropping out of treatment after a psychiatric hospitalization increases the likelihood of rehospitalization from one in 10 to one in four.\(^{41}\) This project will improve follow-up by improving the availability and accessibility of outpatient behavioral health services to be utilized following hospitalization. This measure also directly impacts our identified community needs. There is limited access to mental health services (CN.4) and failure to follow up after discharge creates increased missed appointment rates, resulting in poor utilization of available resources. Additionally, there is insufficient integration of mental health care in the primary care medical care system (CN.5). Improving follow-up after hospitalization allows for the integrated care project and transition managers to assist in better integrating care for these individuals as they begin to receive community-based services. Finally, there is a need for more care coordination (CN.11). Increasing follow-up

---

rates after hospitalization will create the opportunity for better coordination of care between inpatient and outpatient behavioral health service delivery systems.

- **IT-9.2** ED appropriate utilization was selected because 97% of adults and children receiving public community-based mental health services have avoided a crisis episode. JPS Health Network experiences over 24,000 psychiatric emergency visits per year. The availability of additional outpatient behavioral health services will ensure patients engaging in their individualized care plan, enhancing stabilization and service utilization outside of the emergency system. This measure also directly impacts our identified community need to reduce overuse of emergency department services (CN.10). Increased outpatient behavioral health services will result in reduced utilization of emergency services, because patients will have more care options in community-based services.

**Relationship to Other Projects:**

- **1.12.2** – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Create PHP and IOP as part of continuum of care). Expansion under this project is necessary to accommodate the additional demand likely experienced by adding additional locations with more structured care. Additionally, the more structured programs will be utilized by these expanded services when patients begin to deteriorate, potentially avoiding inpatient admissions.
- **2.15.1** – Design, implement, and evaluate projects that provide integrated primary and behavioral health care services (integrated care). Integrated care projects will incorporate newly expanded sites and associated patients.
- **Project 126675104.2.7** – Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders. The expanded hours and continuum will be utilized as a resource by the behavioral health transition management team. The new services/hours will accommodate patient needs upon hospital discharge and avoid readmissions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project.

---

42 Department of State Health Services Behavioral Health Data Book, FY 2010, 4th Quarter, Figures 1.6, 1.7, 1.9, 2.6, 2.7.
JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as mentally ill patients in Tarrant County. The percentage of the population expected to be positively impacted by the project is 100% of patients discharging from Trinity Springs Pavilion. JPS Health Network will improve over baseline the number of patients who received care within 30 days and 20% of patients will reduce emergency department visits for target conditions – behavioral health and substance abuse. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 4 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, his or her ability to control behavioral illness is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that the value of this project is a 3, on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, he or she will be likely to relapse and need follow-up care in a limited psychiatric inpatient area and will be less likely to use the ED allowing more access for other community members.

Specifically, 1371 unique patients (457 unique patients annually for DY3, DY4, and DY5) receiving outpatient behavioral health service from expanded locations/hours will be positively impacted in the following quantifiable ways:

- Increased utilization of community behavioral health care by 5% over life of project.
- Decreased number of cancelled or “no-show” appointments for individuals receiving services through expanded access sites by two percentage points over life of project.
- Improved number of patients who received care within 30 days of hospitalization by a percentage to be determined in DY3.
- Improved number of patients who received care within 7 days of hospitalization by a percentage to be determined in DY3.
- Reduced emergency department visits for Behavioral Health/Substance Abuse conditions by a percentage to be determined in DY3.

Project Option 1.6.2 – Enhance Urgent Medical Advice

**Unique Project ID:** 126675104.1.2  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** This project will establish a 24/7 call center with nurse advice to direct patients to the right care at the right place and reduce ED admissions. This project is a new initiative.

**Need for the project:** Reducing unnecessary ED utilization is a regional need.

**Target population:** Patients and family members that access network services within the Tarrant County Hospital District will benefit from the 24/7 nurse advice line and call center. There are approximately 67,000 patients receiving care in our outpatient primary care clinics and just over 1200 patients that were readmitted for all cause within 30 days or less during the FY2011. While the outcomes of the project are specifically targeted at the medical home population for the potential preventable ED outcome, the All Cause Readmission is targeted at the 1200 plus patients (all payers) that were readmitted to the hospital within 30 days or less. Some of these patients are not enrolled in the Connection program and are not patients receiving care in the outpatient clinics.

Approximately 25-50 new patients are enrolled each week in the Connection program. All patients visiting the network will be directed to the Call Center by utilizing discharge summaries, enrollment documents and other advertising media.

**Expected patient benefits:** The project will connect patients to urgent medical advice, provide first call resolution to most questions and assist patients with access to the JPS Health Network outpatient clinics or other community resources to receive appropriate care. Providing urgent nurse advice has been shown to reduce unnecessary ED admissions in other systems.

**Category 1 or 2 expected patient benefits:** Milestones involve establishing metrics, training nurses by establishing clinical protocols, measuring patient satisfaction with the nurse advice line and increasing the number of patients that use the advice line.

**Category 3 outcomes:** Category 3 outcomes measure potentially avoidable ED admissions with a planned reduction of 10% over the waiver period (2100 visits) and 30-day all-cause hospital readmissions for all payers are expected to be reduced by 15% or 265 fewer readmissions over the waiver period. These outcomes are based on data from FY2011.
Project Option 1.6.2 – Enhance Urgent Medical Advice

Unique Project ID: 126675104.1.2
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
In order to increase patient access to timely medical advice and medical care, JPS Health Network will implement a centralized call center with a focus on one call resolution including a nurse advice team to direct callers to the right place for the right level of service.

Building on current existing infrastructure, technology, people and processes, JPS Health Network will implement a system that allows customer concerns to be addressed as quickly as possible. In order to embed standard protocols and a customer focus, the current decentralized telephone entry points will be centralized under one director of pre-arrival services. Customer service will be standardized and implemented for call center employees, technology will be optimized to improve efficiencies and the nurses will be trained on recognized clinical triage protocols (Schmitt-Thompson) so that medical advice is consistent and timely.1 Partnering with primary care physicians to develop standard protocols and expectations, the nurse triage program will become an extension of the medical home.

The nurse advice team, working under physician approved guidelines, will be available 24/7 to provide timely medical advice, triage need for urgent or emergent medical care, assist with needed same day or next day appointment scheduling in the patient’s medical home (if appropriate), and assist with prescription refills.

The call center will focus on all pre-arrival services including general public inquiries, outpatient appointment scheduling, pre-registration, referrals/outpatient authorization for specialty appointments, and centralized call routing for other network services or individuals.

Goals and Relationship to Regional Goals:
Project Goals:
The five-year goals of this project are to:

- Improve patient access to timely medical advice and medical care;43
- Improve triage so that patients receive care in the most appropriate setting;
- Increase patient satisfaction by providing one call resolution whenever possible; and
- Enhance performance metrics, standardize employee training, and align resources to achieve operational efficiencies.

43 Thompson, DA, Schmitt, B. Clinical Content. Revised 4/2010
This project meets the following Regional goals:
A major goal of the Region is to reduce overutilization of emergency departments for potentially preventable admissions. If a potential patient can be provided appropriate medical advice in a timely manner, many patients will be appropriately directed away from non-urgent care in the ED. Another goal of the Region is to overcome financial barriers to care. The nurse advice program will be a free service provided to the community. The nurse advice team will be a resource for linking patients to all services available in the community.

Challenges:
From an infrastructure starting point, JPS Health Network has recently implemented an EMR (Epic) and a robust telecommunications system (NEC). There are currently over 40 monitored telephone entry points that are advertised to the community at large. With so many decentralized entry points, staffing and standardized customer service expectations are difficult to manage.

A commitment to improvement is not yet ingrained in the culture and registration staff does not understand their role in the patient care experience. Customer service expectations are not aligned to national benchmarks. A phone call is the first entry point to the system and can shape a patient’s expectation of care or guide a patient to the appropriate place to seek care.

Through this project, the organization seeks to embed an understanding of the systemic impact of customer service at every entry point as well as emphasize one call resolution in making sure the patient is directed to the right place for care.

As the safety net provider for the county, JPS Health Network provides care for a large number of uninsured or underinsured patients. The Connections program provides medical care, both chronic and acute, to residents of Tarrant County whose income is less than 300% of poverty level.

Having a 24/7 centralized call center with nurse advice available provides timely access to both our current and prospective patient population. Patients will be directed to one phone number and using the EMR and standardized protocols, a team of call center representatives (both clinical and non-clinical) can triage and direct patients to the appropriate level of care. Patients will access via one number to all the services they need. Patients can be directed to the right place for care. The nurse triage system will capture needed clinical information so that specialists and primary care providers are better able to coordinate care across this very large system. Once implemented the system should reduce inappropriate ED visits as well as readmissions. This project is linked to several other projects in the network designed to improve coordination of care.
5-Year Expected Outcome for Provider and Patients:
The five year expected outcome is to:

- Decrease utilization of the ED for potentially preventable ambulatory care sensitive conditions by -10% or 2100 visits; and
- Reduce all-cause 30-day readmissions by 15% or 265 less readmissions for all payers.

Starting Point/Baseline:

In the current decentralized phone system, JPS Health Network has an abandonment rate that reaches as high as 40% at our monitored telephone entry points during high census. In a 12-month period (FY2011), the system recorded over 2.6 million phone calls received with an overall abandonment rate of 16%. The abandonment rate represents 437,000 potential customer encounters that did not have resolution.

Patient concerns received during regular business hours are forwarded electronically to nurses who are providing patient care, and often go unanswered for several days if not identified as urgent by staff taking the phone call. During evening and weekend hours, a nurse triage system is available for primary care patients. The triage service is receiving about 450 phone calls per month. About 10% of those patient encounters result in a visit to the ED. Based on survey results, the remaining 90% of patients calling the evening service report they would have gone to the ED if the service was not available.

In an initial pull of discharge claims data for fiscal year 2011, there were over 40,000 ED encounters attributed to our JPS Connections participants. Of these visits, over 54% or 21,000 admissions have been identified as potentially preventable ED encounters based on the NYU preventable ED algorithm.44

In addition, the JPS Network had a readmission rate of 14% in our Connections population for hospital fiscal year 2011, accounting for 621 readmissions. For all payers, a total of 1,211 patients accounted for 1,767 readmission encounters.

Rationale:

Lack of coordinated primary care and overutilization of the ED are both addressed in our Community Needs Assessment. This project was selected to both improve access to timely care and coordination of care using a nurse advice team to direct patients to appropriate care. The project also extends the primary care provider reach, as the team can provide 24/7 appointment scheduling for acute care needs, provide additional instructions after appointments or discharge and help to get prescriptions refilled in a timely manner.

44 http://wagner.nyu.edu/faculty/billings/nyued-background.php
Our system has recently recognized the importance of building continuity of care between our inpatient, ED and outpatient system of care. With the implementation of the EMR in May 2012, an opportunity exists to build a coordinated care system for current and prospective patients and their families. Providing 24/7 nurse triage has been shown to reduce ED admissions and improve patient satisfaction.\textsuperscript{45,46}

**Project Components:**
This project was chosen to improve the patient experience, extend primary care capacity by providing enhanced access to timely medical advice and to reduce unnecessary utilization of the ED as well as reduce potentially preventable readmissions.

The project includes all key components identified. Our milestones measure a reduction in potentially preventable ambulatory care sensitive conditions, and reduction in preventable 30-day readmissions.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.8 – Lack of access to health care due to financial barriers
- CN.10 – Overuse of emergency department (ED) services.
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and no federal funding has been received.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:**

**IT-9.2 ED Appropriate Utilization**

By the end of the Waiver, our goal is reduce avoidable ED visits by 10% for the JPS Health Network medical home population. An initial pull from our EMR shows that our Connections patients had a high percentage of potentially preventable ED admissions using the New York University Avoidable ED algorithm. There have been studies showing a reduction in ED utilization when timely medical advice and access to primary care are readily available in a community.\textsuperscript{3,4} Access to 24/7 medical advice is required by patient-centered medical home

\textsuperscript{45} Bunn F, Byrne G, Kendall S. Telephone consultation and triage: effects on health care and patient satisfaction The Cochrane Library 1(2009)

certification agencies including NCQA and the Joint Commission. \(^47,48\) Moreover, numerous studies have found that nurse telephone triage is safe and effective and does not jeopardize patient safety. \(^49,50,51\)

**IT- 3.1 All-cause 30-day Readmission**

Call centers providing medical advice have been shown to be a cost-effective care delivery model. Several articles have been published that show both a reduction in cost and a reduction in avoidable ED visits in pediatric populations. \(^52,53,54\) Over 75% of the inpatient admissions at JPS Health Network originate in the ED. When reviewing factors contributing to all-cause 30-day readmissions, a study of 18 hospitals noted that transitions care planning, availability of clinical follow-up care, medication management and advanced end-of-life care are directly related to readmissions. \(^13vi\)

Planned interventions for the call center include timely medical advice, urgent appointment scheduling in the medical home and timely prescription refills. The call center nurse advice team will link the caller to appropriate resources and reduce potentially preventable admissions.

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects:** This project will support Project 126675104.2.2 (Expand/enhance medical homes) by providing 24/7 access to medical advice. The project also supports Project 126675104.2.11 (Improve patient experience) by providing a customer service center that will provide one call resolution for most patient inquiries. Projects 126675104.2.5 (Enhance care transitions) and 126675104.1.3 (Enhance/expand specialty care) will also benefit from the availability of 24/7 medical advice, and an opportunity to connect patients to the right place for care. The following projects will have a subset of the targeted populations reported in Category 3 (Reducing ED

\(^47\) \url{https://www.ncqa.org} \\
\(^48\) \url{https://www.jointcommission.org} \\
utilization): 126675104.2 (MedStar Patient Navigator) will manage a subset of 778 medical home high utilizers and Project 126675104.2.4 (CHF Heart Failure) will manage a subset of 263 CHF patients.

- **Related Category 4 Population-focused improvements**: This project will support and reinforce reporting domains RD 1.1, RD 1.2, RD 1.3, RD 1.4, RD 1.5, RD 1.6 by providing timely medical advice to direct a patient to care at the right place.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

JPS Health Network defined the population that will be directly impacted by the project as patients who dial 911 for medical assistance. The percentage of the population expected to be positively impacted by the project is 41%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 2 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, they will have improved access to scheduling appointments and speaking directly to a nurse for medical questions in a more efficient manner.

To determine the value to the community of each individual positively impacted, we concluded that the value of this project is a 3 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, the patient experience throughout the community will be improved through lower wait times on the phone and the ability to call one number to achieve multiple basic patient needs, like urgent medical advice and scheduling doctor appointments.

| Milestone 1 [P-2]: Collect baseline data, if medical advice line currently exists in RHP; Develop metrics specific to the medical advice line in use by the performing provider to track access to specified patient population determined by RHP. Metric 1 [P-2.1]: Documentation of baseline assessment Baseline/Goal: Establish and verify baselines for the following:  
- Number of patients who access the nurse advice line  
- Number of patients given an urgent appointment when appropriate  
- Number of patients referred to the ED when appropriate  
- Number of patients provided a medical home appointment when care was not urgent  
- Proportion of ED visits that | Milestone 4 [P-3]: Train nurses on clinical protocols Metric 1 [P-3.1]: Number of nurses trained Baseline/Goal: 50% of nurses employed in the primary care clinics and nurse advice team will be trained on adopted protocols Data Source: Training documents, evidence of course completion | Milestone 10 [I-13]: Increase in the number of patients who accessed the nurse advice line Metric 1 [I-13.1]: Utilization of nurse advice line. Goal: Using validated and verified baseline data from DY2, expand use of the nurse advice line by 25% of unique patients Data Source: EMR and telephone system | Milestone 13 [I-15]: Increase patient satisfaction Metric 1 [I-15.1]: Increase surveyed patients who believed the advice provided was appropriate Goal: Survey will be developed in DY2, and administered starting in DY3. Increase by 10% over DY3. Data Source: Survey tool |

Milestone 3 Estimated Incentive Payment: $1,251,033

Milestone 5 [P-6]: Inform and educate patients on the nurse advice line Metric 1 [P-6.1]: Number of percent of targeted patients informed/educated Baseline/Goal: 80% of new patients empaneled in a Medical Home will receive information on the nurse advice line Data Source: After visit summary from the EMR, new patient orientation information, and other materials |

Milestone 10 Estimated Incentive Payment: $2,230,524

Milestone 11 [I-14]: Increase patients in defined population who utilized the nurse advice line and were given an urgent medical appointment via the nurse advice line when the condition was not urgent Metric 1 [I-14.1]: Number of urgent medical appointments scheduled via the nurse advice line Goal: Increase utilization by 25% of patients using the nurse advice line and needing an urgent medical appointment as validated |

Milestone 13 Estimated Incentive Payment: $2,763,910

Milestone 14 [I-16]: Increase patients in defined population who utilized the nurse advice line and were given a medical home appointment via the nurse advice line when the condition was not urgent Metric 1 [I-16.1]: Number of medical home appointments scheduled via the nurse advice line Goal: Increase by 25% over baseline that number of patients scheduled in a medical home when medical advice was not urgent as validated in DY2 |

Project Option 1.9.2 – Expand Specialty Care for Ophthalmology and Wound Care

**Unique Project ID:** 126675104.1.3  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** This project will increase capacity in targeted specialties within the JPS Health Network. This project represents a new initiative.

**Need for the project:** The demand for specialty care continues to increase along with wait times as patient satisfaction scores decline.

**Target population:** Current and future enrolled JPS Connection patients are the targeted population. There are currently 17,000 diabetic patients in the network that will require a routine eye exam each year of the waiver period. In addition, all patients accessing specialty care will benefit from a reduction in wait times as a specialty access plan is developed. There are over 50,000 unique patients accessing specialty care each year in the network.

There were 794 admissions for either primary or secondary diagnosis of pressure ulcer in FY2011. The project is expected to reduce costs of stay for all patients admitted to the hospital during the waiver year period. With the implementation of a wound care program, cost of stay will be reduced by reducing inpatient days through increased training, standardization of care and the availability of outpatient follow-up care.

**Expected patient benefits:** The project will enhance access to specialty care for both the Medicaid and Connection population for both routine eye exams and wound care thereby reducing unnecessary hospital stays and improving compliance with routine eye exams. The project is focused on reducing wait times and enhancing operational efficiency for 6 additional specialty clinics during the waiver period.

**Category 1 or 2 expected patient benefits:** Milestones include establishing a specialty access plan, establishing and standardizing referral guidelines for specialty care, establishing a wound care clinic and increasing volumes and hours of availability in specialty clinics. Four additional ophthalmology clinic sites will be developed within the patient centered medical homes. Six clinics will be targeted for redesign to include referral standardization, enhancing operational efficiency and expanding both service hours and clinic capacity.
Category 3 outcomes: Category 3 outcomes include improving compliance with routine diabetic eye exams (8,597 patients in DY5), reducing 3rd next available appointment for routine eye exams (17,000 diabetic patients annually) and reducing costs for ulcers acquired both within and outside the hospital (approximately 794 admissions annually).
Project Option 1.9.2 – Expand Specialty Care for Ophthalmology and Wound Care

Unique Project ID: 126675104.1.3
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
To improve access to specialty care for a vulnerable population, JPS Health Network will recruit optometrists to be housed in our primary care clinics for more general eye exams and diagnoses such as hypertensive and diabetic eye exams, glaucoma care, red eye, dry eye and minor traumatic eye injuries. Optometrists can also provide general eye exams and prescriptions for corrective lenses. The optometrists will be first responders and will work closely with our ophthalmology medical director for appropriate referrals. Standardized referral guidelines will be developed and disseminated. Referrals will be tracked for appropriateness and time from referral to consult visit with appropriate clinician. Four exam rooms will need to be appropriately equipped for the provision of retinal photography, visual acuity, refraction and tonometry. Support staff will need to be trained to deliver this care in the primary care office.

In addition, JPS Health Network will launch a Wound Care Center – an outpatient specialty currently not provided. JPS Health Network will recruit a medical director, a mid-level, and RN coordinator. Additionally, the following team members will need to be allocated/recruited, trained and integrated into the team: general and specialty surgeons, infectious disease physician, physical therapists, dietitians, pain management specialist, diabetes educator and general nursing and tech support. The medical director will work with administration to develop a comprehensive wound program for both inpatient and outpatient care and explore development of a shared teaching program. Referral guidelines will be developed and disseminated to referring providers. We expect introduction of a wound care clinic to reduce both inpatient days and cost of stay for patients with a primary or secondary diagnosis of pressure ulcer (707.xx).

The project also includes the development and implementation of a specialty care access plan for the 17 largest specialty clinics. As that plan is developed, six specialty clinics will be targeted for operational redesign to include referral standardization, enhancing operational efficiency and expanding hours of access to reduce 3rd next available appointment times. Currently the specialty clinics average between 50 and 65 days for next available appointment. No show rates are as high as 40% as patients are seeking temporary care in the emergency department or simply going without care in some cases.

Goals and Relationship to Regional Goals:
The five-year goals of this project are to increase timely patient access to targeted specialty services, reduce days to next available new patient appointment for the targeted specialty, increase compliance with diabetic eye exams, increase patient and provider satisfaction, and reduce the inpatient days and inpatient cost of stay for patients with a pressure ulcer.
This project meets the following Regional goals:
As noted in the RHP 10 Community Needs Assessment, lack of access to specialty care and lack of provider capacity likely contribute to poor patient satisfaction and potential overuse of emergency services.

Challenges:
Wait times for ophthalmology at JPS Health Network are increasing with current waits for new patients averaging over 100 days and 75 days for follow-up appointments. Long wait times for appointments contribute to low patient satisfaction scores and a general perception of outcomes impacted by delays in time to care. Long wait times from primary care physician referral to specialty consult also increase patient anxiety and prolong symptoms unnecessarily, as well as delay time to indicated procedures. For the purpose of this project, JPS Health Network will focus on expanding access to ophthalmology. With a larger diabetic population at JPS Health Network, the demand for service will continue to grow. In the United States, it is expected that between 40-45% of diabetic patients will develop diabetic eye disease. Keeping this population in preventive care will reduce cost and improve quality of life.

In addition, JPS Health Network will launch an outpatient wound care program. Data is still being gathered for FY2012, but data for JPS Health Network patients in FY2011 revealed that 141 patients left the hospital with a wound vacuum, averaging $3,654 per patient in supplies and equipment rental. There is not currently an outpatient wound program to assist with managing these patients, so they are appointed randomly with the surgeon or medicine specialist who ordered the wound vacuum for care in the clinic. The Surgery Specialty clinic currently lacks supporting competency to care for this population. In addition to the patients placed on wound vacuums, 794 admissions were attributed to pressure ulcers of all locations resulting in 9,831 patient days. JPS Health Network has two inpatient wound care nurses. A wound care clinic would provide a coordinated care effort, more comprehensive care transitions from hospital to home to clinic for follow-up care, and will likely reduce cost and improve outcomes for this population. A study of data pulled from the U.S. wound care registry states that the most significant cost of wound care in the outpatient setting is home nursing care and that the most common comorbid condition is diabetes. Non-healing surgical wounds were the most common wound listed in the registry. Diabetes foot ulcers were noted to require the most outpatient expense in the registry. JPS Health Network has a population of over 17,000 patients in our outpatient primary care clinics with a diagnosis of type 1 or 2 diabetes. Only 25% of these patients were seen in the ophthalmology service for an annual eye exam. With the implementation of the medical home and a new EMR, the network will refocus on preventive care.

care and wellness in our patient population. Because much of our population has limited resource and relies solely on the network for outpatient care, the addition of these services is needed to provide better access and improve patient satisfaction. Enhancing access to all specialty care programs should reduce inappropriate ED utilization and improve the overall health of our community. Expansion of the ophthalmology service and the addition of a wound care program will significantly impact quality of care for our diabetic population.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome of this project is to reduce days to third next available appointment for routine ophthalmology care to 45 days or less and increase compliance with annual diabetic eye exams from a baseline of 22% to 35% overall compliance. The project has a goal of providing annual eye exams to over 8,597 unique patients by DY5. We expect to reduce inpatient cost of care for patients with a primary or secondary diagnosis of pressure ulcer by 30% based on the number of patients admitted during the waiver project. -Starting Point/Baseline:
In FY2011, just over 17,000 (or 25%) of primary care patients in the network had a diagnosis of type 1 or type 2 diabetes. About 22% of those diagnosed with diabetes or 3,728 patients had at least one visit in the ophthalmology service during that same year. Per the National Institutes of Health (NIH) almost 40-45% of diabetics will require some treatment for diabetic retinopathy. The project will target the approximately 13,000 patients who did not receive routine eye exams due to capacity constraints in our ophthalmology program. In FY2011, there were 794 admissions with a primary or secondary diagnosis of pressure ulcer (707.xx). The average cost of care was $21,422.36.

Rationale:
According to the Behavioral Risk Factor Surveillance System report for Tarrant County 2009/2010, 8.5% of responders over age 18 reported being told by a physician that they had diabetes. This rate is similar to both state and national norms. The cost of preventable hospitalizations in Tarrant County related to diabetes for 2005-2008 was over $240 million. The proportion of adults receiving a diagnosis of diabetes is a much higher rate for those with annual incomes of $15,000 or less. The Connections patient population has a much higher incidence of diabetes than the county, based on our initial data pull from FY2011. The Region 10 Community Needs Assessment found a lower rate of health screening than the nation or state. This project aligns with our goals to improve overall health for our community.

Expanding ophthalmology services meshes with several of our other projects that also focus on improving the preventive health of our diabetic population. A diabetes registry is under development and a patient care committee is developing clinical protocols for managing patients across the continuum. The PCMH (Patient-Centered Medical Home) focus on wellness and preventive care (among other attributes) has been shown to reduce the cost of care by numerous

57 www.tarrantcounty.com/.../Tarrant_County_BRFSS_20092010.pdf
organizations. Compliance with annual diabetic eye exams is a recognized quality measure in the PCMH and AHRQ HEDIS measures. Expanding access to the service line with the use of optometrists will maximize the time and expertise of the subspecialist, improve access for routine preventive care and improve patient satisfaction scores for both the primary care physician and the specialty group.

The wound care program will further assist our diabetic population in achieving a better quality of life. Since the majority of wounds per the national registry are found in patients presenting with diabetes, an outpatient program will improve timely access to medical advice and treatment at the right place for care. Since we lack knowledge, expertise and clinical resources, JPS does not actively anticipate the patient who is most likely to develop a postoperative ulcer, and does not have a program for outpatient referral. Developing outpatient expertise would create an opportunity for additional education for both patients and referring physicians related to anticipating those patients who are likely to develop postoperative infections and wounds with a poor prognosis. A wound program is an essential component of a large safety net hospital. The development of a wound care program would improve patient care coordination from hospital to home to clinic. A standardized clinical program will be developed and shared between inpatient and outpatient caregivers. Clinical expertise and knowledge will be developed to support the new program. Organizations that have been successful in reducing hospital-acquired pressure ulcers have done so by having a focused effort, increasing knowledge and expertise and standardizing reporting and clinical care guidelines. Studies have shown an increase in both inpatient days and cost of care for patients with pressure ulcers.

**Project Components:**

To increase our ophthalmology service capacity, the network will add four optometrists to our Regional medical homes. Wait times for both routine eye care and specialty eye care will be reduced. In addition, a wound care program will offer outpatient care and treatment of postop surgical infections, diabetic ulcers and other non-healing insect bites and wounds. The wound care program will include additional staffing to include a medical director, program coordinator and support staff for the outpatient clinic. An outpatient wound care program will reduce admissions, decrease patient days for all admissions related with pressure ulcers, and decrease average cost of care for inpatient treatment. The milestones chosen include measuring compliance with a diabetic eye exam, patient satisfaction, reduction in third next available

60 Gibsie L. Implementing evidence-based practice to prevent skin breakdown. Critical Care Nursing Quarterly 2008. 31(2) 140-149.
appointment for these specialty visits, and a reduction in -cost of stay/admission for patients diagnosed with pressure ulcers -. To reach these milestones, we will collect data on backlogs and referrals, train staff and physicians on guidelines for specialty referrals, implement a referral tracking system to reduce patients lost in the system, and expand capacity by adding providers and/or extending hours in targeted specialties.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.2 – Shortage of specialty care
- CN.10 – Overuse of emergency services
- CN.11 – Need for more care coordination
- CN.15 – Need for education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** The project is a new initiative. We have not received any other federal funding for the project.

**Related Category 3 Outcome Measures:**

**IT 1.12** Diabetes care: Retinal eye exam – a retinal or dilated eye exam by an eye care professional in the measurement year or a negative eye exam in the year prior by an eye care professional. Expansion of the ophthalmology clinic and service hours will reduce wait times to third next available appointment and increase compliance with diabetic eye exam. Baseline data will be verified in DY2 to validate improvement percentage for DYs 3, 4 and 5.

**IT 1.1** Reduction in third next available appointment for routine eye exams
Third next available appointment is the industry standard to measure access. Focused efforts in referral management and recruitment of specialists should improve the current 100-day wait for ophthalmology clinic. Baseline data will be verified in DY2 to validate expected improvement in DYs 3, 4, and 5.

**IT 5.3** Other reduction in cost of stay for patients with a primary or secondary diagnosis of pressure ulcer (707.xx). The development and launch of a wound program for the health system will bring much needed knowledge, expertise and additional resources to the organization. Reduction of inpatient days will ultimately lead to a reduction in cost of care. *(See outcome measure 3.)*

**Relationship to Other Projects:**
- **Related Category 1 and 2 projects:** Project 126675104.2.2 (Enhance/expand medical homes) will be greatly enhanced as specialty care access is improved. Project 126675014.2.5 (Enhancing care transitions) will reduce inpatient days as patients are directed to the Wound Care clinic to receive outpatient care. Project 126675104.2.11 (Improving patient experience) will direct teams toward improving operational efficiency and reducing third next available appointment in an effort to improve patient satisfaction.
Project 126675104.1.2 (Enhancing urgent medical advice) includes a 24/7 call center for appointment scheduling and patient concerns.

- **Related Category 4 Population-focused improvements:** This project is aligned with RD 2.7 and RD 3. A wound care program will bring evidence-based treatment protocols and provide an alternative to readmission related to postsurgical infections.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

JPS Health Network defined the population that will be directly impacted by the project as Tarrant County diabetes patients in primary care settings. The percentage of the population expected to be positively impacted by the project is 60% of the Medical Home population with diagnosis of diabetes, and 2% of the patients with post-outpatient surgical infections and/or diabetic ulcers, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 4 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, - the identification of early ophthalmology issues in diabetic patients is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that the value of this project is a 3 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, - access to specialty care will be increased leading to an improved patient experience through lower wait times and improved clinical outcomes through specialized wound care initiatives.

### Milestone 3 [P-2]

Train care providers and staff on processes, guidelines and technology for referrals and consultations into selected medical specialties

**Metric 1 [P-2.1]** Training of staff and providers on referral guidelines, process and technology

**Baseline/Goal:** Train 50% of providers and staff trained on referral process.

**Data Source:** Log of specialty care personnel trained and curriculum for training

**Milestone 3 Estimated Incentive Payment:** $941,305

**Rationale/Evidence:** Plan to reduce wait times, monitor referral wait times and increase provider capacity will increase patient and provider satisfaction

**Baseline/Goal:** Develop access plan

**Data Source:** Documentation of provider plan

**Milestone 5 Estimated Incentive Payment:** $722,047

### Milestone 4 [P-5]

Provide reports on the number of days to process referrals and/or wait time from receipt of referral to actual referral appointment.

**Metric 1 [P-5.1]** Generate and provide reports on average referral process time and/or time to appointment (to providers, staff, and referring physicians)

**Baseline/Goal:** Reduce time from referral to appointment date to 7 days or less

**Data Source:** EMR and other systems identified

**Milestone 9 Estimated Incentive Payment:** $722,423

**Milestone 6 [P-5]** Implement the redesign of medical specialty clinics in order to increase operational efficiency, shorten patient cycle time and increase provider productivity.

**Metric 1 [P-5.1]** Number of medical specialty clinics that have completed clinic redesign.

**Baseline/goal:** 3 additional clinics will have completed clinic redesign and have cycle times less than the clinic average cycle time.

**Data Source:** EMR and financial reporting

**Milestone Estimated Incentive Payment:** $772,423

**Milestone 10 [P-17]** Implement the redesign of medical specialty clinics in order to increase operational efficiency, shorten patient cycle time and increase provider productivity.

**Metric 1 [P-17.1]** Number of medical specialty clinics that have completed clinic redesign.

**Baseline/goal:** 3 additional clinics will have completed clinic redesign and have cycle times less than the clinic average cycle time.

**Data Source:** EMR and financial reporting

**Milestone Estimated Incentive Payment:** $772,423

**Milestone 9 Estimated Incentive Payment:** $722,423

**Milestone 10 Estimated Incentive Payment:** $772,423

**Milestone 13 Estimated Incentive Payment:** $1,276,178

**CGCAHPs by 2 mean score points per year to achieve a total of 8 points by DY5**

**Data Source:** CGCAHPs vendor tool, baseline to be determined in DY2

**Milestone 13 Estimated Incentive Payment:** $1,276,178

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $11,354,152*
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.12.2 – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Create partial hospitalization programs and intensive outpatient programs as part of continuum of care)

Unique Project ID: 126675104.1.4
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: This project ensures adequate access to needed services by expanding the number of community-based settings where behavioral health services are delivered. This project will establish a full continuum of care by creating Partial Hospitalization Programs (PHP) and Intensive Outpatient Programs (IOP) to expand treatment availability in our Region in a way that matches level of care with a patient’s needs and acuity. This project is a new initiative

Need for the project: This project addresses the following community needs: a) CN.4 Lack of access to mental health services.

Target population: Psychiatric patients who will be served in new PHP and IOP service locations - DY2 = 91, DY3 = 618, DY4 = 858, DY5 = 858. Total for DY2-5 is 2,425 patients. This project will provide greater management that will result in improved post-discharge engagement and treatment adherence, the rate of readmission for psychiatric services and the general availability inpatient and intensive services for the significant volume of Medicaid and Uninsured psychiatric patient discharging from Trinity Springs Pavilion (JPS’ 96 bed psychiatric facility).

Category 1 or 2 expected patient benefits: Milestones P-2.1, P-3.1, P-4.1, P-6.1, I-36.1, I-11.1, and I-14.1 were selected. We selected the project’s milestones and metrics to meet the needs of our target patient population and because they reflect an logical operational and impact stepping stones.

Category 3 outcomes: Outcomes IT-1.18, IT-3.8, and IT-9.2 were selected. There is an evidence base to suggest that increased behavioral health service locations and PHP services will have positive impact on each of these outcome areas.
Project Option 1.12.2 – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Create partial hospitalization programs and intensive outpatient programs as part of continuum of care)

Unique Project ID: 126675104.1.4
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
This project will expand the number of community-based settings where behavioral health services are delivered so that targeted mentally ill patients\(^{63}\) can receive much-needed psychiatric treatment in an outpatient setting. Specifically, this project will create four new partial hospitalization and/or intensive outpatient programs in Tarrant County. Partial hospitalization programs (PHPs) are typically delivered four to six hours a day with patients attending five days a week. Intensive outpatient programs (IOPs) are typically delivered three hours a day with patients attending three days a week. One location will focus on delivering care to patients dually diagnosed with mental health and substance use disorders. This location will coordinate with Tarrant County Mental Health Mental Retardation (MHMR) to establish both a referring and step-down treatment option for their additional detoxification services. Psychiatric patients will be able to receive continued psychiatric treatment by participating in PHP and IOP without having to remain in the hospital. Services will include weekday medication administration, life skills education, assistance with referrals and resources regarding other community resources, group and individual therapy, and daily psychiatric management by a board certified psychiatrist. JPS Health Network will utilize a flexible treatment model that adapts evidence-based cognitive behavioral therapy (CBT) treatment interventions to the PHP context. JPS Health Network will create four PHPs strategically placed throughout Tarrant County that focus on adult PHP services. We will also utilize the PHP program group structure to offer more flexible IOP continuum of services without increasing resource levels.

Goals and Relationship to Regional Goals:
Project Goals:
This project ensures adequate access to needed services by expanding the number of community-based settings where behavioral health services are delivered. This project will establish a full continuum of care by creating partial hospitalization programs (PHPs) and intensive outpatient programs (IOPs) to expand treatment availability in our Region in a way that matches level of care with a patient’s needs and acuity.

This project meets the following Regional goals:

\(^{63}\) Patients targeted are Tarrant County residents with a primary axis I, or clinical, mental health diagnosis that demonstrate the need for intensive therapy or partial hospitalization services beyond those typically delivered in non-structured outpatient settings.
This project will extend the continuum of behavioral health care available in Tarrant County to include more outpatient options.

**Challenges:**
Tarrant County is struggling with extensive demand that cannot be met with the available behavioral health resources. Increased access to behavioral health services was one of the highest needs identified in the Region 10 Community Health Assessment. An estimated 105,700 people (one in 17 county residents) struggle with a serious mental illness such as bipolar disorder, schizophrenia, or major depression.\(^{64}\) JPS Health Network addresses these needs with emergency psychiatric services, inpatient psychiatric beds and psychiatric medication management services. However, the county’s limited availability of psychiatric services does not include a continuum of care options for medically indigent patients with psychiatric conditions. Instead, these patients’ needs must be met within the existing continuum of available services, which may result in patients receiving more or less intensive levels of care than the severity of their symptoms necessitates, or electing to go untreated and not access needed services. Additionally, the county has significant and increasing demand for psychiatric emergency services as well as inpatient services unmitigated by lower levels of care.

**5-Year Expected Outcome for Provider and Patients:**
JPS Health Network will operate four PHPs and/or IOPs in Tarrant County that will serve 1,567 patients. Expected outcomes are participation of the targeted population in PHP programs, utilization of least restrictive environments, and a reduction in inpatient readmissions.

**Starting Point/Baseline:**
JPS Health Network operates four outpatient behavioral health clinics, two school-based behavioral health clinics, a psychiatric emergency center, and an inpatient psychiatric facility. There are no structured levels of care in the outpatient service delivery system. Service capacity consists of inpatient beds and outpatient medication management only. Adding these expanded service locations will better serve patients needing partial hospitalization and intensive outpatient services. In 2011, our system served 8,824 patients in non-emergency outpatient locations.

**Rationale:**
This project option was selected due to lack of access to mental health services in a community-based setting (CN.4). This project addresses that need by moving the county closer to a full continuum of evidence-based behavioral health services. The project will enable us to validate the efficacy, cost effectiveness, greater accessibility and greater acceptance by individuals struggling with mental illness of partial hospitalization and intensive outpatient services, as well as a measurable impact in reducing overload in psychiatric emergency settings. Utilization of

---

partial hospitalization is considered best practice by most of the nation’s large behavioral health systems. Additionally, significant research documents the efficacy of partial hospitalization, the reduction in inpatient services, and the reduced costs associated with providing care in PHP settings. 65

**Project Components:**
This project does not have core project components. We selected the project’s milestones and metrics to meet the needs of our target patient population. We will measure patient satisfaction with access to behavioral health services after expansion, as well as increase of population served after expansion. The community has a documented need for expanded availability. Evaluating the community’s perception of access and monitoring the increase in capacity will reflect improvements.

**Unique community need identification numbers the project addresses:**
- CN.4 – Lack of access to mental health services. All but one county in Region 10 are recognized as Health Professional Shortage Areas for mental health providers.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Addition of these behavioral health service locations will significantly enhance the existing delivery system. The focus on specialized services will further enhance the community benefit. The intended patient population will be able to utilize the least restrictive environment and have greater accessibility at new service locations. Instead of receiving resource-intensive inpatient services, patients who meet program criteria will transition to community-based care more quickly, reduce their inpatient length of stay, and be able to remain in the community for future treatment rather than being readmitted for inpatient services. These new treatment options will add further needed services within Tarrant County for mentally ill individuals and the hospitals that provide care for them. This project also will expand community resources that will function as part of the continuum care within the MHMR system. Physicians will experience greater access to care for their patients.

65 Continuum of Ambulatory Behavioral Health Services - Position paper by Association for Ambulatory Behavioral Health Services, 2010.
We are not receiving any other federal funding for this work.

**Related Category 3 Outcome Measures:**

**IT-1.18** Follow-up after hospitalization for mental illness. NQF 057620 was selected because between 25 and 50% of patients who miss mental health appointments disengage from treatment entirely.66 Dropping out of treatment after a psychiatric hospitalization increases the likelihood of re-hospitalization from one in 10 to one in four.67 This project will improve follow-up by improving the availability and accessibility of structured outpatient behavioral health services to be utilized following hospitalization. This measure also directly impacts our identified community needs. There is limited access to mental health services (CN.4), and failure to follow up after discharge creates increased missed appointment rates and poor utilization of available resources. Additionally, there is insufficient integration of mental health care in the primary care medical care system (CN.5). Improving follow-up after hospitalization allows for the integrated care project and transition managers to assist in better integrating the care for these individuals as they begin to receive community-based services. Finally, there is a need for more care coordination (CN.11). Increasing follow-up rates after hospitalization will create the opportunity for better coordination of care between inpatient and outpatient behavioral health service delivery systems.

**IT-3.8** Behavioral health/substance abuse 30-day readmission rate was selected because greater availability and accessibility of outpatient behavioral health services will enhance stability in the community and adherence to outpatient visits for patients, which reduces 30-day behavioral health readmission rates.68,69 This measure also directly impacts our identified community needs. There is limited access to mental health services (CN.4) and readmissions result in avoidable utilization of the very limited resources available for inpatient psychiatric beds.

**IT-9.2** ED appropriate utilization was selected because 97% of adults and children receiving public community-based mental health services have avoided a crisis episode.70 JPS Health Network experiences over 24,000 psychiatric emergency visits per year. The availability of additional outpatient behavioral health services will ensure patients engaging in their

70 Department of State Health Services Behavioral Health Data Book, FY 2010, 4th Quarter, Figures 1.6, 1.7, 1.9, 2.6, 2.7.
individualized care plan enhancing stabilization and service utilization outside of the emergency system. This measure also directly impacts our identified community needs. There overuse of the emergency department services (CN.10). Increased outpatient behavioral health services will result in reduced utilization of the emergency services because patients will have more care options in community-based services.

**Relationship to Other Projects:**
- **Related Category 1 and 2 projects**
  - 2.17.1 – Design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders. The Behavioral Health Discharge Management Program team will be able to utilize the PHP programs and locations for patients who deteriorate after discharge but are still able to benefit from the structured services instead of readmission. Additionally, the care managers will be able to monitor high-risk patients who are continuing care through the continuum.
  - 1.12.1 – Establish extended operating hours at a select number of local mental health clinics or other community-based settings in areas of the State where access to care is likely to be limited. Patients who have deteriorated but are still able to benefit from the structured services being served in the new hours and services will be able to utilize the PHP programs and locations to avoid hospitalization.
  - This project to expand locations through partial hospitalization and intensive outpatient services meshes collaboratively with the projects MHMR of Tarrant County is proposing regarding telemedicine, expanded behavioral health services, RN case management, integrated primary care, and detox expansion. These programs will function as additional resources and tools available to patients who require additional behavioral health coordinated care options. It is anticipated the substance use disorder treatment and detox expansion will be particularly integrated, as we have agreed that one partial hospitalization program site will target patients with both a mental illness and a substance use disorder. Patients in this program will enter by stepping down from the expanded detoxification beds as well as stepping up from unsuccessful efforts at lower levels of outpatient care.

- **Related Category 4 Population-focused improvements**: This project will impact RD-2.3. It is expected this project will improve follow-up rates after hospitalization for mental illness. This is expected to reduce behavioral health 30-day readmissions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

JPS Health Network defined the population that will be directly impacted by the project as patients who utilized JPS Health Network outpatient behavioral health clinics. The percentage of the population expected to be positively impacted by the project is 100%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 4 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, her ability to manage her own care plan is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or her dependence on the community is reduced.

Specifically, 2425 patients (DY2 = 91, DY3 = 618, DY4 = 858, DY5 = 858) receiving care from new PHP & IOP service locations will be positively impacted in the following quantifiable ways:

- Increased utilization of community behavioral health care by 7.5% over life of project.
- Improved Consumer satisfaction with Access by 30% over life of project.
- Improved baseline number of patients who received care within 30 days of hospitalization discharge by a percentage to be determined in DY3.
- Improved baseline number of patients who received care within 7 days of hospitalization discharge by a percentage to be determined in DY3.
- Improved baseline number of behavioral health/substance abuse 30-day readmission rate by a percentage to be determined in DY3.
• Reduced Emergency Department visits for Behavioral Health/Substance Abuse conditions by a percentage to be determined in DY3.

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project
Project Option 1.10.2 – Innovation and Transformation Center

Unique Project ID: 126675104.1.5 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The purpose of the project is to erect and staff a continuous quality improvement infrastructure for JPS Health Network. The infrastructure will include: a) Governance and oversight structure for performance improvement initiatives; b) Centralized experts trained in Lean, Six Sigma, Rapid Cycle Improvement and Project Management; c) Resources to educate and expand internal capabilities in PI skills; d) Decision Support resources. Waiver initiatives requiring these resources will be staffed through the ITC. The decision support infrastructure within the ITC will support JPS’ internal performance improvement reporting, the reporting of the Medicaid Waiver projects and JPS Anchor reporting requirements. This is a new initiative.

Need for the project:

The need for this project was defined in part by the JPS Quality Program Assessment which surveyed through interviews, Network’s Board, Executive and Medical Leadership and operational team members(1.10.3.b). The results indicated the skills and infrastructure necessary to support continuous quality improvement and complex process re-design at JPS are inadequate to support the degree of change necessary to successfully drive improvement and support the twenty-plus new transformational projects encompassed in the Waiver project portfolio. The core component of this project is to provide training and education to clinical and administrative staff on process improvement strategies, methods and culture(1.10.3.a).

a) Reducing Inpatient Potential Preventable Conditions (PPC) and cost of care associated with harm is a regional priority. The Innovation and Transformation Center’s initial inpatient projects are aimed at reducing hospital acquired conditions, CAUTI, CLABSI, SSI, VTE, and Falls. The population represented across all five conditions is 32,894 patients by 2011 baseline. The estimated number of lives impacted across all five HACs is 119 (baseline validation is a milestone included in the project).

b) The Innovation and Transformation Center provides essential support for the twenty plus JPS Health Network Waiver Projects. These improvement and population management initiatives will not succeed without the infrastructure, e.g. a governance structure for deploying resources in Lean, Six Sigma and project management and decision support.

c) As the Anchor, JPS will support 26 other providers.

Target population: The population includes all patients served by and within JPS Health Network. Instilling performance improvement skills, instituting an oversight structure with
decision support ensures improvements in care for the entire JPS acute care facility and each of the 43 clinics.

**Category 1 and 2:** Because the ITC contributes to the success of all of the Waiver projects and specifically to reducing harm for our inpatients, Medicaid and uninsured patients will benefit from increased access, improved care coordination, safer, reliable and more cost effective care. The ITC creates the necessary infrastructure to improve organizational performance and reporting capacity. The project includes the development of an Executive Data Warehouse and implementation of web-based reporting infrastructure. The decision support system and dashboard will support rapid-cycle improvement for the PPCs and all Waiver initiatives. The Innovation and Transformation Center’s initial inpatient projects are aimed at reducing hospital acquired conditions, CAUTI, CLABSI, SSI, VTE, and Falls. The population represented across all five conditions is 32,894 patients by 2011 baseline. The estimated number of lives impacted across all five HACs is 119.

**Category 3 outcomes:** The Category 3 outcomes selected include reduction of five PPC’s, CAUTI, CLABSI, VTE, Falls, and SSI.
Project Option 1.10.3 – Innovation and Transformation Center

Unique Project ID: 126675104.1.5 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
JPS Health Network will establish a System Transformation Center to be the central authority for organizing, evaluating, and documenting change efforts. The Transformation Center will be an internal training, education and capacity development resource for JPS Health Network and will lead initiatives to improve reporting, accelerate the use of data for process improvements, and to achieve efficiency using the Lean/Six Sigma methods. The Innovation and Transformation Center (ITC) will promote and manage continuous quality improvement throughout the organization that is driven by a culture that encourages change, supported by accurate and timely data and managed and reported in a way that ensures project success.

Goals and Relationship to Regional Goals:

Project Goals:
The three-year goals are to:

- Create a JPS Health Network Innovation and Transformation Center that will coordinate the implementation of major organizational performance improvement and transformational activities and spread learning and capacity at all levels of the organization.
- Complete internal assessment to determine the resources, e.g., project managers, Lean facilitators, etc. needed initially to support the 1115 Waiver projects and JPS in creating a culture of continuous improvement, one that manages by measuring and reporting. Additionally, the assessment will define the resources needed to improve and sustain JPS Health Network patient experience initiatives.
- Adopt and deploy a uniform approach to managing change that utilizes proven methods such as Lean, Six Sigma, rapid-cycle improvement.
- Adopt processes for prioritizing, chartering, resourcing, determining ROI, and ensuring projects achieve intended outcomes.
- Develop and implement a curriculum which addresses the role of executives, management and performance improvement specialists and project managers in managing change and using tools, e.g., Lean, Six Sigma and rapid-cycle improvement.
- To develop and implement a Quality College as part of all clinicians’ orientation and ongoing education; the curriculum will integrate quality improvement principles specific to the role of the clinicians, include basic PDSA methodology, share performance of improvement projects and lessons learned from patient safety.
- Erect a decision support center, led by a council of data owners that will achieve the following:
Process for continuously auditing the accuracy, efficiency, and completeness of all systems used to gather and report quality and safety performance data
Implement an online Intranet Quality and Performance Dashboard with all organizational quality measures reported and displayed

- Successfully executed the 1115 Medicaid Waiver projects.
- Reduce JPS’ aggregate harm rate resulting from hospital-acquired conditions, central line infections, catheter-associated infections, surgical site infections, venous thrombosis and falls.
- By DY5, improve compliance with best practice processes and achieve:
  - CLABSI rate at NHSN IQR1
  - CAUTI event rate at or below CDC NHSN Benchmark pooled mean or not significantly different, based on p-value analysis
  - Surgical site infection rates less than or equal to NHSN rates
  - Fall with injury rate of less than or equal to X/1,000 patient days
  - Total fall rate of less than or equal to X/1,000 patient days
  - VTE rate reduction by 20% of 2011 baseline

This project meets the following Regional goals:
This project is in line with the Region’s goal to execute the deployment of 1115 Medicaid Waiver projects aimed at increasing access and adding value to the health system. Tools such as project management, Lean, etc. provide a framework for successful design, implementation and managing performance.

Challenges:
Many workflows and care processes at JPS are not highly efficient or reliable, wasting human and financial resources. We encounter daily evidence of waste and inefficiency in clinical and administrative processes. Failure to proactively evaluate and redesign patient care processes with the implementation of the electronic medical record in May 2012, accentuated the unreliability and resulted in increased rates of non-compliance with best practice bundles of care for HACs. Whether it is patients showing up the morning of surgery without prior medical clearance, days in accounts receivable, low compliance rates with evidence-based bundles and/or failure to follow established procedures, we need tools to help us work smarter, reduce our costs without taking it out of quality, service, or access and execute clinical care processes more consistently. The Innovation and Transformation Center will create internal capabilities through training and certification for Lean, Six Sigma, rapid-cycle improvement and other methodologies.

JPS Health Network has poorly developed internal communication structures. Divisions between the silos of administration, nursing, support services, and medical staff have resulted in a multiplicity of parallel and overlapping improvement efforts. There is no clearinghouse or vetting process for improvement efforts and the work of communicating across the functional
divisions is not assigned to any particular unit. Meanwhile, dedicated and creative staff members who see the need for improvement forge ahead, resulting in many ad hoc efforts within the organization. It is essential to retain and encourage this goodwill and energy for improvement, while ensuring that all efforts are aligned and working synergistically to move the institution overall toward a vision of high-quality, patient-centered, coordinated and efficient care.

The Clinical Decision Support capabilities prior to implementing the EMR were mediocre at best; the ability to get stakeholders to mobilize based on data was impaired because of the data validity and accuracy. Clinical Decision Support since May 2012 was brought to a standstill. Clinical Decision Support is under design and will be one of the operational units within the Innovation and Transformation Center.

5-Year Expected Outcome for Provider and Patients:
- High-performing Innovation and Transformation Center
- Decision Support Center
- Robust change management, Lean, Six Sigma internal training program
- Culture of continuous improvement
- Measurement system accessible by any team member on the intranet

Starting Point/Baseline:
The JPS Health Network’s Quality Department has traditionally focused on regulatory compliance and case review. The Network has outstanding quality professionals, with excellent qualifications and training in this approach, and as a result, has done exceedingly well in regulatory review. While desiring to maintain this expertise, JPS Health Network also recognizes they will need a broader approach to quality based on models of organizational Performance Improvement. JPS Health Network will have to accelerate the learning of a new set of skills within the organization: meeting facilitation, team leadership, expertise in the tools of performance improvement, data analysis and graphic display, communication, organizational development and project management.

JPS recently launched a system-wide harm reduction effort aimed at reducing harm in five key areas by December 31, 2016. Each area has a multidisciplinary team working to develop aim statements, measures, tests of change, and ultimately to spread successful improvement strategies. Performance improvement coaches will need to be secured through a contractual relationship, because we do not have this skill set internally. The Innovation and Transformation Center will ensure these teams have the appropriate skill set and organizational support to succeed and spread what they learn; the center will also ensure the implementation of mechanisms to continuously recruit and train internal team members in this area of expertise.

Rationale:
Fragmentation and lack of coordination is a systemic issue for JPS. The Innovation and Transformation Center directly addresses this issue. By aligning improvement efforts and improving communication across the organization and building competencies in performance improvement, JPS Health Network will increase efficiency, reduce redundancy and turn the frustration of multiple uncoordinated change efforts into progressive movement toward objectives.

The selected milestones measure our effectiveness in deploying the various components of the Innovation and Transformation Model; separating each component will allow us to understand barriers and success factors for the specific components.

**Project Components:**

The project is aimed at enhancing improvement capacity within the Network. The project encompasses the component 1.10.3(a) providing training and education to clinical and administrative staff on process improvement strategies, methodologies, and culture. Component (a) includes development of Innovation and Transformation Governance Council to support prioritization, oversight of all PI initiatives; development and oversight of the plan for educating and training JPS team members and physicians in PI; deployment of the internal PI professionals certified in advanced change management. (Addressed in Milestones 1(P-1), Milestone 2(p-2), Milestone 3(P-6))

Component 1.10.3(b) was met through the JPS Quality Program Assessment conducted during DSRIP Y2 which surveyed/interviewed the Network’s Board, Executive and Medical Leadership and operational team members. The results indicated the skills and infrastructure necessary to support continuous quality improvement and complex process re-design at JPS are inadequate to support the degree of change necessary to successfully drive improvement and support the twenty-plus new projects.

Component 1.10.3(c) design data collection systems to collect real-time data that is used to drive continuous quality improvement, is addressed with the development of the Knowledge Management/Decision Support System. The sub-components of data component include: formation of Knowledge Management Council, enhancing the existing, creating or acquiring decision support system; developing near-real-time gap closure reports and intranet access to a comprehensive Network dashboard. The first priorities for inclusion in the measurement and reporting system are the five hospital acquired conditions addressed in this project, the measures supporting the Waiver projects and CMS measure sets. (Addressed in Milestones 4(P-5), Milestone 52(I-10)p-2), Milestone 6(I-7) Milestone 7(1-10) Milestone 8(I-7)

Best practice systems such as Denver Health, Virginia Mason, Geisenger, etc. have demonstrated success in health system transformation with the adoption of programs with these components.

**Unique community need identification numbers the project addresses:**

**CN 11: Need for more care coordination.** All counties identified CN11 as a need. Barriers include complexity of coordination, lack of staff, lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination.
between primary care providers, hospitals, and specialists. Care coordination is a challenge within the single provider’s inpatient arena and contributes to the variation in clinical care and health care acquired conditions.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received funding for it.

Related Category 3 Outcome Measures:
- **CLABSI rate at NHSN IQR1**
  An estimated 41,000 central line-associated bloodstream infections (CLABSI) occur in U.S. hospitals each year. These infections are usually serious infections typically causing a prolongation of hospital stay and increased cost and risk of mortality. CLABSI can be prevented through proper management of the central line. Improvement efforts at JPS are aimed at adopting the techniques recommended by CDC’s Healthcare Infection Control Practices Advisory Committee (CDC/HIPAC) Guidelines for the Prevention of Intravascular Catheter-Related Infections, 2011 and the NHSN CLIP practices.

- **CAUTI event rate at or below CDC NHSN Benchmark pooled mean or not significantly different, based on p-value analysis.**
  CAUTI is the most common UTI HAI infection, accounting for 30% of infections reported by acute care hospitals. CAUTI can lead to such complications such as: cystitis; pyelonephritis, gram negative bacteremia; prostatitis, epididymitis; and orchitis in males and less commonly, endocarditis, vertebral osteomyelitis, septic arthritis, endophthalmitis, and meningitis in all patients. Complications associated with CAUTI cause discomfort to the patient, prolong hospital stay and increase cost and mortality. Each year more than 13,000 deaths are associated with UTIs. Reference: CDC/HIPAC document—Guideline for Prevention of Catheter-Related Infections.

- **Surgical site infection rates less than or equal to NHSN rates.**
  While advances have been made in infection control practices, including improved operating room ventilation, sterilization methods, barriers, surgical technique, and availability of antimicrobial prophylaxis, SSI remain a substantial cause of morbidity and mortality among hospitalized patients. In one study, among nearly 100,000 HAIs reported in one year, deaths were associated with SSIs in more than 8,000 cases.

- **Fall with injury goal for DY5 is less than 72 falls with injury and 0.49 falls/1,000 patient days**

- **Total fall rate of less than or equal to 20% less than the 2011 JPS fall experience (468 falls; 3.18 falls/1,000 patient Days).** Statistics indicate patient falls occur in approximately 1.9 to
8.9% of all acute care hospitalizations with anywhere from 2 – 15% of inpatients experiencing at least one fall. An estimated 30% of inpatient falls result in serious injury. According to the Institute of Healthcare Improvement (IHI), falls are a leading cause of death in people ages 65 or older and 10% of fatal falls for the elderly occurs in hospitals. Preventing patient falls is a top priority for caregivers in the clinical setting. Implementing a more comprehensive falls prevention program ensures interventions can be applied to all patients at risk.

- VTE rate reduction by 20% of 2011 baseline
  According to the AHRQ, one in 10 of the more than 2 million Americans developing DVT goes on to die from PE. These 200,000 patient deaths represent more annual deaths than those from breast cancer, AIDS, and traffic accidents combined. Many of these VTE deaths contribute to hospital mortality. PE is the most common preventable cause of death in the hospital. An estimated 10 percent of inpatient deaths are secondary to PE. Patients who survive the initial diagnosis of PE face a mortality rate of 17.5 percent at 90 days. Not only do patients with VTE suffer a 30 percent cumulative risk for recurrence, they are also at risk for the potentially disabling post-thrombotic syndrome. While many VTEs are clinically silent, symptoms of hospital-acquired VTE often require ongoing therapy and represent a significant morbidity.

**Relationship to Other Projects:**
The Innovation and Transformation Center’s Governance Council will resource the 1115 Medicaid Waiver projects with Lean, Six Sigma and rapid-cycle skill sets; the ITC will provide oversight for all strategic PI teams chartered through its Governance Council.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*
JPS Health Network defined the population that will be directly impacted by the project as patients who are affected by potentially preventable complications. We used historical cost data from JPS Health Network patients to determine the avoidable cost savings per patient through the improvement of clinical outcomes.

To determine the value to each individual positively impacted, we concluded that the value of this project is a 4 on a scale of 1 to 5. We believe this to be the correct number because when a person is positively impacted, their clinical outcomes are improved and their patient experience is improved by a decreased length of stay in the hospital.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, additional ICU and med/surge beds will be available for other patients in need and cost savings will be realized for the hospital district.

### Milestone 1 [P-1]:
Establish a performance improvement office to manage data, improvement trajectory and improvement activities across the Performing Provider’s delivery system.
(Develop and approve a plan to create an Innovation and Transformation Center at JPS that will coordinate implementation of, spread learning from, and report progress on major organizational PI and transformational activities, including but not limited to Waiver implementation, Lean, and Harm Reduction; Restructure the Quality Division to include Knowledge Management, Process Improvement, Clinical Quality in order to centralize and manage data, improvement trajectory and improvement activities across JPS Network.)

**Metric [P-1.1]:** Documentation of the establishment of performance improvement office (Documentation of the ITC Charter, Governance, Staffing and Reporting Structures, prioritizing and chartering tools; evidence of Decision Support Strategic Plan and Knowledge)

### Milestone 2 [P-2]:
Establish a program for trained experts on process improvements to mentor and train other staff, including front-line staff, for safety and quality care improvement. All staff trained in this program should be required to lead an improvement project in their department within 6 months of completing their training.
(Determine and redeploy existing capabilities for supporting Waiver and other high-priority projects with experienced PM and PI skill set; Conduct market research to identify and visit best practice organizations that have successfully implemented Innovation and Transformation processes; **Metric [P-2.1]:** Train the trainer program established (Engage external vendors to develop and implement a curriculum which addresses the roles of executives, management and PI specialists in managing change and using tools, e.g., Lean and Six Sigma, etc. Initial Lean Champion (executives) and Lean Expert training is conducted)

**Baseline No Activity/Goal:** In-house MBB/Sensei

### Milestone 5 [I-10]:
Enhance performance improvement and reporting capacity. The following metrics are suggested for use with an innovative project option to enhance performance improvement and reporting capacity but are not required.

**Metric [I-10.1]:** Increase the number of reports generated through these quality improvement data systems
- Goal: 50% Waiver Projects reporting to ITC
- Data Source: Internal documentation

**Milestone 5 estimated incentive payment:** $2,222,773

### Milestone 6 [I-7]:
Implement quality improvement data systems, collection, and reporting capabilities

**Metric [I-7.1]:** Increase the number of reports generated through these quality improvement data systems
- Goal: Published Indicator inventory (data sources, numerators, denominators, owner, audience, frequency) approved by stakeholders; Intranet Quality;

**Milestone 8 [I-7]:** Implement quality improvement data systems, collection, and reporting capabilities

**Metric [I-7.1]:** Increase the number of reports generated through these quality improvement data systems
- Published Indicator inventory - data sources, denominators, owner, audience,
## ENHANCE PI AND REPORT CAPACITY - CREATE AN INNOVATION AND TRANSFORMATION CENTER

### Year 2 (10/1/2012 – 9/30/2013)
- **Management Dpt:** Establish a PI office
- **Data Source:** Office documentation

**Metric [P-1.2]:** Documentation that the performance improvement office is engaged in collecting, analyzing, and managing real-time data (Monthly dashboards supporting 1115 Waiver projects, 5 HACs included in ITC project).
- **Baseline:** Evidence of training
- **Data Source:** Internal documentation

**Metric [P-2.2]:** Improvement projects led by staff trained through the train the trainer program.
- **Baseline:** Evidence of training
- **Data Source:** Internal documentation

**Metric [I-7.2]:** Demonstrate how quality reports are used to drive rapid-cycle performance improvement.
- **Baseline:** Evidence of training
- **Data Source:** Internal documentation

**Metric [P-3.7]:** Increase Number of Dashboard with at least 75% of all of the quality metrics reported and displayed;
- **Data Source:** Internal documentation

**Metric [P-6.1]:** Increase Number of Dashboard with at least 75% of all of the quality metrics reported and displayed;
- **Data Source:** Internal documentation

### Year 3 (10/1/2013 – 9/30/2014)
- **Management Dpt:** Establish a PI office
- **Data Source:** Office documentation

**Metric [P-1.2]:** Documentation that the performance improvement office is engaged in collecting, analyzing, and managing real-time data (Monthly dashboards supporting 1115 Waiver projects, 5 HACs included in ITC project).
- **Baseline:** Evidence of training
- **Data Source:** Internal documentation

**Metric [P-2.2]:** Improvement projects led by staff trained through the train the trainer program.

#### Total Estimated Incentive Payments for 4-Year Period:

**Year 2 Estimated Milestone Bundle Amount:** $4,055,966

**Year 3 Estimated Milestone Bundle Amount:** $4,148,791

**Year 4 Estimated Milestone Bundle Amount:** $4,445,546

**Year 5 Estimated Milestone Bundle Amount:** $3,672,406

**Total Estimated Incentive Payments for 4-Year Period:** $16,322,709
Project Option 1.1.1 – Establish more primary care clinics – Walk-in Care Clinic

Unique Project ID: 127304703.1.1

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Azle / 127304703

Provider: Texas Health Harris Methodist Hospital Azle’s mission is to improve the health of the people in the communities we serve. The mission is the foundation for all of the facilities activities. Texas Health Harris Methodist Hospital Azle, a 36-bed hospital, is located on the border of Tarrant and Parker County, resulting in Texas Health Azle being the major source of primary health care to the area’s 30,000 citizens since 1954.

Provider’s Role in Region: The Tarrant County side has many resources, such as public health services; however, there is no public transportation from Azle to access these services. Parker County does not have a county hospital and only one clinic in Weatherford, which is approximately 20 miles from Azle. Again, there are no transportation options to Weatherford. Access for Medicaid patients is an equal concern. Although there are physicians in the large cities who accept Medicaid, there is not adequate transportation to these facilities.

Regional Need: The rural parts of Parker County provide an economic challenge. In fact, 18.7 percent of households in North Parker make less than $25,000 a year. In Parker County, the uninsured rate has jumped from 14.1 percent in 2007 to 24.8 percent in 2010\textsuperscript{vii}. The percent of children without insurance is 11.8\textsuperscript{i} percent. Lack of insurance increases their dependence on Medicaid. As a result, 56% of the patients seen in the emergency room at Texas Health Azle were either unfunded or Medicaid. This translates into approximately 13,154 patients.

Project Intervention: Unfunded or Medicaid patients typically do not have access to primary care. With limited options, many patients utilize the emergency department for routine medical care. This is costly and, in many cases, inconvenient. Low acuity patients generally have to wait until the more emergent cases are treated. The proposed Walk-in Clinic is new.

Target Population and Benefit: Because of funding issues, there are few physicians in the Azle area, who have available appointments for Medicaid and unfunded patients. Azle area physicians most often limit the number of Medicaid and unfunded patients they will accept. Others are forced to see physicians in the large Metroplex areas, such as Fort Worth. Unfortunately, there are no public transportation options available from Azle to these urban areas. In addition, there will be a decrease usage of the Emergency Department for those patients who now use it for non emergent care, which can be better served in a clinic setting. The walk-in clinic will provide a lower cost alternative to the Emergency Department to enable greater continuity of care for Medicaid and low income patients.

Category 1 Expected Patient Benefits: The project seeks to provide a medical home for approximately 875 unfunded or Medicaid patients by DY5, resulting in higher quality of care in a more cost effective setting.

Category 3 Outcomes: By the end of waiver, there will be a 50% reduction in unfunded/Medicaid and Medicare patients in the Emergency Department for non-emergent visits (~1490 visits) compared to baseline year, which translates to a 5.9% reduction in all ED visits. This would save in healthcare cost alone approximately $1,117,322.00.

Project Option 1.1.1 – Establish more primary care clinics – Walk-in Care Clinic
**Unique Project ID:** 127304703.1.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Azle / 127304703

**Project Description:**
These funds will be used to create a Walk-in Care Clinic in Azle (utilizing either unused clinical space in the existing building operated by JPS Health Network or the Professional Office Building on THAZ campus).
- Hours: This clinic will be open 10 hours a day, seven days a week.
- Staffing: staffed by a physician or mid-level provider along with at least one RN and one patient care technician.
- Population: Intervention population includes patients who are uninsured/Medicaid and Medicare patients who do not have a primary care provider residing in Northwest Tarrant, Northeast Parker, and Southwest Wise Counties who present for non-emergent\(^\text{71}\) services as defined by level four or five on the ESI classification scale, and who need to see a provider the same day.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to provide services to a minimum of 20-25 patients a day who otherwise would be treated by the Texas Health Harris Methodist Hospital Azle’s Emergency Department for non-emergent services, or not be treated at all due to a lack of provider access.

Along with primary care services, the Walk-in Care Clinic will provide acute care services, disease prevention information, screening, early detection services, along with educational and referral resources such as specialty care. The mission of this service is to improve access to primary care services for the unfunded/Medicaid and Medicare patients, reduce the incidence and mortality of certain diseases in the community setting, as well as treating acute illnesses as presented.

This project meets the following Regional goals:
The focus areas of the Region are:
(1) to provide improved access to health care for people with financial barriers;  
(2) address geographic barriers that impede access to care; and 
(3) reduce overuse of emergency department services.
This project will contribute to achieving these goals by implementing a community-based innovative primary care clinic. There is no public transportation in Azle; therefore, there is limited access to the clinics located in the larger metropolitan areas. In addition, Azle has a

---

disproportionate population of low-income or uninsured patients. These factors combine to drive patients to the emergency department. This clinic will provide centrally located, cost-effective, high-quality care.

**Challenges:**
Parker County is located just west of Tarrant County, a large urban county containing the cities of Fort Worth and Arlington. Being close to a major metropolitan center would suggest increased access to health care. Unfortunately, this is not the case. Azle straddles the Tarrant/Parker county line. The Parker County side has little to no resources. There is no county hospital in Parker County and only one county-supported family practice clinic. The one clinic is located approximately 20 miles from Azle. Unemployment has almost doubled in the past three years, rising from 4.1% in 2007 to 7.7% in 2010.\(^\text{72}\)

An uninsured rate has jumped from 14.1% in 2007 to 24.8% in 2010.\(^\text{73}\) The percentage of children without insurance is 11.8. According to the Texas Medical Association, the uninsured are up to four times less likely to have a regular source of health care and are more likely to die from health-related problems. They are much less likely to receive needed medical care, even for symptoms that can have serious health consequences if not treated. About one in five Texans lives at or below the poverty level; for children, it’s nearly one in three. Extending health coverage to the uninsured could improve their overall health by 7 to 8%. Lack of insurance increases their dependence on Medicaid.\(^\text{74}\)

**5-Year Expected Outcome for Provider and Patients:**
The Walk-in Care Clinic will increase access to primary care. Patients will be able to choose where to receive health care based on the appropriate setting, instead of financial considerations. By the end of the Waiver, there will be a 50% increase of patient visits to the clinic as compared to baseline data.

**Starting Point/Baseline:**
From October 1, 2011 to September 30, 2012, there were 25,162 visits to the Emergency Department at Texas Health Harris Methodist Azle. There were 2,703 unfunded/Medicaid and Medicare patients treated for non-emergent care, who could have benefited from services provided in a primary care setting. In DY2 we will establish the clinic, and in DY3 we will review clinic usage to determine the baseline data for DYs 4 and 5.

**Rationale:**
Texas Health Harris Methodist Hospital Azle Emergency Department’s current payer mix is comprised of 21% Medicaid and 35% uninsured patients. The Walk-in Care Clinic will provide comprehensive preventive and acute health services to individuals in the communities where people live, work, and worship along Northwest Tarrant County, Northeast Parker County, and Southwest Wise County.

**Project Components:**
More than half of the patients using Texas Health Harris Methodist Hospital Azle’s Emergency Department are uninsured or have Medicaid, lack a primary care provider, and could benefit from having access to primary care services. By establishing the Walk-In Care Clinic, these patients will be able to develop a medical home.

The lack of primary care services available to unfunded/Medicaid and Medicare patients create an environment where these patients have to use the emergency department for primary care and non-emergent treatment because they have limited options for their care (P-2). In DY3 we will determine the volume of patient visits based on the day of the week and hours utilized to determine the baseline for DYs 4 and 5. We believe that with marketing and patient education, we can increase the usage of the clinic by 50% by end of Waiver as compared to baseline data.

**Unique community need identification numbers the project addresses:**
- CN.7 – Need to address geographic barriers that impede access to care
- CN.8 – Lack of access to health care due to financial barriers
- CN.10 – Overuse of emergency department (ED) services

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
JPS Health Network operates a currently underutilized clinic approximately 2 miles from Texas Health Harris Methodist Hospital Azle’s campus. Because of its location near the Parker and Wise County lines, many patients in the surrounding areas are unable to receive treatment because they do not reside in Tarrant County. There are relatively few clinics where these patients can receive outpatient care. Many of them go without preventive and primary care services and ultimately end up in the emergency department seeking treatment. This project will expand access to primary care services for this patient population, reducing ED utilization, costs, and duplication of services. Sharing existing space with JPS makes better utilization of existing resources in a cooperative manner.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/rationale for Selecting the Outcome Measures:**
IT-9.2 – ED appropriate utilization
The goal of the Walk-In Care Clinic is to provide unfunded, Medicaid and Medicare patients a more suitable venue to address their non-emergent primary health care needs. ED appropriate utilization will capture the redirection of these non-emergent ED visits to the Walk-in care clinic through the reduction of overall ED visits annually.

By focusing on this outcome, we’ll be able to see how effectively we reach the targeted ED population and ultimately be able to improve their access to primary care services, disease prevention information and early detection services.

**Relationship to Other Projects:**

**Related Category 1 and 2 projects:** 127304703.2.1- Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases – Healthy Education and Lifestyles Program (HELP) Chronic Disease Management Program

**Related Category 4 population-focused improvements:** N/A

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

- **Approach/Methodology:** For every non-emergent ED visit avoided, $150 is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing health care costs, individual costs, and community costs.

- **Rationale:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with more than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already navigate frequent flyers away from the ED.

Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.12.2 – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Substance Abuse Expansion)

**Unique Project ID:** 127373205.1.1

**Performing Provider Name/TPI:** Helen Farabee Centers / 127373205

**Provider:** The Helen Farabee Center consists of 9 clinics in north-central Texas serving 19 counties across 16,705 square miles and a population of 318,665. The Helen Farabee Center is a Community Mental Health/Intellectual & Developmental Disability authority/provider. The Center serves primarily indigent clients and roughly 30% of them have Medicaid.

**Intervention:** This project involves hiring a program manager, two licensed substance abuse counselor and one support staff who will provide substance abuse services in the Wise county region. The project is an expansion of services provided within the Center’s region and it is a new service for Wise County.

**Need for the project:** The project meets the following needs identified through a regional needs assessment: CN.4 Lack of access to mental health services; CN.7 Need to address geographic barriers that impede access to care.

**Target population:** The target population for this project includes Adults/Children with a single substance-abuse or dependence diagnosis who do not meet Co-Occurring Psychiatric and Substance Abuse Disorder (COPSD) service eligibility requirements per our contract with the Department of State Health Services. Estimated number of patients to be served in DY3 is 50 patients, increasing to 55 and 58 in DY’s 4 and 5, respectively. The project represents a needed service that is currently absent in the identified service area and one that can be provided at low or no cost to Medicaid/Indigent recipients.

**Category 1 or 2 expected patient benefits:** The benefit is the increase in substance abuse services. This benefit meets the purpose of establishing and providing substance abuse services in the identified service area.

**Category 3 outcomes:** The benefit of the project is a 5% and 10% improvement in quality of life as measured by substance abuse assessments in DY’s 4 and 5, respectively. This meets the project purpose of meeting substance abuse needs for people in the identified service area.
Project Option 1.12.2 – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Substance Abuse Expansion)

Unique Project ID: 127373205.1.1
Performing Provider Name/TPI: Helen Farabee Centers / 127373205

Project Description: This project involves hiring a program manager, two licensed substance abuse counselors and one support staff who will provide substance abuse services in the Wise county Region (ZIP codes 76431, 76225, 76234, and 76073). The target population for this project includes adults/children with a single substance abuse or dependence diagnosis who do not meet co-occurring psychiatric and substance abuse disorder (COPSD) service eligibility requirements per our contract with the Department of State Health Services. As referrals come in, individuals’ treatment needs are assessed by the counselor, treatments are planned and conducted on an outpatient basis at center facilities in the Region. Continuous assessments are conducted that inform treatment or indicate discharge/referral services. Services are terminated when needs have been met. The project fits within the Project Area by enhancing the availability of substance abuse services in a location not currently providing them. The project fits the intervention through expanding the number of settings where substance abuse services are provided.

Goals and Relationship to Regional Goals:

Project Goals:
The goal is to establish a substance abuse division in Wise County by hiring four staff members (one program manager, two licensed chemical dependency counselors, and one support staff), and then providing substance abuse services in that county.

This project meets the following Regional goals:
The project is related to Regional Area of Focus One: Access to Care. The majority of Regional survey respondents indicated access to routine specialty care was difficult. Mental/behavioral health care services were the most difficult for low-income patients to access.

The project is related to Area of Focus Two: Care Coordination. The majority of respondents did not believe that low-income patients could access behavioral/mental health providers.

The project is related to Area of Focus Three: Community Health. Respondents felt that behavioral health, substance abuse and insufficient access to care were the top issues affecting population health.
The Helen Farabee Center primarily serves low-income individuals seeking mental/behavioral health care. The substance abuse project removes a major barrier to obtaining access to assessments for substance-related conditions and subsequent outpatient treatment locally.

**Challenges:**
Currently, substance abuse services are provided in only one county within Helen Farabee Center’s catchment area. As a result, substance abuse services are not available for many communities we serve. This project addresses that challenge by expanding services to a community that has previously lacked services.

**5-Year Expected Outcome for Provider and Patients:**
The expected outcome for the provider is to have established a substance abuse division in additional counties, provide needed services in that community, and to see improved quality of life as measured through standard assessments.

**Starting Point/Baseline:**
There are currently no substance abuse services provided by the Wise County clinic. The expected outcome at the end of the Waiver is to have a staffed substance abuse division at the clinic, providing substance abuse services on a routine basis.

**Rationale:**
During May 2012, the Helen Farabee Center solicited feedback via a survey from local stakeholders to inform planning for expansion and improvement of behavioral health services. Access to mental/behavioral health care was identified as difficult by 41.2% of the respondents, and substance abuse services were ranked as the most important service not currently provided in all service areas. Access to mental health appointments occurs on a walk-in basis; however, if patients require substance abuse services we cannot provide them in Wise County. Enhancing service availability for substance abuse services will help meet this need. Based on substance abuse arrest records in Wise County provided by the DSHS Treatment Statistics website, a conservative estimate of the number of patients who would potentially access substance abuse services in Wise County is 50 in DY3.

When patients with behavioral health issues cannot get timely evaluations and care through a local mental health authority, they will likely visit a local emergency department. AHRQ reports that one in eight of 95 million emergency department visits involved people with a mental health disorder. A quarter of these mental health disorders involved a substance abuse problem. Nearly 41% of these mental disorder and/or substance abuse-related visits resulted in hospitalization.75

---

Many patients could be diverted from emergency departments if immediate substance abuse screenings/interventions were available.

**Project Components:**
Enhancing substance abuse service availability for Wise County requires an expansion of those services into that underserved area.

The milestones and metrics were chosen based on the elements required in order to provide substance abuse services at a new location where none had been provided before. Substance abuse divisions require state licenses, equipment, administrative protocols/guidelines, hiring and training staff, evaluation and improvement activity and tracking utilization. A customizable improvement milestone was selected based on existing milestone I-11.1. This milestone (I-X.1) was customized by removing the mobile clinic aspect, since this project involves creating a new substance abuse division at an existing facility in Wise County. The customized milestone still measures increased utilization of behavioral health services using roughly the same data source (without referencing expanded transportation programs).

**Unique community need identification numbers the project addresses:**
- CN.4 – Lack of access to mental health services
- CN.7 – Need to address geographic barriers that impede access to care
- CN.8 – Lack of access to health care due to financial barriers (i.e., lack of affordable care)

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The project enhances care delivery by providing the substance abuse intervention dimension that is currently lacking. It provides Center psychiatrists with immediate referral and coordination options if clinically indicated. It allows the local mental health authority to provide complete behavioral health care that includes substance abuse services.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

*IT-10.1 Quality of Life*

This outcome is important since improvements in this measure correlate to increased time in a regular community setting versus seeking help through the emergency department or state hospital. When patients with behavioral health issues cannot get timely evaluations and care through a local mental health authority, they will likely visit a local emergency department.
AHRQ reports that one in eight of 95 million emergency department visits involved people with a mental health disorder. A quarter of these mental health disorders involved a substance abuse problem. Nearly 41% of these mental disorder and/or substance abuse-related visits resulted in hospitalization. Many patients reporting improved QOL ratings may also be diverted from emergency departments if immediate substance abuse screening/interventions were available. The outcome also reflects any impact substance abuse services will have in ensuring patients remain in the community and abstinent from drugs/alcohol. The expected improvement milestone for DY4 is to see improvement in quality of life, comparing assessments at first contact with assessments at three months, as measured by the Substance Abuse Adult/Child Treatment Assessment, for 5% of patients in Wise County. The milestone increases to 10% for DY5.

**Relationship to Other Projects:**
This Substance Abuse expansion project is related to project “127373205.1.2 Improve access to specialty care (Psychiatric Open Access)” in that it is providing access to a service that would otherwise require a long wait or not be available in Wise County.

The project relates to “127373205.2.1 Recruit, train and support consumers of mental health services to provide peer support services (Peer Support)” in that it also is establishing services that have previously not been provided in Wise County.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
MHMR of Tarrant County (081599501.2.1)  
Wise Regional Health System (130606006.2.3)

The target population for this project includes adults/children with a single substance abuse or dependence diagnosis who do not meet co-occurring psychiatric and substance abuse disorder (COPSD) service eligibility requirements per our contract with the Department of State Health Services. Part of this eligibility includes geographic location limited to Wise County. We do not believe the project duplicates another provider’s intervention for the same target population in this county.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

---

Project Valuation:

Substance abuse imposes a heavy burden on emergency department and primary care settings. When individuals are screened for substance abuse and receive appropriate treatment, the related utilization and abuse of health care settings will go down 50% with a savings of $3.81 to $4.30 for every dollar spent on treatment services. We used the average of $4.05 saved for every dollar spent on treatment services. The savings of $4.05 was determined by the Texas Drug Demand Reduction Advisory Committee Report to state leadership. That savings amount was determined based on costs saved from incarceration, hospitalization, emergency department usage, and homelessness.

77 Texas Drug Demand Reduction Advisory Committee: Report to State Leadership, January 2009 (http://www.dshs.state.tx.us/sa/ddrac/)

Project Summary Template to be completed for each Category 1 and 2 project
Project Option 1.9.2 – Improve access to specialty care (psychiatric open access)

**Unique Project ID:** 127373205.1.2  
**Performing Provider Name/TPI:** Helen Farabee Centers / 127373205

**Provider:** The Helen Farabee Center consists of 9 clinics in north-central Texas serving 19 counties across 16,705 square miles and a population of 318,665. The Helen Farabee Center is a Community Mental Health/Intellectual & Developmental Disability authority/provider. The Center serves primarily indigent clients and roughly 30% of them have Medicaid.

**Intervention:** This project expands the hours for psychiatric evaluation by expanding our current contract for telemedicine services in Wise County. The project is new.

**Need for the project:** The project meets the following needs identified through a regional needs assessment: CN.4 Lack of access to mental health services; CN.7 Need to address geographic barriers that impede access to care.

**Target population:** The target population for this project is Adults/Children who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (Adults with Major Depression, Bipolar Disorder, Schizophrenia and Children with a diagnosis of mental illness who exhibit serious emotional, behavioral, or mental health disorders). The estimated number of patients will be determined in DY2 per Milestone 1, Metric 1. An estimate is that 48 patients would be referred for psychiatric evaluation in DY2, increasing to 65 and 71 patients in DYs 4 and 5, respectively. The project represents a needed service that is currently absent in the identified service area and one that can be provided at low or no cost to Medicaid/Indigent recipients.

**Category 1 or 2 expected patient benefits:** The benefit is the access to on-demand psychiatric evaluation and earlier treatment. This benefit meets the purpose of improving access to specialty services (psychiatry) in the identified service area.

**Category 3 outcomes:** The benefit of the project is a 5% and 10% improvement in quality of life as measured by assessments in DY’s 4 and 5, respectively. This meets the project purpose of improving quality of life through immediate psychiatric access for people in the identified service area.
**Project Option 1.9.2** – Improve access to specialty care (psychiatric open access)

**Unique Project ID:** 127373205.1.2  
**Performing Provider Name/TPI:** Helen Farabee Centers / 127373205

**Project Description:**
This project expands the hours for psychiatric evaluation by expanding our current contract for telemedicine services in Wise County (ZIP codes 76431, 76225, 76234, and 76073). The expanded hours will provide for open-access (on-demand) routine psychiatric evaluations for individuals determined eligible to receive services under the Texas Recovery and Resiliency model. The target population for this project is adults/children who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (adults with major depression, bipolar disorder, schizophrenia and children with a diagnosis of mental illness who exhibit serious emotional, behavioral, or mental health disorders). The project fits within the Project Area, since psychiatry is considered specialty care and is being expanded. The project fits within the intervention in that the expansion of psychiatric availability improves access to these services by eligible individuals.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The project goals include collecting baseline data for wait times, completing and submitting a plan for electronic referrals, training medical staff, implementing referral technology to improve provider communications, and incrementally increasing the volume of specialty care visits via the open-access model.

This project meets the following Regional goals:
The project is related to Regional Area of Focus One: Access to Care. The majority of Regional survey respondents indicated access to routine specialty care was difficult. Mental/behavioral health care services were the most difficult for low-income patients to access.

The project is related to Area of Focus Two: Care Coordination. The majority of respondents did not believe that low-income patients could access behavioral/mental health providers.

The project is related to Area of Focus Three: Community Health. Respondents felt that behavioral health, substance abuse and insufficient access to care were the top issues affecting population health.
The Helen Farabee Center primarily serves low-income individuals seeking mental/behavioral health care. The open-access model removes a major barrier to obtaining access to quick and meaningful psychiatric evaluations and initial pharmacological treatments.

**Challenges:**
Currently the average wait time for an initial psychiatric evaluation is 10 weeks, making access to much-needed psychiatric medical care delayed at the Helen Farabee Center. The project addresses this barrier by creating an open-access (on-demand) model for psychiatric evaluation via telemedicine. The team implementing this project consists of initial intake clinicians who make the initial referrals for psychiatric evaluations, support staff who coordinate the video session, and contracted psychiatrists and other medical support personnel who conduct the evaluations.

**5-Year Expected Outcome for Provider and Patients:**
There is currently no mechanism for on-demand (walk-in) psychiatric evaluations for routine outpatient behavioral health services. The expected outcome during the Waiver period is to increase the number of psychiatric evaluations provided within one business day by creating an on-demand model. This is designed to have the anticipated effect of improving quality of life through removing a barrier to outpatient behavioral health services. Another expected outcome would be at least a 5% increase in the number of unique patients accessing services.

**Starting Point/Baseline:**
There are currently no on-demand psychiatric evaluations for routine behavioral health services.

**Rationale:**
Expediting services can decrease symptoms and increase functioning in individuals, ensuring timely access to initial evaluations and freeing other prescribers to provide quicker follow-up encounters. Neufeld et al. (2012) used the mean time between appointments as potential indicators for measuring quality of life. An on-demand (walk-in) model of care would expedite services, potentially reduce psychiatric admissions and potentially reduce emergency department usage by individuals in Wise County.

---

http://newprairiepress.org/journals.html.

Project Components:

The project component -- (a) “increasing service availability with extended hours” provides a cost-effective\(^8^0\) and concrete way to improve access to psychiatric services. This is accomplished by extending the available hours for contracted psychiatric evaluation providers in order to meet on-demand needs (P-2, P-11). Core component (b) “Increase the number of specialty clinic locations” was not addressed since our region has an adequate number of physical access points at which on-demand evaluations can occur. The Center currently operates 9 existing sites which enable most of the population in our catchment area to drive to a location in less than an hour.

This makes it unnecessary for us to increase the number of clinic locations. Component (c) “Implement transparent, standardized referrals across the” ensures efficient access to the new on-demand evaluation services. This is accomplished by creating an electronic standardized referral process and training staff on the process (P-7, P-8, P-9). Component (d) “Conduct quality improvement for project using methods such as rapid cycle improvement” is achieved by tracking and reporting on project impacts such as evaluation utilization and wait times compared to baseline data (P-3). This data is reported monthly to the Center’s Improvement and Oversight Committee. Access to behavioral health care was identified as difficult by 41.2% of community stakeholder respondents and barriers to access in terms of long wait times were identified as most important by 40.9%.

Baseline data is being collected in order to know the extent to which access to psychiatric services has been improved through the open-access model. Implementation plans for e-referrals ensure process efficiency. Training specialty care providers is required with a new access model of care. Developing and implementing technical referral capabilities will enable improved and streamlined provider communications. The improvement milestone of increasing clinic volume and improving patient access will help remove access barriers perceived by the community.

Unique community need identification numbers the project addresses:

- CN.4 – Lack of access to mental health services
- CN.7 – Need to address geographic barriers that impede access to care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

The project significantly enhances the existing delivery of psychiatric evaluations by eliminating the potential 10-week wait for medical interventions for routine behavioral health conditions.

The open-access model is designed to provide psychiatric evaluations the same day or next business day following the determination that patients are eligible for services.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

*IT-10.1 Quality of Life.*

This outcome is important since improvements in this measure correlate to increased time in a regular community setting versus seeking help through the emergency department or state hospital. When patients with behavioral health issues cannot get timely evaluations and care through a local mental health authority, they will likely visit a local emergency department. AHRQ reports that one in eight of 95 million emergency department visits involved people with a mental health disorder. A quarter of these mental health disorders involved a substance abuse problem. Nearly 41% of these mental disorder and/or substance Abuse-related visits resulted in hospitalization.\(^1\) Many patients reporting improved QOL ratings may also be diverted from emergency departments if an immediate psychiatric evaluation were available. The outcome also reflects any impact psychiatric evaluation services will have in ensuring patients remain in the community. The expected improvement milestone for DY4 is to see improvement in quality of life, comparing assessments at first contact with assessments at three months, as measured by the ANSA, for 5% of patients in Wise County. The milestone increases to 10% for DY5.

**Relationship to Other Projects:**

The project relates to 127373205.2.1 Recruit, train and support consumers of mental health services to provide peer support services (peer support), in that it also establishes services that have previously not been provided in Wise County.

The Project relates to 127373205.1.1 Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (substance abuse expansion), in that it also provides a behavioral health service in an area that currently has very limited access to the service.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Lakes Regional MHMR Center (121988304.1.2)
Medical Center of Arlington (020950401.1.1)
North Hills Hospital (094105602.1.1)
Pecan Valley Centers (130724106.1.1)

---

The target population for this project is adults/children who meet diagnostic service eligibility requirements per our contract with the Department of State Health Services (adults with major depression, bipolar disorder, schizophrenia and children with a diagnosis of mental illness who exhibit serious emotional, behavioral, or mental health disorders). Part of this eligibility includes geographic location limited to Wise County. The services provided by the mental health authority are specific to DSHS’s Texas Recovery and Resiliency model of care. We do not believe the project duplicates another provider’s intervention for the same target population.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years. Based on the literature, an estimated Quality of Life Year gained by this intervention is 0.0245 years. The result is a $1,225 quality of life improvement per patient impacted. The valuation is aligned with the Medicaid Waiver goals to develop programs that enhance access to health care, increase the quality of care, the cost-effectiveness of care provided, and the health of the patients and families served. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research). Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state. Cost-utility analysis is a useful tool for assessing the value of new health service interventions because it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency department visits that are avoided). In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added. The number of life-years added is based on a review of the scientific literature. A search of the scientific literature identified the following two studies. The first study looked at telemedicine and mental health and was conducted by Pyne (2010)\(^2\) which showed a 0.015 incremental QALY for patients with depression in rural New Mexico who received depression treatment by telemedicine. Another study by Hollinghurst et al. (2010)\(^3\) examining online cognitive behavioral treatment (CBT) of depression found the QALY gain for the wait list

---

Region 10 RHP Plan Page 247
control group of 0.494 (sd=0.099) while the QALY gain for the intervention group was 0.528 (sd=0.081). The additional QALY gain for intervention was 0.034. The average of the two estimated QALYs is 0.0245.

**Milestone 1** [P-3]: Collect baseline data for wait times, backlog, and/or return appointments in specialties

**Metric 1** [P-3.1]: Establish baseline for performance indicators

**Numerator:** Total number of days patients waited from evaluation request to evaluation encounter.

**Denominator:** Number of clients requesting psychiatric evaluations (current estimate is 48 for DY2).

**Baseline/Goal:** To determine the average wait time for an initial psychiatric evaluation.

**Data Source:** EHR, Internal Database

**Milestone 1 Estimated Incentive Payment:** $18,647

**Milestone 2** [P-7]: Complete a planning process/submit a plan to implement electronic referral technology (choose at least one metric):

**Metric 1** [P-7.2]: Metric:

Development of an implementation plan for e-referral

**Baseline/Goal:** Develop a plan that

**Milestone 4** [P-8]: Develop the technical capabilities to facilitate electronic referral

**Metric 1** [P-8.1]: Demonstrate technical mechanisms to be used to operate referral system are in place

**Baseline/Goal:** Develop a Referral Management system that will enable providers to efficiently refer consumers for psychiatric evaluations in the on-demand model

**Data Source:** Referral Management system

**Milestone 4 Estimated Incentive Payment:** $22,377

**Milestone 5** [P-9]: Milestone: Implement referral technology and processes that enable improved and more streamlined provider communications

**Metric 1** [P-9.1]: Documentation of referrals technology

**Baseline/Goal:** With improved technology and e-referral, to establish more efficient and fluid communication among providers

**Data Source:** patient registry

**Milestone 7** [I-23]: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-23.1]: Documentation of increased number of visits.

Demonstrate improvement over prior reporting period (baseline for DY2). Total number of visits for reporting period.

**Baseline/Goal:** Increase the number of psychiatric evaluations by 5% over baseline by 09-30-15 (estimated to be 65 patients).

**Data Source:** Registry, EHR, claims or other Performing Provider source

**Milestone 8** [I-23]: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-23.1]: Documentation of increased number of visits.

Demonstrate improvement over prior reporting period (baseline for DY2). Total number of visits for reporting period.

**Baseline/Goal:** Increase the number of psychiatric evaluations by 10% over baseline by 09-30-16 (estimated to be 71 patients).

**Data Source:** Registry, EHR, claims or other Performing Provider source

**Metric 2** [I-23.2]: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline for DY2). Total number of unique patients encountered in the clinic for reporting period.

**Baseline/Goal:** Increase unique number of patients by 2.5% over baseline.

**Data Source:** patient registry

**Metric 2** [I-23.2]: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline for DY2). Total number of unique patients encountered in the clinic for reporting period.

**Baseline/Goal:** Increase unique number of patients by 5% over baseline.

**Data Source:** patient registry

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $265,003
**Attachment 1**

**Project Summary Template to be completed for each Category 1 and 2 project**

**Project Option 1.1.1 – Expand Pediatric Primary Care (WRHS - Pediatric Project)**

**Unique Project ID:** 130606006.1.2 (Pass 3b)

**Performing Provider Name/TPI:** Wise Regional Health System/130606006

**Provider:** Wise Regional Health System (WRHS) is a health system licensed for 148 beds. The service area is Wise, Montague, Jack, Parker, and parts of Tarrant County. This service area holds 64,000 residents and is expected to grow to 74,000 by 2017. WRHS is the main hospital provider in the county. There are almost 15,000 children in Wise County. In DY1 there were 4,566 pediatric visits to WRHS with an estimated 5,600 between both hospitals in Wise County. There were 1,644 pediatric patients to clinics who will participate in the education opportunities of this project.

**Intervention:** This project will add a pediatrician to serve residents in the service area. This project is designed to reduce pediatric Emergency Department visits for preventable conditions or conditions that are suitable to be addressed in a primary care. This is a new initiative to address the lack of provider capacity and shortage of primary care services.

**Need for the project:** This project is related to the regional goals of improving access to primary and preventive care. The service area impacted by this project includes Northwest ISD, the fastest growing school district in Texas.

**Target population:** Wise County pediatric residents; namely the Medicaid/CHIP/uninsured population, who have limited access to primary care. The number of patients impacted by this project are as follows DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905.

**Expected patient benefits:** Between 2000 and 2010, the percentage of Texas doctors accepting Medicaid patients decreased from 67% to 31%. About 40% of the children in the North Texas Corridor have no or limited access to health insurance. The goal of our project is to increase availability of access to pediatric primary care for the Medicaid/CHIP/uninsured population, in order to decrease the over utilization of ED services.

**Category 1 or 2 expected patient benefits:** Category 1 Milestones call for us to plan for and open a pediatric clinic including the recruiting of a pediatrician. A nurse line will also be made available to existing primary care physicians treating pediatric patients.

**Category 3 outcomes:** IT 1.1 Third next available appointment and IT-3.9.2 Reduce Pediatric Emergency Department Visits have been selected as the Category 3 outcomes for this project. The goal of this project is increase access to pediatric primary care while reducing the over utilization of the ED. The - estimated reduction in pediatric ED visits will be -13% by DY5
Project Option 1.1.1 – Expand Pediatric Primary Care (WRHS - Pediatric Project)

**Unique Project ID:** -130606006.1.2 (Pass 3b)
**Performing Provider Name/TPI:** Wise Regional Health System/130606006

**Project Description:**
**Project Area:** Expand pediatric primary care for Wise County to prevent unnecessary use of emergency department services.
**Project Intervention:** Design and implement pediatric primary care services tailored towards individuals and families currently utilizing the Emergency Department for primary care services.

The goal of this project is to expand the capacity of pediatric primary care in Wise County through - Wise Regional Health System (WRHS) - and local primary care clinics, so that children receive the right care at the right time; have access to same-day appointments thereby reducing the unnecessary use of emergency department (ED) services. The additional capacity will be integrated with other community-based providers across a continuum of care to establish a virtual safety net for children’s health care. Wise Clinical Care Associates physician group has five primary care providers in Wise County, who treated approximately 1,644 pediatric patients in DY1. The implementation of this project will include educating these providers on the addition of pediatric primary care services and the upcoming implementation of a pediatric primary care nurse line -. Many factors contribute to unnecessary ED use, including financial and language barriers and habitual overutilization of emergent healthcare resources. Unnecessary visits will be avoided through the expansion of primary care pediatric services and through education of Wise County residents about these new services and other available health care resources. This project will have far-reaching positive results. It will affect not only Wise County pediatric patients, but - other patients and families who will learn about other health care resources, preventive health care measures such as immunizations, and healthy habits. Unnecessary ED visits will decrease Region wide as a result. The Regional Health Partnership 10 Community Needs Assessment Report reveals that the need for pediatric care in Wise County will grow by 23% over the demonstration period. Without intervention such as the expansion and implementation of new pediatric primary care services, the overutilization of countywide EDs will continue to grow. -The number of patients impacted by this project are as follows DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905. The estimated reduction in ED pediatric visits will be 13% by DY5.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goals of the project are to increase the availability of pediatric primary care services in Wise County, by adding a clinic location and pediatrician and ensure the appropriate use of such
services by the population through support systems and - work with local primary care services. Incremental increases in local pediatric primary care clinics with after-hours availability will ensure availability and use of cost-effective, high-quality pediatric care and health advice, and reduce unnecessary ED use. This project will have far-reaching positive results, affecting not only Wise County pediatric patients, but other patients and families who will learn about other methods to obtain health care, preventive health care measures such as immunizations, and healthy habits. Unnecessary ED visits will decrease Region wide as a result. To improve accessibility to pediatric primary care services, we will measure and improve provider availability through the third next available appointment calculation. This proven measure correlates with improved access to care regardless of appointment type (e.g., new patient, established patient, routine care, sick visit).

This project meets the following regional goals:
This project is related to the Regional goals of improving access to primary and preventive care, decreasing potentially preventable admissions, decreasing potentially preventable readmissions, decreasing potentially preventable complications, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services. This project will have far-reaching positive results, affecting not only Wise County pediatric patients, but their families who will learn about other methods to obtain health care and maintaining healthy habits. Unnecessary ED visits should decrease Region wide as a result.

Challenges:
A major challenge will be changing the behaviors of families who have used emergency services for low complexity care. This challenge will be addressed through - education in the use of health literacy principles, language and culturally appropriate approaches the through the use of community health workers who reside in the community and understand the customs and speak the language. Another challenge will be recruiting sufficient numbers of staff who are bilingual and multicultural.

5-Year Expected outcome for Provider and Patients:
The five-year expected outcomes of the project include an increase in the number of children with recommended well-child visits, increase in children receiving immunizations on schedule, increase in availability of same day or next day “sick” visits, reduction in the inappropriate emergency department use and reduction in overall cost of health care for children in Wise County. The number of patients impacted by this project are as follows DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905. The estimated reduction in pediatric ED visits will be 13% by DY5.

Starting Point/Baseline:
The baseline for this project is the number of pediatric providers in Wise County at the beginning of DY1. The Regional Health Partnership 10 Community Needs Assessment Report reports four pediatricians provided primary care pediatric services to Wise County residents at the beginning of DY1. In DY1 Wise Regional Health System had 4,566 pediatric ED visits; countywide it is projected that there were approximately 5,600 pediatric ED visits. With consideration of this data, WRHS will establish the baseline of countywide pediatric emergency department visits in DY2.

**Rationale:**
As concluded in the Regional Health Partnership 10 Community Needs Assessment Report, the demand for pediatric primary care services, which are both accessible and convenient for patients and their families, exceeds the available capacity, thus limiting health care access for many low-level acute care management or chronic conditions. Emergency departments are treating high volumes of pediatric patients with preventable conditions or conditions that are suitable to be addressed in a primary care setting. Additionally, many pediatric primary care physicians accept a limited number of the Medicaid/CHIP/uninsured population and may have limited or no extended hours, ultimately even further restraining the capacity of many families to access important primary care services. Between 2000 and 2010, the percentage of Texas doctors accepting Medicaid patients decreased from 67% to 31%. About 40% of the children in the North Texas Corridor have no or limited access to health insurance.

**Project Components:**
Project 1.1 “Establish more primary care clinics” does not contain core project components. Milestones and metrics are based on relevancy to the RHP 10’s pediatric population, the community needs for additional pediatric primary care and the baseline data of non-emergent emergency department use by children.

The milestones and metrics selected for the project will provide a step by step integration of the expansion of pediatric primary care. During the selection of these measures, special consideration was made to illustrate the methods of delivery using primary care services. As illustrated by the milestones and metrics selected, the implementation of this project will allow primary care clinics to be expanded through training and development and the addition of a nurse line, coupled with the establishment of a new pediatric practice. This project will require the addition of staff and providers in an effort to increase the volume of patients utilizing primary care clinics, while enhancing the abilities of the clinics to provide urgent care services. In DY 2, WRHS will conduct and participate in strategic planning and development with regard to the new primary care practice. DY 3 will include the recruiting, training and hiring of additional providers and staff, and the establishment of a new pediatric primary care clinic. In DY 4, WRHS will look to increase the volume of the newly established pediatric primary clinic by 10%
A 20% increase in clinic volume over baseline is expected in DY 5. In addition, a patient experience survey will be implemented to measure and quantify patient satisfaction.

**Unique community need identification numbers the project addresses:**
- CN 1 Lack of provider capacity
- CN 2 Shortage of primary care services

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This is a new initiative to address the lack of provider capacity and shortage of primary care services. This project is designed to address the needs of our community by redirecting pediatric patients that are currently receiving treatment in the ED for preventable conditions or conditions that are suitable to be addressed in a primary care setting into clinics; while expanded said clinics ability to deliver pediatric focused primary care services. We have not received any other federal funding for this program.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:**

**Outcome Measure # 1:** OD-9 Primary and Preventive Care. IT-3.9.2 ED appropriate utilization. (Stand alone measure)
This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children.

**Outcome Measure # 2:** IT-1.1 Third next available appointment.
This measure was selected because it is a proven measure of provider availability that improves access to care without regard of appointment type, e.g. new patient, established patient, routine care, sick visit, etc. thus, enabling us to truly evaluate provider availability and increases in availability.

**Relationship to Other Projects:**
2.1.1 Enhance/Expand Medical Homes
It is anticipated that through the coupling of these projects an optimal primary care environment will be established. While current clinics will be reworked to focus on patient centered care based on the Patient Centered Medical Home (PCMH) model, services will be expanded to provide pediatric primary care through the addition of pediatric focused primary care providers in an optimal environment for Wise County residents.
RD-1.6 Pediatric Asthma with a measure of pediatric patients that return to the ED for asthma treatment within 15 days.

The implementation of this project will reduce this measure by capturing the target population, pediatric patients currently the ED for low-level acute care management or chronic conditions, and redirecting them to pediatric primary care services. In turn pediatric primary care providers will manage patients with chronic conditions, such as asthma, resulting in a reduction of ED pediatric asthma related visits.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Regional Health System has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.) When calculating the total value, this project is valued at $17,177,531.

Wise Regional Health System defined the population that will be directly impacted by the project as pediatric patients receiving care in two separate settings. One outcome measure is pediatric ED admissions and the other outcome measures clinic setting visits. The percentage of the population expected to be positively impacted by the project is 13% on the hospital side, which was determined based on studies of similar projects implemented elsewhere. The number of patients impacted by this project are as follows DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. We also estimated the number of pediatric patient visits and calculated value based upon third day next available appointments.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, their whole family is impacted since this project targets pediatric patients. Not only is the health of the child improved but time efficiency for families is improved.
To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, dependence on the community is decreased.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $12,551,370*
Project Summary

Project Option 1.9.2 – Expand Specialty Care Capacity-Access Redesign to target quicker access to psychiatric services

**Unique Project ID:** 130724106.1.1

**Performing Provider Name/TPI:** Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106

**Provider:** Pecan Valley Centers is the Local Authority for mental health and developmental disability services for a six county region (5 of which are included in RHP 10). The total area covers 4267 sq miles and has a total population of 442,719. Pecan Valley Centers, as the local authority for the service area, is the safety net for mental health services for individuals without Medicaid or other funding source. Although we serve individuals with Medicaid, Medicare and other funding sources more than half of our population served do not have a funding source.

**Intervention:** This project will implement a redesign to access for services by expanding specialty care access to psychiatrists and other behavioral health providers. By decreasing wait times for services individuals will have less use of emergency rooms for behavioral health issues. This project is an expansion and enhancement of the current intake eligibility assessment process for mental health services. The expansion will be to add additional staff to impact the wait times to receive services.

**Need for the project:** Access to mental health services was identified as a community need for Region 10. By improving the intake process, individuals will be engaged into treatment in less time, thus increasing the opportunity for positive outcomes.

**Target population:** The target population is adults and youth with severe mental illness requesting routine services and meeting the diagnostic criteria for mental health services.

Estimated number of patients to be served over course of waiver period-Based the current monthly average number of individuals assessed for routine mental health services the estimated number of individuals to be served over the waiver period would be 2500 (including both adults and children/youth). Approximately 55% (1200 individuals) of our population has no funding source or are indigent and 25% (500) of adults and 75% (150) of youth have Medicaid, so this project will impact a large portion of both Medicaid recipients and uninsured individuals.

**Category 1 or 2 expected patient benefits:** The projects aims to see an increase of 15% in DY4 and 25% increase in DY5 of psychiatric events and

DY 2-Baseline collection and data collection plans with 4 hospitals

DY 3-two clinics and an estimated 10 new staff positions will be implementing the access redesign;

DY 3-The project aims to see a decrease from 40 days to 28 days to see a doctor from intake assessment. This will impact an estimated 900 individuals, who are seeking eligibility services during DY3. The prompt processing of request for services will improve access to other behavioral health providers in addition to the psychiatrist. This support from behavioral health clinicians in support of psychiatric services is beneficial since these staff have frequent and more intense involvement with the clients and can work with the psychiatrist to better meet the needs of the clients.
DY 4-75% or estimated 675 referrals will be processed and categorized correctly to ensure correct treatment.
DY 4-15% increase (or estimated 1495 events) of psychiatric visits
DY 5-25% increase (or estimated 1625 events) of psychiatric visits
DY 5-60% of new individuals will see a psychiatrist within 10 days of eligibility assessment.

**Category 3 outcomes:** IT-9.2- Our goal is to reduce emergency department visits for behavioral health/substance abuse by an estimated 25% by DY5. The improvement targets are yet to be fully determined for behavioral health services.
Project Option 1.9.2 – Expand Specialty Care Capacity-Access Redesign to target quicker access to psychiatric services

Unique Project ID: 130724106.1.1
Performing Provider Name/TPI: Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106

Project Description:
Project Area: Expand Specialty Care Access
Project Intervention: Improve access by increasing providers in order to decrease waiting times for psychiatric services

According to the dictionary, access can be defined as “the ability to approach, enter, exit, communicate or make use of.” As this relates to behavioral health services it can be defined as the ability to receive a needed service with easy access. The lack of providers and cumbersome systems, have typically made access to behavioral health services difficult. As behavioral health services continue to be a great need, accessing these services is becoming more important to community members. This ease of access is complicated by the lack of behavioral health providers in the area. In 2011, 77% of counties in Texas were designated as Health Professional Shortage Areas.(1) Since Texas ranks highest among states in the number of uninsured individuals, and the lowest state of funding for behavioral health services per capita, the need greatly surpasses the resources. This need for behavioral health services continues to increase in Pecan Valley’s six (including five counties in Region 10) county service area. Gaps in services exist, and this project will aim to close those gaps and provide a wider continuum of services. One identified gap is the absence of a behavioral health clinic in Somervell County. Currently those individuals must drive to another county to access their behavioral health services. This lack of engagement has the potential to be reflected in ED utilization or other more costly services. The goal of this project is to improve access by increasing capacity to specialty (psychiatry) services, to better accommodate the high demand for these services and decrease wait times for service engagement. In order to accomplish these goals, a clinic will be opened in Somervell County and additional providers will be added to the workforce in existing clinics to accommodate increased need for behavioral health services.

The aim of the program is to improve access to identified services in a timely fashion. Individuals requesting behavioral services typically want to receive those services as soon as possible. Often individuals wait to request a behavioral health service until their situation has reached the unbearable point, and asking them to wait to receive the services is not well-accepted. Expanded access will be implemented for individuals requesting routine psychiatric/behavioral health services (individuals needing crisis services will be seen immediately) and allow individuals access to the requested services. The access program will
include a team of individuals aimed toward client services. These individuals will include licensed professionals (LPHA) to complete an assessment to determine initial eligibility and diagnostics. Qualified mental health professionals community specialists (QMHP-CS) will be available to develop treatment goals and provide referrals for additional services. Team members will also include those providing counseling, nursing and psychiatric services. The teams will be located in five counties of Region 10, including Erath, Hood, Johnson, Parker and Somervell. Pecan Valley currently has behavioral health clinics in these counties, except Somervell. All service needs identified in the initial assessment and plan of care session will immediately be linked to appropriate referrals, and follow-up will be provided by QMHP-CS staff to ensure establishment of service connection. Upon completion of these assessments and referrals, a psychiatric evaluation will immediately be scheduled to be completed within 10 business days. This will improve access to psychiatric care.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The five-year goals of this project are: (1) to increase access to ongoing community-based behavioral health care services for the target population, and (2) early engagement with individuals with chronic mental health conditions. Increased access to psychiatry services will improve the quality of life for people, and reduce ED utilization, inpatient admissions and unnecessary involvement with law enforcement.

This project meets the following Regional goals:
The project meets the goals of RHP 10 to improve the quality of life for members of their family and their community. This will also result in improved health outcomes and decrease costs due to ED use and hospitalizations.

**Challenges:**
The national average of individuals waiting for mental health services is 47 days. Research shows that each day individuals must wait for a service lessens the likelihood that they will actually engage in services. 84 Pecan Valley’s current initial intake process is structured so that individuals are required to make multiple appointments with multiple providers before receiving psychiatric services. Although these multiple appointments are necessary, the process is not effective in engaging individuals. Barriers such as transportation, employment, financial hardship and family commitments often result in many missed appointments. As a result, individuals do not receive the services they need. This can lead to encounters with hospitals for emergency medications and added life stressors. Reducing the number of appointments to two or

---

less lessens the hardship placed upon individuals requesting services, and provides better, quicker service continuity.

**5-Year Expected Outcome for Provider and Patients:**
The five-year expected outcome of this project is to provide psychiatric services within 10 days to 60% of eligible individuals requesting routine behavioral health services and increase the volume of psychiatric services by 25%.

**Starting Point/Baseline:**
Pecan Valley currently provides behavioral health services, including psychiatry. Since December 2011, an average of 2,173 clients (adults and youth) have been active clients. Of this population, 26% (adults) and 75% (youth) have Medicaid, and 55% of both adults and youth have no funding source. Each month an average of 75 new clients are admitted through the regular intake process. Pecan Valley Centers has been participating in an Access Redesign project since May 2012 with consultant firm MTM. The goal of this project is to reduce the number of days an individual waits for psychiatric services. Due to this project, data has begun to be collected regarding number of days from initial contact for services to the completion of a psychiatric evaluation. No changes have been made to the current intake process, as the main aim of the six months of this project has been to evaluate gaps and identify needs. The current average waiting period to access a psychiatrist from the first call to an initial visit is 40 days. In May, June and July 2012, less than 10% of individuals requesting routine services actually received a psychiatric evaluation within 10 days. The number of staff currently directly linked to access is eight. The proposed additional staff for expanded access would be 17 staff members.

**Rationale:**
The Pecan Valley Region is a rural, medically underserved community where there are also transportation issues. Often individuals are unable to access care in their own community due to lack of resources. Improving access to behavioral health services improves quality of life and decreases use of more costly services.

Inadequate access to specialty care has contributed to the limited scope and size of safety net health systems. To achieve success as an integrated network, gaps must be thoroughly assessed and addressed. According to the Community Needs Assessment, behavioral health care is difficult to access. The primary barrier to behavioral health services is lack of capacity. By increasing capacity, improved client outcomes and client satisfaction will occur while also reducing ED use. This project addresses those gaps by adding an additional clinic in the community, and adding staff and clinicians to provider quicker access to requested services in all clinics.

---

85 www.texmed.org.
Project Components:
The core components to increase service availability with extended hours will be addressed in project 1.12.1 not directly in this project. As access is improved for individuals to receive psychiatric services sooner, the extended hours will be impacted as more physician time as well as other behavioral health clinician time will be available. The project will not include the core component of increasing the number of specialty clinic locations. As a result of the improved encounters to psychiatric services through access redesign, currently the need for a new clinic is not evident. The core component of implementation of transparent and standardized referrals across the system will be evident by the implementation of referral a tracking process to shorten wait times from referral to appointment and ensure an accurate referral category.

Our milestones measures will assess the increased access to services by (1) adding an additional behavioral health clinic, and (2) providing quicker engagement to services. As a result of this increased capacity, we are measuring improved access to psychiatric services through the milestone of improved engagement and increase volume of psychiatric services.

Unique community need identification numbers the project addresses:
- CN.4 – Lack of access to mental health services
- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.11 – Need for more care coordination
- CN.10 – Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it. The project will redesign access to services to by adding providers to engage clients in less time.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

\[ IT-9.2 \text{ ED appropriate utilization} \]

The goal of this project is to engage clients in fewer days. By accomplishing this, fewer people in services with Pecan Valley will seek behavioral health services from the ED. Cost containment is a goal for RHP 10 due to growing costs related to hospital and ED utilization. This discrepancy is evidence of the gap in behavioral health services. Pecan Valley’s project will
improve access to behavioral health services by shortening wait times to access services. Improved access will decrease ED utilization for emergency medications.

Numerator: the number of ED utilizations by Pecan Valley clients within 30 days of intake assessment
Denominator: the number of individuals assessed for initial eligibility (intake) by Pecan Valley.
By the end of the Waiver project, our goal is to show 25% reduction in emergency department utilization for behavioral health/substance abuse.

**Relationship to Other Projects:**
Improving capacity will increase the need for integrated care. As both medical and behavioral health care are integrated (2.15.1-Integrate Primary and Behavioral Health Care) more individuals will have access to needed services, thereby reducing costs and unnecessary ED visits.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
Performing providers with similar projects related to specialty care, and more specifically, psychiatry have communicated via email to discuss the potential of collaborating, as well as project progress, challenges and impact.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
The valuing process developed by Pecan Valley includes both an evaluation of costs savings as well as impact on quality of life of individuals involved with the program. This project will impact individuals from five counties of Pecan Valley Region, who have been newly admitted into behavioral health services and require routine behavioral health services. The population will be identified as individuals with severe mental illness. These new admits will be tracked to determine ED use within 30 days of admission to behavioral health services, with the improvement outcome being decreased ED utilization and reduced costs. Based on a review by the Indigent Care Collaborative in Central Texas, the average use of the emergency department by people with a behavioral health diagnosis is 7.085 visits per year, with the national average of an emergency department visit by a person with a behavioral health diagnosis is $1,500 per

---

On average, a person with a behavioral health diagnosis will have an annual cost of $10,628 in emergency department visits. On average, it costs $12 per day to provide community mental health services to adults at an annual average cost of $4,380 per year, providing a cost savings of $6,248 per patient year. Utilizing the Region 10 Category 3 pricing Model, Pecan Valley values the reduction in emergency department use by clients with behavioral health at $13,706,550, as related to the priority population for community centers as defined by the Texas Department of State Health services.

In addition to health care cost savings, there is an added value to the person suffering with behavioral health issues. According to a study performed for the Center for Health Care Service, access to telemedicine services increases the quality-adjusted life years by 2.45%. Utilizing the cost-utility analysis at a rate of $50,000 per life year, the adjusted value per person is equivalent to $1,225 per year. Based on the Region 10 Category 3 pricing model, Pecan Valley values the impact to the individuals to be served at $2,149,875 over the course of the grant, for a total grant valuation of $15,856,425. This amount does not include a value for the community impact, which would reach across multiple areas and which is not limited to, but would include reducing lost wages and lost productivity in the community, increasing the access to emergency departments due to a reduction in improper utilization, and a reduction in incarceration the behavioral health-affected population.

### Performance Improvement Plan: Access Redesign to target quicker access to psychiatric services

**Pecan Valley Centers for Behavioral and Developmental Health Care**

#### Outcome Measure(s):

**OD.9**

#### Year 2

(10/1/2012 – 9/30/2013)

**Milestone 1** [P-3]: Collect baseline data for wait times, backlog, and/or return appointments in specialties.

**Metric 1** [P-3.1]: Establish baseline performance indicators.

**Baseline/Goal:** Identify wait times from request for services to point of psychiatric evaluation.

**Data Source:** EHR, Administrative records.

**Milestone 1 Estimated Incentive Payment:** $1,463,400

**Milestone 2** [P-X]: Implement a data collection and reporting mechanism between performing provider and community providers to enable the tracking of ED utilization in order to evaluate outcome measure.

**Metric 1** [P-X]: Operational procedures between stakeholders for data exchange.

**Baseline/Goal:** Established data collection/exchange plan with four hospitals.

**Data Source:** data collection plan.

**Milestone 2 Estimated Incentive Payment:** $1,463,400

#### Year 3

(10/1/2013 – 9/30/2014)

**Milestone 3** [P-17]: Implement the redesign of medical specialty clinics in order to increase operational efficiency, shorten patient cycle time and increase provider productivity.

**Metric 1** [P-17.1]: Number of medical specialty clinics that have completed clinic redesign.

**Baseline/Goal:** 2 clinics

**Data Source:** Specialty clinic appointment tracking system.

**Milestone 3 Estimated Incentive Payment:** $1,409,101

**Milestone 4** [P-5]: Provide reports on the number of days to process referrals and/or wait time from receipt of referral to actual referral appointment.

**Metric 1** [P-5.1]: Generate and provide reports on average referral process time and/or time to appointment to providers, staff, and referring physicians.

**Baseline/Goal:** New referrals will be processed and scheduled within 28 days of initiation.

**Numerator:** Sum, for all referrals, of the number of days between

**Metric 2** [P-5.2]: Documentation of increased number of unique patients, or size of patient panels.

**Data Source:** Encounter data, billing records.

**Milestone 4 Estimated Incentive Payment:** $1,450,498

#### Year 4

(10/1/2014 – 9/30/2015)

**Milestone 5** [I-25]: Increase the number of referrals for the most impacted specialties that are reviewed and assigned into appropriate categories (i.e., urgent appointment, routine appointment, or e-consult).

**Metric 1** [I-25.1]: Proportion of referrals appropriately categorized.

**Goal:** 75% increase or 675

**Data Source:** Patient’s medical record, internal data records.

**Milestone 5 Estimated Incentive Payment:** $1,409,101

#### Year 5

(10/1/2015 – 9/30/2016)

**Milestone 6** [I-1.23]: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-23.1]: Documentation of increased number of visits.

**Demonstrate improvement over prior reporting period (baseline for DY2)**

**Goal:** 25% increase

**Data Source:** Encounter data, billing records.

**Milestone 6 Estimated Incentive Payment:** $2,684,564

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $11,330,564
Project Summary

Project Option 1.12.1– Extending Services Beyond Normal Business Hours

Unique Project ID: 130724106.1.2 (Pass 2)
Performing Provider Name/TPI: Pecan Valley Centers for Behavioral and Developmental HealthCare/130724106

Provider: Pecan Valley Centers is the Local Authority for mental health and developmental disability services for a six county region (5 of which are included in RHP11). The total area covers 4267 sq miles and has a total population of 442,719. In the last 12 months, provider has served an average of 2173 individuals (adults and youth). Pecan Valley Centers, as the local authority for the service area, is the safety net for mental health services for individuals without Medicaid or other funding source. Although we serve individuals with Medicaid, Medicare and other funding sources more than half of our population served do not have a funding source and would go without mental health services without the local authority.

Intervention: This project will be the extending of clinic hours in some Pecan Valley Centers outpatient mental health clinics beyond 5:00 PM on certain days. Transportation will also be provided during these extended hours in an attempt to improve access and improve rates of kept appointments. Currently only one outpatient clinic has extended hours. This project will increase the number of clinics to a total of 3 clinics with extended hours. Transportation is not currently provided in any clinic.

Need for the project: Access to mental health services was identified as a community need for Region 10. By extending the hours of operations in clinics, more individuals will be able to access treatment without interfering with daily activities such as employment, school and family care commitments. After hour services will provide an opportunity for existing patients to continue to maintain services without being absent from employment. In addition, it will provide an opportunity for those in the community to receive services who would not otherwise do so due to scheduling conflicts. Various studies show that when patients are able to access and adhere to behavioral health treatment, it reduces the use of higher costing facilities such as hospitalization or incarceration. By providing transportation, a potential barrier to treatment will be addressed. Although Medicaid recipients have transportation available to them, it may not be accessible after 5 pm. For others, public transportation may not be available after 5 pm or is cost prohibitive.

Target population: The target population is adults and youth with severe mental illness needing appointments after 5 pm. Estimated number of patients to be served over course of waiver period: 1500 (existing and potential new clients). Approximately 55% (1200 individuals) of our population has no funding source or are indigent and 25% (500) of adults and 75% (150) of youth have Medicaid, so this project will impact a large portion of both Medicaid recipients and uninsured individuals.

Category 1 or 2 expected patient benefits: The project will aim to improve adherence to scheduled appointments. For those individuals receiving services after 5pm, we expect to see a 10% decrease (from 27%) of cancelled or no-shows for appointments.

DY 2-Thorough assessment to enable the identification of two sites to expand services hours and transportation services to impact the most people.
DY 3-Establish two clinic sites to expand operations after 5 pm and introduce transportation services servicing clients with appointments after 5 pm
DY 4-evidence of 5% (from 27%) decrease in no shows/cancellations for scheduled appointments
DY 5-10% decrease (from 27%) in no shows/cancellations for scheduled appointments

**Category 3 outcomes:** IT-6.1 70% improvement over baseline of patient satisfaction scores. Studies through the American Medical Association affiliate Press Ganey reports that positive patient satisfaction equates into patient retention and that satisfied consumers are also more compliant with care. By improving client satisfaction and retaining patient engagement, Pecan Valley Centers will continue to minimize the population we serve in the community from receiving services in more restrictive and expensive environments such as hospitals (costs an average of $7,249 more than community services) or jails (costs an average of $6,580 more than community services). By extending hours of clinics, patients are able to receive services without interruption of their workday, allowing the patient to reach full wage earnings during that pay period. This benefit to the community will impact their service delivery satisfaction.
**Project Option 1.12.1– Extending Services Beyond Normal Business Hours**

**Unique Project ID:** 130724106.1.2 (Pass 2)

**Performing Provider Name/TPI:** Pecan Valley Centers for Behavioral and Developmental HealthCare/130724106

**Project Description:**
This project will result in a select number of Pecan Valley Centers outpatient mental health clinics remaining open past 5 p.m. on certain days for doctor appointments and related services. In addition, we will offer transportation services for people needing after-hours appointments, where transportation is a barrier from receiving services. The need for behavioral health services continues to increase in our Region. Positive behavioral health care outcomes are contingent on patients’ ability to obtain routine examinations and health care services as soon as possible after a specific need for care has been identified. However, many Texans are unable to access either routine services or other needed care in a timely manner because they lack transportation or because they are unable to schedule an appointment due to work scheduling conflicts. Problems also arise from school scheduling conflicts in the case of children or because they have obligations to provide care for children or elderly relatives during normal work hours. Many individuals with behavioral health needs are hesitant to seek treatment, and such barriers may be sufficient to prevent access entirely. Any such delay in accessing services or any break or disruption in services may result in functional loss and worsening symptoms. These negative health outcomes come at great cost to the individual and result in increased costs to payers when care is finally obtained.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The five-year goals for this project are: (1) to enhance service availability to both adults and children and adolescents by expanding the clinic hours beyond normal business hours and increase access to services for the target population, and (2) to ensure that transportation service is available for those needing assistance during the expanded clinic hours. As a result, individuals will experience a higher level of satisfaction with their services due to timely care, appointments, and information.

**This project meets the following Regional goals:**
The project meets the goals of RHP 10 to improve the quality of life for members of their family and their community and access to services. This will also result in improved health outcomes and decrease cost due to ED use and hospitalization.
Challenges:
There is very limited public transportation service during normal business hours. It is expected that there is even more limited or possibly nonexistent transportation services currently available outside of normal business hours in most of our counties. Community transit providers will be contacted during the early phase of the project to see if they are able to expand outside of normal business hours with their services. If not, Pecan Valley will attempt to fill the gap for transportation outside normal business hours.

5-Year Expected Outcome for Provider and Patients:
By offering expanding clinical hours and transportation services, Pecan Valley expects to reduce cancellations and no-shows and to improve consumer satisfaction with access to care. A 10% reduction in cancellations and no-shows will occur during the extended hours, along with a 60% improvement in consumer satisfaction concerning timely care, appointments and information.

Starting Point/Baseline:
Currently only one location has extended clinic hours. An evaluation is required to determine staff needs for this expansion to other locations and to determine the number of individuals seen in each clinic. The expected outcome will be expansion of clinic hours in at least two new locations. The expansion of clinic hours beyond normal business hours will involve all clinic staff, including the psychiatrist.

Rationale:
It is well known the national supply of behavioral health providers does not meet the need for services. It is the goal of health care improvement to provide more access to care by enhancing service availability in order to assist more individuals and families with mental health support to avoid more costly ED and inpatient care. This enhancement of services can also increase patient satisfaction and encourage engagement into services. The Pecan Valley Region is a rural community, with challenges of being medically underserved as well as lacking in transportation. Often individuals are unable to access care in their own community due to lack of resources.

Improving access to behavioral health services by expanding clinic hours beyond normal business hours of 8 a.m. to 5 p.m. can help cut down on more costly services and encourage patient engagement and increase satisfaction. Ensuring that transportation resources are available during these expanded hours will also help. To achieve success as an integrated network, gaps must be thoroughly assessed and addressed. According to the Community Needs Assessment, behavioral health care is difficult to access. This project will help to fill some of these gaps in services.

Project Components:
a) The core components of increasing service availability with extended hours and ensuring transportation is available during those extended hours will be fulfilled by extending clinic hours beyond normal business hours in high-volume clinics and developing a transportation program to operate during those extended hours.

b) A review of this project to extend hours to increase access to services will occur. From this review key opportunities and challenges will be identified and determined if they can be implemented on a larger scale.

c) Our milestones and metrics will (1) assess the gaps in accessibility to prioritize the geographic areas in our Region where extended clinic hours and transportation services are needed most, and (2) establish extended clinic hours and transportation services in at least two of the high-volume clinics to a) measure the number of patients served during the extended clinic hours and b) measure the number of patients served by the transportation program during those extended hours. These milestones and metrics were selected to make more cost-effective community health services available to working individuals, and parents and caregivers who provide care for family members during normal business hours.

**Unique community need identification numbers the project addresses:**

- CN.4 – Lack of access to mental health services
- CN.7 – Need to address geographic barriers that impede access to care
- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

a. **Outcome Measure 1:** IT-6.1 Percent improvement over baseline of patient satisfaction scores

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

The goal of this project will be provide access to behavioral health services beyond normal business hours in clinics. By improving access, individuals will have better outcomes and potentially reduce costs. Cost containment is a goal for RHP 10, as well as providing quality care at the right time. With the project, Pecan Valley expects to see improved client satisfaction in individuals’ ability to have better access to needed services. By the end of the Waiver project, our goal is to show 60% of individuals reporting increased satisfaction with getting timely care, appointments, and information during the extended clinic hours.
**Relationship to Other Projects:**
Extending clinic hours and providing a transportation service will shorten the wait for behavioral health services (1.9.2-Expand Specialty Care Capacity) which, in turn, will help reduce costs and unnecessary ED visits. This project will also increase the need for integrated care. As both medical and behavioral health care are integrated (2.15.1-Integrate Primary and Behavioral Healthcare), more patient satisfaction is expected due to an improved delivery system.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
Extending clinic hours and providing a transportation service will shorten the wait time for behavioral health services (1.9.2-Expand Specialty Care Capacity) which in turn, will help reduce costs and unnecessary ED visits. This project will also increase the need for integrated care. As both medical and behavioral healthcare are integrated (2.15.1-Integrate Primary and Behavioral Healthcare), more patient satisfaction is expected due to an improved delivery system. This project will participate in the Region’s Learning Collaborative. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative.

**Project Valuation:**
Pecan Valley developed the valuation of this project based upon both cost savings and impact on quality of life. This project potentially affects individuals from five counties, and more specifically the areas of service determined to most have the need for extended hours. The population will include both adults and youth with severe mental illness and who are currently eligible to receive services from Pecan Valley. According to the study, Impact of Proposed Budget Cuts to Community-Based Mental Health Services,91 citizens who suffer from behavioral health issues, but do not receive treatment, shift costs from cheaper community-based service delivery methods to more expensive environments, such as state hospitals and jails. According to the study, the average annual cost of providing community-based treatment for an adult is $4,380 per year as opposed to an average cost of $11,629 for a state hospital stay and a $10,960 cost to jails for inmates with mental illnesses. By calculating the cost difference per year of treating a person suffering from mental illness in the community as opposed to a jail setting, Pecan Valley Centers estimates a cost savings of $5,337,696 over the life of the grant. Pecan Valley Centers expects that this will provide a minimum value of $397,488 over the life of the grant. Utilizing the Region 10 pricing model, Pecan Valley Centers assigns the project of enhancing service availability a total value of $5,770,471.

**Year 2** (10/1/2012 – 9/30/2013)

**Milestone 1 [P-1]: Identify areas which lack sufficient transportation to appointments and extended operating hours**

**Metric 1 [P-1.1]: Assessment of gaps in accessibility to establish/prioritize geographic areas for intervention**

Baseline/Goal: 2 clinics with extended hours serving 1,500 patients.

Data Source: Survey of outpatient providers; interviews with key stakeholders; Clinic records regarding kept and missed appointments.

Milestone 1 Estimated Incentive Payment: $1,089,569

**Year 3** (10/1/2013 – 9/30/2014)

**Milestone 2 [P-5]: Establish extended hours option**

**Metric 1 [P-5.1]: Number of areas prioritized for intervention with extended hours in operation**

Baseline/Goal: 2 clinics with extended hours serving 1,500 patients.

Data Source: Encounter data.

**Metric 2 [P-2.1]: Number of areas prioritized for intervention with transportation services in operation**

Baseline/Goal: 2 clinics with transportation services serving 500 patients.

Data Source: Encounter data.

Milestone 2 Estimated Incentive Payment: $1,196,626

**Year 4** (10/1/2014 – 9/30/2015)

**Milestone 3 [I-13]: Adherence to scheduled appointments**

**Metric 1 [I-13.1]: 5% decrease (from 27%) in the number of cancelled or no-show appointments.**

Numerator: number of cancelled or “no-show” appointments for individuals receiving services through expanded access sites.

Denominator: number of individuals receiving services through expanded access sites.

Note: This would be measured at specified time intervals throughout the project to determine if there was a decrease.

Goal: 5% decrease from 27%

Data Source: Encounter data from expanded access sites.

Milestone 3 Estimated Incentive Payment: $1,282,219

**Year 5** (10/1/2015 – 9/30/2016)

**Milestone 4 [I-13]: Adherence to scheduled appointments**

**Metric 1 [I-13.1]: 10% decrease (from 27%) in the number of cancelled or no-show appointments.**

Numerator: number of cancelled or “no-show” appointments for individuals receiving services through expanded access sites.

Denominator: number of individuals receiving services through expanded access sites.

Note: This would be measured at specified time intervals throughout the project to determine if there was a decrease.

Goal: 10% decrease from 27%

Data Source: Encounter data from expanded access sites.

Milestone 4 Estimated Incentive Payment: $1,238,860

---

**Year 2 Estimated Milestone Bundle Amount:** $1,089,569

**Year 3 Estimated Milestone Bundle Amount:** $1,196,626

**Year 4 Estimated Milestone Bundle Amount:** $1,282,219

**Year 5 Estimated Milestone Bundle Amount:** $1,238,860

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $4,807,273
**Project Summary Template to be completed for each Category 1 and 2 project**

**Project Option 1.1.2** – Johnson County Hope APRN Clinic – 1.1.2C Expand Primary Care Capacity (1(D) – Expand Primary Care Clinic Staffing)

**Unique Project ID:** 131036903.1.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Cleburne / 131036903  
**Provider:** Texas Health Harris Methodist Hospital Cleburne is a full-service, 137-bed acute care hospital. Several hospital performing providers in and out of the Texas Health Resources system are developing similar projects that will expand primary care capacity to Medicare, Medicaid/uninsured patients. This project does not directly support, reinforce or enable other projects in the RHP plan due to the remote location of Texas Health Cleburne.

**Intervention:** To provide supplemental primary care providers and to expand primary care access to patients in the region Primary Care would be provided by APRNs with prescriptive authority under direct physician supervision. This project is a new intervention.

**Need of the project:** The use of APRNs as intermediate care providers will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. Expanding primary care capacity is critical to expand the medical home model and redesign primary care.

**Target population:** The identified target populations of patients the urgent care clinic will service are Non-Funded /self-pay without access to additional resources and high frequency of inpatient admissions and ER visits within the last 6 months. The identified target populations of patients the urgent care clinic will service are:

- a) Diagnoses to include COPD, heart failure, diabetes
- b) Non-funded/self-pay without access to additional resources
- c) High frequency of inpatient admissions and ED visits within the last six months

<td>2160</td>
</tr>
</tbody>
</table>

**Expected patient benefits:** Within our service area, Medicaid and low-income patients struggle to find access to primary care services, cannot afford the needed labs and/or prescription drug medication in order to continue treatment.

**Category 1 or 2 expected patient benefits:** This project will establish additional clinics, train additional providers, increase primary care clinic volume of visits and eventually increase the number of the target population reached.

**Category 3 outcomes:** By the end of the waiver, our goal is to have ≥10% of patients 18 years and older who are uninsured or underfunded seen in a primary care setting (either a THC based urgent care clinic or the JC HOPE Clinic).
Improvement targets for both outcome measures chosen were selected based on populations of patients the project proposes to serve, and align with the goal of decreasing inappropriate utilization of the ED by providing an alternative in an urgent care clinic managed by APRNs, and partnering with the JC HOPE clinic to provide primary care resources for patients who currently do not have access to primary care.

Outcome Measure #1: IT 9.2 Right Care, Right Setting; IT-9.2 ED appropriate utilization
Reduce Emergency Department visits for target conditions: Congestive Heart Failure (CHF), diabetes, CV/Hypertension, Chronic Obstructive Pulmonary Disease (COPD), asthma.

Project Option 1.1.2 – Johnson County Hope APRN Clinic – 1.1.2C Expand Primary Care Capacity (I(D) – Expand Primary Care Clinic Staffing)

Unique Project ID: 131036903.1.1

Performing Provider Name/TPI: Texas Health Harris Methodist Cleburne / 131036903

Project Description:
The Category 1 project proposed by Texas Health Cleburne (THC) is a collaborative effort with the HOPE clinic in Johnson County as a resource clinic for underinsured, non-funded adult patients. Given the limited resources provided by the Johnson County HOPE clinic, THC will provide supplemental primary care providers to increase the volume of patients who can be seen at HOPE. In addition, overflow patients will be seen in an urgent care clinic based at THC. Primary care will be provided by APRNs with prescriptive authority under direct physician supervision. The patients who are candidates for the urgent care clinic will be referred from the THC inpatient population and the outpatients from the THC Emergency Department only.

Goals and Relationship to Regional Goals:

Project Goals:
Within our service area, Medicaid and low-income patients struggle to find access to primary care services, cannot afford the needed labs and/or prescription drug medication in order to continue treatment. It may be difficult for the patients to get a primary care appointment in a timely manner due to traditional office hours and the practice of medicine structured around the physician, not the patient. Moreover, it is the project’s goal of health care improvement to provide more preventive and primary care to keep individuals and families healthy, and avoid more costly ED and inpatient care. RHPs are in real need of expanding primary care capacity in order to implement delivery system reforms needed to provide the right care at the right time in the right setting for all patients.

This project meets the following Regional goals:

i) Transform health care delivery from a disease-focused model of episodic care to a patient-centered, coordinated delivery model that improves patient satisfaction and health outcomes, reduces unnecessary or duplicative services, and builds on the accomplishments of our existing health care system; and

ii) Develop a Regional approach to health care delivery that leverages and improves on existing programs and infrastructure, is responsive to patient needs throughout the entire Region, and improves health care outcomes and patient satisfaction.
Challenges:
Because many of the primary care providers in Johnson County do not accept Medicaid, Medicare, or indigent care patients, a large population of patients frequent the emergency department as their only source of primary care. Of these patients, a large percentage present with chronic conditions that have exacerbated, warranting hospital admissions. The HOPE clinic in Johnson County is the only free clinic that accepts indigent or Medicaid patients. Because the clinic is managed and run by volunteer practitioners, clinic hours are limited, and this patient population is managed on a first-come, first-served basis by telephone appointment only. This project offers additional resources to the HOPE clinic and an alternative when the clinic’s limited scheduling capacity is full.

5-Year Expected Outcome for Provider and Patients:
Five-year goals are:
- Increase HOPE clinic resource FTE by 0.5/DY2 until DY5
- Improve access to care for indigent residents in Johnson County
- Augment access for underinsured and underfunded THC patients by opening an urgent care clinic managed by APRNs with prescriptive authority

Starting Point/Baseline:
The baseline for the proposed project is derived from researching the current volume the HOPE clinic can allow, given the current allocation of a 20-hours/week APRN. Our aim is to increase the volume of patients seen by the HOPE clinic, outsourcing current THC APRN staff. In addition, because HOPE clinic management has expressed a limit on the number of patients it’s willing to see per day, this project has plans to train additional support staff, allocate real estate on-site at the hospital, hire additional APRNs, and procure a medical director to provide access for THC patients. The identified target populations of patients the urgent care clinic will service are:

d) Diagnoses to include COPD, heart failure, diabetes
e) Non-funded/self-pay without access to additional resources
f) High frequency of inpatient admissions and ED visits within the last six months

</table>
**Rationale:**
According to the Texas Center for Health Disparities, there are striking disparities in health status, access to health care and risk factors between the racial and ethnic minorities and the general population in Texas. The greater Dallas – Fort Worth area is the nation’s fifth largest metropolitan area and is home to nearly 6 million residents, and more than 2 million of them are first- and second-generation Americans. Approximately one-sixth of Dallas – Fort Worth residents live under the federal poverty level and one-third live just over the federal poverty level. Health disparities also result from lack of minority health professionals, low health literacy, lack of training of health professionals in addressing these disparities, and unequal exposures to environmental risks. According to the Texas State Data Center, by the year 2040 Texas will need over 350,000 health professionals, of whom nearly 180,000 will be serving the non-white Texas population. In 2000, there were only 41,000 health professionals serving these populations.

**Project Components:**
The use of APRNs as intermediate care providers will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. Expanding primary care capacity is critical to expand the medical home model and redesign primary care. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes. We are expanding:

A. Primary care clinic space by utilizing hospital based existing real estate for a proposed urgent care access.
B. Primary clinic hours will be expanded related to the provision of additional APRN resource to manage the increase in volume of patients.
C. Primary clinic staffing will be expanded to include an APRN who will be available at the HOPE clinic and additional staffing for the hospital based urgent care clinic.

Milestones and metrics include:
- Establish additional/expand existing/relocate primary care clinics.
  - Metric: Number of additional clinics or expanded hours or space
- Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers.
  - Metric: Documentation of increased number of providers and staff and/or clinic sites
- Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.
  - Metric: Documentation of increased number of visits. Demonstrate improvement over prior reporting.
- Increase access to primary care capacity using innovative project option.
  - Metric: Increase percentage of target population reached
Numerator: Number of individuals of target population reached by the innovative project

Denominator: Number of individuals in the target population

RHPs are in real need of expanding primary care capacity in order to implement delivery system reforms needed to provide the right care at the right time in the right setting for all patients. Additional staff members and providers are necessary to increase capacity to deliver care.

Unique community need identification numbers the project addresses:

- CN.1 – Lack of provider capacity
- CN.2 – Shortage of primary care services (e.g., pediatric, prenatal, family care)
- CN.7 – Need to address geographic barriers that impede access to care
- CN.8 – Lack of access to health care due to financial barriers (i.e., lack of affordable care)
- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination
- CN.12 – Need for more culturally competent care to address unmet needs (e.g., Latino-population need care, translators, translated materials)

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project supports the AHRQ Transitional Care Model with the addition of using the APRN prescriptive authority (New Courtland Center for Transitions and Health University of Pennsylvania School of Nursing; NewCourtlandCenter@nursing.upenn.edu).

Related Category 3 Outcome Measures:

Outcome Measures:
IT 9.2 Right Care, Right Setting
IT-9.2 ED appropriate utilization – reduce emergency department visits for target conditions: congestive heart failure (CHF), diabetes, CV/hypertension, chronic obstructive pulmonary disease (COPD), asthma

Reasons/Rationale for Selecting the Outcome Measures:
By the end of the Waiver, our goal is to have ≥10% of patients 18 and older who are uninsured or underfunded seen in a primary care setting (either a THC-based urgent care clinic or the JC HOPE Clinic).

In DY2 and DY3, establishing a learning collaborative using process milestones will include (1) Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans, (2) Establish baseline rates, and (3) Disseminate findings, including lessons learned and best practices, to stakeholders. Improvement targets for both outcome measures chosen were selected based on populations of patients the project proposes to serve, and align with the goal of decreasing inappropriate utilization of the
ED by providing an alternative in an urgent care clinic managed by APRNs, and partnering with the JC HOPE clinic to provide primary care resources for patients who currently do not have access to primary care.

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects:** Several hospital performing providers in and out of the Texas Health Resources system are developing similar projects that will expand primary care capacity to Medicare, Medicaid/uninsured patients. This project does not directly support, reinforce or enable other projects in the RHP plan due to the remote location of Texas Health Cleburne. This project will, however, potentially have a positive impact on the same outcome measures and population-focused improvements as the other proposed RHP projects and interventions and contribute to best practices and lessons learned.

- **Related Category 4 population-focused improvements:** This project’s Category 4 Reporting Domain includes RD-1 Potentially preventable admissions (PPAs) in low-income, Medicaid, and uninsured Johnson County adult population with the reporting measures of RD-1.1 CHF, RD-1.2 Diabetes with short-term complications or uncontrolled diabetes, and RD-1.4 COPD or asthma. This project will support, reinforce, and enable other projects through its design and intervention for the above described patient population by adding to best practices and lessons learned.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $448 is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with more than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already navigate frequent flyers away from the ED.
Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option – 1.1.2 – Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

Unique Project ID: 135036506.1.1
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Provider: Baylor All Saints Medical Center at Fort Worth, located near downtown Fort Worth, is a full-service hospital dedicated to providing for the health care needs of the community. Baylor Fort Worth is among Tarrant County’s oldest not-for-profit hospitals and celebrated 100 years of service in 2006. The medical center has 525 licensed beds and offers a broad range of medical services including programs of excellence in cardiology, transplantation, neurosciences, oncology and women’s services. Baylor Fort Worth’s service area represents a population of 1.2 million.

Intervention: This project will implement increased access to a Patient-Centered Medical Home (PCMH) clinic designed to provide comprehensive and high-quality primary care services to underserved patients. The project is an expansion of Baylor’s Clinic strategy in Fort Worth and Tarrant County. This expansion will focus on the recruitment of more underserved (Medicaid and Uninsured) patients from the community at-large and patients awaiting access to other public resources.

Need for the project: Access to quality primary care services has been demonstrated to improve health outcomes and reduce avoidable hospital utilization among underserved patients.

Target population: Uninsured and Medicaid population in Tarrant County. Clinic capacity will allow approximately 600 new patients per year to receive services. Estimated number of patients to be served over course of waiver period: 1850 new patients from DY3-DY5.

Category 1 or 2 expected patient benefits: Establish/expand/relocate primary care clinics; train/hire additional primary care providers and increase number of clinics for existing providers; increase primary care visit volumes; and increase access to primary care capacity. These milestones and metrics tie into the project purpose through increasing visits and opening the PCMH to non-Baylor patients.

Category 3 outcomes: (all baselines will be reevaluated and reestablished in DY2)

- **IT-1.7: Controlling High Blood Pressure.** Our goal is to increase the number of patients with controlled blood pressure (< 140/80 mmHg) from 57.5% currently to 63.6% in DY5.
- **IT-6.1: Percent Improvement over baseline of patient satisfaction scores (clinic wait times).** Our goal is to increase patient satisfaction from 82.4% currently to 84.9% in DY5.
- **IT-6.1: Percent Improvement over baseline of patient satisfaction scores (timely response to patient phone calls).** Our goal is to increase patient satisfaction from 94.2% currently to 95.0% in DY5.
- **IT-12.1: Breast Cancer Screening.** Our goal is to increase the number of appropriate women who receive breast cancer screenings from 45.0% currently to 50.4% in DY5.
- **IT-12.5: Other USPSTF screening outcome (Influenza Vaccination).** Our goal is to increase the number of adults 18 and over who receive an influenza vaccination from 62.5% currently to 67.8% in DY5.
Project Option – 1.1.2 – Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion

**Unique Project ID:** 135036506.1.1

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Project Description:**
The Baylor Clinic, on the Baylor All Saints Medical Center at Fort Worth campus, would expand current capacity by opening patient panels to non-Baylor patients (including Medicaid and uninsured patients) and fully utilize the space and providers’ capacity. Additional support staff will be hired to better coordinate patient care, ensure transition from the hospital to a Baylor Clinic, and help to facilitate the care of the complex underserved patients. The NCQA-recognized PCMH at Baylor Clinic will open the current panel to the underserved community and provide volume relief for other providers/health systems in the area, while providing these high-quality primary care services to more people in one location. In addition to receiving primary care, this project also proposes that ancillary services such as labs, imaging (i.e., CT scans, MRI, mammograms, ultrasound, echocardiograms, and interventional radiology) and diagnostics (i.e., colonoscopy, stress tests, esophageal diagnostic, retinal screens) would also be provided upon physician request. This project aims to close the loop of care and increase patient compliance by co-locating/coordinating many of the essential services that the underserved population often has issues accessing and completing.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The five-year goals of this project are: (1) to provide a PCMH and PCP to a greater number of the underserved population, (2) provide continuity and transition to post-acute care services, (3) improve patients’ health outcomes and status, (4) create an integrated primary care model for underserved patients in Tarrant County to receive high-quality, complete care keeping these patients from utilizing the emergency department for low acuity needs and preventing readmissions that could have been avoided with proper primary care.

This project meets the following Regional goals:
The Region has a primary care provider and capacity issue for the underserved population. This project aims to address increasing access to primary care and providing high-quality, comprehensive care to patients in a less costly setting. Emergency department utilization is high in RHP 10, and by providing more patients with the primary care they need, the goal is to keep them from using the ED as a means to receive basic care.

**Challenges:**
Providers and hospitals are reluctant to expand primary care capacity in charity clinics due to the inherent necessity for other downstream services, procedures, and costs associated with adding a patient with multiple, complex needs from the underserved population. Additionally, there is not enough primary and specialty care providers and services supply to meet the demand from this population. Basic primary care needs are unable to be fulfilled because of the lack of funding and capacity to take more patients, thus leading to increased (re)admissions and prevalence of disease complications. Lastly, due to the transient nature of this population, it is difficult to achieve the full extent of quality and clinical outcomes associated with a Patient Centered Medical Home. This project addresses these challenges by creating a low-cost, effective, co-located and comprehensive model specifically for the underserved population. We plan to expand our care teams and services offered to facilitate some of the primary care access issues that exist in Tarrant County.

**5-Year Expected Outcome for Provider and Patients:**
At the end of five years, 1,850 new, unduplicated patients will have received PCMH/primary care services at the Baylor Clinic on the Baylor All Saints Medical Center Campus. We expect that at least 10-15% of patients who continue to come to the Baylor Clinic will achieve better adult preventive scores (APS) and have overall better clinical outcomes.

**Starting Point/Baseline:**
In the past year, the Baylor Clinic on the Baylor All Saints Medical Center at Fort Worth served over 600 unduplicated patients. To date, there has not been a formal process to take patients from the community; capacity is typically reserved for those patients who come from a Baylor All Saints Medical Center ED. In addition to patients discharged from Baylor All Saints Medical Center, our target population will focus on 1,850 patients of the more than 443,000 patients who are uninsured/underserved in Tarrant County.

**Rationale:**
We chose this project option because of the demonstrated need in the RHP and to leverage our PCP/PCMH model to patients outside of the Baylor system. According to the Community Health Needs Assessment, 66% of the Region is designated as a medically underserved area and 24.6% of individuals in Tarrant County are uninsured. The combination of these two factors leads to increased ED utilization and clinical complications due to lack of adequate access to coordinated, primary care services. In 2010, there were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1,000 persons in the Region. Additionally, the top outpatient services utilized include internal medicine, labs, psychiatry and pulmonology. These services can be better coordinated and managed in a primary care setting, ensuring patients receive the care they need in a timely fashion with adequate follow-up.

93 RHP 10 Community Health Needs Assessment.
Baylor clinics have a proven track record for improving patient outcomes and creating primary care capacity in underserved areas. Leveraging this model would improve health outcomes for patients and other performing providers.

**Project Components:**

a) *Expand primary care clinic space.* We will not physically expand the primary care clinic space, but we will more fully utilize the current space we have and will take advantage of underutilized space in the Baylor Clinic to see more patients. By carving out space to handle non-clinical needs such as finding community resources, education, coordinating care/appointments, etc., this will allow more room for providers to see patients and handle clinical needs.

b) *Expand primary care clinic hours.* We plan to expand our hours through the expansion of care teams. By adding mid-levels and other non-physician support staff, there will be more provider hours available, more appointment availability through expanding our current capacity from two appointment slots an hour to four (for example).

c) *Expand primary care clinic staffing.* We plan on hiring at least 2 FTEs to add to the care team in Fort Worth in order to increase our capacity and services offered. We also plan to make the current staff hours more efficient so that more appointments per hour can be offered to patients.

We also plan to engage regularly in continuous quality improvement activities that focus on: (1) identifying key challenges with the expansion of this project, (2) determine opportunities to scale all or part of the project, depending on available resources and financial constraints, and (3) look for ways to increase efficiency and effectiveness.

The milestones and metrics chosen for this project are more heavily focused on improvements in capacity and patient satisfaction rather than process, because much of the infrastructure and logistics are already in place, as Baylor is already an NCQA-recognized PCMH\(^4\). The focus of the metrics is on further improving and refining the PCMH baseline that has been established. Improvement metrics that hone in on increasing capacity, patient satisfaction and serving more patients are the impetus of this project. We also plan on engaging in continuous quality improvement activities on a regular basis that focus on: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints and 3) look for ways to increase efficiency and effectiveness.

**Unique community need identification numbers the project addresses:**

- CN.2 – Shortage of primary care services
- CN.8 – Lack of access due to financial barriers
- CN.10 – Overuse of ED services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project has not received funding from any federal source. It enhances current delivery system reform by focusing on providing high-quality, low-cost and comprehensive services to the underserved population, which in turn decrease ED utilization and promotes preventive services.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic. The Category 3 outcomes will be primarily focused on new patients to the Baylor Clinic.

IT-1.7 Controlling high blood pressure (NCQA-HEDIS 2012, NQF 0018) (Stand-alone measure)
By providing medication management, proper primary care attention and education, patients in our PCMH can achieve better blood pressure control in the outpatient setting and avoid complications. In Region 10, hypertension was identified as one of the top five most prevalent diseases in the area, with over 1,000 preventable admissions in 2010. Hypertensive complications can be especially deadly in the African-American population, who make up 12% of the RHP 10 population.

IT-6.1 Percent Improvement over baseline of patient satisfaction scores (Stand-alone measure)
Patients’ ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust patients have with their clinic and provider, eventually leading to better outcomes and lower costs. Data from Press Ganey Associates in 2007 demonstrates that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Baylor Clinics have historically had high performance in all measures related to patient satisfaction; however, there is opportunity for improvement. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below:

1) Patients are getting timely care, appointments and information (Stand-alone measure):
   Wait times

---

95 RHP 10 Community Health Needs Assessment.
2) Patients are getting timely care, appointments and information (Stand-alone measure): Returning patient phone calls

The following two outcome measures focus on adult preventive services recommended by USPSTF as low-cost, highly effective interventions that prevent and maintain patients’ health status. Patients who are a part of a Baylor PCMH are routinely screened and monitored to ensure that they are receiving all preventive services that are appropriate for their age and condition.

*IT-12.1 Breast Cancer Screening (Non-Stand-alone Measure)*

In Tarrant County, only 58% of women over 40 receive breast cancer screenings,98 we hope to screen more women and utilize early detection methods for breast cancer.

*IT-12.5 Other USPSTF-endorsed screening outcome measures (Influenza Vaccination Rate)*

In Tarrant County, only 40% of individuals over 18 received an influenza vaccination in the past 12 months. Less than one out of every three African-American or Hispanic individuals in Tarrant County received an influenza vaccination. There were 290 influenza-related deaths in RHP 10 in 2010.99 The rate of influenza vaccinations in the Region is quite low, and there is an opportunity to increase the number in the target population who receive this basic vaccination.

**Relationship to Other Projects:**

*135036506.2.1 Expand Chronic Care Management Model-Create Chronic Disease management and Prevention Program*

The Chronic Care Management Model expansion is related to this project because the additional staff that will be hired under this project of primary care capacity expansion will be co-located and provide education and management of CHF, diabetes and asthma/COPD.

*135036506.1.2- Improve Access to Specialty Care-Expand Specialty Care Services*

Improving access to specialty care is related to this project because patients who require certain specialty care procedures such as outpatient specialty provider visits, wound care, and office-based procedures, catheterizations, surgeries (i.e., gallbladder or hernia), excision of masses (breast, lymphoma), and cataracts, would receive coordinated care/referrals to these services as well as the necessary follow-up required for continuity of care in a primary care clinic setting.

*135036506.2.2- Develop Care Management Function that Integrates Primary and Behavioral Health Needs of Individuals- Behavioral Health Counseling, Screening and Treatment*

The project relates to this project of expansion of primary capacity because behavioral health would now be a co-located service offered to patients who require this service. This would increase the effectiveness of primary care by addressing behavioral health issues at the same time.

---

98 RHP 10 Community Health Needs Assessment.
99 RHP 10 Community Health Needs Assessment.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
Other projects that focus on expanding primary care are: 216719901.1.1 (Glen Rose–Increase Physician Office Visits), 022817305.X.X (Tarrant County Public Health–Creation of TB Clinics), 138980111.1.1 (University of North Texas Health Science Center–Expand Primary Care Capacity for Medicaid Dual Eligible Elders). The providers of these projects have confirmed that: (1) we each serve distinct geographical areas and/or (2) populations of the underserved. Our projects focus on increasing access to all underserved members of the community and creating a PCMH for these patients. The aforementioned projects serve distinct populations and are focused on carved out services.
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor All Saints Medical Center at Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Baylor All Saints Medical Center at Fort Worth defined the population that will be directly impacted by the project as 1,850 underserved patients in the Fort Worth area of the more than 443,000 uninsured in Tarrant County. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because this project provides a PCP/PCMH setting for underserved patients who do not have one. This alone has a large impact on individuals being able to meet basic health care needs and receive the medical attention they need to sustain their health. To determine the value to the community of each
individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her dependence on community resources is better utilized and over time, will decrease. When these patients receive health care, they are able to manage their conditions better and in a timely manner, remain productive members of society, stay out of the ED and avoid costly clinical exacerbations. In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and Regional projects. These criteria took factors such as transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability, and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature-based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the Regional cap of funding into consideration.

**Milestone 1** [P-1]: Establish additional or expand existing or relocate primary care clinics

**Metric 1** [P-1.1]: Number of additional clinics or expanded hours or space.

- Baseline/Goal: Determine optimal usage of clinic space and shift utilization based on clinical need (i.e., carve out space for consults and non-clinical issues to allow more space for providers to see a greater number of patients).
- Data Source: Documentation of space reallocation/increased utilization plans.
- Determine provider capacity to hold at least one evening clinic a week.

**Milestone 1 Estimated Incentive Payment:** $344,306

**Milestone 2** [P-5]: Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers.

**Milestone 3** [I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-12.1]: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline for DY2).

- Goal: at minimum 600 new, unduplicated patients will be seen at the Baylor Clinic over baseline.
- Data Source: E.H.R.

**Milestone 3 Estimated Incentive Payment:** $375,619

**Milestone 4** [I-15]: Increase access to primary care capacity.

**Metric 1** [I-15.1]: Increase percentage of target population reached.

- Goal: Increase access to 15% of available Baylor Clinic capacity to eligible community patients (non-Baylor patients).
- Data Source: Electronic Tracking/E.H.R.

**Milestone 4 Estimated Incentive Payment:** $314,306

**Milestone 5** [I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-12.1]: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline for DY2).

- Goal: at minimum 1200 new patients will be seen at the Baylor Clinic (cumulative over baseline).
- Data Source: E.H.R.

**Milestone 5 Estimated Incentive Payment:** $376,711

**Milestone 6** [I-15]: Increase access to primary care capacity.

**Metric 1** [I-15.1]: Increase percentage of target population reached.

- Goal: Increase access to 20% of available Baylor Clinic capacity to eligible community patients (non-Baylor patients).
- Data Source: Electronic Tracking/E.H.R.

**Milestone 6 Estimated Incentive Payment:** $351,196

**Milestone 7** [I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 1** [I-12.1]: Documentation of increased number of unique patients, or size of patient panels. Demonstrate improvement over prior reporting period (baseline for DY2).

- Goal: at minimum 1850 new patients will be seen at the Baylor Clinic (cumulative over baseline).
- Data Source: E.H.R.

**Milestone 7 Estimated Incentive Payment:** $311,196

**Milestone 8** [I-15]: Increase access to primary care capacity.

**Metric 1** [I-15.1]: Increase percentage of target population reached.

- Goal: Increase access to 25% of available Baylor Clinic capacity to eligible community patients (non-Baylor patients).
- Data Source: Electronic Tracking/E.H.R.

**Milestone 8 Estimated Incentive Payment:** $361,196

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project
Project Option – 1.9.2 – Improve Access to Specialty Care-Expand Specialty Care Services

Unique Project ID: 135036506.1.2
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Provider: Baylor All Saints Medical Center at Fort Worth, located near downtown Fort Worth, is a full-service hospital dedicated to providing for the health care needs of the community. Baylor Fort Worth is among Tarrant County’s oldest not-for-profit hospitals and celebrated 100 years of service in 2006. The medical center has 525 licensed beds and offers a broad range of medical services including programs of excellence in cardiology, transplantation, neurosciences, oncology and women’s services. Baylor Fort Worth’s service area represents a population of 1.2 million.

Intervention: This project will increase access to needed specialty care services (i.e. outpatient visits with specialty physicians, hospital-based procedures) for uninsured patients under the care of a Baylor clinics in Fort Worth. This is a new project and will provide access to specialty services previously unattainable for uninsured patients.

Need for the project: Specialty services are a key element to providing a full continuum of care to patients (beyond what can be provided in a primary care clinic) and an important contributor to improved health outcomes. Shortage of specialty care was one of the key needs identified in the region.

Target population: The target population will be a subset of established Baylor clinic patients who require specialty services. While historical data suggests 10-15% of all established patients will develop a need for specialty services, constraints in available specialists and facilities should allow the project to serve approximately 5% of all established patients within a given year. Estimated number of patients to be served over course of waiver period: 209 new patients from DY3-DY5 will receive specialty care services. The Specialty Care program will open up access to specialty services previously not available to uninsured patients, except in emergent situations.

Category 1 or 2 expected patient benefit: Conduct gap assessment of specialty care; collect baseline data for backlog/return appointments; increase number of specialist providers, clinic hours available for high impacted medical specialties; and increase specialty care clinic volumes of visits. These milestones and metrics tie into the project purpose through increasing visits and contracting with more specialty care providers in the community.

Category 3 outcomes: (all baselines will be reevaluated and reestablished in DY2)
- IT-11.1: Improvement in Clinical Indicator in identified disparity group: Improvement in Asthma Bundle. Our goal is to improve performance of our Asthma metrics Percent of Opportunities Achieved (POA) from 63.4% completed opportunities currently to 68.6% completed opportunities in DY5.
- IT-12.2: Cervical Cancer Screening. Our goal is to increase the number of appropriate women receive screenings from 72% currently to 75.9% in DY5.
- IT-12.3: Colorectal Cancer Screening. Our goal is to increase the percentage of appropriate patients receive screenings from 23.4% currently to 34.3% in DY5.

Project Option – 1.9.2 – Improve Access to Specialty Care-Expand Specialty Care Services
Unique Project ID: 135036506.1.2
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Project Description:
Patients (including Medicaid and uninsured) in an established PCMH can receive specialty care services at Baylor Clinic, including office visits with specialists, wound care, and facility based procedures such as cardiac catheterizations, certain surgeries (i.e., gallbladder/hernia), excision of masses (breast, lymphoma), and cataract removal and excluding transplants, oncology and perinatal services. Specialty care referral and coordination would come from the PCMH clinic per request by the patient’s PCP.

Goals and Relationship to Regional Goals:
Project Goals: The goals for this project are to increase/improve access to specialty care services, engage a greater number of providers/facilities to provide these services, increase the number of completed specialty referrals for patients and improve disease-specific clinical outcomes affected by increased access to target specialists.

This project meets the following Regional goals:
This project helps offset some of the demand for specialty care services in a coordinated way that synchronizes with the Regional needs of providing access to more specialty care, and also coordinates the care for the patient to ensure more timely care.

Challenges:
The major challenges with providing increased access to specialty care are multiple: 1) there is a lack of supply of specialty providers in the Region and even smaller supply who are willing to provide specialty care services to the uninsured/Medicaid population, 2) specialty care is expensive to provide for patients who have little or no ability to pay. Major procedures/surgeries can be a financial burden for performing providers and related entities, 3) there is often a long wait list for patients to receive specialty care, leading to clinical exacerbations due to less timely care and 4) there is no coordination or follow-up for patients who do receive specialty care leading to infections, healing issues and lack of wound management which can often lead to a (re)admission to the hospital. We plan to address these challenges through developing community relationships with providers and facilities in the area, find ways to provide more access points for these patients to receive the care they need in a timely manner, monitor utilization and outcomes to be good stewards of the limited specialty care resources available in the Region. Additionally, we plan to engage specialists in the primary care team to ensure continuity of care and through using our E.H.R, we will be able to monitor patients appropriately.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes are to provide specialty care to approximately 209 unduplicated patients over the Waiver period, increase the number of contracted providers/facilities to at least nine; to increase the number of completed referrals for specialty care services by 20% over baseline; and help facilitate the coordination and collaboration of specialists and primary care providers for our patients.

Starting Point/Baseline:
Currently, a small number of specialty referrals is coordinated on a case-by-case basis with a limited network of specialty care providers and Baylor All Saints Medical Center at Fort Worth. This project will begin by more accurately capturing baseline data and formalizing the specialty care referral process. The constraints of limited specialty care providers and facilities willing to care for this population have allowed similar programs in the area to meet demand for approximately 5% of a clinic’s patient population.

Rationale:
A key strategy for the Baylor Clinics has been the expansion of primary care access for the underserved population. Increased access to primary care has been strongly correlated with better health outcomes and lower avoidable hospital utilization within this patient population. While primary care providers are able to manage and treat many conditions, historic experience suggests that 10-15% of a clinic’s patient population will likely develop a specialty care need at some point. Left untreated, this 10-15% of patients is likely to develop further exacerbation of health problems, experience more complications and increase the likelihood of avoidable hospital utilization. Additionally, as part of an effort to create a complete and robust care team for our patients, making specialty care part of that team is essential. We chose this project option to supplement our goals of engaging specialty care physicians in providing the more complex and advanced procedures/screenings but also to conduct some basic preventive screenings and education for the patient. We feel that this will make specialists a formal part of the overall care team. Baylor Clinics have established relationships with providers in the community and as we grow, we plan to leverage and expand those relationships in order to serve more of our patients. As Baylor Clinics take on more patients from the community, we anticipate that there will be an increased need for specialty care services in this population. This project proactively creates increased specialty access for these new patients as well established clinic patients who have historically had poor access to specialty care. The Region 10 Community Health Needs Assessment reported a need to increase specialty supply over the next five years, particularly for high-demand specialties.

Project Components:
We plan on completing all required project components for the expansion of specialty care project: a) Increase service availability with extended hours: we will increase service availability by offering more appointments to patients in the outpatient setting and coordinate with surrounding hospitals to provide the inpatient services the patient may need, b) Increase number
Regional Healthcare Partnership

of specialty clinic locations: we plan to contract with at least 9 providers/facilities over the course of the waiver, providing more locations for patients to receive the specialty care they need.

c) Implement transparent, standardized referral processes across the system: we already provide a standard referral form and process which is documented in the patient E.H.R and is visible by all staff but will work to improve the tracking, reporting and collection of the referral data and
d) Conduct quality improvement for project using methods such as rapid cycle improvement: we will engage in: 1) identifying key challenges with the expansion of this project, 2) determine opportunities to scale all or part of the project- depending on available resources and financial constraints, 3) find ways to integrate the specialist into the care team as much as possible.

Unique community need identification numbers the project addresses:

- CN.3 – Shortage of specialty care
- CN.8 – Lack of access due to financial barriers

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: This project does not receive any source of federal funding and has been identified as a significant Regional need. It enhances the existing delivery system reform initiative by coordinating specialty care through a primary care setting; thus managing utilization, costs and reducing complications for patients. This project would supply the specialty care needs identified by the Region and individual providers but also ensures that utilization is controlled.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

*IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (Stand-alone measure)*

We will measure improvement in asthma for Baylor Clinic patients who receive specialist care using a standard asthma metrics that consists of: documentation of action/management plan, severity assessment, controller therapy for those who are eligible, and spirometry within last two years. This measurement, which we call the percent of opportunity achieved (POA), is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from bundle performance, which is usually an all-or-none metric calculating the percentage of patients who have achieved all the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period. For example: For asthma, there are four opportunities (i.e., metrics) per patient: (1) documentation of action/management plan, 2) severity assessment, 3) controller therapy for those who are eligible, and 4) spirometry within last two years. The denominator would be number of patients times 4. So, for example, if there are 10 patients times 4 opportunities each =
40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed, this means that our POA = 30/40, or 75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to reach 85% achievement.

Asthma affects about 7% of the Tarrant County population and accounted for 1,158 hospitalizations in 2010.100 Meng, Leung et al. found that patients with asthma who saw a specialist had higher rates of compliance, because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients, leading to better quality outcomes and long(er)-term control.101 Making the pulmonologist a part of our asthma patients’ care team will help to avoid exacerbations, prevent complications and reduce hospitalizations. Many underserved patients in the region require specialty care related to chronic diseases. A 2010 study by Bellinger et al. confirmed that minority and underserved populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.102

**IT-12.2 Cervical Cancer Screening (Non-Stand-alone Measure)**

In Tarrant County approximately 77% of women received a Pap smear in the last year; however, this percentage was lower for minorities in the county. According to the National Cancer Institute, African-American women are more likely to be diagnosed with cervical cancer and Hispanic women have the highest cervical cancer incidence rate among all women.103 There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a PCP/PCMH setting.

**IT-12.3 Colorectal cancer screening (Non-Stand-alone Measure)**

In Tarrant County, less than 13% of individuals 50 and over obtained a fecal occult blood test within the past two years, and less than 10% of Tarrant county residents 50 and over met colorectal cancer screening guidelines.104 There is a definite need for these services in Tarrant County, and the Baylor Clinic plans to provide these screenings to a greater number of people. There is greater need for patients to receive (appropriate) sigmoidoscopies/colonoscopies in the region as a preventive measure. According to the CDC, Hispanics and African-Americans are less likely to get screened for colorectal cancer, and it is often found in the latter stages of the disease as compared to their Caucasian counterparts.105 There is an opportunity to increase the

105 Centers for Disease Control and Prevention: http://www.cdc.gov/.
colorectal cancer screening rates by engaging specialists in the Tarrant County area to provide these basic and advanced screenings along with education focused on this topic.

**Relationship to Other Projects:**
This project is related to 135036506.1.1: Expand Existing Primary Care Capacity-Baylor Clinic Capacity Expansion. Increasing access to specialty care is related to the aforementioned project of expanding primary care capacity for two reasons: (1) as more patients enter the PCMH, there will be a linear increase in the need for specialty care services, and (2) primary care is essential to coordinate the specialty care and to allow for adequate follow-up for the patient, in order to avoid complications or issues that may arise after specialty care is received.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
Related projects in RHP 10 are: Helen Farabee Centers’ project focused on psychiatric services (Project 127373205.1.2); John Peter Smith Hospital’s project focused on incorporating ophthalmology into PCP setting (126675104.1.3) and, Pecan Valley’s project focused on psychiatric services (130724106.1.1). Our project aims to open access to patients who could not otherwise receive the specialty care they need and will require coordination and collaboration with other performing providers in the region. Our project does not (1) serve the same specialty care population as the aforementioned projects, and (2) we plan to have a broader scope of specialty care services offered through our PCMH.

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Baylor All Saints Medical Center at Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the...
health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Baylor All Saints Medical Center at Fort Worth defined the population that will be directly impacted by the project as underserved individuals in the Fort Worth and Tarrant County area who access to specialty care services. People who receive these services must be a patient of the Baylor Clinic prior to being referred to specialty care. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when people are positively impacted, their ability to maintain their health and address their complex health needs will be addressed. People will receive the procedures, diagnostics, etc. that they previously were unable to afford or could not have access to.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when people are positively impacted, their clinical exacerbations are lessened and they incur less costly procedures and surgeries versus waiting for specialty care and having a more serious condition occur.

In conjunction with determining the value to the individual and community, we used a qualitative grading system to determine relative values that can be compared to like projects within our health care system and Regional projects. These criteria took factors such as transformational impact, population served by project, alignment with community needs, cost avoidance, sustainability, and partnership collaboration into account. This weighted scoring criteria combined with the aforementioned literature-based econometric approach helped to determine funding allocations for each of our projects. For example, based on the approach to value Category 3 outcomes for each project in an econometric way, the sum of values for our projects would be $300 million. By taking this information in combination with the weighted scoring criteria, we were able to determine how to allocate dollars by project. If a project had a relative score of 7.6 versus a 6.5, the project with a score of 7.6 would be allocated a greater portion of the dollars taking the Regional cap of funding into consideration.

Project Option 1.1.2 – Expand Pediatric Primary Care

Unique Project ID: 138910807.1.1 (Pass 2)

Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807

Provider: Children’s has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children’s has pediatric specialty outpatient services in Dallas, Plano and Grapevine (Region 10). Children’s also has a system of primary care centers, MyChildren’s, which focuses on providing primary care to children covered by Medicaid and CHIP. There is one MyChildren’s office in Grapevine (Region 10). Annually, Children’s has approximately 600,000 patient contacts. Children’s has the largest market share for pediatrics in the DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured).

Intervention: The purpose of this project is to expand the hours of operation to include nights and weekends at the MyChildren’s location in Grapevine and to establish a 24 hour RN triage telephone service. It is an expansion of an existing initiative.

Need for the project: The need for this project is documented in the community needs assessment, specifically: CN. 1 Lack of provider capacity, CN. 2 Shortage of primary care services and CN. 10 Overuse of emergency department (ED) services.

Target population: Children in RHP 10 covered by Medicaid and CHIP. Estimated number of patients to be served over course of waiver period: 6,770 patients annually on panel at MyChildren’s Grapevine and 3,500 patient contacts for the specific services offered in this project. Provide access to primary care in the appropriate setting on nights and weekends and use an RN after-hours triage telephone system to determine need for appropriate urgent care or emergency care use. MyChildren’s Grapevine payor mix is 75% Medicaid, 5% Self-pay (uninsured), 15% CHIP and 5% Commercial Insurance.

Category 1 and 2 expected patient benefit: Process and improvement milestones were selected to support the successful implementation of the project. Expected benefits include increased patient satisfaction, improved health and reduced overall costs.

Category 3 outcomes: OD-9 Preventive and Primary Care. IT.9.2 ED appropriate utilization.

This measure was selected because the project is designed to support appropriate utilization of ED services and reduce the inappropriate use of ED services. By expanding the hours for pediatric primary care and by providing a 24 hour nurse triage phone line, patients and families will have access to care outside of the ED during evenings, nights and weekends. Literature suggests that families using a nurse triage line report up to an 86% reduction in seeking ED care after using a nurse triage telephone line. Anecdotally, parents of younger children and new parents tend to seek more medical care for their infants and young children. MyChildren’s patient panels tend to be younger children so there is a potential for even greater impact in reduction of inappropriate use of ED services.
Project Option 1.1.2 – Expand Pediatric Primary Care  
**Unique Project ID:** 138910807.1.1 (Pass 2)  
**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Project Description:**
Expand the capacity of pediatric primary care in Tarrant County through: (B) expanding primary clinic hours and (C) expanding primary care clinic staffing to better accommodate the needs of the pediatric population (Medicaid and CHIP), so that children receive the right care at the right time; have access to same-day appointments thereby reducing the unnecessary use of emergency department services. No additional primary care clinic space (component A) is anticipated, as additional capacity can be achieved in the current space by increasing hours open and adding staff. This project will also establish a 24/7 pediatric nurse/physician advice line and outreach call capability. The additional capacity will be integrated with all other community-based providers across a continuum of care to establish a virtual safety net for children’s health care.

**Goals and Relationship to Regional Goals:**
**Project Goals:**
The goals of the project are to increase the availability of pediatric primary care services in Tarrant County and ensure the appropriate use of such services by the population through support systems and electronic technology. Incremental increase in the local pediatric primary care through after-hours availability, coupled with a 24/7 pediatric nurse/physician advice line and outreach call capability will ensure both the availability and use of cost-effective, high-quality pediatric care and health advice and reduce unnecessary use of emergency department services.

This project meets the following Regional goals:  
This project is related to the Regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions, decreasing potentially avoidable complications, increasing self-management skills and increasing adherence to self-care plans.

**Challenges:**
A major challenge will be changing the behaviors of families who have used emergency services for low-complexity care. This challenge will be addressed through the use of health literacy principles, language and culturally appropriate approaches through the use of community health workers who reside in the community and understand the customs and speak the language. A second challenge will be recruiting sufficient numbers of staff who are bilingual and multicultural. Children’s is the pediatric training site for many student health care training programs. Bilingual and culturally diverse students will be identified through the relationships developed during the training at Children’s and then recruited after the student training is completed.

**5-Year Expected Outcome for Provider and Patients:**
The five-year expected outcomes of the project include: increase in the number of children with all recommended well-child visits, increase in children receiving immunizations on schedule, increase in availability of same-day or next-day sick visits, reduction in the inappropriate emergency department use and reduction in overall cost of health care for children in Tarrant County.

**Starting Point/Baseline:**
The baseline for this project is the hours of operations of MyChildren’s locations in Tarrant County at the beginning of DY1.

**Rationale:**
The project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (lack of after-hours access).

The demand for pediatric primary care services for children on Medicaid and CHIP, which are both accessible and convenient for patient families, exceeds the available capacity, thus limiting health care access for many low-level acute care management or chronic conditions. Emergency departments are treating high volumes of pediatric patients with preventable conditions or conditions that are suitable to be addressed in a primary care setting. Additionally, many pediatric primary care physicians accept a limited number of the Medicaid/CHIP/uninsured population and may have limited or no extended hours, ultimately even further restraining the capacity of many families to access important primary care services. Between 2000 and 2010, the percentage of Texas doctors accepting Medicaid patients decreased from 67% to 31%. In the North Texas Corridor, almost 40% of children either have no health insurance or insurance with limited access (Medicaid and CHIP).

**Project Components:**
Project 1.1 Establish more primary care clinics contains core project components. As noted above, we will not be using component (A), expand clinic space but will increase capacity through components (B) expand clinic hours and (C) expand primary care staffing. 

Milestones and metrics are based on relevancy to the RHP 10’s pediatric population, the community needs for additional pediatric primary care and the baseline data of non-emergent emergency department use by children.

**Unique community need identification numbers the project addresses:**
- CN. 1 Lack of provider capacity.
- CN. 2 Shortage of primary care services.
- CN. 10 Overuse of emergency department (ED) services.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
The project will significantly enhance the current supply of pediatric primary care and lessen the burden of care in current Federally Qualified Health care Centers and other centers which serve children covered by Medicaid and CHIP.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

OD-9 Preventive and Primary Care. IT-9.2 ED appropriate utilization. (Stand-alone measure) 
This measure was selected because the project is designed to support appropriate utilization of ED services and improve the health of low-income children. By expanding the hours for pediatric primary care and by providing a 24 hour nurse triage phone line, patients and families will have access to care outside of the ED during evenings, nights and weekends. Literature suggests that families using a nurse triage line report up to an 86% reduction in seeking ED care after using a nurse triage telephone line. Anecdotally, parents of younger children and new parents tend to seek more medical care for their infants and young children. MyChildren’s patient panels tend to be younger children so there is a potential for even greater impact in reduction of inappropriate use of ED services.

**Relationship to Other Projects:**
This project is related to the other projects submitted by Children’s Medical Center in Pass 2 for RHP 10:

1.2 Implement Disease Management
1.3 Expand Pediatric Behavioral Health
2.1 Expand/Enhance Medical Homes

These projects all enhance the services provided in a community-based pediatric medical home dedicated to providing primary and secondary medical services to children in RHP 10 covered by Medicaid and CHIP.

**Related Category 4 population-focused improvements**

- RD-1 Potentially Preventable Admissions
- RD-2 30-day readmissions
- RD-3 Potentially Preventable Complications
- RD-4 Patient-centered Health care
- RD-6 Initial Core Set of Health Care Quality Measures

By providing additional access to primary care through extended hours and use of a 24/7 RN triage phone line, potentially preventable admissions, 30-day readmissions and potentially preventable complications can all be reduced. Patient-centered health care measures should improve by increasing customer satisfaction. Emergency department efficiency should improve with less low-complexity illness in emergency departments. The core set of health care measures should improve for the children covered by Medicaid and CHIP who access care through improvements made with this project.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

This project was valued using a Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals: 4
- Addresses Community Needs: 2
- Project Investment: 1
- Project Scope: 1
- Value Weight of the Project: 8
Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

# Expand Pediatric Primary Care

**Related Category 3**

**Outcome Measure(s):** 138910807.3.1

<table>
<thead>
<tr>
<th>Year 2</th>
<th>Year 3</th>
<th>Year 4</th>
<th>Year 5</th>
</tr>
</thead>
</table>

**Milestone 1** [P-4]: Expand the hours of a primary care clinic, including evening and/or weekend hours

- **Metric 1** [P-4.1]: Increased number of hours at primary care clinic over baseline

  **Rationale/Evidence:** Expanded hours not only allow for more patients to be seen, but also provide more choice for patients.
  
  **Goal:** Expanded hours offered by 9/30/13.
  
  **Data Source:** Clinic documentation

**Milestone 1 Estimated Incentive Payment (maximum amount):** $159,375

**Milestone 2** [P-5]: Train/hire additional primary care providers and staff and/or increase the number of primary care clinics for existing providers

- **Metric 1** [P-5.1]: Documentation of increased number of providers and staff and/or clinic sites.

**Milestone 3** [P-7]: Establish a nurse advice line and/or primary care patient appointment unit.

- **Metric 1** [P-7.1]: Documentation of nurse advice line and/or primary care patient appointment unit.

  **Rationale:** In many cases patients are unaware of the appropriate location and timing to seek care for urgent and chronic conditions. Implementation of a nurse advice line allows for primary care to be the first point of contact and offer clinical guidance around how to mitigate symptoms, enhance patient knowledge about certain conditions and seek timely care services.

  **Goal:** RN advice line implemented by 9/30/14

  **Data Source:** Advice line and appointment unit implementation, operating hours and triage policies. Advise line system logs, triage algorithms and appointment unit operations/policies.

**Milestone 3 Estimated Incentive Payment (maximum amount):** $262,500

**Milestone 4** [I-12]: Increase primary care clinic volume of visits and evidence of improved access for patients seeking services.

- **Metric 1** [I-12.1]: Documentation of increased number of visits.

  **Rationale:** Identifying patient flow as it relates to urgent care needs allow Performing Providers to tailor staffing, triage protocols and service hours to best address patient needs and increase capacity to accommodate both urgent and non-urgent appointments.

  **Goal:** 300 urgent care after hours additional visits from baseline

  **Data Source:** Registry, EHR, claims or other Performing Provider source

**Milestone 4 Estimated Incentive Payment (maximum amount):** $262,500

**Milestone 5** [I-13]: Enhanced capacity to provide urgent care services in the primary care setting.

- **Metric 1** [I-13.1]: Percent patients receiving urgent care appointment in the primary care clinic (instead of having to go to the ED or an urgent care clinic) within 2 calendar days of request. Demonstrate improvement over baseline rates

  **Numerator:** number of patients receiving urgent care appointment within 2 days of request

  **Denominator:** number of patients requesting urgent care appointment

**Milestone 5 Estimated Incentive Payment (maximum amount):** $159,375

**Year 2** (10/1/2012 – 9/30/2013)

**Year 3** (10/1/2013 – 9/30/2014)

**Year 4** (10/1/2014 – 9/30/2015)

**Year 5** (10/1/2015 – 9/30/2016)

Overall call abandonment rate. Abandonment rate is the percentage of calls coming into a telephone system that are terminated by the person originating the call before being answered by a staff person. It is related to the management of emergency calls. This metric speaks to the capacity of the nurse advice line.

**Goal:** Average 3 calls per night

**Data Source:** Automated data from call center

**Milestone 6 Estimated Incentive Payment (maximum amount):**

- **Year 2 Estimated Milestone Bundle Amount:** $318,750
- **Year 3 Estimated Milestone Bundle Amount:** $281,250
- **Year 4 Estimated Milestone Bundle Amount:** $262,500
- **Year 5 Estimated Milestone Bundle Amount:** $195,000

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $1,057,500
Project Option 1.3.1 – Implement and Utilize Pediatric-Specific Disease Management System Functionality

**Unique Project ID:** 138910807.1.2 (Pass 2)

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Provider:** Children’s has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children’s has pediatric specialty outpatient services in Dallas, Plano and Grapevine (Region 10). Children’s also has a system of primary care centers, MyChildren’s, which focuses on providing primary care to children covered by Medicaid and CHIP. There is one MyChildren’s office in Grapevine (Region 10). Annually, Children’s has approximately 600,000 patient contacts. Children’s has the largest market share for pediatrics in the DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). The payor mix for MyChildren’s Grapevine is 75% Medicaid, 15% CHIP, 5% Self-pay (uninsured) and 5% commercially insured. Combined percentage of children in the schools with school-based clinics who are eligible for free or reduced price lunches (similar income guidelines as for Medicaid and CHIP eligibility) is 55%.

**Intervention:** The purpose of this project is to implement a disease management program at the MyChildren’s location and in school-based primary care settings in RHP 10. It is a new initiative.

**Need for the project:** The need for this project is documented in the community needs assessment, specifically: CN. 1 Lack of provider capacity, CN. 2 Shortage of primary care services, CN. 3 Shortage of specialty care, CN. 8 Lack of access to healthcare due to financial barriers, CN. 10 Overuse of emergency department (ED) services, CN. 11 Need for more care coordination, CN. 12 Need for more culturally competent care to address unmet needs. CN. 13 Necessity of patient education programs and CN. 15 Need for more education, resources and promotion of healthy lifestyles.

**Target population:** Children in RHP 10 covered by Medicaid and CHIP who have chronic diseases. Estimated number of patients to be served over course of waiver period: 13,200 patient contacts. Provide disease management to children with chronic diseases resulting in the best management of chronic disease with the least cost and minimal disruption of daily life for these children and their families.

- Estimated patients by year: DY3: 540  DY4: 1,050  DY5: 1,320
- Estimated contact per patient year: DY3: 3  DY4: 4  DY5: 5.6
- Estimated patient contacts per year: DY3: 1,600  DY4: 4,200  DY5: 7,400  total 13,200

**Category 1 and 2:** Process and improvement milestones were selected to support the successful implementation of the project.

**Category 3:** OD-9 Preventive and Primary Care. IT-3.9.3 Pediatric/Young Adult Asthma Emergency Department Visits. (Stand alone measure) This measure was selected because the project is designed to support appropriate management of asthma and reduce the use of ED services for asthma management. Studies have shown a more than 50% reduction in future ED use for asthma management by patients enrolled in an asthma management program. While other chronic diseases such as obesity and diabetes will also be targeted by this project, asthma...
accounts for the highest volume and greatest percentage of ED visits at Children’s emergency rooms for any chronic illness.

**Project Option 1.3.1 – Implement and Utilize Pediatric-Specific Disease Management System Functionality**

**Unique Project ID:** 138910807.1.2 (Pass 2)

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Project Description:**
Expand the implementation of Children’s Medical Center’s (CMC’s) disease management programs into CMC’s primary care setting in Tarrant County and in other selected primary care settings such as school-based settings.

**Goals and Relationship to Regional Goals:**
Children’s Medical Center (CMC) has seven Joint Commission Disease-Specific Certified disease management programs; however, resources, infrastructure and technology have been severely limited, and therefore, CMC is able to care for only a very small percentage (<1%) of chronic disease management patients in Tarrant County. The goal of this project is to expand the CMC-certified disease management programs capacity to treat more patients, to provide the infrastructure and support needed to accomplish standardized, evidence-based chronic illness management in the primary care setting including school-based health clinics, and implement the infrastructure that supports the Regional goals of patient population health, panel management and coordination of care.

**Project Goals:**
- Expand the CMC-certified disease management programs in the community ambulatory settings
- Design care coordination strategies that are designed to optimize care across a continuum, including home, school and community settings
- Design culturally appropriate patient/family self-management programs for chronic illness management
- Incorporate electronic registries, predictive modeling, decision support and social awareness systems that are pediatric-specific and family-focused into team-based practice settings
- Incorporate and maintain evidence-based standards in the pediatric disease management programs

This project meets the following Regional goals:
This project is related to the Regional goals of improving access to primary and preventive care, decreasing potentially avoidable admissions, decreasing potentially avoidable readmissions,
decreasing potentially avoidable complication, increasing self-management skills, increasing adherence to self-care plans and increasing the availability of primary and preventive services.

**Challenges:**
A major challenge will be changing patient/family behaviors to improve and maintain the health of children with chronic illnesses. Training patients/families in self-management of their own health is a challenge for any population of chronically ill patients. Another challenge will be the ability to risk-adjust the population and tailor the interventions to achieve the best outcomes with limited resources. These challenges will be addressed by using behavior change science, health literacy principles, language and culturally appropriate approaches and the use of community health workers who reside in the community, understand the customs and speak the language. State-of-the-art, evidence-based software will be used for risk-adjusting the population and identifying the children who are appropriate for enrollment in disease management programs and identifying the children who are at highest risk.

**5-Year Expected Outcome for Provider and Patients:**
Implementing and utilizing pediatric-specific disease management system functionality is a prerequisite for many of the improvements targeted by pediatric medical home initiatives to prevent disease, minimize unnecessary exacerbation of chronic illness, train patients/families in effective behavior change and self-management techniques and maintain a higher state of well-being across the family. Additionally, pediatric-specific disease management programs that are electronically supported and integrated consistently across the continuum of care can keep children out of the emergency department, specialist clinics and inpatient beds. The expected result will be decreased ED visits, decreased specialty clinic visits and decreased preventable admissions/readmissions/complications (PPAs, PPRs and PPCs).

**Starting Point/Baseline:**
Baseline will be number of patients from Tarrant County enrolled in program during DY1.

**Rationale:**
The project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (lack of coordination of care for chronic disease management).

Effective and accessible pediatric-specific chronic disease management programs have been shown to have a measurable impact on quality of life, reducing the risk and consequences of worsening health conditions and reducing the need for unnecessary ED visits, specialist visits and inpatient admissions/length of stay (LOS).
In 2006, at the Public Health Forum, held in Austin, it was reported that one in three children in Texas can be considered overweight or obese. Additionally, the racial disparity of higher diabetic-related deaths in African-Americans demonstrated in the adult population is also present among children. According to the Dallas Morning News, “those of Mexican ancestry, for example, are nearly twice as likely to have diabetes as non-Hispanic whites.” With the association of diabetes and obesity there is also concern of the future trajectory as low-income preschool obesity within the Dallas/Fort Worth Metropolitan Statistical Area was 17.2% in 2009, placing many young children at higher risk of developing diabetes in later years. Finally, the Community Needs Assessment Report documented increasing rates of many chronic diseases, including but not limited to asthma and diabetes.

According to Children’s Medical Center data, between 2000 and 2010, the number of Children’s Medical Center admissions of youth with a primary or secondary diagnosis of asthma increased by 15%.

**Project Components:**
The project components will include:

a. Enter patient data into unique chronic disease registry
b. Use registry data to proactively identify, contact, educate and track patients by disease status, risk status, self-management status, self-management status, community and family need
c. Use registry to develop and implement targeted QI plan
d. Conduct quality improvement or project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population and identifying key challenges associated with the expansion of the project, including special considerations for safety net populations.

These components were selected because they provide a logical framework for successful completion of the project.

Milestones and metrics are based on relevancy to the RHP 10’s pediatric population, the community needs for disease management and the capabilities to develop a community-based disease management program.

**Unique community need identification numbers the project addresses:**
- CN. 1 Lack of provider capacity
- CN. 2 Shortage of primary care services
- CN. 3 Shortage of specialty care
- CN. 8 Lack of access to health care due to financial barriers
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project will significantly increase the number of pediatric patients enrolled in disease management programs in RHP 10.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
OD-9 Preventive and Primary Care. IT-9.3 Pediatric and Young Adult Asthma Emergency Department Visits. (Stand-alone measure)

This measure was selected because the project is designed to enable effective management of pediatric asthma, which will support appropriate utilization of ED services for pediatric and young adult asthma. Studies have shown a more than 50% reduction in future ED use for asthma management by patients enrolled in an asthma management program. While other chronic diseases such as obesity and diabetes will also be targeted by this project, asthma accounts for the highest volume and greatest percentage of ED visits at Children’s emergency rooms for any chronic illness.

Relationship to Other Projects:
1.1 Expand Access to Pediatric Care
1.3 Expand Pediatric Behavioral Health
2.1 Expand/Enhance Medical Homes

This project supports and reinforces the other projects that Children’s is proposing in RHP 10 by providing the infrastructure to manage the difficult and challenging patients with chronic diseases.

Related Category 4 population-focused improvements
RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-4 Patient-centered Health care
-RD-6 Initial Core Set of Health Care Quality Measures

By providing increased disease management services to children in Tarrant County, potentially preventable admissions, 30-day readmissions and potentially preventable complications can all be reduced. Patient-centered health care measures should improve by increasing customer satisfaction. Emergency department efficiency should improve with fewer poorly managed pediatric patients with chronic disease. The core set of health care measures should improve for the children covered by Medicaid and CHIP whose chronic diseases are better managed through improvements made with this project.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

This project was valued using a Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals 5
- Addresses Community Needs 5
- Project Scope 4
- Project Investment 2
- Value Weight of the Project 16

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

**Year 2 (10/1/2012 – 9/30/2013)**

**Milestone 1** [P-2]: Review current registry capability and assess future needs.

**Metric 1** [P-2.1]: Documentation of review of current registry capability and assessment of future registry needs.

- **Numerator**: Number entered into the registry: 0 if documentation is not provided, 1 if it is provided.
- **Denominator**: Total patients with the target condition.

**Rationale/Evidence**: Used to determine if the necessary elements for a chronic disease registry are in place for optimal care management.

**Necessary elements may include** inpatient admissions, emergency department visits, test results, medications, weight, activity level changes, and/or diet changes.

**Goal**: Review complete by 9/30/13.

**Data source**: EHR systems and/or other performing provider documentation.

**Year 3 (10/1/2013 – 9/30/2014)**

**Milestone 2** [P-4]: Implement/expand a functional disease management registry.

**Metric 1** [P-4.1]: Registry functionality is available in X% of the Performing Provider’s sites and includes an expanded number of targeted diseases or clinical conditions.

- **Numerator**: Number of sites with registry functionality.
- **Denominator**: Total number of sites.

**Rationale/Evidence**: Utilization of registry functionalities helps care teams to actively manage patients with targeted chronic conditions because the disease management registry will include clinician prompts and reminders, which should improve rates of preventive care. Having the functionality in as many sites as possible will enable care coordination for patients as they access various services throughout a Performing Provider’s facilities. Registry use can be targeted to clinical conditions/diseases most pertinent to

**Year 4 (10/1/2014 – 9/30/2015)**

**Milestone 3** [I-16]: Increase the number of patient contacts recorded in the registry relative to baseline rate.

**Metric 1** [I-16.1]: Total number of in-person and virtual (including email, phone and web based) visits, either absolute or divided by denominator.

- **Numerator**: Number of patient contacts recorded in the registry.
- **Denominator**: Number of targeted patients in the registry (“targeted” as defined by Performing Provider).

**Rationale/evidence**: Help physicians and other members of a patient’s care team identify and reach out to patients who may have gaps in their care.

**Goal**: 4 patient contacts per year by 9/30/15.

**Data source**: Internal clinic or hospital records/documentation.

**Milestone 5 Estimated Incentive Payment (maximum amount)**: $262,500

**Year 5 (10/1/2015 – 9/30/2016)**

**Milestone 4** [I-17]: Use the registry to perform routine follow-up monitoring to ensure adherence to the disease management program.

**Metric 1** [I-18.1]: As measured by the number of patients adhering to the recommended program regimen compared to the total number of patients following a program regimen – using the patient registry.

- **Numerator**: Number of patients of a certain target group involved in disease management programs.
- **Denominator**: Total number of patients in the target group or the clinic.

**Rationale/Evidence**: Improve effective management of chronic conditions and ultimately improve patient clinical indicators, health outcomes and quality, and reduce unnecessary acute and emergency care utilization.

**Goal**: 25% of eligible patients participating in program by 9/30/16.

**Data Source**: Internal clinic or hospital records/documentation, 330 patients.

**Milestone 7** [I-18]: Perform routine follow-up monitoring to ensure adherence to the disease management program.

**Metric 1** [I-18.1]: As measured by the number of patients adhering to the recommended program regimen compared to the total number of patients following a program regimen – using the patient registry.

- **Numerator**: Number of patients of a certain target group involved in disease management programs.
- **Denominator**: Total number of patients in the target group or the clinic.

**Rationale/Evidence**: Improve effective management of chronic conditions and ultimately improve patient clinical indicators, health outcomes and quality, and reduce unnecessary acute and emergency care utilization.

**Goal**: 25% of eligible patients participating in program by 9/30/16.

**Data Source**: Internal clinic or hospital records/documentation, 330 patients.

Children’s Medical Center

138910807
Project Option 1.12.2 – Enhance Community-Based Settings Where Behavioral Health Services May Be Delivered in Underserved Areas

Unique Project ID: 138910807.1.3 (Pass 2)
Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807

Provider: Children’s has two hospitals, one in Dallas with 487 licensed beds and one in Plano with 72 licensed beds. Children’s has pediatric specialty outpatient services in Dallas, Plano and Grapevine (Region 10). Children’s also has a system of primary care centers, MyChildren’s, which focuses on providing primary care to children covered by Medicaid and CHIP. There is one MyChildren’s office in Grapevine (Region 10). Annually, Children’s has approximately 600,000 patient contacts. Children’s has the largest market share for pediatrics in the DFW region with 51% of the market for inpatient discharges. Of that volume, 67% of the cases were either covered by a government payor (Medicaid and CHIP) or had no insurance (indigent/uninsured). The payor mix for MyChildren’s is 75% Medicaid, 15% CHIP, 5% self-pay (uninsured) and 5% Commercially insured.

Intervention: The purpose of this project is to bring behavioral health services into the primary care setting through the MyChildren’s office in Region 10. It is a new initiative.

Need for the project: The need for this project is documented in the community needs assessment, specifically: CN. 1 Lack of provider capacity, CN. 3 Shortage of specialty care, CN. 4 Lack of access to mental health services, CN. 5 Insufficient integration of mental health care in the primary care medical system, CN. 10 Overuse of emergency department (ED) services, CN. 11 Need for more care coordination and CN. 12 Need for more culturally competent care to address unmet needs.

Target population: Children in RHP 10 covered by Medicaid and CHIP who have behavioral health needs. Estimated number of patients to be served over course of waiver period: ~1700 patient contacts and 330 patients. (3% of patient panel. Studies suggest a higher incidence, however that is for older pediatric patient populations Since MyChildren’s tends to see younger patients, a lower percentage was used.) Provide behavioral health services to children in the medical home setting to allow for more rapid access to behavioral health services and better coordination of behavioral and medical services for children and their families.

Category 1 or 2: Process and improvement milestones were selected to support the successful implementation of the project.

Category 3 outcomes: OD-1 Primary Care and Chronic Disease Management IT-1.18 Follow-up after Hospitalization for Mental Illness. (Stand alone measure) This measure was selected based on its relevance to the project and its goals. Providing outpatient follow-up after an inpatient hospitalization for mental illness will be a vital step in the developing and maintaining the continuum of care for behavioral health and avoiding additional high-cost inpatient stays.
**Project Option 1.12.2** – Enhance Community-Based Settings Where Behavioral Health Services May Be Delivered in Underserved Areas

**Unique Project ID:** 138910807.1.3 (Pass 2)
**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807

**Project Description:**
Expand pediatric behavioral health capacity in the Children’s primary care setting, MyChildren’s, in Tarrant County to align and coordinate care for behavioral and medical illnesses to improve patient/family self-management and reduce unnecessary exacerbation of chronic illnesses. Collaborate with Timberlawn Services and other behavioral health care providers for coordination of care between medical services and behavioral health services.

**Goals and Relationship to Regional Goals:**
**Project Goals:**
The following goals address Regional needs of better coordination of care between behavioral health and medical providers and increasing access to behavioral health services.

1. Build clinical protocols with primary care physicians and psychiatrists
2. Place pediatric behavioral health capacity (social workers and psychologists) in primary care settings
3. Integrate behavioral health and medical health treatment plans into a family-focused, comprehensive and culturally appropriate approach, using a care team approach
4. Improve coordination of care between behavioral health and medical providers

1700 patient contacts and 330 patients are estimated.

This project meets the following Regional goals:
This project is related to the Regional goal of increasing access to behavioral health services and integrating mental health care into the primary care system.

**Challenges:**
A major challenge will be to identify, recruit and retain pediatric behavior health staff. Children’s and its academic partner, UT Southwestern, have one of the country’s largest pediatric psychiatry and psychology training programs in the country. Staff will be recruited from the training program. Another challenge will be the development of processes and protocols to integrate behavioral health services into the primary care setting and align/integrate behavioral health and medical services. We will work with Timberlawn Psychiatric Services, which currently provides inpatient and outpatient behavioral health services to children and adolescents in RHP 10, to assist us in overcoming the challenges noted. We will also collaborate with other behavioral health care providers in RHP 10.

5-Year Expected Outcome for Provider and Patients:
- Increase behavioral health visits in primary care center
- Transition appropriate patients from specialty mental health care to primary care
- Implement primary care-initiated behavioral health visits in primary care clinic

Starting Point/Baseline:
In 2011, there were no behavioral health services available in the MyChildren’s locations. As a result, medical professionals and behavioral health professionals were treating the same children without common evidence-based protocols and without an integrated family-focused, comprehensive and culturally appropriate care team approach.

Rationale:
The project is data-driven and based on community needs and local data that demonstrate the project is addressing an area of poor performance (lack of coordination of care for behavioral and medical care).

Texas ranks 50th nationally in mental health funding. Despite the strong relationship between behavioral health and medical illness related outcomes and costs, the percentage of the 200% FPL population receiving behavioral health care to primary care settings is below the national average in Texas. Children’s Medical Center is not a NorthSTAR provider, and consequently, children who may be successfully served in primary care settings are referred to NorthSTAR. This results in dilution of limited NorthSTAR funds, inadequate services available to children, and coordination of care issues.

According to Beyond ABC, Growing Up in the North Texas Corridor, the number of children in the North Texas Corridor identified with a diagnosable emotional disturbance or addictive disorder has increased to approximately 9,304 in 2010. According to 2005 research conducted by the National Institute of Mental Health, half of all lifetime cases of mental illness begin by age 14. Services in the health care community frequently do not include the family-focused and comprehensive approach needed to adequately address these mental health issues. Rather, nearly
all the intensive service availability, including evidence-based programs such as multisystemic therapy, is provided through the juvenile justice system. Furthermore, the number of youth served in the juvenile justice system is increasing, as evidenced by a 17% increase in the number of children receiving psychotropic medications in juvenile detention from 2010 to 2011.

Expanded pediatric behavioral health capacity and integration with medical care in the primary care setting in a family-focused, comprehensive and culturally appropriate manner will improve access for children to behavioral health services, prevent unnecessary exacerbation of chronic illnesses, improve patient/family self-management and improve cost and quality outcomes. The result will be reduced ED visits, specialty care visits and preventable admissions/readmissions for the identified population.

Project Components:
There are no project components for this project.

The milestones and metrics for this project are based on the relevancy to RHP 10 population, the community need, RHP priority and the starting point.

Unique community need identification numbers the project addresses:
- CN. 1 Lack of provider capacity
- CN. 3 Shortage of specialty care
- CN. 4 Lack of access to mental health services
- CN. 5 Insufficient integration of mental health care in the primary care medical system
- CN. 10 Overuse of emergency department (ED) services
- CN. 11 Need for more care coordination
- CN. 12 Need for more culturally competent care to address unmet needs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project represents a new initiative to bring behavioral health services into MyChildren’s Medical Home Practice.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
OD-1 Primary Care and Chronic Disease Management
IT-1.18 Follow-up after Hospitalization for Mental Illness. (Stand-alone measure)

This measure was selected based on its relevance to the project and its goals. Providing outpatient follow-up after an inpatient hospitalization for mental illness will be a vital step in developing and maintaining the continuum of care for behavioral health and avoiding additional
high-cost inpatient stays. By specifically targeting timely outpatient follow-up after an inpatient stay for mental illness, additional processes and resources will be dedicated to provide timely outpatient follow-up.

**Relationship to Other Projects:**
1.1 Expand Access to Pediatric Care
1.2 Expand Disease Management Services
2.1 Expand/Enhance Medical Homes

**Related Category 4 population-focused improvements:**
RD-1 Potentially Preventable Admissions
RD-2 30-day readmissions
RD-3 Potentially Preventable Complications
RD-4 Patient-centered Health care
RD-5 Emergency Department
RD-6 Initial Core Set of Health Care Quality Measures

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s Learning Collaborative activities. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative.

**Project Valuation:**
This project was valued using a Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals 2
- Addresses Community Needs 4
- Project Scope 1
- Project Investment 1
- Value Weight of the Project 8

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into
adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

#### Milestone 1 [P-2]: Identify licenses, equipment requirements and other components needed to implement and operate options selected.

- **Metric 1 [P-2.1]** Develop a project plan and timeline detailing the operational needs, training materials, equipment and components.
- Research existing regulations pertaining to the licensure requirements of psychiatric clinics in general to determine what requirements must be met.
- When required, obtain licenses and operational permits as required by the state, county or city in which the clinic will operate.
  - Goal: Project plan completed by 9/30/13
  - Data Source: Project Plan

**Milestone 1 Estimated Incentive Payment (maximum amount):**

138910807.1.3 | 1.12.2 | NO COMPONENTS | Expand Behavioral Health care Capacity | 138910807 |

#### Milestone 2 [P-4]: Hire and train staff to operate and manage projects selected.

- **Metric 1 [P-4.1]** Establish behavioral health services in new community-based settings in underserved (targeted) areas.
- **Metric 1 [P-4.1]** Number of new community-based settings where behavioral health services are delivered:
  - Goal: 1 new setting
  - Data Source: Number of patients served at these new community-based sites

**Milestone 2 Estimated Incentive Payment (maximum amount):**

- $159,375

#### Milestone 3 [P-3]: Develop administrative protocols and clinical guidelines for projects selected.

- **Metric 1 [P-3.1]** Manual of operations for the project detailing administrative protocols and clinical guidelines:
  - Goal: Protocols and Guidelines developed by 9/30/13
  - Data Source: Administrative protocols; Clinical guidelines

**Milestone 3 Estimated Incentive Payment (maximum amount):**

- $140,625

#### Milestone 4 [P-6]: Establish behavioral health services in new community-based settings in underserved (targeted) areas.

- **Metric 1 [P-6.1]** Number of new community-based settings where behavioral health services are delivered:
  - Goal: 1 new setting
  - Data Source: Number of patients served at these new community-based sites

**Milestone 4 Estimated Incentive Payment (maximum amount):**

- $262,500

#### Milestone 5 [I-11]: Increase utilization of community behavioral health care.

- **Metric 1 [I-11.1]** Percent utilization of community behavioral health care services:
  - Numerator: Number receiving community behavioral health care after access expansion
  - Denominator: Number of people eligible for receiving community behavioral health services after access expansion
  - Goal: 25% patients referred receive the service., 75 patients
  - Data source: Claims data and encounter data

**Milestone 5 Estimated Incentive Payment (maximum amount):**

- $262,500

#### Milestone 6 [I-12]: Use of Emergency Department Care by individuals with mental illness or substance use disorders.

- **Metric 1 [I-12.1]** X% decrease in inappropriate utilization of Emergency Department.
  - Numerator: total number of individuals receiving services through expanded access sites who inappropriately use emergency department.
  - Denominator: total number of individuals receiving services through expanded access sites
  - Rationale: see project description.
  - Goal: Percentage decrease to be determined in DY2
  - Data Source; Claims data and encounter data from ED and expanded access sites

**Milestone 6: I.12. Estimated Incentive Payment (maximum amount):**

- $195,000

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project
Project Option 1.7.1 – Telemedicine for Children Recovering From Severe Burns

Unique Project ID: 138980111.1.1
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: The project establishes a Telemedicine (Telehealth) Clinic based at the UNTHSC Department of Pediatrics to provide follow-up services to children from North and West Texas who are recovering from burns and who require the expertise available at the Shriners Burn Hospital in Galveston. This project is a new initiative for UNTHSC.

Need for the project: The project goals include: improving the overall health of the population being served, improving the health care experience (quality of care), and providing the best care possible while reducing health care costs over time. The UNTHSC campus with consultation and care directed by the Shriners Burn Team in Galveston, offers a unique opportunity for patients to receive their care much closer to home, will reduce transportation and care costs, emergency room utilization and re-hospitalizations.

Target population: Children from North and West Texas who are recovering from burns and who require the expertise available at the Shriners Burn Hospital in Galveston. It is estimated that more than 100 patients will be served over the course of the waiver period. Eighty-four percent of the target population receives Medicaid or lacks health insurance coverage.

Expected patient benefits: The project will provide a unique children’s patient population with a greater opportunity at health, student, and family success. It will ensure the availability of treatment before illnesses become more expensive to treat for both Medicaid and those needing health care services without insurance.

Category 1 or 2 expected patient benefits: Category 1 or 2 milestones selected for project? How do they tie into project’s purpose? This project will implement a telemedicine program, increase number of telemedicine visits by 25 by DY4 and 100 by DY5 over baseline and achieve improvements in access to care of patients receiving telemedicine/telehealth services by reducing wait times to 12 days by DY4 and 10 days by DY5.

Category 3 outcomes:

i. IT 6.1 Our goal is to improve patient satisfaction with getting timely care, appointments and information by 10% by -5% over the baseline in DY 4 and 10% by DY 5.

ii. IT 9.2 Our goal is to decrease inappropriate ED utilization for target population by ~5% over the baseline in DY4 and 10% by DY 5.

iii. IT 1.1 Our goal is to improve time to third next available appointment by ~5% over the baseline in DY4 and 10% by DY 5.
iv. IT 10.1 Our goal is to improve Quality of Life scores by - 2.5% over the baseline by DY4 and 5% by DY5.

**Project Option 1.7.1 – Telemedicine for Children Recovering From Severe Burns**

**Unique Project ID:** 138980111.1.1

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Project Description:**

The intent of this project is to establish a Telemedicine (Telehealth) Clinic based at the UNTHSC Department of Pediatrics in order to provide follow-up services to children from North and West Texas who are recovering from burns and who require the expertise available at the Shriners Burn Hospital in Galveston. The patients will have been cared for initially in Galveston and then released home, anticipating frequent follow-up visits at Galveston.

**Goals and Relationship to Regional Goals:**

**Project Goals:**

The immediate purpose is to provide follow-up burn care, facilitated by Telemedicine services, so that these children may remain closer to home, have fewer absences from school and their parents from work, and to be able to utilize resources at UNTHSC to enhance opportunities for recovery and rehabilitation from disabilities induced by severe burns. The patient visits will occur in UNTHSC clinic(s) equipped to interact with the Burn Team at Shriners Children’s Hospital, Galveston.

Many of these children and families may also lack a primary care medical home for delivery of other preventive health care services. The program will reduce avoidable emergency department visits. A medical home for the patient and the entire family can assist with recovery and provide the necessary coping skills.

**This project meets the following Regional goals:**

The UNTHSC campus, with consultation and care directed by the Shriners Burn Team in Galveston, offers a unique opportunity for patients to receive their care much closer to home. The development of such a capability will fulfill an unmet community need in the care of patients surviving severe burns. Transportation and care, emergency department utilization, and rehospitalization may all be reduced by this proposed partnership between UNTHSC and the Shriners Burn Hospital. The project will accomplish assessment of identified needs, including outpatient follow-on care needs of severely burned children, other pediatric children specialty care needs currently unmet in the Region, provision of care coordination and transition, and emergency department care reduction.
Challenges:
Providing specialty and follow-up medical care to severely burned children, improving the lives of the children as they recover, assisting the family with care coordination, and at the same time reducing costs associated with their care are critical to the success of this project. Currently the North Texas area does not offer children who suffer severe burns follow-up care.

According to Marcin et al., a pre-telemedicine medical needs survey demonstrated several barriers in access to subspecialty care (traveling, missing work, relying on the ED and medication regulation).\textsuperscript{106} Overall satisfaction with the telemedicine program was very high in the study.\textsuperscript{107} Other studies demonstrate that care is easier to obtain, there was a lower incidence of missed appointments, and satisfaction with reduced travel time. As a result, patients were willing to return to future telemedicine clinic sessions.\textsuperscript{108, 109, 110}

According to Nguyen et al., total cost for 1,000 telemedicine follow-up visits for burn care were $145,522, averaging $146 per visit.\textsuperscript{111} In 2002, Redlick et al. reported patients’ telemedicine consultations were completed in only 2.7 hours (including travel time to site, waiting in the clinic, seeing the specialist, and returning home). The average expense per patient including meals, transportation, parking, hotel and child care was $16.66 for a telemedicine consult, which was considerably less than patient’s estimated average cost of $615.74 for an out-of-town consultation.\textsuperscript{112} Additionally, Mertens et al. reported in a study of patient satisfaction and cost effectiveness that families of burned children reported an average savings of $16. per visit in child care and transportation savings of $145. Furthermore, in a series of burned children, Resendez et al. reported the average travel time for a hospital visit was 9.75 hours versus 1.64 hours for the telemedicine clinic, which resulted in a decrease in cost to the caregiver.\textsuperscript{113}

\textsuperscript{107} Ibid.
5-Year Expected Outcome for Provider and Patients:

- Provide telemedicine services for children recovering from severe burns, to allow them to be evaluated long distance by the Burn Team at Shriners Children’s Hospital, Galveston by increasing visits 10% each year.
- Reduce travel costs and inconvenience of frequent follow-up trips from North Texas to Shriners Burn Hospital by attaining a 10% or higher increase in patient satisfaction scores over baseline.
- Reduce unnecessary emergency department and hospital visits for burn patients by at least 10% from DY3 levels.
- Determine other possible pediatric telemedicine needs for North Texas with an additional specialty service for children established in addition to outpatient telemedicine burn care.
- Provide pediatric telemedicine specialty care to children in the Region by linking with an additional clinic location.
- Provide third next available appointment within 10 days of request.
- Improve patient satisfaction scores in getting timely care, appointment and information by 10% over baseline.

Starting Point/Baseline:

Based upon information provided by the Shriners Burn Hospital, we anticipate that the majority of these patients will be eligible for Medicaid. There are over 100 patients currently active who have been treated recently in Galveston, but reside in the North Texas area. Currently patients are followed up for care at quarterly visits for one year after discharge. This would equate to approximately 300 to 400 encounters for this initial active patient population based upon their time after discharge. We anticipate that the success of this initiative could lead to expansion of telemedicine services to involve other children with special needs as well as the establishment of a network involving smaller communities in rural Texas with limited resources. Baseline data will be collected in DY3.

The project will also increase the number of telemedicine and telehealth clinics in North Texas by at least one site. This will require identification of children’s specialty medical needs in the urban and rural areas of North Texas, identifying physician and staff, and linking of additional locations. Patient and Parent satisfaction improvements can be based on CGCAHPS pre-and post-survey results. Other value based cost savings will also be determined using pre- and-post baseline data.
Rationale:
This project was selected based on the evidence base described in 3.c above as well as the following factors:

- National Institutes of Health supports research in burn care follow-up that prevents complications and improves the recovery process.
- Trends in medical home show that centered and coordinated care may improve health outcomes once patients select a single source of management for their health care and rehabilitation needs. UNTHSC Department of Pediatrics can provide these services for our North Texas pediatric burn patients.

Project Components:
The core project components include:

a) provide patient consultations by medical and surgical specialists as well as other types of health professional using telecommunications; and
b) conduct quality improvement using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety net populations.

The milestones and metrics contained in the plan allow us to meet the goal of providing these services within RHP 10 while ensuring access to the highest level of specialty care. Quality Milestone P-3 was selected to promote collaborative learning around shared or similar projects.

Unique community need identification numbers the project addresses:

- CN.1 – Lack of provider capacity
- CN.2 – Shortage of primary care services
- CN.3 – Shortage of specialty care
- CN.7 – Need to address geographic barriers that impede access to care

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and has not been funded by any other federal funds.
Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

Outcome Measure 1: IT-6.1 (1) Patient Satisfaction percent improvement over baseline of patient satisfaction scores for getting timely care, appointments, and information
Improvement Target: 10% increase over baseline in patient satisfaction as measured by CGCAHPS survey on patient’s overall health status/functional status.
Rationale: Children’s burns account for many hours of care and follow-up visits lasting months to years (children under 5 account for almost 20% of all burn cases in the U.S.). Successful treatment outcomes and patient satisfaction are correlated. When the patient and parents are satisfied with the medical care and service they receive, they are more likely to follow treatment plans, complete treatments and not drop out of care.

Outcome Measure 2: IT-9.2 ED Appropriate Utilization
Decrease inappropriate use of emergency departments by target population.
Improvement Target: 10% decrease in inappropriate emergency department visits over baseline.
Rationale: This measure was selected because partnerships; a regular source of care; assistance in navigating the health care system; education on illnesses; and continuity of care offer the potential to encourage appropriate use of care and improve the health of project patients while lowering costs.

Outcome Measure 3: IT-1.1 Third next available appointment
Improvement target is to decrease time to third next available appointment by 10% over baseline
Rationale: Improvement efforts are focused on developing the most efficient scheduling systems that can meet the needs of children with severe burns and their families. The third next available appointment is the industry standard for measuring appointment access. Reducing how long a patient waits to be seen is a key to improved health care.

Outcome Measure 4: IT-10.1 Quality of Life
Demonstrate improvement in quality of life (QOL) scores.
Improvement Target: 5% improvement over baseline for patients receiving intervention.
Rationale: If patients and parents participate in a coordinated multidisciplinary burn care program, the patient has the greatest chance of a satisfying long-term outcome. Improved quality of life improves the patients’ ability to integrate back into a social and school environment, which is very difficult after a severe burn. Improving quality of life scores allow burn survivors and their caregivers to become integrated back into their community and assures a high quality of life and life success.
Relationship to Other Projects:

N/A

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Specifically, this project’s value was calculated on four outcomes, which included (1) Third next available appointment, (2) Patient satisfaction percent improvement over baseline of patient satisfaction scores, (3) ED appropriate utilization, and (4) quality of life.

a. For third next available appointment, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. We anticipate that all of the population will be positively impacted by a 10% decrease in time to third next available appointment, -.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,183 (Baylor Health Care System data).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which was valued at $237 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”,
due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For patient satisfaction percent improvement over baseline of patient satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. We anticipate that we will test the entire population, and expect to increase the patient satisfaction scores for the project by 10%.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $13 (per General Services Administration’s federal per diem rates, as well as information provided by UNT Health Science Center’s Department of Pediatrics), which was based on two percent of the expected reduced cost of each estimated travel occurrence, in addition to the reduced cost of lost productivity for both school and work.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which was valued at $11 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For ED appropriate utilization, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. The percentage of improvement expected by the project is 10%, equating to 10 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,500 due to the patient population mix.
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $1,200 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved with the project.

d. For quality of life, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. We anticipate testing the entire population and expect to increase the quality of life scores by 5%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,510 (as cited in the articles, "Relationships between Quality of Life Questionnaire (QLQ) and the SF-36 among young adults burned as children" in the journal, ScienceDirect and “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all
projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
## Introduce, Expand, or Enhance Telemedicine/Telehealth — Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the Region - Telemedicine for Children Recovering From Severe Burns

Region 10 RHP Plan

Page 347
Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project
Project Option 1.1.3 – Community-Based Primary Care for the Elderly

Unique Project ID: 138980111.1.2
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: This project is a community-based geriatric primary care model to reach Medicaid eligible elders as well as childless adult “near elders” (ages 50-64), who are not receiving medical care through project 138980111.1.3 by development and implementation of mobile teams and clinics in order to reduce hospitalizations, increase access to care and improve patient quality of life. This is a new initiative for UNTHSC that utilizes mobile teams and clinics to increase access to care. Patients requiring intensive geriatrician management will be referred to project 138980111.13 and those suffering from depression will be referred to project 138980111.1.6 for treatment. The outcomes of this project will be measured independently of other geriatric-related projects.

Need of the project: This project will improve access to ongoing preventive, primary and chronic care which is a major Region 10 goal by focusing on a key population, low-income seniors, which the community health needs assessment has found to be the population experiencing the highest growth rate, as well as the costliest.

Target population: Medicaid eligible elders and near elders residing in RHP 10. Estimated 20,476 - Medicaid eligible elders and near elders who are residing in RHP 10.

Expected patient benefits: This project will have tremendous benefit to the Medicaid and Uninsured of RHP 10 by providing appropriate levels of care within the community where the patients live. By providing regular medical contact to older adults with multiple chronic conditions, we will increase access to care, improved health, and reduce cost burden to CMS.

Category 1 or 2 expected patient benefits:
This project will increase access to care by generating four mobile teams and opening two community-based clinics.

Category 3 outcomes:

v. IT 2.12- Our goal is to reduce all cause admission rates for target population by 3% in DY4 (15 admission prevented) and 5% by DY5 (25 admissions prevented) as measured by Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions.

vi. IT 3.1 Our goal is to reduce all cause 30 day readmission rates by 5% (5 re-admissions prevented) in DY4 and 10% (10 re-admissions prevented) in DY5 for target population -.

vii. IT 6.1 Our goal is to improve patient satisfaction scores for patient’s involvement with shared decision making by 10% by DY4 and 15% by DY5 among all 3,071 patients.
viii. IT 10.1 Our goal is to improve Quality of Life scores for target population by 5% over baseline by DY4 and 10% over baseline by DY5 among all 3,071 patients.

**Project Option 1.1.3 – Community-Based Primary Care for the Elderly**

**Unique Project ID:** 138980111.1.2

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Project Description:**
Project Area: Expand Primary Care Capacity  
Project Intervention: Expand Mobile Clinics

We propose a community-based geriatric primary care model to reach Medicaid-eligible elders as well as childless adult near elders (ages 50-64) through development and implementation of mobile clinics. Medical teams, led by physician assistants (PAs) or nurse practitioners (NPs) that incorporate community health workers (CHWs) and others (pharmacy, physical therapy, social work), will provide appropriate levels of care to patients within community settings and clinics who are not currently receiving services based on their individual needs. Appropriate referrals to the UNTHSC Division of Geriatrics will be provided (project 138980111.1.3). This enhancement of geriatric primary care services will expand encounters to a significant portion of Medicaid-eligible elders within Tarrant County and RHP 10.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The project goal is to implement community-based medical models for Medicaid-eligible elders in RHP 10 using mobile clinics, community-based clinics, nurse advice line, and urgent-based primary care appointments to (1) increase access to care, (2) increase access to urgent care, (3) reduce all-cause hospital admissions, (4) reduce 30-day hospital readmissions, (4) improve overall patient satisfaction, (5) improve patient satisfaction with involvement in medical decision making, and (6) improve patient quality of life.

This project meets the following Regional goals:
A major goal of the Region is to improve access to ongoing preventive, primary and chronic care. This project will contribute to achieving that goal by focusing on a key population, low-income seniors, which the Community Health Needs Assessment has found to be the population experiencing the highest growth rate, as well as the costliest.

**Challenges:**
A 2009 report titled “Addressing the Needs of Older Adults in Tarrant County” identified access to providers as a key barrier for elders in the community, which is consistent with many other areas of Texas and the U.S. Low-income and underserved adults and elders rarely have access to geriatric primary care services, and suffer from higher rates of chronic medical conditions (e.g., diabetes, hypertension) that, without regular care, can escalate to acute episodes, poorer health status and lower quality of life. Additionally, Medicaid-eligible elders suffer from increased health burden, are less educated, and have lower access to care. As of June 2012, there were
20,476 Medicaid-eligible patients in RHP 10. The goal of this project is to establish mobile clinics consisting of NPs and CHWs along with PT, social work and pharmacy, to provide appropriate levels of care for a minimum of 15% (3,071 patients) of all Medicaid-eligible elders in Tarrant County and RHP 10. By overcoming the access to care barrier, we expected to significantly impact the health of Medicaid elders and near elders of RHP 10.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes are to (1) provide geriatric primary care services to 15% (3,071) of Medicaid-eligible elders in RHP 10, (2) reduce all-cause hospital admissions by 5% (25 admissions), (3) reduce all-cause 30-day readmission rates by 10% over baseline (10 readmission), (4) increase patient satisfaction with involvement in medical decision making 15% and (5) increase quality of life (QOL) by 10%.

Starting Point/Baseline:
As of June 2012, there were 20,476 senior and near senior patients in RHP 10, which is a sizable number of elders, with the aging segment of the community continuing to grow. This project will target a minimum of 15%, or 3,071 patients, of the Region’s senior and near senior population by DY5. The Division of Geriatrics currently serves approximately 2.5% of this population, and these patients are not necessarily receiving ongoing care. We currently have some providers trained in the team-based, chronic care and medical home models, but we will also hire over 20 FTEs as part of this project’s goal to greatly enhance services. The baseline time period is DY2.

Rationale: The U.S. population is aging at a rapid rate; however, the availability of geriatric primary care services is not expanding at the same rate. UNTHSC has a unique ability to meet the aging needs of Tarrant County with aging being a particular strength of UNTHSC. This project builds on existing strengths to enhance access to geriatric primary care services in order to meet the emerging medical needs of our community. Provision of such services at the community level will afford optimal management of chronic medical conditions and improve quality of life through a more cost-effective system. The milestones and metrics were specifically chosen for monitoring and ensuring program effectiveness.

Project Components:
No core project components are required for this project area. Core activities include: (1) expand primary care community-based clinic space for elders for RHP 10, (2) identify and address language access needs and/or gaps in language access, (3) increase self-management training to patients, (4) hire and train staff to use the UNTHSC registry reports to develop and implement targeted QI plan.
Our milestones were chosen to measure primary care expansion for this population. Specifically: (1) we are adding over 20 FTEs to staff and support four newly established mobile teams and (2) the two new community-based clinics. As a result of these capacity expansions, we will be able to demonstrate improved access to primary care for this population, measured by the number of unique patient encounters above baseline. Quality Milestone P--10 was selected to promote collaborative learning around shared or similar projects.

Unique community need identification numbers the project addresses:

- CN.1 Lack of provider capacity
- CN.2 Shortage of primary care services
- CN.7 Need to address geographic barriers that impede access to care
- CN.8 Lack of access to health care due to financial barriers
- CN.9 Need for increased geriatric, long-term, and home care resources
- CN.10 Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

Outcome Measure 1: IT 2.12- Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions.
Improvement goal is 10% reduction (25 admissions prevented) in hospital admissions due to PQI composite measure by the end of the Waiver period.

-Numerator: All unplanned hospital admissions from PQI composite measure among patients receiving services from the project entitled Community-Based Primary Care for the Elderly in DY4/DY5.
-Denominator: All hospitalized Medicaid eligible elders and near elders receiving services from the project entitled Community-Based Primary Care for the Elderly in DY4/DY5
-Data Source: program records/EMR/Claims records

Rationale: According to the CDC 2010 estimates, approximately 16% of those 65 and above will experience a hospital stay within a 12 month timeframe and the percentage increases to 21% for those ages 85 and over. Medicaid eligible elders are more likely to experience hospital admission owing to chronic illnesses and comorbidities. Additionally, it has been proposed that upwards of 40% of hospital admissions are avoidable. Our mobile clinics will address this need.

Outcome Measure 2: IT 3.1 All-cause 30-day readmission rate – NQF 1789: 1 All-cause 30-day readmission rate for Medicaid-eligible elders 65 and near elders receiving services from the
project titled Community-Based Primary Care for the Elderly. Improvement goal is 10% reduction (10 readmissions prevented) in all-cause 30-day readmission rate by the end of the Waiver period.

Numerator: All unplanned all-cause 30-day readmission of Medicaid eligible elders and near elders receiving services from the project entitled Community-Based Primary Care for the Elderly in DY4/DY5.

Denominator: All hospitalized Medicaid eligible elders and near elders receiving services from the project entitled Community-Based Primary Care for the Elderly in DY4/DY5

Data Source: program records/EMR/Claims records

**Rationale:** Approximately 20% of Medicaid eligible elders are readmitted to hospitals within 30-days of discharge, which is a significant financial drain that also reduces overall quality of life. By providing care to 15% of the Region’s senior and near senior population through implementation of our mobile teams and community-based clinics, we propose to reduce 30-day readmissions, thereby providing a substantial cost savings.

**Outcome Measure 3: IT 6.1 Percent improvement over baseline of patient satisfaction scores:** Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Improvement goal is 5%.

1. Are getting timely care, appointments, and information; (Stand-alone measure)
2. How well their doctors communicate; (Stand-alone measure)
3. Patient’s rating of doctor access to specialist; (Stand-alone measure)
4. Patient’s involvement in shared decision making, and (Stand-alone measure)
5. Patient’s overall health status/functional status. (Stand-alone measure)

**Rationale:** Prior work has shown that patient perception of involvement in medical decision making and medical care is directly related to outcomes (Brody et al 1989). The Consumer Assessment of Health Plans Survey (CAHPS) module on Patient/Caregiver Experience – Shared Decision Making will be administered prior to receiving a clinic visit by the community-based mobile clinics for baseline perception based on prior medical experiences. The questionnaire will be administered again after clinic visit and again at follow-up visits to determine the improvement in patient perception of involvement in shared decision making experienced from receiving care through the community-based medical model. This Category 3 improvement target complements and expands on our Category 1 milestones significantly.

**Outcome Measure 4: IT 10.1 Quality of Life** – Demonstrate improvement in quality of life (QOL) scores, as measured by evidence-based and validated assessment tool (SF-36), for the target population.

**Rationale:** Prior work shows how quality of life and health status have reciprocal relationships. In fact, the Oregon Health Insurance Experiment (Finkelstein 2011) demonstrated that enrollment in Medicaid had a significant beneficial impact on quality of life, health care utilization (including preventive care measures and hospitalizations),
and overall medical expenditures and debt when compared to the control group with no insurance. By implementing this community-based medical model, we propose to improve quality of life by 10% over baseline. We will achieve this improvement by providing medical services through mobile teams and community clinics, nurse advice lines, and acute care along with continuity of care processes utilizing community health workers. Improved QOL will translate to significant improvement in a broad range of health outcome measures as outlined above and result in a significant cost savings over the course of the project.

**Relationship to Other Projects:**
138-980111.1.3 Expand Primary Care Capacity – Expand Existing Primary Care Capacity – 1.1.2: Expanding Geriatric Primary Care and Consultative Services to Medicaid-eligible Elders. The project titled Community-Based Primary Care for the Elderly will support this effort by referring patients with complex needs requiring regular direct care from geriatricians, and will enable the Geriatric Clinic to refer less complex cases to the community-based model for maintenance and follow-up. These projects will work in tandem to provide appropriate level of care targeted to the specific patient’s needs.

138-980111.2.5 Implement/Expand Care Transitions Program – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population – 2.12.2: Discharge Planning and Care Coordination for Medicaid-eligible elders. The project titled Community-Based Primary Care for the Elderly will reinforce this project by providing a referral mechanism for patients without regular primary care providers. Upon discharge, patients who do not receive regular follow-up from a primary care provider can be referred to the community-based program for regular care and follow-up, utilizing the evidence-based care transitions implemented. 138980111.1.6 – The current project does not provide behavioral treatment for mental health disorders, therefore patients suffering from depression will be referred to project 138980111.1.6 for depression treatment and management. The goals of this project will be measured independently of all other geriatric-related projects.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at
the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Specifically, this project’s value was calculated on four outcomes, which included (1) All-Cause 30-day Readmission Rate, (2) Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions, (3) Improving Patient Satisfaction Scores and (4) Quality of Life.

a. For All Cause 30 day Readmission Rate, UNT Health Science Center defined the population that will be directly impacted as Patients receiving services from the project titled Community-Based Primary Care for the Elderly who have been admitted to a hospital. It is anticipated that approximately 500 patients will be hospitalized annually. Based on various literature, it is estimated that 20% (or 100) of the target population will be readmitted within 30 days. The percentage of improvement - expected by the project is 10%, equating to 10 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data). The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions, UNT Health Science Center defined the population that will be directly impacted as approximately 3,071 patients receiving services from the project titled “Community-Based Primary Care for the Elderly.” Based on various literature, it is anticipated that approximately 500 of those patients will be admitted to a hospital. The percentage of improvement expected by the project - is 5%, equating to 25 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,100.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an
additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For Patient Satisfaction Percent Improvement Over Baseline of Patient Satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as 3,071 individuals who will receive services through this project. We are anticipating that we will test the entire population and are expecting to increase the patient satisfaction scores of patient’s involvement in shared decision making by 15%.

Utilizing, - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16 (per article “BMC Medicine Research” in the journal BioMed Central), which is based on two percent of the expected reduced cost of mobile healthcare.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

d. For Quality of Life, UNT Health Science Center defined the population as the 3,071 individuals who will receive services through the project titled Community-Based Primary Care for the Elderly. We anticipate that we will survey the entire population and expect to increase quality of life scores by 10% for patients receiving services through this project.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755 (as cited in the article “Cost–effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial”, in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an
additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Region 10 RHP Plan
Attachment 1

Project Option 1.1.2 – Expanding Geriatric Primary Care and Consultative Services to Medicaid Eligible Elders

**Unique Project ID:** 138980111.1.3  
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Provider:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** This project will provide an enhanced medical home model and expand access to primary care and consultative services to Medicaid eligible-elders. This project is an expansion of existing services and patients served will not overlap with those from projects 138980111.1.2 and 138980111.1.6 though it will serve as a referral source for medically complex patient seen by those programs as well as a referral source to those programs for medically stable and depressed patients.

**Need of the project:** A major goal of the region is to provide improved access to ongoing preventive, primary and chronic care. This project fits this goal by focusing on a key population, low-income seniors, which the community needs assessment has found to be the population experiencing the highest growth rate, as well as the costliest.

**Target population:** Estimated 1,013 Medicaid eligible elders of Tarrant County age 65 and above who receive services from the UNTHSC Department of Internal Medicine.

**Expected patient benefits:** This project is important in that Medicaid elders suffer multiple chronic conditions that effect function and quality of life and are costly to CMS when these conditions are not managed appropriately. Enhanced access to geriatric primary care services to this population will afford optimal management of co-morbid and chronic medical conditions thereby lowering costs to CMS.

**Category 1 or 2 expected patient benefits:** The project seeks to expand access to geriatric primary care services within the UNTHSC Department of Internal Medicine by 35% through hiring new providers and staff, adding 3 half-day clinics and expanding hours by 25% and to develop automated tracking system for measuring time to next available appointment.

**Category 3 outcomes:**
- IT 2.12- Our goal is to reduce all cause hospital admission rates by 5% (estimated 8 hospitalizations prevented) over baseline by DY5 as measured by Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions for those receiving intervention
- IT 6.1 Our goal is to improve patient satisfaction with getting timely care, appointments and information by 5% over baseline by DY5
- IT 3.1 Our goal is to reduce all cause 30 day readmission rates by 10% (3 readmissions prevented) for population receiving intervention by DY5
- IT 12.4 Our goal is to improve pneumonia vaccination status for those receiving intervention by 15% (51 new vaccinations) by DY5.
Project Option 1.1.2 – Expanding Geriatric Primary Care and Consultative Services to Medicaid-Eligible Elders

**Unique Project ID:** 138980111.3
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Project Description:**
Project Area: Expand Primary Care Capacity
Project Intervention: Expand existing primary care capacity
The proposal is to provide primary care and geriatric consultative services in the Geriatrics Assessment Program developed by the University of North Texas Health Science Center’s Department of Medicine/Division of Geriatrics and that has operated for over 20 years. This model of assessment and care provides an enhanced medical home model for older adults and their caregivers. Social service coordinators provide the initial intake process for all new geriatrics patients, and an interprofessional team consisting of a geriatrician, physician assistant and/or nurse practitioner, nurses, medical assistants and social workers provide a comprehensive geriatrics assessment that consists of medical, psychosocial, functional, and cognitive evaluations. A patient and family conference occurs where a plan of care is developed and options for care and care coordination are discussed. Patients are then followed at least every three to four months for chronic disease management and continued care coordination. This approach has been shown to decrease hospitalizations, nursing facility admissions and improve the quality of life of older adults and their caregivers.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
Access to Geriatrics Assessment Programs have shown improvement in older adults’ chronic medical conditions, improved diagnosis of cognitive and functional conditions, decreased hospitalizations and improved caregiver stress and satisfaction. The five-year goals of this project are: (1) to expand access to geriatric primary care services for Medicaid-eligible elders within the UNTHSC Department of Internal Medicine by 35% through hiring new providers and staff, adding clinics and expanding hours, and (2) to facilitate access to UNTHSC Division of Geriatrics clinic through establishment of an automated tracking system measuring next available offered appointment, thereby reducing days to third next available appointment.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project will contribute to achieving that goal by focusing on a key population,
low-income seniors, which the Community Needs Assessment has found to be the population experiencing the highest growth rate, as well as the costliest.

**Challenges:**
Recent data from the Texas Medical Association revealed that only 31% of Texas physicians will accept new Medicaid patients in 2012. These numbers are at an all-time low and this trend will greatly affect access to ambulatory clinical care for Medicaid-eligible older adults who currently number 14,791 in Tarrant County, based on data from the Texas Department of Health and Human Services. Most older adults have at least three or more chronic conditions, and vulnerable elders will have not only medical problems, but also cognitive, functional, and psychosocial issues that affect their ability to remain independent. These older adults, and in particular the Medicaid-eligible, require more frequent access to medical care and services and utilize emergency department and hospital services more often.

**5-Year Expected Outcome for Provider and Patients:**
By expanding UNTHSC Division of Geriatrics clinic capacity, this project will: (1) increase access to geriatric primary care services for Medicaid-eligible elders within the UNTHSC Department of Internal Medicine by 35% through hiring new providers and staff, adding clinics and expanding hours, and (2) facilitate access to UNTHSC Department of Internal Medicine/Division of Geriatrics Clinic through establishment of automated tracking system measuring next available appointment, thereby reducing days to third next available appointment, (3) reduce all-cause hospital admission rates for patients receiving intervention by 5% over baseline, (4) reduce all-cause 30-day readmission rates by 10% over baseline, (5) increase patient satisfaction scores in getting timely care, appointments and information by 5% over baseline, and (6) improve pneumonia vaccination status for older adults receiving intervention by 15% over baseline.

**Starting Point/Baseline:**
This project is designed to increase access to geriatric primary care services for Medicaid-eligible elders through expanding capacity of the UNTHSC Department of Internal Medicine/Division of Geriatrics. Baseline data on the number of patients meeting eligibility criteria will be collected in DY3.

**Rationale:**
The UNTHSC Geriatric Assessment Program (GAP) Program has been a very successful model of ambulatory geriatrics care that is ripe to be expanded to the Medicaid-eligible geriatrics patients in Tarrant County who are having difficulty accessing medical care, let alone the necessary specialty of geriatrics comprehensive assessment and care.

**Project Components:**
To achieve the goals of this project, which involve expanding primary care capacity, the following core components are necessary. This project contains all the core components (expand staff, hours and space).

By achieving our milestones of adding staff, we will establish additional primary care clinics and expand hours of existing clinics to enhance access to primary care services to Medicaid-eligible seniors of Tarrant County, improve pneumonia vaccination status, reduce all-cause 30-day admissions and all-cause 30-day readmission rates, and increase patient satisfaction for Medicaid-eligible seniors in Tarrant county receiving the intervention. Quality milestone P-10 was selected to promote collaborative learning around shared or similar projects.

Unique community need identification numbers the project addresses:
- CN.1 – Lack of provider capacity
- CN.9 – Need for increased geriatric, long-term, and home care resources
- CN.10 – Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome measures:

Outcome Measure 1: IT 2.12- Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions - Goal is reduction in all-cause readmission rates of 3% (estimated 5 hospitalizations prevented) over baseline in DY4 and 5% (estimated 8 hospitalizations prevented) over baseline in DY5 (total reduction goal of 5% over course of project) in Medicaid-eligible elders.
Rationale: According to the CDC 2010 estimates, approximately 16% of those 65 and above will experience a hospital stay within a 12-month time frame and the percentage increases to 21% for those ages 85 and over. Medicaid-eligible elders are more likely to experience hospital admission owing to chronic illnesses and comorbidities. Additionally, it has been proposed that upwards of 40% of hospital admissions are avoidable. By enhancing access to geriatric primary care to those patients seen by the UNTHSC Department of Internal Medicine, we seek to reduce admissions among this population.

Outcome Measure 2: IT 6.1 Percent improvement over baseline of patient satisfaction scores:
Percent improvement over baseline of patient satisfaction scores for one or more of the patient
satisfaction domains that the provider targets for improvement in a specific tool (for this project, we are measuring patient satisfaction with getting timely care, appointments and information. Goal is 5% improvement for all 1,013 patients.

Rationale: A sizable literature supports the notion that patient satisfaction with medical care has direct impact on patient outcomes as well as clinical quality and operation performance. In fact, these are related to commonly implemented quality metrics utilized by clinics throughout the U.S. We seek to improve patient satisfaction with getting timely care, appointments and information by 5% over the Waiver period. We will collect baseline data prior to and after clinic appointments. In DY4 we seek to improve patient satisfaction scores by 3% over baseline and we seek to improve satisfaction scores by 5% over baseline in DY5.

**Outcome Measure 3:** IT 3.1 All-cause 30-day readmission rate – NQF 1789 for Medicaid-eligible elders 65 and above who receive care from the UNTHSC Department of Internal Medicine. Improvement goal is 5% reduction (2 re-admissions prevented) in all-cause hospital readmission rate over baseline in DY4 and a 10% reduction (3 re-admissions prevented) in all-cause readmission rate over baseline in DY5 in Medicaid-eligible elders.

Rationale: Approximately 20% of Medicaid-eligible elders are readmitted to hospitals within 30 days of discharge, which drastically increases medical costs. By enhancing access to geriatric primary care for Medicaid-eligible elders receiving services within the UNTHSC Department of Internal Medicine, we propose to reduce 30-day readmissions by 10% by the end of the Waiver period for the target population. This reduction in readmissions will result in a significant cost savings.

**Outcome Measure 4:** IT 12.4 Pneumonia vaccination status for older adults (HEDIS 2012) for Medicaid-eligible elders 65 and above who receive care from UNTHSC Department of Internal Medicine. Improvement goal is 15% increase (51 new vaccinations) in adults ages 65 and above from target population who ever received a pneumonia vaccine.

Numerator: Number of adults ages 65 and above from the target population that have ever received a pneumonia vaccine.

Denominator: Number of adults ages 65 and above in the target population.

Data source: Program records, EHR, claims

Rationale: The risk for developing pneumonia is higher among the elderly owing to chronic (often comorbid) illnesses; however, approximately 33% of elders have not received vaccination (Jackson & Janoff 2008). Pneumonia is often cited as the fifth leading cause of death among the elderly. Given the increased medical illnesses and comorbidities among our target population, they are at increased risk for pneumonia. The current project seeks to increase the percentage of elders ever receiving a pneumonia vaccine by 15% over the Waiver period (10% over baseline in DY4 [33 new vaccinations] and 15% over baseline in DY5 [51 new vaccinations]).

**Relationship to Other Projects:**
138-980111.1.2 Expand Primary Care Capacity – Expand Mobile Clinics -1.1.3: Community-Based Primary Care for the Elderly. The current project will support and reinforce the Community-Based Primary Care for the Elderly project by providing a referral source for complex cases requiring intensive geriatrician input and management. Such patients identified within the community will be referred to and treated by the current project. Therefore, these two projects will work in tandem to provide appropriate level of care within the most appropriate setting based on the individual patient’s needs.

138-980111.2.5 Implement/Expand Care Transitions Programs – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population – 2.12.2: Discharge Planning and Care Coordination for Medicaid Eligible elders. It is anticipated that several of the patients receiving this evidence-based transitions care program will be patients of the UNTHSC Geriatric Clinic and, therefore, these projects will support one another by providing a seamless transition from acute care settings back to the primary care provider.

138980111.1.6 – the current project will not provide behavioral treatment and management for mental health conditions and, therefore, will refer all identified depressed patients to project 138980111.1.6 for treatment and management.

The goals of this project will be measured independently of all other projects.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates - that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project.

UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Specifically, this project’s value was calculated on four outcomes, which include (1) Prevention Quality Indicators (PQI) composite measures potentially preventable hospitalizations for Ambulatory Care Sensitive Conditions -, (2) Improving the percentage of patient satisfaction
scores over the baseline, (3) All-cause readmission rates; and (4) pneumonia vaccination status for older adults.

- For Prevention Quality Indicators (PQI) composite measures potentially preventable hospitalizations for Ambulatory Care Sensitive Conditions - the UNT Health Science Center defined the population that will be directly impacted by the project - as Medicaid-eligible elders of Tarrant County ages 65 and above, who receive services from the UNTHSC Department of Internal Medicine, which would be approximately 162 individuals. The percentage of improvement expected by the project is 5%, equating to 8 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,100 due to the patient population mix.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,260 for each positive outcome realized. Another additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $2,840 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

- For all cause 30 day readmission rate, the UNT Health Science Center defined the population that will be directly impacted by the project as the number of hospitalized Medicaid-eligible elders of Tarrant County ages 65 and above, who receive services from the UNTHSC Department of Internal Medicine, which would be 33 individuals. The percentage of improvement expected by the project is 10%, equating to 3 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (Texas Department of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,495 for each...
positive outcome realized. Also, an additional multiplier was applied to determine the
benefit it provided to the community, the resulting additional valuation amount is $2,996
for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which
is the number of valuation years, to determine the total direct outcome value. Finally, an
additional 30% multiplier was applied, also known as the “halo effect”, due to the
positive impact the project would have on the population beyond those directly involved
by the project.

- For patient satisfaction percent improvement over baseline of patient satisfaction scores,
UNT Health Science Center defined the population that will be directly impacted by the
project as Medicaid-eligible elders of Tarrant County ages 65 and above, who receive
services from the UNTHSC Department of Internal Medicine, - which would be
approximately 1,013 individuals. We are anticipating that we will test the entire
population, and - are expecting to increase - the patient satisfaction scores for the project
by 5%--.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to
the health care system, it was determined that the valuation amount for each positive
outcome realized would be $15 (per information provided by the UNT Health Science
Center’s Division of Geriatrics) -.  

For the selected outcome, an additional multiplier was applied to determine the benefit it
provided to the individual, the resulting additional valuation amount is $9 for each
positive outcome realized. Also, an additional multiplier was applied to determine the
benefit it provided to the community, the resulting additional valuation amount is $6 for
each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which
is the number of valuation years, to determine the total direct outcome value. Finally, an
additional 30% multiplier was applied, also known as the “halo effect”, due to the
positive impact the project would have on the population beyond those directly involved
by the project.

- For pneumonia vaccination status for older adults, UNT Health Science Center defined
the population that will be directly impacted by the project as Medicaid-eligible elders of
Tarrant County ages 65 and above, who receive services from the UNTHSC Department
of Internal Medicine is estimated to be 1013 individuals, of which 674 have received the
vaccination. It is anticipated that approximately 15.3% or 51 additional patients will receive the vaccination.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $15,682 (as cited in the article “Incidence and Cost of Pneumonia in Medicare Beneficiaries” in Chest Journal).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $6,273 for each positive outcome realized. Also, additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $6,273 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Project Option 1.2.1 – Training Primary Care Workforce in Evolving Health Care Delivery Models

Unique Project ID: 138980111.1.4
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) /138980111

Providers: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: This project will support development of current and future primary care workforce through providing updated primary care training programs including training on the medical home and chronic care models, disease registry use for population health management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement. This is a new initiative.

Need for the project: This project supports the regional goals of improved care coordination and more patient education programs by providing primary care continuing medical education to physicians, resulting in improved patient care.

Target population: Patients of the primary care workforce receiving training. Based on 10% of PCP workforce (physicians, nurses, clinical staff, etc) in RHP 10 receiving the intervention (training), it is estimated that 171 physicians will receive training and an estimated 29,534 patients enrolled in Medicaid will be impacted.

Expected patient benefits: The project is important because the Medicaid population we are targeting (those at high risk for pneumococcal infection) can result in costly admissions and readmissions if they are not appropriately assessed for immunization status or immunized.

Category 1 or 2 expected patient benefit: This project seeks to increase training to 10% (1,279) of RHP 10 PCP workforce and increase knowledge assessment scores for trainees by at least 2% over baseline by DY4 and 3% over baseline by DY5.

Category 3 outcomes:
ix. IT 11.3- Our goal is 1% improvement over baseline by DY4 and 2% improvement over baseline by DY5 in pneumococcal vaccine status for targeted population- (baseline established at beginning of project from data sources).

x. IT 9.2 Our goal is to reduce inappropriate ED usage of targeted patients by 1% over baseline by DY4 and 2% over baseline by DY5.

xi. IT 12.4 Our goal is to improve pneumonia vaccination status for targeted older adults by 2% over baseline by DY4 and 3% over baseline by DY5.
Project Option 1.2.1 – Training Primary Care Workforce in Evolving Health Care Delivery Models

Unique Project ID: 138980111.1.4
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) /138980111

Project Description:
Project Area: Training of Primary Care Workforce
Project Intervention: Update primary care training programs to include training on the medical home and chronic care models, disease registry use for population health management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement.

UNTHSC Professional and Continuing Education (PACE) will employ a series of educational activities, develop community partnerships with advocacy groups, health care service providers and area health education centers to train RHP 10’s primary care workforce on emerging and evolving health care delivery models, including strategies to deploy newer effective models for improved patient outcomes, such as medical home model, chronic care model, interprofessional and team-based care, cultural competency and improved use of palliative care. This project will support the educational and skill development of the current and future primary care workforce in newer organized and effective models of health care delivery. This project will support other Medicaid Waiver projects of implementation of medical homes, chronic care models, interdisciplinary and team-based care to better manage high-risk patients with chronic disease. This project will also promote disease registries, patient panel management and QI/PI. It will establish and expand a faculty development program, increase staff and faculty participation and increase primary care training in traditional and alternative modalities, including in continuity clinics (multiple sessions). A gap analysis of the primary care workforce will be conducted. A complex, multifaceted continuing education model of continuing education, including varying types of live, online and QI/PI activities will be utilized. Multiple clinical teaching tools will be developed and disseminated for primary care and interprofessional clinics/sites.

Goals and Relationship to Regional Goals:

Project Goals:
The overall goal of this project is to increase the training of the primary care workforce in RHP 10 on evolving health care delivery models. Specific goals include:

• Conduct an assessment of 5% (639) of the primary care workforce in RHP 10.
• Enroll 5% (11) of faculty/staff into faculty development program.
• Develop and disseminate at least one clinical tool.
• Educate 10% of the PCP workforce (1,279 providers) in RHP 10 with expanded training programs.
• Improve trainee knowledge assessment scores by 2% in DY4 and 3% over DY4 in DY5.
• Improve number of staff completing courses by 2% in DY4 and 3% over DY4 in DY5.

This project meets the following Regional goals:
This project supports the Regional goals of improved care coordination and more patient education programs by providing primary care continuing medical education to physicians. Primary care training on medical home and chronic care models, and the use of disease registries will result in increased rates of pneumococcal vaccinations and reduce inappropriate ED use.

Challenges:
Changes in the health care system occur rapidly. Advances in therapies and diagnostics, clinical guidelines, data transmission and interpretation, and the understanding of efficacy and effectiveness by comparative analyses are slow to be incorporated into primary care practice, which negatively impact patient care and lead to increased costs and decreased outcomes.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome is to update and expand primary care training programs to include training on medical home and chronic care models, disease registry use for population health management, increase enrollment of health care providers in these programs and as a result, improve the percentage of high-risk populations receiving preventive measures such as the pneumococcal vaccination, and increase patient self-management. This project will improve pneumococcal vaccinations in minority populations receiving the intervention by 2% over baseline, improve pneumonia vaccination status for older adults receiving the intervention by 3% over baseline, and reduce ED visits for target conditions by 2% over baseline.

Starting Point/Baseline:
Development, distribution and collection of Regional assessment of attitudes, beliefs and knowledge of primary care workforce in RHP 10 to determine where current gaps exist. Activities will be designed based on this collection of information, which will improve the knowledge, attitudes, competence and performance of RHP 10’s primary care workforce with regard to medical home model, chronic care model, interprofessional and team-based care, cultural competency and improved use of palliative care. Impact will be assessed using a mixed-methods approach, which considers qualitative and quantitative data and information to fully realize the outcomes of the project. Outcomes will be demonstrated through better management of high-risk patients with chronic disease, particularly those with diabetes, hypertension,
congestive heart failure and asthma. According to the Texas Public Use Data File, all of these conditions are potentially preventable conditions tracked by the State. For example, according to hospitalcompare.gov, in Tarrant County, there were 2,951 hospitalizations for bacterial pneumonia in 2010, resulting in an estimated $602 million in hospital charges. On average only 76% of inpatients were assessed for or given pneumococcal vaccinations. Between October 2010 and October 2011, the three largest hospitals in the county had a combined 1,493 readmissions for pneumonia estimated to result in charges of $44.7 million. Baseline data for this project will be collected in DY3.

**Rationale:**
Initial hospitalizations for pneumonia will be reduced through use of newer delivery models such as the medical home. In addition, coordination of care upon hospital discharge will be improved through the use of these models. Quality, cost-effective patient care is negatively impacted by individual, clinical and systemic barriers. Often, these barriers are due to deficiencies in knowledge and competence, appropriate examples, or attitudinal predispositions. UNTHSC PACE has demonstrated its ability to use certified interdisciplinary continuing education and community partnerships to change health care provider behavior, promote the adoption of best practices and improve performance through enhanced knowledge and competence. Ultimately, patient care is improved.

**Project Components:**
No core project components required for this project area. Core activities include:
- Utilize a gap analysis to assess and/or measure PCP’s NCQA PCMH readiness.
- Conduct educational sessions
- Implement a comprehensive, multidisciplinary intervention to address the needs of the shared, high-risk patients
- Evaluate effectiveness of PCP training

The milestones selected for this project will allow us to reach and/or measure the accomplishment of our five-year expected outcome to improve coordination of care which will positively impact patient self-management, interprofessional management and use of preventive measures such as the pneumococcal vaccination.

**Unique community need identification numbers the project addresses:**
- CN.11 – Need for more care coordination
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.
Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome measures:

Outcome Measure 1: IT-11.3- Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity.
Measure: Percentage of people at high risk for infection receiving pneumococcal vaccination
Numerator: Number of people ages 18 and older at high risk for infection who have received a pneumococcal vaccination
Denominator: Number of people ages 18 and older at high risk for pneumococcal infection
Data Source: Meaningful Use Data
Rationale: The outcomes measure selected – IT-11.3-, specifically addresses gaps in care provided to the targeted population. Minority populations, especially African-Americans and Hispanics, are disproportionately underimmunized for invasive pneumococcal bacteria. Training includes modules in pneumonia prevention, including immunization. Medical home and chronic care models have been shown to improve immunizations.

Outcome Measure 2: IT-9.2 ED appropriate utilization
Reduce emergency department visits for target conditions
- Congestive heart failure
- Diabetes
- End-stage renal disease
- Cardiovascular disease/hypertension
- Chronic obstructive pulmonary disease
- Asthma
Data Source: North Texas Regional Extension Center and/or North Texas Accountable Healthcare Partnership
Rationale: The outcomes measure selected – IT-9.2 ED appropriate utilization
Reduce emergency department visits for target conditions
- Congestive heart failure
- Diabetes
- End-stage renal disease
- Cardiovascular disease/hypertension
- Chronic obstructive pulmonary disease
- Asthma
Specifically address desired results of training components, that patients receive care in the appropriate setting. Each cause of ED visits listed above is potentially preventable with
appropriate management and self-management. Appropriate training of the PC workforce can improve these aspects leading to fewer ED visits.

**Outcome Measure 3: IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)**

Numerator: Number of adults ages 65 and older who have ever received a pneumonia vaccine.

Denominator: Number of adults ages 64 and older in the patient or target population

Data Source: EMR, claims

**Rationale:** The outcomes measure selected – IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012) specifically addresses gaps in primary care, where suboptimal rates of pneumonia immunizations are administered to older patients. Training includes modules in pneumonia prevention, including immunization. Medical home and chronic care models have been shown to improve immunizations.

**Relationship to Other Projects:**

This project supports 138980111.2.2 – Apply Process Improvement Methodology to Improve Quality/Efficiency – Design, develop, and implement a program of continuous, rapid process improvement that will address issues of safety, quality, and efficiency – 2.8.1- Improving Primary Care Clinical Processes to Reduce Hospitalization Risk. Many of the providers targeted in 138980111.2.2 will also receive targeted information during this project, reinforcing the intervention and supporting the outcomes measures.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Specifically, this project’s value was calculated on three outcomes, which include (1) improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity - (percentage of people at high risk for infection receiving
pneumococcal vaccination), (2) pneumonia vaccination status for older adults and (3) ED appropriate utilization.

a. For - Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity, UNT Health Science Center defined the - population - that will be directly impacted by the project as patients in RHP 10 who are considered high risk for infection and receive services from PCPs receiving intervention, which would be approximately 38,185. The percentage of improvement in pneumonia vaccinations for this population is expected to be 2%, equating to 764 lives positively impacted by this outcome.

-Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $417 (as cited in the article, “Pneumococcal Vaccination Reduces Mortality and Costs in Elderly” in the internet journal at www.respiratoryreviews.com), -which was based on the average savings per person vaccinated.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $167 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $167 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For pneumonia vaccination status for older adults, UNT Health Science Center defined the - population - that will be directly impacted by the project as patients in RHP 10 who are 65 and older-and receive services from PCPs receiving - intervention, which would be approximately 14,167. The percentage of improvement in pneumonia vaccinations for this population is expected to be 3%, equating to 425 lives positively impacted.

Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $417 (as cited in the article, “Pneumococcal Vaccination Reduces Mortality and Costs in Elderly” in the internet journal at www.respiratoryreviews.com), -which was based on the average savings per person vaccinated.
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $167 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $167 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For ED appropriate utilization, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who visit the ED and receive services from PCPs receiving intervention, which would be approximately 23,612 patients. The percentage of improvement by the project is 2%, equating to 472 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,200 due to the patient population mix. For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $480 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $480 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health
Science Center discounted all projects to a reduced price in order to stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
### Increase Training of Primary Care Workforce – “Other” Project Option: Update Primary Care Training Programs to Include Training on the Medical Home and Chronic Care Models, Disease Registry Use for Population Health Management, Patient Panel Management, Oral Health, and Other Identified Training Needs and/or Quality/Performance Improvement – 1.2.1: Training Primary Care Workforce in Evolving Health Care Delivery Models

Project Option 1.2.2 – Community Health Worker Network

**Unique Project ID:** 138980111.1.5  
**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Provider:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** The existing CHW training offered by the UNTHSC TPHTC will be expanded to offer cross-training for CHW with basic - case management skills as well as much needed placement assistance for CHWs who have traditionally struggled with finding employment in RHP 10. Internships with RHP 10 providers will be added to the training program. Additionally, existing partnerships with RHP 10 providers will be leveraged to facilitate job placement for newly trained CHWs. CHWs will be trained to work as part of multidisciplinary health care teams, and will be specifically well-suited to serve as frontline paraprofessionals who can spend more time with patients than physicians and nurses. CHWs most often spend their time making sure patients understand their treatment plans, scheduling needed follow-up appointments and coordinating services that may be available to patients, all with an emphasis on providing culturally competent care. Since CHWs extend the reach of typical primary care providers, they have been shown to improve patient satisfaction and quality of life, as well as patient health outcomes.

**Need of the project:** Given that four out of the nine counties in RHP 10 are designated Health Professional Shortage Areas and five out of the nine counties in RHP 10 are designated Medically Underserved Areas, the importance of this project cannot be overemphasized. Expanding the primary care workforce to include culturally competent community health workers will add resources to the region's health care infrastructure at relatively low cost and address the needs of provider capacity and shortage of primary care services. The addition of CHWs to the region’s primary care workforce will increase the ability of RHP 10 providers to address patient’s concerns and ensure appropriate and timely follow-up care, all of which will result in improved patient satisfaction and quality of life.

**Target population:** Low income, racial or ethnic minority or uninsured patients seen by RHP 10 providers where newly trained CHWs are placed. Estimated 2,500 patients will be served over course of waiver.

**Expected patient benefits:** It is expected that patient satisfaction and quality of life will improve after a CHW becomes part of the patient’s health care team. CHWs will engage in personalized, culturally competent interactions with patients to communicate necessary information patients regarding their care. The addition of the CHW will provide patients with the opportunity to better understand their care and add a member to the health care team who is more accessible than physicians and nurses.

**Category 1 or 2 expected patient benefits:**

xii. 25% increase (8) in number of CHW rotations over baseline by DY4
xiii. 50% increase (10) in number of CHW rotations over baseline by DY5
xiv. 25% increase (4) in number of CHWs accepting positions over baseline by DY4
xv. 50% increase (8) in number of CHWs accepting positions over baseline by DY5

Category 3 outcomes:

i. IT-6.1 – 5% increase by DY4 and 10% increase by DY5 in patient satisfaction over baseline measured by CG-CAHPS survey
ii. IT-10.1 – 5% increase by DY4 and 10% increase by DY5 in quality of life measured by the SF-36
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Project Description:
Project Area: Increase Training of Primary Care Workforce
Project Intervention: Increase the number of primary care providers
The existing CHW training offered by the UNTHSC TPHTC will be expanded to offer cross-training for CHW with basic - case management skills, as well as much-needed placement assistance for CHWs who have traditionally struggled with finding employment in RHP 10. Internships with RHP 10 providers will be added to the training program. Additionally, existing partnerships with RHP 10 providers will be leveraged to facilitate job placement for newly trained CHWs. CHWs will be trained to work as part of multidisciplinary health care teams, and will be specifically well-suited to serve as frontline paraprofessionals who can spend more time with patients than physicians and nurses. CHWs most often spend their time making sure patients understand their treatment plans, scheduling needed follow-up appointments and coordinating services that may be available to patients, all with an emphasis on providing culturally competent care. Since CHWs extend the reach of typical primary care providers, they have been shown to improve patient satisfaction and quality of life, as well as patient health outcomes. The service area of current UNTHSC CHW training efforts will be greatly expanded to include the entire RHP 10.

Goals and Relationship to Regional Goals:

Project Goals:
Utilizing CHWs will increase the capacity of RHP 10 providers to deliver services that are community-based, culturally competent and - designed to specifically - address the needs of vulnerable patients, and will ultimately result in improvements in - - - patient satisfaction and quality of life. -. Evidence suggests that CHWs are particularly effective in assisting patients in accessing appropriate care and services in a timely manner, improving patient outcomes, and also, - reducing the occurrence of unnecessary complications. Our CHWs will teach their clients to maximize their use of the health care system based on training in the areas of health advocacy, service coordination, and capacity building, to name a few. Additionally, CHWs will ensure that their patients leave their appointments with a clear understanding of treatment plans and follow up care. Specifically, the result of these efforts will be more efficient use of health care services among patients working with CHWs. -Since our trainees may work with patients in a variety of health care settings and with diverse health needs, we choose to measure improvements in quality of life and patient satisfaction, rather than focusing on any particular clinical outcome.

This project meets the following Regional goals:
Given that four out of the nine counties in RHP 10 are designated Health Professional Shortage Areas and five out of the nine counties in RHP 10 are designated Medically Underserved Areas, the importance of this project cannot be overemphasized. Expanding the primary care workforce to include culturally competent community health workers will add resources to the Region’s health care infrastructure at relatively low cost, and address the needs of provider capacity and shortage of primary care services. The addition of CHWs to the region’s primary care workforce will increase the ability of RHP 10 providers to address patient’s concerns and ensure appropriate and timely follow-up care, all of which will result in improved patient satisfaction and quality of life.

Challenges:

Community health workers (CHWs) are lay members of communities who work in association with local health care systems, academic institutions, health departments and community-based organizations. They typically share the ethnicity, language, socioeconomic status and life experiences of the community members they serve. Their primary function is to serve as liaisons between the community and the health care system and/or resources within the community. National sociodemographic changes in the past decade have resulted in a greater reliance on CHWs across many communities in the U.S. Population changes, increasing numbers of younger low-income families, provider shortages, and an increased need for language interpretation and cultural understanding in health care delivery have placed increasing demands on the health care system, and many of these demands can be efficiently met by CHWs. CHWs are considered an effective means to delivering health care and education to underserved and isolated communities.\(^\text{114}\)

Studies using CHWs in community interventions report improved patient outcomes,\(^\text{115,116,117}\) greater patient satisfaction,\(^\text{130}\) and the ability to successfully explore and understand patient and family needs beyond traditional approaches.\(^\text{118}\)

While most health care providers agree that using community health workers enhances patient care, they would also agree that hiring CHWs to become part of a multidisciplinary health care

---

team is not feasible because CHW services are not currently reimbursed in Texas. Blue Cross Blue Shield of Minnesota has already begun reimbursing for CHW services as part of a demonstration project and has documented marked cost-savings.\textsuperscript{119}

The two most effective ways to build the evidence needed to convince policymakers that CHW services improve patient outcomes and are cost effective, and therefore, should be reimbursed, is to (1) create opportunities for CHWs to work within the current health care infrastructure so RHP 10 providers can see firsthand how beneficial their services can be to improving patient outcomes and reducing costs; and (2) expand CHW training beyond traditional health education to include skills that are more useful in a clinical setting (e.g., case management).

The Texas Public Health Training Center at UNTHSC has offered CHW training for the past five years. In that time, we have trained over 50 CHWs with the 160-hour state-certified curriculum and delivered almost 2,000 hours of continuing education to CHWs on topics ranging from diabetes management to bullying to advanced care planning for older adults. We are well-positioned to expand beyond traditional CHW training because of our unique placement within a health science center. Moreover, finding placements for CHW trainees with health care providers within RHP 10 will also be facilitated by leveraging existing relationships UNTHSC and the TPHTC maintains with RHP 10 providers. Based on the existing evidence demonstrating improved health outcomes among patients participating in interventions using CHWs, our goal is to increase patient satisfaction and quality of life among patients receiving care from RHP 10 providers that incorporate CHWs into their multidisciplinary health care teams.

5-Year Expected outcome for Provider and Patients:
The five-year goals of this project are to expand the utilization of CHWs providing primary care services in RHP 10 performing providers. Specifically, this will be accomplished by expanding CHW training - to - areas that will make CHWs more useful to RHP 10 performing providers, developing mentoring programs for newly trained CHWs, increasing the number of CHW trainees to 25 per year in DY4 and DY5, and increasing the number of CHWs employed by RHP 10 performing providers to 10 in DY4 and DY5. This project will also improve patient satisfaction scores of patients’ overall health status/functional status by 10% over baseline and improve quality of life scores (SF-36) by 10% over baseline.

Starting Point/Baseline:
Currently, the UNTHSC TPHTC serves as a Texas DSHS-certified CHW training site with resources allocated to handle organization, marketing, tracking, recruitment, retention, certification and compliance with DSHS - and provides training to CHWs in Tarrant County. However, access to CHW training and the services we propose are extremely limited in the

\textsuperscript{119} Community health workers in Minnesota: Bridging barriers, expanding access, improving health. Blue Cross and Blue Shield of Minnesota. 2010.
counties beyond Tarrant in RHP 10. The proposed project will expand - the scope and volume of services provided by trained CHWs working with RHP 10 providers.

**Rationale:**
Several studies from the states of Massachusetts, Minnesota, Florida and Arizona have demonstrated that CHWs are effective in improving patient outcomes and reducing health care expenditures. However, data in Texas are limited since CHW services are not yet reimbursed by third party payors. Anecdotal reports of grant-funded interventions using CHWs in Texas have also shown similar results. The rationale for the enhancement of our CHW training program with case management skills and internship experiences with RHP 10 providers and the facilitation of job placement for newly trained CHWs with RHP 10 providers lies in the difficulty CHWs face when trying to secure employment with health care providers when their services are unable to be billed to third party payors. We expect that RHP 10 providers will take notice of the improvements in patient satisfaction and quality of life, as well as other clinical benefits not measured by this study, and deem the investment in CHWs worthwhile. It is also our expectation that the results of this project will contribute to the existing evidence in support of third party reimbursement of CHW services in Texas.

**Project Components:**
Training CHWs and equipping them with skills to be members of inter-professional teams - can not only reduce health care costs, but - can also result in improved patient outcomes, such as improved patient satisfaction and quality of life. CHWs can spend more time with patients at less cost to health care providers to ensure that patients understand their care, manage their chronic conditions and utilize the health care system effectively. The individual role of a CHW trainee placed with an RHP 10 provider will depend on the position the RHP 10 provider gives the CHW trainee. However, regardless of the specifics of the position, every CHW will enhance the health care encounter of every patient served by implementing the competencies taught in the CHW training, including health advocacy, capacity building and service coordination, to name a few.

Our milestones measure expansion of the primary care workforce. We are training new CHWs and seeking to place them in performing providers’ facilities throughout RHP 10. In doing this, we will increase patient satisfaction and quality of life for the targeted population. Quality milestone P-3 was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.2 – Shortage of primary care services (e.g., pediatric, prenatal, family care)
- CN.12 – Need for more culturally competent care to address unmet needs (e.g., Latino-population need care, translators, translated materials)
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

We propose to organize and formalize CHWs in RHP 10 with the establishment of the UNTHSC Community Health Worker Academy in order to achieve the ultimate goal of improving health outcomes among RHP 10 Medicaid beneficiaries. In order to achieve these goals, the CHW Academy will provide: (1) Organization that will result in greater visibility and marketability in the Regional health care market, because the capabilities of CHWs are not well understood; (2) Training that will build on existing state-certified training, but will expand to include specialty areas of focus to make CHWs more marketable to RHP 10 providers; (3) Development, referring to cross-training with basic skills from other areas to increase CHW utility in clinical settings; (4) Facilitation of placement that is critical in this Region as most RHP 10 providers have limited experience in utilizing CHWs. A positive primary care exposure will be provided through mentorship of CHWs in training and newly trained CHWs by CHW instructors. This mentorship will include the necessary coaching to enable CHWs to perform in primary care settings. Existing models within the School of Public Health will be used to create internship/job opportunities and will be leveraged to rapidly integrate CHWs into various health care settings (e.g., hospitals, community-based clinics). This project builds upon the HRSA-funded Texas Public Health Training Center (TPHTC) and leverages existing CHW infrastructure in Tarrant County.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

b. **Outcome Measure 1:** IT-6.1(1) Patient Satisfaction
   
   Percent improvement over baseline of patient satisfaction scores for patients getting timely care appointments, and information.

   **Improvement Target:** 10% increase over baseline in patient satisfaction as measured by CGCAHPS survey on patients getting timely care appointments and information.

   **Rationale:** The project will add 40 CHWs and place them in performing providers’ facilities throughout RHP 10. This improvement target measures the expected outcome of improved patient satisfaction.

c. **Outcome Measure 2:** IT-10.1 Quality of life

   Demonstrate improvement in quality of life scores, as measured by evidence-based and validated assessment tool (SF-36), for the target population.

   **Improvement Target:** 10% increase in the SF-36 score by the end of the Waiver

   **Rationale:** This outcome improvement target measures quality of life scores of the patients served by community health workers assigned to providers’ facilities. Quality of life is a critical part of a person’s health. Appraisals of quality of life may be an early indicator of changes in health, as they are often more malleable than traditional
health indicators such as cholesterol levels or hemoglobin A1c. Further, assessments of quality of life provide great insight into how a patient perceives the effect of his or her own health and its subsequent effect on overall life.

**Relationship to Other Projects:**
This project is related to one other project from UNTHSC. It is related to 13898011.1.2 Expand Primary Care Capacity – Expand Mobile Clinics –1.1.3: Community-Based Primary Care for the Elderly – Community-Based Primary Care for the Elderly in that this project will train the CHWs needed for the multidisciplinary teams. This project may support other projects in RHP 10 in that the following projects may utilize the training supported by this project to train patient navigators:

- Establish/Expand a Patient Care Navigation Program
- Implement Evidence-based Health Promotion Programs – Establish self-management programs and wellness using evidence-based designs

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Specifically, this project’s value was calculated on two outcomes, which included (1) improving patient satisfaction scores, and (2) quality of life.

- For Patient Satisfaction Percent Improvement over Baseline of Patient Satisfaction Scores, UNT Health Science Center defined the population that will be directly impacted by the project as patients seen by providers where newly trained CHWs/promotoras are placed, which would be approximately 2,500 individuals. We are anticipating that we
will test the entire population, and are expecting to increase the patient satisfaction scores for the project by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $32 (as cited in the article, “Medicaid Savings Resulted When Community Health Workers Matched Thoses With Needs To Home and Community Care” in the journal, Health Affairs), which was based on two percent of the expected reduced annual Medicaid spending per participant.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

- For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as Patients seen by providers where newly trained CHWs/promotoras are placed, which would be approximately 2,500 individuals. We anticipate that we will test the entire population and are expecting to increase the quality of life scores by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome would be $3,755 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Control Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s
project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Milestone 1 [P-2]: Expand primary care training for CHWs**

**Metric 1 [P-2.1]: Expand the primary care community health workers/promotoras training programs and/or rotations**

- Baseline/Goal: Training program expanded to accommodate 20 additional CHWs per year
- Data Source: Program Records

**Metric 1 [P-2.2]: Hire one additional precepting primary care faculty members (CHW instructors)**

- Baseline/Goal: TBD
- Data Source: Program records

**Milestone 1 Estimated Incentive Payment (maximum amount):** $1,558,618

**Milestone 2 [P-3]: Expand positive primary care exposure for residents/trainees (CHWs)**

**Metric 1 [P-3.1]: Develop mentoring program with primary care faculty and new CHW trainees**

**Milestone 4 [P-2]: Expand primary care training for CHWs**

**Metric 1 [P-2.1]: Expand the primary care community health workers/promotoras training programs and/or rotations**

- Baseline/Goal: Training program expanded to accommodate 20 additional CHWs per year
- Data Source: Program Records

**Metric 2 [P-2.2]: Hire additional precepting primary care faculty members (CHW instructors) as needed**

- Baseline/Goal: TBD
- Data Source: Program records

**Milestone 4 Estimated Incentive Payment (maximum amount):** $1,625,977

**Milestone 5 [P-3]: Expand positive primary care exposure for residents/trainees (CHWs)**

**Metric 1 [P-3.1]: Develop mentoring program with primary care faculty**

**Milestone 7 [I-11]: Increase primary care training and/or rotations for CHWs**

**Metric 1 [I-11.1]: Increase the number of primary care residents and/or trainees, as measured by percent change of class size over baseline or by absolute number**

- Goal: 25% increase in the number of CHWs over baseline
- Data Source: Program records

**Metric 2 [I-11.2]: Increase the number of primary care trainees rotating at the Performing Provider’s facilities**

- Goal: 25% increase (8) in the number of CHWs over baseline
- Data Source: Program records

**Milestone 7 Estimated Incentive Payment: $1,739,417**

**Milestone 8 [I-12]: Recruit/hire more trainees/graduates to primary care positions in Performing Provider facilities**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $19,813,826
“Other” project option: Implement other evidence-based project to enhance service availability of appropriate levels of behavioral health care in an innovative manner not described in the project options above –1.12.4: Community-Based Behavioral Health care for Depressed Medicaid Elders and Near Elders

**Unique Project ID:** 138980111.1.6 (Pass 2)

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC)/138980111

**Provider:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other health care professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** The project will create a mobile mental health team consisting of community health workers (CHWs) and licensed mental health providers (social workers and psychologists) that will provide behavioral health services for depression to Medicaid eligible elders (65 and above) and near elders (50-64) of Tarrant County. This project is a new initiative and will provide depression treatment and management to those not receiving services. Projects 138980111.1.2, 138980111.1.3 and 138980111.2.5 do not provide mental health services and, therefore, will serve as a referral source to the current program. The goals of the current program will be evaluated independently of all other programs.

**Need of the project:** This project would contribute to increasing access to care by focusing on low-income seniors suffering from symptoms of depression. It is anticipated that over 5,000 Medicaid eligible elders in Tarrant County suffer from symptoms of depression at any given time.

**Target population:** At least 5,000 of the approximately 18,000 elders and near elders residing in Tarrant County experience depression at any given time. Estimated 1,500 patients will be served over course of waiver period.

**Expected patient benefits:** Depression is a major health problem for the elderly as it exacerbates medical illness and substantially increases medical cost. By providing behavioral health services (i.e. screens, therapy, referrals, case management), this project will reduce depression symptoms, improve patient quality of life and patient satisfaction with involvement in decision-making among Medicaid eligible elders and near elders suffering from symptoms of depression in Tarrant County.

**Category 1 or 2 expected patient benefits:**

1. 15% (750 patients) of Medicaid-eligible elders suffering from symptoms of depression utilize behavioral health service by DY4 and 30% (1,500 patients) by DY5
2. 5% decrease from baseline by DY4 and 7% decrease from baseline by DY5 in number of cancelled or no-show appointments

**Category 3 outcomes:**

i. IT-1.8 – Conduct depression screening and treatment planning protocols for 750 patients by DY4 and 1,500 patients by DY5

ii. IT-1.9 – 5% (75 patients) in remission at 12 months by DY4 and 10% (150 patients) in remission at 12 months by DY5
iii. IT-6.1 – 3% improvement from baseline by DY4 and 5% improvement from baseline by DY5 in patient satisfaction scores for involvement in medical decision-making for all 1,500 patients

iv. IT-10.1 – 5% increase from baseline by DY4 and 10% increase from baseline by DY5 in quality of life as measured by SF-36, for all 1,500 patients

Project Option 1.12.4 – Enhance service availability of appropriate levels of behavioral health care – “Other” project option: Implement other evidence-based project to enhance service availability of appropriate levels of behavioral health care in an innovative manner not described in the project options above –1.12.4: Community-Based Behavioral Health care for Depressed Medicaid Elders and Near Elders

**Unique Project ID:** 138980111.1.6 (Pass 2)

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC)/138980111

**Project Description:**

**Project Area:** Enhance service availability of appropriate levels of behavioral health care

**Project Intervention:** Other project option: Implement other evidence-based project to enhance service availability of appropriate levels of behavioral health care in an innovative manner not described in the project options above.

The project titled Community-Based Behavioral Health care for Depressed Medicaid Elders and Near Elders will create a mobile mental health team consisting of community health workers (CHWs) and licensed mental health providers (social workers and psychologist) that will provide behavioral health services for depression within Tarrant County to Medicaid-eligible elders (65 and above) and near elders (50 and above). Based on prior literature demonstrating the effectiveness of incorporating CHWs into collaborative teams for depression management (Wennerstrom 2011; Ekers 2011; Patel 2011), CHWs will deploy through existing infrastructures such as the UNT Health clinics, senior citizen centers, food banks, churches, Regional gatherings (e.g., health fairs) and in-home visits to conduct screenings and provide referrals to the social worker or psychologist team members. The intervention will follow the IMPACT model with CHWs filling the roles of providing screenings, referrals and case management with social workers and psychologist serving as the Depression Care Managers (providing counseling as needed). Together, the Depression Care Manager and CHWs will work with the patient’s primary care physician for comprehensive depression treatment and management (www.impact-uw.org; Van Leeuwen et al 2009; Arean et al 2008). Psychologists and a social worker will design and implement a training program from evidence-based therapies that is culturally and linguistically appropriate for the target populations, and provide training and supervision to the CHWs, who will conduct provide the behavioral health services throughout Tarrant County. The behavioral health services will include depression screenings, treatment, provide appropriate referrals to social workers and psychologist, and provide as needed, and care coordination for
depressed patients. Therefore, this program will provide a novel skill set to CHWs, generate workforce enhancement at nonspecialist levels, and greatly facilitate access to depression-specific comprehensive behavioral health care. There are an anticipated 18,000+ Medicaid-eligible elders in Tarrant County (as of June 2012) with an anticipated 5,000+ suffering from symptoms of depression. The depression treatment teams will provide depression-related health services to a minimum of 1,500 patients over the course of this five-year project. Therefore, the project fits under Category 1, #12 – Project Area (Enhance service availability) of appropriate levels of behavioral health care, #4 Other project description: mobile depression teams that can provide evidence-based treatment in Tarrant County.

Goals and Relationship to Regional Goals:

Project Goals:
The project goal is to deploy a depression treatment team throughout Tarrant County through hiring psychologists and a, social workers (BSW and LMSW), creating an evidence-based training program for depression behavioral health, hiring and training CHWs, and prioritizing areas to receive project intervention in order to provide evidence-based depression management based on the IMPACT model to (1) increase utilization of community behavioral health, (2) increase depression remission rates at 12-months, (3) increase patient satisfaction with access to care, and (4) improve the quality of life of depressed Medicaid-eligible elders and near elders.

This project meets the following Regional goals:
A major goal of the Region is to improve access to ongoing care. This project will contribute to achieving that goal by focusing on a key population, low-income seniors, along with a prevalent and extremely costly health condition, depression.

Challenges:
Depression is a major source of morbidity and mortality among the elderly (Palsson 1997; Cuijepers 2002). Depression increases risk for complications from other medical issues, impairs activities of daily living and reduces quality of life (Gurland 1992) and increases risk for 30-day hospital readmissions (Silverstein 2005). According to the CDC, depression reflects a substantial cost with an estimated $17-$44 billion annually in lost workdays in the U.S. In Oklahoma depression-related Medicaid costs were the second highest among the population (Garis 2003). Additionally, individuals suffering from a chronic medical condition and depression incur 50-100% increases in health service use and costs (Thomas 2006). Medicaid-eligible elders are at particular risk for depression; in fact, a report from the Substance Abuse and Mental Health Services Administration (SAMHSA) showed that 32% of Medicaid adult enrollees were treated for either minor depression or anxiety disorders, with 17% having been treated for major depression (Buck et al. 1995). In the New Hampshire report on depression, 49% of Medicaid elders suffered from some evidence of depression, which was similar to that found in Oregon.
(Finkelstein 2011). Despite the fact that 80% of people suffering from depression can be helped and Medicaid offers therapies through various pathways, the majority of sufferers will not receive care due to lack of access and awareness. The current project proposes to teach create a collaborative depression management team consisting of community health workers (CHWs, social workers and psychologists) to provide depression treatment and management within community-based and clinic-based settings per the IMPACT model to address the major problem of depression within the Medicaid-eligible elder population. According to Oriol (2009), depression screenings through mobile clinics yielded a substantial estimated value of quality adjusted life years saved.

5-Year Expected Outcome for Provider and Patients:
By treating depression among Medicaid-eligible elders and near elders in Tarrant County, the five-year expected outcomes are to (1) increase access to treatment and management for depressed elders and near elders (1,500 patients to be treated), (2) achieve 12-month remission in 10% of treated patients (150 patients), (3) improve patient quality of life by 10% over baseline and (4) improve overall patient satisfaction with involvement in medical decision making by 5%.

Starting Point/Baseline:
As of June 2012, there were over 18,000 elders and near elder Medicaid patients in Tarrant County. Based on prior work, it is anticipated that over 5,000 of these Medicaid patients suffer from symptoms of depression at any given time. This project will provide behavioral health services to a minimum of 1,500 Medicaid elders and near elders throughout Tarrant County by the end of the project. The baseline time period is DY3.

Rationale:
The U.S. population is aging at a rapid rate; however, the availability of geriatric primary care and specialty services to meet the mental health needs of this population is not expanding at the same rate. With its particular strength in aging, UNTHSC has a unique ability to meet the needs of Tarrant County’s aging population. This project builds on existing strengths to enhance access to geriatric depression behavioral health services in order to meet the emerging medical needs of our community. Provision of such services at the community level will afford optimal management of depression and improve quality of life through a more cost-effective system.

Project Components:
No core project components are required for this project area. Core activities include: (1) develop a manual for CHW –implemented depression behavioral health program screening and referrals, peer support, and case management –implemented depression behavioral health program, (2) hire and train CHWs, (3) hire social workers and train on IMPACT model, (4)
identify and prioritize areas for intervention, and (4 5) implement depression behavioral health program.

Our milestones were chosen to measure effective implementation of a depression behavioral health team. Specifically: (1) hire and train team (psychologists, social workers, and CHWs), (2) establish extended hours, transportation and/or mobile clinic options, (3) increase utilization of community behavioral health care for targeted population, and (4) deploy the team throughout Tarrant County. Quality Milestone P-10 was selected to promote collaborative learning around shared or similar projects. As a result of these capacity expansions, we will be able to demonstrate effective identification and treatment of depression among a significant number of Medicaid elders.

Unique community need identification numbers the project addresses:
CN.4 Lack of access to mental health services
CN.5 Insufficient integration of mental health care in the primary care medical care system
CN.7 Need to address geographic barriers that impede access to care
CN.8 Lack of access to health care due to financial barriers
CN.9 Need for increased geriatric, long-term, and home care resources

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
Outcome Measure 1: IT-1.8 Depression Management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134). Numerator: Patient’s screening for clinical depression using a standardized tool AND follow-up plan is documented. Screening – testing done on people at risk of developing a certain disease, even if they have no symptoms. Standardized Tool – an assessment tool that has been appropriately normalized and validated for the population in which it is used. We will utilize the Geriatric Depression Scale (GDS). Follow-up Plan. Proposed outline of treatment to be conducted as a result of clinical depression screen. Such a follow-up must include further evaluation if screen is positive and may include documentation of a future appointment, education, additional evaluation, and/or referral to a practitioner who is qualified to diagnose and treat depression, and/or notification of primary care provider. Denominator: All eligible cases. Data source: Program Records.

Rationale: Depression is a major, but under-treated, problem among the elderly population, which is disproportionately experienced by poor elderly. Additionally, access to care for depressed Medicaid eligible elderly is a key issue given the limited numbers of health care providers that provide therapeutic treatment for depression. This project will substantially
increase access to empirically validated depression treatment protocols by incorporation of CHWs, social workers and psychologists into a collaborative depression treatment team as depression therapists for the elderly within community-based settings.

**Outcome Measure 2: IT-1.9 Depression Management: Depression Remission at Twelve Months (NQF#0710).** Numerator: All eligible cases with a diagnosis of major depression or dysthymia and an initial GDS score greater than 10 who achieved remission at twelve months as demonstrated by a twelve month (+/- 30 days) GDS score of 10 or less. Denominator: All eligible cases with a diagnosis of major depression or dysthymia and an initial GDS score greater than 10. Data Source: Program Records, Electronic Health Records.

**Rationale.** Prior work demonstrates the efficacy of psychotherapy in the treatment of depression, including among the elderly. Additionally, psychotherapy (cognitive and cognitive behavioral in particular) typically demonstrates superior relapse rates as compared to medication management. The combined CHW and social worker (or other health professional) team approach as used with the IMPACT program, has been shown effective in a number of studies (Wennerstrom 2011; Patel 2011; Unutzer 2001). Here, we propose that 10% of the 1500 (150) depressed patients receiving treatment will be no longer classified as depressed at 12-months post treatment.

**Outcome Measure 3 : IT 10.1 Quality of Life –** Demonstrate improvement in quality of life (QOL) scores, as measured by evidence-based and validated assessment tool (SF-36), for the target population. Improvement target is 5% over baseline by DY4 and 10% over baseline for all 1,500 patients by DY5.

**Rationale:** Prior work shows how quality of life and health status have reciprocal relationships. In fact, the Oregon Health Insurance Experiment (Finkelstein 2011) demonstrated that enrollment in Medicaid had a significant beneficial impact on quality of life, health care utilization (including preventive care measures and hospitalizations), and overall medical expenditures and debt when compared to the control group with no insurance. By implementing community-based depression behavioral health teams, we propose to improve quality of life by 10% over baseline. We will achieve this improvement by providing depression screenings, treatments, referrals, and care coordination through mobile teams. Community health workers, social workers and psychologists will provide the behavioral health depression management according to the IMPACT model in a variety of settings. Improved QOL will translate to significant improvement in a broad range of health outcome measures as outlined above and result in a significant cost savings over the course of the project.

**Outcome Measure 4 : IT 6.1 Percent improvement over baseline of patient satisfaction scores:** Percent improvement over baseline of patient satisfaction scores for one or more of the
patient satisfaction domains that the provider targets for improvement in a specific tool. Improvement goal is 5% for all 1,500 patients.

1. Are getting timely care, appointments, and information (Stand-alone measure)
2. How well their doctors communicate (Stand-alone measure)
3. Patient’s rating of doctor access to specialist (Stand-alone measure)
4. Patient’s involvement in shared decision making (Stand-alone measure)
5. Patient’s overall health status/functional status (Stand-alone measure)

**Rationale:** Prior work has shown that patient perception of involvement in medical decision making and medical care is directly related to outcomes (Brody et al. 1989). Additionally, patient involvement in decision making for depression management is essential. The Consumer Assessment of Health Plans Survey (CAHPS) module on Patient/Caregiver Experience – Shared Decision Making will be administered prior to receiving a visit by the depression teams for baseline perception based on prior medical experiences. The questionnaire will be administered again after clinic visit and again at follow-up visits to determine the improvement in patient perception of involvement in shared decision making experienced from receiving treatment by the depression teams. This Category 3 improvement target complements and expands on our Category 1 milestones significantly.

**Relationship to Other Projects:**
13 8980111.1.2 Expand Primary Care Capacity – Expand Mobile Clinics; 1.1.3: Community-Based Primary Care for the Elderly. The current project will support and reinforce the Community-Based Primary Care for the Elderly project by providing behavioral health services to appropriate patients, which is not provided by project 138980111.1.2. Therefore, these two projects will work in tandem to provide appropriate level of care within the most appropriate setting based on the individual patient’s needs.

13 8980111.1.3 Expand Primary Care Capacity – Expand Existing Primary Care Capacity; 1.1.2: Expanding Geriatric Primary Care and Consultative Services to Medicaid-Eligible Elders. The current project will support the project entitled Expanding Geriatric Primary Care and Consultative Services to Medicaid-Eligible Elders by providing depression-specific behavioral health services to patients, which will not be provided by that project. These projects will work in tandem to provide appropriate level of care targeted to the specific patient’s needs.

13 8980111.2.5 Implement/Expand Care Transitions Program – Implement one or more pilot intervention(s) in care transitions targeting one or more patient care units or a defined patient population; 2.12.2: Discharge Planning and Care Coordination for Medicaid-Eligible elders. The current project will provide depression-specific behavioral health as needed to these recently discharged patients, which are services not provided by project 138980111.2.5, thereby supporting the project entitled Discharge Planning and Care Coordination for Medicaid Elders.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

This project will participate in the Region’s Learning Collaborative. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative.

Project Valuation:

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Specifically, this project’s value was calculated on four outcomes, which included (1) depression screening and treatment, (2) depression remission at 12 months, (3) quality of life and (4) patient satisfaction.

a. For Depression Management: Screening and Treatment Plan for Clinical Depression, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are anticipating that we will provide depression screening and treatment plans for all patients.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $704 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, which resulted in a valuation amount of $1,055 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”,

due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For Depression Management: Depression Remission at Twelve Months, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are expecting to decrease depression remission at twelve months for at least 10% of patients, equating to 150 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $704 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, which resulted in a valuation amount of $1,055 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

c. For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are anticipating that we will test the entire population, and are expecting to increase quality of life scores by 10%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16,750 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention.
This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

d. For Patient Satisfaction Percent Improvement over Baseline of Patient Satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are anticipating that we will test the entire population and are expecting to increase the patient satisfaction scores of patient’s involvement in shared decision making by 5%.

Utilizing, the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16 (per article “BMC Medicine Research” in the journal BioMed Central), which is based on two percent of the expected reduced cost of mobile health care.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $20,000,000
**Project Option 1.2.2** – Increase Training of Primary Care Workforce – Increase the number of primary care providers (i.e., physicians, residents, nurse practitioners, physician assistants) and other clinicians/staff (health coaches and community health workers/promotoras) – 1.2.2: Expansion of Plaza/UNTHSC/TCOM Family Medicine Residency Program

**Unique Project ID:** 138980111.1.7 (Pass 2)

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC)/ 138980111

**Provider:** UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

**Intervention:** Increase the number of primary care providers, particularly family medicine residents, through the expansion of its current 4-4-4 Plaza Hospital/UNTHSC Family Medicine Residency Program to a 6-6-6 program. This is an expansion of a current UNTHSC family medicine residency program at Plaza Hospital.

**Need of the project:** This project supports the RHP 10 goals of improving the health of the population, decreasing per capita costs of service, and improving experience of care through increased access to primary care and preventive health services by increasing family resident providers in training and subsequently in Texas following their graduation from the program.

**Target population:** The target population consists of 18 family medicine resident trainees who will serve patients at Plaza Hospital and the additional patients that will be seen by those residents. It is estimated that the additional residents will conduct 2,000 additional patient visits.

**Expected patient benefits:** The increase in the number resident positions will help to provide care for the anticipated increase of Texans who will gain access to healthcare as a result of the Affordable Care Act.

**Category 1 or 2 expected patient benefits:**
- i. Increase the number of residents by 4 per year by DY4 and by 6 per year by DY5
- ii. Increase the number of primary care visits by 750 over baseline by DY4 and by 1,250 over baseline by DY5

**Category 3 outcomes:**
- i. IT-14.6 – 5% increase by DY4 and 10% increase by DY 5 in percent of trainees who have spent the last five years living in a HPSA or MUA by DY5
- ii. IT-14.7 – 5% increase by DY4 and 10% increase in percent of trainees who report they plan to practice in HPSAs or MUAs by DY5
- iii. IT-14.8 – 5% increase by DY4 and 10% increase in percent of trainees who report they plan to serve Medicaid populations by DY5
Project Option 1.2.2 – Increase Training of Primary Care Workforce – Increase the number of primary care providers (i.e., physicians, residents, nurse practitioners, physician assistants) and other clinicians/staff (health coaches and community health workers/promotoras) – 1.2.2: Expansion of Plaza/UNTHSC/TCOM Family Medicine Residency Program

Unique Project ID: 138980111.1.7 (Pass 2)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/ 138980111

Project Description:
Project Area: Increase Training of Primary Care Workforce
Project Intervention: Increase the number of primary care providers (i.e., physicians, residents, nurse practitioners, physician assistants) and other clinicians/staff

UNTHSC seeks to address the DSRIP Category 1 project area of increase training of primary care workforce by increasing the number of primary care providers, particularly family medicine residents, through the expansion of its current 4-4-4 Plaza Hospital/UNTHSC family medicine residency program to a 6-6-6 program. This program will also promote careers in family medicine in medically underserved areas and Health Professional Shortage Areas.

Goals and Relationship to Regional Goals:

Project Goals:
The project goal is to increase primary care residency training in order to increase the workforce in primary care, specifically family medicine and promote careers in family medicine within Texas with emphasis in medically underserved areas and Health Professional Shortage Areas (HPSAs) through the following: (1) Enrolling an additional six trainee physicians in the Plaza/UNTHSC family medicine residency program representing a 50% increase from current baseline numbers. These additional enrollees, with continued UNTHSC support, will graduate into the primary care workforce after DY5. (2) Increasing the percentage of trainees who have spent at least five years living in a HPSA or medically underserved area (MUA). (3) Increasing percentage of trainees who plan to practice in HPSAs or MUAs. (4) Increasing the percentage of trainees who plan to serve Medicaid populations; and (5) Increasing the number of patient visits by at least 750 in DY4 and 1,250 in DY5.

This project meets the following Regional goals:
The Region’s goals are to meet and improve the health of the population, decrease per capita costs to serve and improve experience of care. This project supports these goals by increasing access to primary care and preventive health services through an increase in family resident providers in training and in Texas following their graduation from the program.
Challenges:
TCOM has had a longstanding commitment to educate primary care physicians in order to provide access to care for residents of Texas. In 2012, TCOM was recognized by the Texas Academy of Family Physicians for achieving 25% of graduating students entering family medicine residency. Given this consistent percent of students wanting to pursue family medicine, the challenge faced by UNTHSC/TCOM is providing available residency training positions in family medicine within the Fort Worth/Tarrant County Region to accommodate the increased TCOM class size that will graduate in 2015 and beyond. This challenge is coupled with Regional and national statistics that the country will need 39,000 more family physicians by 2020, with the need particularly great in Texas, which ranks 47th among states in active primary care doctors for its population. According to G. Sealy Massingill, president of the Tarrant County Medical Society, Tarrant County will be 10-15% short of primary care physicians needed. The family medicine residency at Plaza Medical Center/UNTHSC is currently capped at 12 funded positions. Therefore, UNTHSC seeks to address these challenges by using Medicaid Waiver funds to increase the current number of family medicine residency program positions by 50% from a 4-4-4 program to a 6-6-6 program.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes are to (1) increase the percentage of trainees within the expanded residency who are from HPSAs/MUAs by 10% over baseline, (2) increase the percentage of residents who report that they plan to practice in HPSAs or MUAs by 10% over baseline, (3) increase the percentage of residents who plan to serve Medicaid populations by 10% over baseline.

Starting Point/Baseline:
The residency program in family medicine at Plaza Medical Center is a dually accredited AOA/ACGME residency program that in October 2012 received its ACGME accreditation for 12 ACGME positions. The program was already AOA accredited for 12 positions and was inspected in 2012, receiving a maximum five-year approval. The program currently receives CMS funding for 12 positions (4-4-4) and is capped at this number despite recent ACGME accreditation. The program has 11 residents enrolled (4-4-4). The current residency continuity ambulatory training site is located on Seminary Drive in Fort Worth within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02. Currently the Seminary clinic has a 36% Medicaid payer mix. In 2011-2012, residents provided 5,500 patient visits, which has been consistent for the last three years. This project will allow the number of patient visits to increase by 750 in DY4 and by 1,250 in DY5. The UNTHSC Department of family medicine provides the faculty supervision, teaching, and program directorship for the residency. Currently the department has seven dedicated
Regional Healthcare Partnership

residency faculty committing a total of 3 FTE to residency training activities (four residents to one faculty). Baseline rates for Category 3 outcome measures will be established in DY3.

Rationale:
In 2005, the Council on Graduate Medical Education (COGME) issued a report titled Physician Workforce Policy Guidelines for the United States 2000-2020, which projected a shortage of about 85,000 physicians in 2020. In 2008, the Association of American Medical Colleges (AAMC) updated projections indicating a shortage of 124,000 physicians by 2025 and that universal access to health care would increase this deficit by an additional 31,000 doctors. The American Academy of Family Physicians (AAFP) projects similar shortages of 149,000 physicians and 39,000 family physicians by 2020. Health Resources and Services Administration (HRSA) projects a shortage of 65,560 primary care physicians by 2020.

The Affordable Care Act could give millions of uninsured Texans access to health care. The law shifts the health care focus toward prevention, making primary care providers, particularly family physicians, even more important. Tarrant County Commissioner Roy Brooks said, “the requirements of the act itself will force the system to react in certain ways, and one of the inevitable reactions is that we will have to have a highly trained workforce to help make this system work. We will have to go into training mode that will require the participation of all of our educational resources.” G. Sealy Massingill, president of the Tarrant County Medical Society reported in a recent article that Tarrant County will be 10-15% short of the primary care physicians needed. He points to one limiting factor to primary care growth is too few residency positions available for first-year medical school graduates. “Last year, 1,404 people graduated from medical schools in Texas, but there were only 1,390 residency slots,” said Gary Floyd, vice speaker of the medical association’s House of Delegates.

UNTHSC is uniquely poised to address the shortage of primary care providers. TCOM in 2011 has increased its first-year medical school enrollment to 230, an increase of 75 positions as compared to six years ago. Despite national trends of fewer students graduating into family medicine residencies, TCOM has consistently graduated a high percentage of students into family medicine. In 2012, over 25% of our graduates entered a family medicine residency. With the increase in students prepared to graduate in 2015, the additional residency positions created by this project will serve to retain these trainees in Tarrant County.

Project Components:
No core project components are required for this project area. Core activities include: (1) increasing training of a primary care workforce by increasing the number of family medicine residents trained over current baseline numbers by 50%, (2) hiring two additional precepting faculty, (3) developing a quality assessment/quality improvement curriculum for residents, (4)
additional residents rotating at UNTHSC facilities, and (5) increasing the number of patient visits.

The milestones and metrics were chosen to measure the expansion of the primary care residency training program and increase in intent to serve in HPSAs and the general Medicaid population. Specifically: (1) we will grow and expand the resident program by 50%, 2) we will expand the precepting faculty available to train and mentor primary care trainees, 3) we will develop and implement a quality assessment/improvement curriculum for trainees, 4) we will increase the percentage of residents with intent to serve in HPSAs and MUAs and to serve the Medicaid population and (5) we will increase access to primary care as reflected in increased patient visits. Increase access to primary care was selected as a customized milestone and increase in number of patient visits was selected as a corresponding metric because an increase in resident trainees will result in an increased number of patient visits. Quality Milestone P-11- was selected to promote collaborative learning around shared or similar projects.

Unique community need identification numbers the project addresses:
CN.1 Lack of provider capacity
CN.2 Shortage of primary care services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

Outcome Measure 1: IT – 14.6 Percentage of trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA). Improvement goal is 10% increase in percentage of trainees who have spent the last five years living a HPSA or MUA.

Rationale: Recruitment of trainees from HPSA/MUAs will increase the likelihood that they will return to their communities upon graduation. Likewise, since the residency is located within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02 and serves patients from these areas, residents are more likely to remain in this area. Focusing on these outcomes will provide the necessary primary care services, prevention, and chronic disease management to patients who currently lack access.
**Outcome Measure 2:** IT- 14.7 Percentage of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey. Improvement goal is 10% increase in percentage of trainees who report that they plan to practice in HPSAs or MUAs.

**Rationale:** Residents often pursue a location for practice where they trained, grew up, or where their spouse or significant other grew up. Recruitment of trainees from HPSA/MUAs will increase the likelihood that they will return to their communities upon graduation. Likewise, since the residency is located within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02 and serves patients from these areas, residents are more likely to remain in this geographical area.

**Outcome Measure 3:** IT – 14.8 Percentage of trainees who report that they plan to serve Medicaid populations based on a systematic survey. Improvement goal is 10% increase in percentage of trainees who report that they plan to serve Medicaid populations.

**Rationale:** Residents often pursue a location for practice where they trained, grew up, or where their spouse or significant other grew up. Recruitment of trainees from HPSA/MUAs will increase the likelihood that they will return to their communities upon graduation. Likewise, since the residency is located within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02 and serves patients from these areas, residents are more likely to remain in this geographical area. In addition, the current residency clinic has a 36% payer mix.

**Relationship to Other Projects:** NA

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates - that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*
Specifically, this project’s value was calculated on three outcomes, which included (1) percentage of trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA), (2) percentage of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey, (3) percentage of trainees who report that they plan to serve Medicaid populations based on a systematic survey.

a. For percentage of trainees who have spent at least five years living in a HPSA or MUA, UNT Health Science Center expects to increase the number of family medicine residency trainees by six, which will increase the overall number of residency trainees from 12 to 18. It is anticipated that increasing the number of trainees will allow us to increase the number of patient visits by 2,000 for the project period. In addition, it is anticipated this project will increase the percentage of residents who have spent at least five years living in HPSAs or MUAs by 10%.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,131 (as cited by Agency for Healthcare Research and Quality (AHRQ). Mean Expenses per Person with Care for Selected Conditions by Type of Service: United States, 2010. Medical Expenditure Panel Survey Household Component Data, along with recommendations provided by UNT Health), as the result- of decreasing per capita cost per patient case by increasing primary care services, prevention, and chronic disease management to patients who currently lack access.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $1,878 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $1,878 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

b. For percentage of trainees who report that they plan to practice in HPSAs or MUAs -, UNT Health Science Center expects to increase the number of family medicine residency trainees by six, which will increase the overall number of residency trainees
from 12 to 18. It is anticipated that increasing the number of trainees will allow us to increase the number of patient visits by 2,000 for the project period. In addition, it is anticipated this project will increase the percentage of trainees who report that they plan to practice in HPSAs or MUAs based on systematic survey by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,131 (as cited by Agency for Healthcare Research and Quality (AHRQ). Mean Expenses per Person with Care for Selected Conditions by Type of Service: United States, 2010. Health), as the result of decreasing per capita cost per patient case by increasing primary care services, prevention, and chronic disease management to patients who currently lack access.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $1,878 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $1,878 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Region 10 RHP Plan
Project Option – 1.7.2 - Introduce, Expand, or Enhance Telemedicine/Telehealth – Implement remote patient monitoring programs for diagnosis and/or management of care – 1.7.2: Managing Chronically Ill Medicaid Patients using Interventional Telehealth

Unique Project ID: 13898-01111.1.8 (Pass 3)  
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Provider: UNT Health is the Faculty Group Practice at the University of North Texas Health Science Center comprised of over 220 physicians and other healthcare professionals practicing in 29 locations throughout Fort Worth and Tarrant County. In 2012, UNT Health recorded 553,820 patient encounters of which, approximately 93,471 or 17% were covered by Medicaid. The total gross patient charges recorded for unsponsored charity care provided in 2012 were $82,268,290.

Intervention: This project will use an innovative telehealth monitoring system to manage chronically ill adult patients discharged from hospitals in RHP 10. This project is a new initiative on the part of UNTHSC that utilizes patient monitoring services provided through Care Cycle Solutions (CCS) who have developed proprietary software systems to monitor and manage patients and improve care coordination.

Need of the project: The project is related to the goals of improving the overall health of the population being served, improving the health care experience (quality of care), and providing the best care possible while reducing health care costs over time. Our own research based on CCS telehealth monitoring data (published in 2011 in the Journal of Primary Care & Community Health and the American Journal of Managed Care) showed how telehealth monitoring was associated with reduced 30-day hospitalization rates and, thus, better quality care for Medicare home health patients. The project is consistent with the RHP 10 goals of improved patient health, quality of care and lower costs.

Target population: Chronically ill Medicaid patients discharged from RHP 10 hospitals and enrolled in the telehealth monitoring program. Estimate 700 patients to be served over course of waiver.

Expected patient benefits: A remote monitoring device is placed at the home of each patient and it allows clinicians to communicate with patients and/or their caregivers. The monitoring device tracks vital signs and it can be adapted to work with a glucometer or a peak-flow meter. Patients benefit from intensive monitoring through better care coordination, individualized needs assessments, the initiation of other needed services, and improved access to health care services. This in turn will lead to substantial, measurable improvements in quality of life and activities of daily living given the poor baseline health levels of the population targeted. The patient benefits derived from these improvements will be best captured directly by increases in physical/mental health indicators (e.g., SF-12 scores) and activities of daily living (e.g., Barthel Index scores). The proposed project is important in that the Medicaid population we are targeting (older adults with multiple chronic health conditions) will be costly to CMS in the medium to long-term if these health conditions are not managed properly (and the costs will be incurred by both Medicaid and Medicare).

Category 1 or 2 expected patient benefits:

4. Initiate use of other needed services (e.g., visits from nurses, health educators, respiratory therapists; continuous remote patient monitoring; improved chronic disease management
skills) for the first time for 50% (150) of enrolled patients by DY4 and 55% (385) of enrolled patients - by DY5

5. Improved access to health care services for 700 (300 DY4 and 400 DY5) residents of communities that did not have such services locally before the program

Category 3 outcomes:

i. 3% increase in SF-12 scores over baseline by DY4 and 5% increase over baseline by DY5 (average improvement in patient SF-12 summary scores from beginning to end of program participation)

ii. 3% increase in Barthel Index scores over baseline by DY4 and 5% increase over baseline by DY5 (average improvement in patient Barthel Index scores from beginning to end of program participation)
Project Option – 1.7.2 - Managing Chronically Ill Medicaid Patients Using Interventional Telehealth

Unique Project ID: 13898-0111.1.8 (Pass 3)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Project Description:
Project Area: Introduce, Expand, or Enhance Telemedicine/Telehealth
Project Intervention: Implement remote patient monitoring programs for diagnosis and/or management of care. Providers should demonstrate that they are exceeding the requirements of the EHR incentive program.
This project will use an innovative telehealth monitoring system to manage chronically ill adult patients discharged from hospitals in RHP 10. We will use proprietary software systems developed by Care Cycle Solutions (CCS) to monitor and manage patients and improve care coordination. A telehealth monitoring services company based in Dallas, with 33 offices in Louisiana and Texas, CCS provides daily patient monitoring to 2,200 patients, making it one of the largest telehealth services provider in the United States. Over the last six years, CCS has provided telehealth monitoring services to 16,000 patients—most of them Medicare patients, but many of them dual-eligibles (Medicare and Medicaid). The CCS approach includes a remote monitoring device that is placed at the home of each patient, a transmission system to transfer clinical data to the monitoring center, and a communication system (phone line or a wireless adapter) to allow clinicians to communicate with patients and/or their caregivers. The monitoring device is able to track, for example, blood pressure, heart rate, body weight, and oxygen saturation levels, and it also can be adapted to work with a glucometer or a peak-flow meter depending on individual needs. Patient monitoring data will be reviewed continuously by clinicians with acute care experience (e.g., a nurse or respiratory therapist), and the data will be utilized to identify and design interventions as well as for overall care coordination. Medicaid patients discharged from selected RHP 10 hospitals will be identified and enrolled in the proposed interventional telehealth program. Each patient will be on the program an average of six months. We will be able to manage 150 patients per month during DY4 and 200 patients per month during DY5 (for a total of 700 Medicaid beneficiaries).

Goals and Relationship to Regional Goals:

Project Goals:
The main goal of this project is to implement a telehealth monitoring program to more effectively manage the multiple health conditions of chronically ill Medicaid patients. The project is designed to: (1) Implement a remote patient monitoring program based on evidence-based models and adapted to fit the needs of the population and local context; (2) improve access to specialist care and other needed services (e.g., community-based nursing, case management, patient education and counseling); (3) implement interventions to achieve improvements in
access to care of patients receiving telemedicine/telehealth services using an innovative project option; (4) improve overall quality of life; and (5) improve functional independence (activities of daily living).

This project meets the following regional goals:
The project is related to the goals of improving the overall health of the population being served, improving the health care experience (quality of care), and providing the best care possible while reducing health care costs over time. Our own research based on CCS telehealth monitoring data (published in 2011 in the Journal of Primary Care & Community Health and the American Journal of Managed Care) showed how telehealth monitoring was associated with reduced 30-day hospitalization rates and better quality care for Medicare home health patients. The proposed project is important in that the Medicaid population we are targeting (older adults with multiple chronic health conditions) will be costly to CMS in the medium to long-term if these health conditions are not managed properly (and the costs will be incurred by both Medicaid and Medicare). The project is consistent with the RHP 10 goals of improved patient health, quality of care and lower costs.

Challenges:
Adults with chronic health conditions account for about 30% of personal health care spending in the United States ($635 billion) and inefficiencies in chronic disease management and health care coordination are partly responsible for these disproportionately high health care costs. Telehealth monitoring (“the use of telecommunications and information technology to provide access to health assessment, diagnosis, intervention, consultation, supervision and information across distance”) may be a cost-effective solution to manage the Medicaid population with chronic health conditions. Several studies using either randomized or pre/post test study designs have shown that telehealth monitoring systems can reduce the number of hospitalizations and emergency department visits for chronically ill patients, and they can also lead to improvements in quality of life and better control of chronic health conditions (e.g., stable levels of glycosylated hemoglobin for patients with diabetes).

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes for participating Medicaid patients are to: (1) improve quality of life scores by 5% and (2) improve functional independence (activities of daily living) by 5%.

Starting Point/Baseline:
This project will begin during DY2 and DY3 with a needs assessment to identify needed specialties/services, participation in collaborative learning activities, and program implementation. The proposed interventional telehealth program will serve 700 Medicaid beneficiaries with chronic health conditions in DY4 and DY5. Medicaid patients discharged from RHP 10 hospitals will be identified and enrolled in the proposed interventional telehealth program. Each patient will be on the program an average of six months, and we will be able to manage an average of 150 patients per month during DY4 and 200 patients per month during DY5 (with new Medicaid beneficiaries added to the interventional telehealth program as patients leave the program—mainly because their chronic health condition has been stabilized). Baseline
measures, established for each patient upon enrollment in the intervention, will be compared to their last measure for quality of life and activities of daily living to assess program effectiveness.

**Rationale:**
Inefficiencies in chronic disease management and health care coordination are costly to the health care system and telehealth monitoring is an evidence-based approach that may prove to be a practical and cost-effective health care delivery mode for Medicaid patients with chronic health conditions. Implementing a remote patient monitoring program for health care management may improve access to needed health services (such as community based nursing, case management, patient education and counseling). The proposed remote patient monitoring program may also improve access to care coordination in ways that would not have occurred for the Medicaid population targeted for the intervention.

**Project Components:**
No core project components are required for this project area. Core activities include:
- Conducting a needs assessment to identify needed specialties that can be provided via telemedicine
- Conducting a needs assessment to identify needed services that could be delivered via telehealth
- Participating in face-to-face learning at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects
- Implementing remote patient monitoring program based on evidence-based models and adapted to fit the needs of the population and local context
- Creating a plan to monitor and enhance technical properties, bandwidth, of telemedicine/telehealth program

Our project involves the implementation of a remote patient monitoring program to manage chronically ill adult patients discharged from hospitals in RHP 10. The milestones and metrics selected were chosen based on community needs in RHP 10. More specifically, the milestones selected focus on conducting a needs assessment to identify needed specialties and services that can be provided via telehealth, implementing a remote patient monitoring program based on evidence-based models and adapted to fit the needs of the population and local context, and create a plan to monitor and enhance the technical properties of the telehealth program. The improvement milestones were selected to improve access to services and different types of much needed care options in RHP 10 for chronically ill patients. Functional status (activities of daily living) and quality of life measures will be tracked to inform the progress of the proposed telehealth monitoring program in meeting the needs of Medicaid beneficiaries with chronic health conditions in RHP 10. Quality Milestone P-11- was selected to promote collaborative learning around shared or similar projects.

**Unique community need identification numbers the project addresses:**
- CN.7 – Need to address geographic barriers that impede access to care
- CN.9 – Need for increased geriatric, long-term, and home care resources
- CN.11 – Need for more care coordination.
- CN.13 – Necessity of patient education programs.
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and reasons/rationale for selecting the outcome measures:

IT-10.1 Quality of Life

Demonstrate improvement in quality of life (QOL) scores, as measured by evidence-based and validated assessment tool, for the target population.

Improvement Target: Improvement goal is 5% increase in quality of life scores over baseline by the end of the waiver period. Quality of life will be measured using a validated, widely used instrument (SF-12).

Rationale: Remote patient monitoring has been shown to lower the risk of hospitalization for Medicare and Medicare/Medicaid dual eligible patients with chronic health conditions. These reductions in hospitalization rates are a direct consequence of better care coordination and chronic disease stabilization resulting from intensive patient monitoring. The SF-12 is a general survey instrument designed to capture different dimensions of health and quality of life. The instrument allows for the measurement of not only general physical and mental health but also other important health domains (physical functioning, role functioning, bodily pain, vitality, and social functioning). These health outcomes are expected to improve for our targeted low-income population as a result of better care coordination and chronic disease management achieved by our interventional telehealth program.

IT-10.2 Activities of Daily Living

Demonstrate improvement in ADL scores, as measured by evidence-based and validated assessment tool, for the target population.

Improvement Target: Improvement goal is 5% increase in functional independence (activities of daily living (ADLs)) scores over baseline by the end of the waiver period. Functional independence will be measured using the Barthel Index, a validated, widely used score.

Rationale: Remote patient monitoring has been shown to lower the risk of hospitalization for Medicare and Medicare/Medicaid dual eligible patients with chronic health conditions. These reductions in hospitalization rates are a direct consequence of better care coordination and chronic disease stabilization resulting from intensive patient monitoring. The Barthel Index is a general assessment score of functional independence that includes ten items (bathing, grooming, feeding, dressing, bowels, bladder, toilet use, stairs, transfers, and mobility). The overall index score ranges from 0 to 100, with a higher number indicating more independence. Functional independence is expected to improve for our low-income population as a result of better care coordination and chronic disease management achieved by our interventional telehealth program.

Relationship to Other Projects:
N/A
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B

Specifically, this project’s value was calculated on two outcomes, which included (1) Quality of Life and (2) Activities in Daily Living.

a. For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as patients selected for remote patient monitoring, which would be approximately 700 patients. We anticipate that we will remotely monitor the entire population selected using interventional telehealth and are expecting to increase the quality of life (SF-12) scores by 5%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to the customary $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
b. For Activities in Daily Living (ADLs), UNT Health Science Center defined the population that will be directly impacted by the project as patients selected for remote patient monitoring, which would be approximately 700 patients. We anticipate that we will remotely monitor the entire population selected using interventional telehealth and are expecting to increase the Barthel Index of ADL (functional independence) scores by 5%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $2,500 (as cited in the article, “Assessment of post-stroke quality of life in cost-effectiveness studies: The usefulness of the Barthel Index and the EuroQoL-5D” from the journal Quality of Life Research, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which used the Barthel Index to assess the impact of the target population as a means to calculate an incremental quality-adjusted life-year and applied it to the customary $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.9.2 – Expand Pain Management Care Services

Unique Project ID: 162334001.1.1 (Pass 2)
Performing Provider Name/TPI: JPS Health Network Physician Group/162334001

Provider: The provider system consists of approximately 130 physicians and 30 midlevel providers. The service area is all of Tarrant County. Provider works almost exclusively in JPS Health Network facilities (the region’s public/safety net hospital system) treating JPS patients. Approximately 30% of JPS PG patients are Medicaid and 48% are indigent/uninsured.

Intervention: This project will increase access to specialized pain management as well as expand scope of services to patients needing both medical and complex interventional pain medicine services. By designing a single site pain management clinic and implementing four satellite Patient Centered Medical Home (PCMH) clinics designed for chronic pain management as well as creating an inpatient consult program for those admitted with pain, this will improve access to specialty care for a vulnerable population. This project includes both the expansion and re-design of an existing pain program, as well as many new initiatives and innovative service delivery.

Need for the project: Pain Management currently lacks adequate access to a centralized pain management clinic, interventional pain procedures and inpatient pain consults. Additionally, there are several challenges for the performing provider. There are currently not enough providers to see the volume of patients that require services. Also, there is a shortage of clinic space and no dedicated clinic for pain services causing wait times for the limited interventional services available to be several weeks. Lastly, many advanced pain therapies are unavailable to the indigent patient population. This project will provide funds to hire providers, build a new dedicated pain clinic within a procedure suite, provide inpatient services and allow the full range of advanced pain treatments to become available to patients.

Target population: The underserved/Self-Pay population of Tarrant County and will serve >25,000 over the course of the waiver. The benefit of this project for the Self-Pay and Uninsured population of the region will be to have access to specialized pain management services including both medical management as well as interventional pain services for complex and chronic pain patients. The resulting benefit should be more appropriate dispensing, management and reduced extended utilization of pain medication with better availability to interventional pain procedures to better manage acute pain. This should allow for reduced utilization of Emergency services as well as better inpatient pain management for oncology and related pain inpatient stays with an overall reduced utilization of inpatient services as well.

Expected patient benefits:
- The project seeks to increase specialty care clinic volume of visits and evidence of improved access for patients seeking services from current rate of <30 to >45 in DY4/5.
- IT 2.13 Reduce inpatient admits on those with pain as primary diagnosis by 15%.
- IT 4.10 Reduce ALOS of Oncology patients admitted with pain as primary diagnosis by 40%.
- IT 9.2 Reduce inappropriate utilization of ED with those of pain diagnosis by 20%.

**Project Option 1.9.2** – Expand Pain Management Care Services

**Unique Project ID:** 162334001.1.1 (Pass 2)

**Performing Provider Name/TPI:** JPS Health Network Physician Group/162334001

**Project Description:**
This project will increase access to specialized pain management as well as expand scope of services to patients needing both medical and complex interventional pain medicine services. By designing a single site pain management clinic and implementing four satellite Patient Centered Medical Home (PCMH) clinics designed for chronic pain management as well as creating an inpatient consult program for those admitted with pain, this will improve access to specialty care for a vulnerable population.

This redesign will be the most efficient for the staff providing care, the patients receiving care and enhance procedure cost controls. Most of the procedures currently performed in a JPS Health Network operating room can be done in a procedure room setting with appropriate sedation and monitoring. This would be a significant cost savings and we would be able to provide care to a greater number of patients. The clinic staff would utilize the pain clinic procedure room for most procedures, with operating room utilization only when required.

JPS Physician Group will recruit pain specialists to be housed in this central clinic. This will include the recruiting of a medical director and several mid-level providers. This redesign will support pharmacy services, clinic security, drug testing policy and procedures, patient termination policy procedures, and protocol for violators as well as referral guidelines. We are projecting to have two board certified pain physicians and two mid-levels dedicated to this center. For our inpatient consults, we will have one dedicated board certified pain physician along with one mid-level dedicated to service the inpatient population.

We expect introduction of this centralized pain management program to reduce inpatient days, cost of care and ER appropriate utilization measures.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The purpose of this project is to bring acute and chronic pain management services to patients cared for in the indigent care program of Tarrant County. This will bring cutting-edge treatments not currently available to patients with both malignant and non-malignant pain conditions. The centralized pain clinic will provide services for >45 patients per day with minimal wait times. At this site, patient care will be provided by board certified pain medicine specialists and, as a
result, we expect great improvement in availability and level of services as well as overall patient satisfaction.

This project meets the following Regional goals:

As noted in the RHP 10 Community Needs Assessment, lack of access to specialty care and lack of provider capacity likely contribute to poor patient satisfaction and potential overuse of emergency services.

Challenges:
Pain management currently lacks adequate access to a centralized pain management clinic, interventional pain procedures and inpatient pain consults. Additionally, there are several challenges for the performing provider. There are currently not enough providers to see the volume of patients who require services. Also, there is a shortage of clinic space and no dedicated clinic for pain services, causing wait times of several weeks for the limited interventional services available. Lastly, many advanced pain therapies are unavailable to the indigent patient population. This project will provide funds to hire providers, build a new dedicated pain clinic within a procedure suite, provide inpatient services and allow the full range of advanced pain treatments to become available.

5-Year Expected Outcome for Provider and Patients:

In addition to increasing patient satisfaction, by the end of the Waiver, we plan to reduce emergency department appropriate utilization for chronic pain conditions by 20%, reduce hospital admissions for pain diagnosis by 15% and reduce average length of stay due to uncontrolled pain for oncology patients by 40%. We will also provide the full scope of pain medicine services for patients and develop medical homes for patients needing long-term chronic pain management.

Starting Point/Baseline:
The time period used for our initial baseline was January 2011 – December 2011. We used only the population of JPS Connections patients as well as any self-pay patients. During this period, we had 2.5 FTE providers trained as pain specialists and no mid-levels. This population includes approximately 70% of ED visits with a primary diagnosis of pain, 38% of oncology admits related to pain needs, and 59% of admissions related to pain.

Rationale:
This clinical structure is needed in part because it is no longer possible to adequately assist primary care providers and meet patients’ pain management needs at JPS Health Network under a traditional clinic structure. This is due to the inability to perform many advanced procedures efficiently in a clinic environment and improved management by highly trained providers.

Project Components:
To provide a complete spectrum of pain management services at a single site for the JPS Health Network and pain-focused PCMH clinics in four strategic locations. The goal is to be able to provide care for >45 patients per day at a primary site with coordinated delivery at other locations to be able to accommodate >50 patients per day bringing the total to >100. Increased numbers of specialist and extenders to meet procedural demand and referral demands for in-person specialty visits, consults and procedures will allow patients to receive more timely services.

The core components addressed:

- Increase service availability with extended hours
- Increase number of specialty clinic locations
- Implement transparent, standardized referrals across the system
- Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned”, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations

Our milestones measure an increased population receiving pain management by increasing the number of specialists to meet the demand for in-person visits and procedures, allowing patients to receive more timely services. Implementing a single-site pain management facility with medical management and procedural capability creates efficiency. This will be in concert with four additional highly trained physicians operating in PCMH clinics in strategic locations to service chronic pain patients across Tarrant County. There will also be the ability to provide inpatient pain consults and a specialized pain clinic for oncology patients.

**Unique community need identification numbers the project addresses:**

CN.3  Shortage of specialty care  
CN.8  Lack of access to health care due to financial barriers  
CN.10  Overuse of emergency department services

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project will increase access for the pain management population, resulting in decreased wait times by providing pain services for >45 patients per day at a central location and >50 patients per day at satellite PCMH clinics, as well as >30 inpatient pain consults. This will also expand scope of pain services to multiple categories of both medical and interventional complex pain patients including inpatient and ambulatory oncology patients.

This redesign will be the most efficient for the staff providing care, the patients receiving care and enhance procedure cost controls. Most of the procedures currently performed in a JPS Health Network operating room can be done in a procedure room setting if sedation and monitoring are available. This will be a significant cost savings and we will be able to provide care to a greater
number of patients. The clinic staff will utilize the pain clinic procedure room for most procedures, with the main operating room used only when absolutely necessary.

Implementing a single site pain management facility with medical and procedural management capability will create an efficiency not seen today. This will be in concert with four additional highly trained physicians operating in PCMH clinics in strategic locations to serve chronic pain patients across Tarrant County. There will also be the ability to provide inpatient pain consults and a specialized pain clinic for oncology patients.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

**Potentially Preventable Admissions IT – 2.13 Other Admissions Rate:** Expansion of a pain management clinic will reduce the need for inpatient admissions receiving specialized pain management services. Also, if admitted, the inpatient consult will directly benefit the patient by having a specialized pain consult during his or her stay. Currently, 59% of admissions related to pain could be affected by having a pain management program. Our goal is to reduce admissions of this population by 15% by the end of the Waiver.

**Potentially Preventable Complications and Healthcare Acquired Conditions IT – 4.10 Other Outcome Improvement Target to Decrease ALOS:** With an inpatient consult for those oncology admissions related to pain, the average length of stay will be shortened as the patient will be treated by a specialized pain physician. Today, 38% of oncology admits are admitted due to a primary diagnosis of pain and with no inpatient consult provided by a specialized pain physician, the ALOS is >6. Our goal by the end of the Waiver is to reduce ALOS by 40% to this population making the ALOS 3.6.

**Right Care, Right Setting IT – 9.2 ED Appropriate Utilization:** With the availability of a centralized pain management clinic, the available wait times to be seen will be substantially reduced, eliminating the need to visit the ED. This population includes 70% of ED visits with a primary diagnosis of pain that may not require an ED visit if the availability of an appointment at a pain center was accessible. Our goal by the end of the Wavier is to reduce inappropriate utilization of ED for pain diagnosis by 20%.

**Relationship to Other Projects:**

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Physician Group has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

JPS Physician Group defined the population that will be directly impacted by the project as patients with a primary diagnosis code of pain, both inpatient and outpatient. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is 4.

**Milestone 1** [P-1]: Conduct specialty care gap assessment based on community need.

**Metric 1** [P-1.1]: Documentation of gap assessment.

Goal: Produce a comprehensive gap assessment to meet demand for services and improve specialty care access.

Data Source: Needs assessment pulled from EHR.

**Milestone 1 Estimated Incentive Payment:** $1,728,710

**Milestone 2** [P-11]: Launch/expand a specialty care clinic for pain management.

**Metric 2** [P-11.1]: Establish/expand

**Milestone 3** [P-17]:
- Implement the re-design of pain specialty clinics in order to increase operational efficiency, shorten patient cycle time and increase provider productivity.
- **Metric 3** [P-17.1]: Number of medical specialty clinics that have completed clinic redesign.
  
  Goal: To shorten appointment cycle time and maximize provider productivity allowing the most efficient utilization of specialty provider resources.

  Data Source: Specialty clinic appointment tracking system

  **Milestone 3 Estimated Incentive Payment:** $1,803,639

**Milestone 4** [P]:
- Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.
- **Metric 4** [P-1.2]: Documentation of increased number of visits.
  
  Goal: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

  Data Source: Enrollment reports, EHR

  **Milestone 4 Estimated Incentive Payment:** $1,932,650

**Milestone 5** [I-2]: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 5** [I-2.1]: Documentation of increased number of visits.

Goal: In DY4, increase volume of visits at pain center from current rate of <30 to > 50. As well as >50 at the four satellite PCMH offices and >30 inpatient consults.

Data Source: Enrollment reports, EHR

**Milestone 5 Estimated Incentive Payment:** $1,867,294

**Milestone 6** [I-6]: Patient satisfaction with pain management services.

**Milestone 6 Estimated Incentive Payment:** $1,867,294

**Milestone 7** [I-2]: Increase specialty care clinic volume of visits and evidence of improved access for patients seeking services.

**Metric 7** [I-2.1]: Documentation of increased number of visits.

Goal: In DY5, increase volume of visits at pain center from current rate of <30 to > 60. As well as >50 at the four satellite PCMH offices and >30 inpatient consults.

Data Source: Enrollment reports, EHR

**Milestone 7 Estimated Incentive Payment:** $1,867,294

**Milestone 8** [I-6]: Patient satisfaction with pain management services.
**Expand high impact specialty care capacity in the pain management area including both increased interventional and medical pain management for JPS patients.**

**The redesign will include:**
- Clinic & procedure suite layout and design
- Clinic mgt & staffing
- Physician/provider staffing
- Referral guidelines and requirements
- Overall protocol guidelines for full pain clinic operations
- Patient termination policy, procedure, and protocol for violators
- Drug testing policy and procedures
- Spine surgical backup and surgery services
- Pharmacy services support
- Clinic security
- Establish 4 primary care PCMH’s specializing in care for chronic pain patients which will increase outpatient visits
- Develop a pain management specialty care clinics

**Milestone 4 [-I-1]:** Increase the number of specialist providers, clinic hours and/or procedure hours available for the high impact/most impacted medical specialties.

**Metric 4 [-I-1.1]:** Increase number of specialist providers, clinic hours and/or procedure hours in targeted pain management specialty.

**Goal:** Increase number of specialists to meet demand and referral demand for in-person visits and procedures that will allow patients to receive more timely services. This entails two board certified pain specialists and two mid-levels at the pain center along with four PCP’s with a primary emphasis in pain at the PCMH clinics. For inpatient, one board certified pain specialist and one mid-level.

**Metric 6 [-I-6.1]:** Patient satisfaction scores

**Goal:** Improve patient satisfaction scores in HCAPHS for pain management by 1.5 points over baseline of 80.5 in DY4

**Data Source:** HCAPHS report

**Milestone 6: Estimated Incentive Payment:** $1,932,649

**Metric 8 [-I-6.1]:** Patient satisfaction scores

**Goal:** Improve patient satisfaction scores in HCAPHS for pain management by 3.0 points - over baseline of 80.5 in DY5

**Data Source:** HCAPHS report

**Milestone 8: Estimated Incentive Payment:** $1,867,294
Expand high impact specialty care capacity in the pain management area including both increased interventional and medical pain management for JPS patients.

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 1.1.2 – Expand Primary Care Capacity – Expand existing primary care capacity by expanding primary care clinic hours

Unique Project ID: 216719901.1.1
Performing Provider Name/TPI: Glen Rose Medical Center / 216719901

Provider: GRMC is a rural 16 bed hospital in Glen Rose, Texas serving a population of 7584 in 2011 with a 23% growth in Seniors (65 and over). GRMC is the county hospital in Somervell County for all indigent care as well as being the only facility in Somervell County.

Intervention: Expand clinic hours to allow residents of Somervell County to receive primary care services in an office environment therefore reducing the amount of ER visits for “clinic” type services & reducing readmissions. This is a new initiative.

Need for the project: 216 admissions last year were readmits at a cost of $9000 per patient – reducing this by 10% saves $198,000 in one year.

Target population: Uninsured and underinsured of Somervell county. Estimated number of patients to be served over course of waiver period: 663 additional. Having after hours clinic times available will allow Medicaid and uninsured patients the ability to be seen for well checks and hospital follow ups in an office environment instead of waiting until their conditions exacerbate. The opportunity for convenient, local healthcare is more likely to draw lower income patients that can not afford to drive to Fort Worth where public care might be available.

Category 1 or 2 expected patient benefits: Patient numbers – either new patients or the numbers that come during additional hours. The Category 1 or 2 milestones give us a blueprint to follow enabling us to measure the improvement achieved with this project.

Category 3 outcomes: Reduction in readmissions. The Medicaid and Uninsured patients of our county will be able to make follow up visits after hospital discharges.
Project Option 1.1.2 – Expand Primary Care Capacity – Expand existing primary care capacity by expanding primary care clinic hours

Unique Project ID: 216719901.1.1
Performing Provider Name/TPI: Glen Rose Medical Center/216719901

Project Description:
Expand existing primary care capacity by expanding the primary care clinic hours. We propose to add additional hours to our existing primary care clinics so that patients in the ZIP codes 76043, 76070 and 76077 will have access to the services needed in a timely manner. Currently our clinics are open 8:30 a.m. to 5 p.m. Monday-Thursday and 8:30 a.m. to noon on Fridays. We plan to open an after-hours clinic one night a week so that patients, including the working poor, will have access to their primary care physicians at least 8 non traditional workplace hours. Primary care at the right time is essential in preventive care particularly in chronic conditions such as COPD, CHF and diabetes. A delay in care in these conditions can lead to exacerbation of symptoms, onset of new illnesses that causes the patient to be seen in the emergency department and readmission in cases of recent discharge from an acute stay. The addition of clinic service hours will increase access to primary physicians providing enhanced outpatient management of chronic medical conditions, increase self-management and quality of life for patients served, and reduce readmissions.

Goals and Relationship to Regional Goals:

Project Goals:
The five-year goal of this project is to better serve patients in our area by seeing 15% more patients on an outpatient basis sooner, decreasing preventable hospital admissions and decreasing hospital readmissions by 10%.

This project meets the following Regional goals:

Challenges:
Three of the most common causes for readmissions in acute care hospitals are CHF, COPD and diabetes. Around 5.8 million people in the United States have heart failure with an additional 670,000 people diagnosed with it each year.120 About 1.8 million adults have diabetes in Texas,121 and COPD is the third leading cause of death in the United States.122

120 Heart Failure Fact Sheet – cdc.gov
County, these three diagnoses are responsible for 45% of the deaths, according to the Texas Center for Health Statistics. A study in the New England Journal of Medicine shows 50.1% of the Medicare patients discharged from the hospital and rehospitalized within 30 days after discharge had not had an outpatient visit at a cost to Medicare of approximately $17.4 billion. Current a new patient in Somervell County must wait an average of six weeks before being seen by a primary care physician and an established patient must wait seven to ten weeks for the first available appointment. The expansion of "after hours" clinic is essential to allow patients to be seen in a timely manner, and to receive the right care at the right time in the right setting, thereby decreasing readmissions.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome of this project is to reduce readmissions to GRMC by 10% by increasing our physicians’ office visits by 15%. In a year, this will allow an additional 663 patients per physician to be seen, allowing for follow-up after discharge from the hospital. These additional follow-up appointments will assist in increasing self-management and preventive care.

Starting Point/Baseline:
From October 2011 to August 2012, of the 934 acute care and observation stays, 216 patients were readmitted within a 30-day time frame. We currently have five physicians employed by the hospital as well as two nurse practitioners with outpatient clinics open all day Monday through Thursday and half a day on Fridays.

Rationale:
The Community Health Needs Assessment points to access to primary care as an issue within our county. It also establishes an aging population, and as primary care physicians become increasingly fewer and harder to find in rural areas, it is incumbent on our facility to try to provide the right care at the right time in the right setting.

Project Components:
When patients in our community have timely access to their primary care providers, readmissions will decrease, and cost to patients will be reduced. With the expansion of clinic hours, Component A is not a necessity since we will use the same space we currently use for normal business hours. To defer adding any cost, we will not use Component C, expanding primary care staffing, but will instead flex our current staff to cover the additional hours.

Our milestones will measure the additional clinic hours and visits provided, as well as documenting the correlation in Category 3 of decreased readmissions.

---

Unique community need identification numbers the project addresses:

- CN.2—Lack of provider capacity

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project is a new initiative. No federal funding has been received for it.

**Related Category 3 Outcome Measures:**

**Reasons/Rationale for Selecting the Outcome Measures:**

**Outcome Measure 1:** Potentially Preventable Readmissions – 30-day Readmission Rates (stand-alone) The National Prevention Council has created the national prevention strategy, which places emphasis on wellness and prevention, with patients being seen in a clinic setting postdischarge, and with earlier intervention to decrease readmissions and lower costs associated with readmissions.

**Relationship to Other Projects:**

N/A

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

There are no other providers in the RHP proposing similar project with the same patient base. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Glen Rose has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

Glen Rose defined the population that will be directly impacted by the project as readmitted inpatients. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add milestone bundle amounts over Years 2-5):** $402,243
Category 2: Program Innovation and Redesign
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.4.1– Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

**Unique Project ID:** 020950401.2.1

**Performing Provider Name/TPI:** Medical Center of Arlington /020950401

**Provider:** Medical Center of Arlington is a 278 bed acute care hospital with a primary and secondary service area population of 570,000. It is also a level 4 trauma center with 32% inpatient Medicaid and Uninsured, 51% ED patients are Medicaid and uninsured.

**Intervention:** The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose is to change the organizational culture and impact patient safety and quality with improved patient experience. This is a new intervention.

**Need for the project:** Patient experience scores reflect a deficiency in key areas that are critical for patient safety and quality of care. These include communication with physicians and nurses, communication regarding medications and discharge process. Patients who are Medicaid eligible or uninsured are most vulnerable to communication matters due to greater language and cultural barriers. These patients also face greater obstacles for discharge planning with lack of resources and support in post-acute care. Underserved and Medicaid patients will benefit to a greater degree with improvement in processes that make for a better patient experience.

**Target population:** Target population is all patients served by hospital. Estimated number of patients to be served over course of waiver period: This would be difficult to quantify since all patients are targeted priority on inpatients; we estimate 15,000 a year or 60,000 over course of the waiver will be impacted. We do actively survey 100 patients a month/1200 a year. Patients who are Medicaid eligible or uninsured are most vulnerable to communication matters due to greater language and cultural barriers. These patients also face greater obstacles for discharge planning with lack of resources and support in post-acute care. Underserved and Medicaid patients will benefit to a greater degree with improvement in processes that make for a better patient experience.

**Category 1 or 2 expected patient benefit:** How do they tie into project’s purpose? The project seeks to improve in patient satisfaction scores as measured by HCAHPS Grand Composite. This will be a benefit to patients from better communication with nurses and doctors, better medication management, pain management and discharge planning. Studies have shown with improved patient experience, the quality of care patients experience also improves. This will result in reduce preventable complications such as infections, less readmissions and reduced medication errors. It is estimated patients impacted will be DY 2-15,000, DY 3-15,450, DY 4-16,222, DY5-17,033.

**Category 3 outcomes:** IT-6.1 Our goal is to improve Percent Improvement over baseline of patient satisfaction scores from 64% currently to 75% by DY5. Improvement in scores is part of the purposed of project.
Project Option 2.4.1– Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

**Unique Project ID:** 020950401.2.1  
**Performing Provider Name/TPI:** Medical Center of Arlington /020950401

**Project Description:**  
Medical Center of Arlington is proposing a project to establish baseline Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey scores and implement a patient/family experience strategic plan.

A steering committee will be formed and workgroups of the committee will work on process improvements for patient experience targets. Evaluation will be performed and documented to measure implementation progress, results and make adjustments to improvement plans. As part of the strategic plan, patient experience will be an integral part of employee orientation. A communication plan on work being done to improve the patient experience will be developed and implemented to ensure all employees and physicians are included on progress and initiatives. Studies have shown that improved patient experience can improve patient health outcome and quality.

**Goals and Relationship to Regional Goals:**

**Project Goals:**  
The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose of performing this project is to engage all stakeholder such as leader and employees who can be the high-level role to drive the patient experience improvement across the hospital for a cultural change at the organizational level.

**This project meets the following Regional goals:**  
A major goal of the Region is to pursue the triple aim of improving patient experience of care, improving health of populations and reducing health care costs. Redesigning the patient experience in the Region will impact the health of our community by keeping patients engaged in the health care system.

**Challenges:**  
The hospital has been participating in HCAHPS to measure patient experience in the hospital setting. Implemented training plans have not improved scores. Medical Center of Arlington has achieved grand composite scores of 64% for 2010Q3-2011Q2 and 64% for 2010Q4-2011Q3, which is consistently been below the CMS national average. The scores summarize:
• How well nurses and doctors communicate with patients
• How responsive hospital staff are to patients’ needs
• How well hospital staff help patients manage pain
• How well the staff communicates with patients about medicines, and whether key information is provided at discharge
• Cleanliness and quietness of patients’ rooms
• Patients’ overall rating of the hospital and whether patients would recommend the hospital to family and friends

The project will address targeted patient experiences with that have not been improved by other initiatives.

5-Year Expected Outcome for Provider and Patients:
We expected to be > 75th percentile on grand composite scores for CMS HCAHPS at the end of the Waiver period.

Starting Point/Baseline:
Medical Center of Arlington has achieved grand composite score of 64% in 2010Q3-2011Q2 and 64% 2010Q4-2011Q3, which has consistently been below the CMS national average.

Rationale:
Patient experience scores are measured internally and reported quarterly from a Gallup Survey. These scores are shared with senior leaders and staff in Dashboards and reports. Various committees work on departmental and process issues, but a coordinated, system wide approach is lacking. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization’s resolve to get better and stay better.

The overall approach to redesigning patient experience will be centered on cultural change at the organizational level. This will involve clinicians, patients and their families or caregivers. An organizational strategy will be developed so that we manage patient experience and create avenues to implement the strategic plan/vision. This project option is best for organizational integration, which is critical to successful patient experiences.

Project Components:
All core components will be implemented.
   a) Organizational integration and prioritization of patient experience;
   b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and
Regional Healthcare Partnership  Region 10

Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;

c) Implementing processes to improve patients’ experience in getting through to the clinical practice;

d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Establishing a steering committee with high-level leadership is necessary to drive cultural change to impact patient experiences. A communication plan will be developed to inform all employees and physicians of the work of the steering committee and results to better integrate the process and changes into the culture. Process improvements needed will be identified and analyzed with Lean Six Sigma tools. The work groups will be empowered to implement changes identified and report back to the steering committee. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Evaluation, control and sustain activities are necessary for continuous quality improvements. We will measure the impact of the improvements implemented from CMS HCAPS scores.

Unique community need identification numbers the project addresses:
- CN.10 – Overuse of the emergency department services
- CN.11 – Need for more care coordination
- CN.12 – Need for more culturally competent care to address unmet needs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:

IT-6.1 Percent improvement over baseline of patient satisfaction scores

An organizational strategy will be developed so that hospital will manage patient experience and create avenues to implement the strategic plan/vision. Performance will be measured, among other factors, by the extent to which patient experience improves.

In October 2005, the Joint Commission’s Journal on Quality and Patient Safety published a series of case studies of health care institutions’ efforts to improve both quality and safety. One
of these was from Lehigh Valley Hospital in Allentown, Penn., which used active engagement of patients and families in attempting to improve patient safety.124

Weingart and colleagues (2006) examined inpatients’ reports of service incidents — deficiencies in service quality such as waits/delays, poor communication, poor care coordination, lack of respect for personal preferences, or environmental issues. They found that roughly 40% of patients reported at least one incident and that reporting of incidents was associated with diminished patient satisfaction.125

Also, Kaldenberg and Trucano (2007) examined facility-level relationships between hospital-acquired infection (HAI) rates and patient perceptions of specific aspects of hospital quality in the State of Pennsylvania. Specifically, they chose three questions from an inpatient survey thought to measure practices that, when poorly executed, could create a more infection-prone environment: ratings of cleanliness; of the skill of the person who took the patient’s blood; and of nurses’ response to the call button. All three were found to be significantly, negatively correlated with HAI rates.126

Relationship to Other Projects:
This project is to redesign to improve the patient experience. Projects 020950401.2.3 will enhance the coordinated care model for access to care to better meet the needs of patients and family.

This project supports 020950401.4.5, RD-4 Patient-centered health care. The project will implement training and improvement work on experience targets aimed to increasing patient satisfaction with the hospital, nurses and physicians that will result in a better patient experience.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
The other providers proposing similar projects:

- JPS
- Plaza Medical Center Fort Worth
- Glen Rose Medical Center

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center of Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Medical Center of Arlington defined the population that will be directly impacted by the project as patients with Medicare and all patients who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 4 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The rate per Medicare case of $10,661 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY 5 -1.05% . This totaled $1,236,300.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $ 532,000. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $ 539,000.

The total value of the project was calculated at $2,307,724. Approximately 79% of the project value was assigned to the Category 2 project, $1,824,718 and 21% to the Category 3 project, $483,010.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

Unique Project ID: 020950401.2.2
Performing Provider Name/TPI: Medical Center of Arlington /020950401

Provider: Medical Center of Arlington is 278 bed acute care hospital with a primary and secondary service area population of 570,000. Level 4 trauma center with 32% inpatient Medicaid and Uninsured, 51% of ED patients are Medicaid and uninsured.

Intervention: This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Process improvement would be an expansion/enhancement.

Need for the project: Mortality for sepsis nationally is >30%. Regional readmissions for sepsis are was 22% in 2011 with mortality for readmission at 10.5%. Sepsis was also top 50% of reasons patients readmitted for each of the 10 index conditions and a higher mortality rate for readmission than all other conditions. Readmission for sepsis can occur due to early discharge, improper antibiotic treatment and lack of continuation of medication .(DFW Hospital Council data)

Target population: The target population is patients presenting to ED and all patients diagnosed with sepsis shock, severe sepsis. Approximately 50% of patients to be screened are Medicaid and indigent. It is estimated currently 15% of our patients treated for sepsis are Medicaid eligible or indigent. Estimated number of patients to be served over course of waiver period: Based on current processes over 625 patients, however with improvement in diagnosis a key element of the program, this number is expected to increase to estimated 1200 patients in 5 years. Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

Category 1 or 2 expected patient benefits: The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence-based care with improved the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with severe sepsis and septic shock. We expect to diagnose and treat 1200 sepsis patients (estimated at DY 1-112, DY2-235, DY 3-259, DY 4-284, DY 5-310). 112 patients were diagnosed in DY 1 with the implementation of the sepsis program. However only 82 patients were properly treated with the evidence based care plan from the program. In addition it is estimated based on similar size hospitals with sepsis programs, we should expect to diagnosis between 235 and 300 patients a year. Potentially we are
not properly diagnosing 125 patients a year. Patients that may not diagnosed/diagnosed timely or not receive evidence based treatment may have resulted in death or disability. The program will have great benefit to patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.

Category 3 outcomes: The outcomes selected reflect the effectiveness of implementing evidence-based care such as reduction in mortality and decreased length of stay.

IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis estimated DY 1 mortality was 27% and improvement of 25% by DY 5, mortality would be 20%.
IT -4.9 Our goal is the reduce the Average length of stay of patients with sepsis Estimated DY 1 ALOS was 8.9, a reduction goal by DY 5 of 2 days to ALOS of 6.9.

Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

Unique Project ID: 020950401.2.2
Performing Provider Name/TPI: Medical Center of Arlington /020950401

Project Description: The project will design and implement a process improvement plan to increase the utilization and compliance with sepsis resuscitation and management bundles to improve patient outcomes.

Medical Center of Arlington is committed to continuous quality improvement so all of our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for emergency department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient who screens positive for severe sepsis or septic shock and is hypotensive.

Medical Center of Arlington will also track primary endpoints of mortality and ICU LOS. Process and other measures that will be tracked include percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the
mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous renal replacement therapy.

Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate >4 mmol/L (36 mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of sepsis resuscitations and management bundles still remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to implement Process Improvement plan to improve safety and quality for those patients with sepsis. We will:

1. Achieve 90% compliance with the sepsis resuscitation and management bundles in patients admitted to the ICU.
2. Substantially improve early sepsis identification, reduce sepsis-related mortality by 25% from baseline.
3. Develop an effective and fully implemented measurement and reporting system supporting compliance with the sepsis resuscitation and management bundles.
4. Continue to work with Emergency Medical Services to improve delivery of care provided to patients with suspected infection.
5. Improve identification of sepsis patients housewide by implementing nursing admission screening and shift assessments for sepsis screening.
6. Improve identification of sepsis, compliance with current sepsis resuscitation and management bundles in the emergency department.

This project meets the following Regional goals:
This project supports the Regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence-based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of posthospital care in addition to quality-adjusted life gained.

**Challenges:**
According to the CDC 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the factors contributing to the design of evidenced-based standardized care sets and subsequent adoption of those tools will reduce variation and associated cost. Early recognition and management of sepsis results in lives saved.

**5-Year Expected Outcome for Provider and Patients:**
We expect to reach 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate > 4 mmol/L (36 mg/dl). We also expect to be 90% compliant with application of the sepsis bundles for patients who meet specified criteria.

**Starting Point/Baseline:**
The number of patients with severe sepsis, septic shock and/or lactate > 4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would be 235 to 300 per year for a total of 1200 patient over course of the waiver. The hospital only diagnosed 112 patients in DY 1. Of those patients diagnosed only 82 received evidenced based care for sepsis bundles. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012. Early data collection indicates compliance with sepsis bundles is as low as 50%.

**Rationale:**
According to the CDC 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS, which has improved. We are in the early stages of implementing the program components, and we still face challenges. Additional interventions will be implemented (e.g., shift assessments on all in-house
patients). To be successful, we need to eliminate/correct processes that create time delays, non-compliance to order set, and failure to identify/diagnose sepsis. We have been as low as 50% in compliance in implementing sepsis bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

**Project Components:**
The project components to report number of patients diagnosed correctly and for sepsis bundle compliance are necessary to measure the success of implementing the sepsis improvement plan.

A sepsis improvement plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, inpatient units, EMS), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay, compliance with sepsis diagnosis and protocols for sepsis bundles are critical. In implementation, it is necessary to examine the plan, understand what is working and what is not, identify barriers and make corrective action. Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvement.

**Unique community need identification numbers the project addresses:**
- CN 11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Sepsis resuscitation and management bundle program kicked off in 2012 as a hospital-specific program. Applying process improvement methodologies to the sepsis program will greatly enhance the chances of success in implementing the plan and seeing reduction in mortality and average length of stay.
Related Category 3 Outcome Measures:
We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Outcome Measures and Reasons/Rationale For Selecting The Outcome Measures:

**IT-4.8 Sepsis mortality (Stand-alone measure)**

By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease length of stay, reduce health care cost and mortality. Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection.

**IT-4.9 Average length of stay (Non-stand-alone measure)**

By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease complications with resulting length of stay in ICU and overall LOS.

Relationship to Other Projects:
This project supports the population-focused improvements 020950401.4.4, RD-3 Potentially Preventable Complications (PPCs). Improved quality with evidence-based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
The following providers are also proposing projects to address sepsis resuscitation and management improvement:

- JPS
- Plaza Medical Center Fort Worth
- North Hills Hospital
- Huguley Memorial Medical Center
- Texas Health Harris Methodist HEB

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.
Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Medical Center Arlington defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 3%, which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 50. The estimated pricing for mortality of $10,000 per life was used. This reflected such considerations a costs for care, lost wages, and quality of life. This totaled approximately $500,000 for 5 years.
The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 9 days per patient. This was estimated at total of reduced in patient days by DY 5 of 1765. The estimated cost per day for a sepsis patient is $907. This totaled approximately $1,600,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $500,000.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 1. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $962,000.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of mortality reduction at $440,000.
To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $641,000.

The total value of the project then was estimated at $4,643,316. Approximately 79% of the total value was assigned to Category 2 project and the remaining 11% of value assigned to Category 3 outcome for Sepsis Mortality and 9.7% assigned to Category 3 outcome for reduced Average Length of Stay.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.12.2– Implement a Care Transition Program for Patient at high risk of readmission

**Unique Project ID:** 020590401.2.3

**Performing Provider Name/TPI:** Medical Center of Arlington / 020590401

**Provider:** Medical Center of Arlington is 278 bed acute care hospital with a primary and secondary service area population of 570,000. Level 4 trauma center with 32% inpatient Medicaid and Uninsured, 51% of ED patients are Medicaid and uninsured.

**Intervention:** The project is to implement a program for improvements in care transitions and coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. Medical Center of Arlington has not had a formal care transition program only discharge planning and placement.

**Need for the project:** Readmissions within 30 days of admission was 14% in 2011 (71,153). Of the total readmission in the region, 22% were Medicaid eligible or uninsured (15,653). Reduction in readmissions in region will save lives and reduce overall health care costs.

**Target population:** The target population of inpatient admissions that are high risk for readmission. We estimate 34% of patients that are at risk for re-admission are a high risk. Based on studies of readmissions, 20% of high risk patients are readmitted in 30 days and 32% are readmitted in 90 days. Estimated number of patients to be served over course of waiver period: It is estimated 1,050 patients will be served over the course of the waiver. Patients who are Medicaid eligible or uninsured will benefit as they more often have higher risk to transition from hospital care due to lack of financial resources, language and cultural barriers and lack of support systems.

**Category 1 or 2 expected patient benefit:** The purpose of the project is to select the patients at high risk of readmission and selected interventions to reduce readmission. The process milestone to standardized care transition processes and create a patient identification system are necessary to have program for those interventions needed and a way to identify high risk patients. Reducing preventable hospitalizations and preventable rehospitalization lowers health costs and improves patients’ quality of life. In DY3 we expect to have 250 patients in the care transition program, by DY 4 this will increase to 525 additional patients and by DY 5, 787 additional patients. This is expected to be unique patients will be receiving targeted interventions to reduce the risk of re-admission.

**Category 3 outcomes:** IT -3.2 Congestive Heart Failure 30 day readmission rate. Congestive Heart Failure readmission at Medical Center of Arlington has been > 20%. Purpose is to reduce high risk patient, it is known that patients with CHF are high risk due to chronic nature of illness and medications.
**Project Option 2.12.2**– Implement a Care Transition Program for Patient at high risk of readmission

**Unique Project ID:** 020950401.2.3  
**Performing Provider Name/TPI:** Medical Center of Arlington/020950401

**Project Description:**
This project will establish a Care Transition program for discharged patients who are at high risk of readmission in need of care coordination.

The project corresponds to Project Area 2.12 Implement/Expand Care Transitions Programs, Option 2.12.2. In developing the program, various interventions will be tested and piloted to decide best work for what patients. These will include discharge checklists, hand-off communication plans with receiving providers, and early follow-up such as home care visits, primary care outreach, and/or patient callbacks. Resources such as staffing, service providers (internal or external) and partners necessary to carry out the interventions will be indentified and acquired.

Care Transition plan processes will be developed along with policies and procedures to implement the interventions identified as best practices.

A risk assessment tool will be used to identify patients at high risk for readmission and most in need of intensive case management on a routine basis A case management registry will be implemented to demonstrate case management functionality.

A monthly meeting for collaboration will be held with eight other providers in the Region (RHP 9, 10 and 18) implementing care transition programs. Those participating in the collaborative include case management, quality, and chief medical officer. The goal will be to decide on protocols and interventions, partnering with other providers, and sharing experiences and results.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The ultimate goal of this project is to implement improvements in care transitions and coordination of care from inpatient to outpatient, postacute care, and home care settings in order to prevent increased health care costs and hospital readmissions. In order to achieve this goal, care transitions must be safe and effective. The purpose of this project is to assure a comprehensive, evidence-based program including written policies and procedures with protocols, staff training and quality improvement activities is put into practice to reduce readmissions.
This project meets the following Regional goals:
Regional goals include having better health outcomes and reduced health cost. This project contributes to these goals with better/optimal health outcomes achieved by improving patient education, self-management skills, and safe, effective care transition to postacute to avoid gaps/failures in care delivered to patients. Reducing readmission prevents morbidity declines, stabilizes health and prevents hospitalization costs.

Challenges:
Medical Center of Arlington, like many acute care hospitals, faces challenges in ensuring appropriate discharge and safe, effective care transition. We rely on other providers for the postacute care of patients. There are inherent issues with relying on other providers, such as hand-off communications, standard of care variations, and lack of feedback on results of postacute care. Patients’ circumstances can also present challenges. These include but are not limited to, barriers from patients’ socioeconomic status, lack of support (family/community), and lack of insurance/financial coverage for postacute services.

A Care Transition program will implement interventions such as hand-off communication tools and follow-up with postacute care providers to bridge the gap to better ensure care is provided timely and appropriately. The program will also attempt to identify patients’ individual barriers before discharge. Once the barriers are known, case managers can proceed with effective interventions to mitigate risk of ineffective discharge and transition.

5-Year Expected Outcome for Provider and Patients:
Medical Center of Arlington’s goal is to register at least 50% of patients identified as high risk for readmission in registry. In DY3 we expect to have 250 patients in the care transition program, by DY 4 this will increase to 525 additional patients and by DY 5, 787 additional patients. This is expected to be unique patients, that will be receiving targeted interventions to reduce the risk of re-admission. We expect the re-admissions for these patients to be reduced by 50%.

Starting Point/Baseline:
Medical Center of Arlington has identified 16,000 cases at risk for readmission from Q1 2011 to Q4 2011. We estimate 34% of patients are at risk for readmission. Based on studies of readmissions, 20% of high-risk patients are readmitted in 30 days and 32% are readmitted in 90 days. In DY2, we will establish a baseline number for high-risk patients using appropriate risk assessment tools to establish the defined population that will be targeted with the care transition program. We estimate there are 1,050 patients in a year at high risk for readmission in 30 days based on these trends.

Rationale:
Patients face many obstacles in discharging from acute care hospitals to ensure a safe and effective transition to the next care setting. We have identified and measured readmissions over time and have improved the rate of readmission with traditional discharge planning. However,
the traditional discharge planning process is proving less effective with more patients with chronic diseases and patients with multiple comorbidities, as the care transition is often too complex for standard discharge planning.

Care transition coordination at postdischarge from an acute care setting with specific evidence-based interventions is necessary to reduce risk factors and avoid readmissions.

**Project Components:**
The components in this project option allow for more innovation with testing and piloting of interventions such as discharge checklists, hand-off communication with receiving providers, which is important to Medical Center of Arlington. Preset interventions limit the tailoring of care, and Medical Center of Arlington seeks the opportunity to test new interventions with population and market changes, as well as with updated evidence-based interventions available in the next five years.

The milestones selected reflect the actions necessary to develop a care transition program. The project will need to pilot and test interventions on the patient population targeted for care transition programs. The risk assessment tool will be developed and utilized to select the patients in need of care management. Interventions will be added to policy and procedures to allow for system adoption by identifying responsible parties, activities, timelines and anticipated outcomes related to a successful discharge and follow-up care. Tracking patients, interventions and outcomes will be a part of the project. As such, a case management registry will be implemented.

**Unique community need identification numbers the project addresses:**
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Medical Center of Arlington has not had a formal care transition program. Discharge planning for postacute services has been provided for patients based on medical need. Ensuring appropriate services are carried out to avoid discontinuity of care and follow-up to measure results on interventions have not been consistently in place.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
*IT-3.2 Congestive heart failure 30-day readmission rate*

Congestive heart failure was the top cause of preventable hospitalizations (194.8 per 1,000 Medicare enrollees) in RHP 10. Reducing preventable hospitalizations and preventable rehospitalization lowers health costs and improves patients’ quality of life.
The basis for selecting a Care Transition program is the evidence-based studies that have tested various interventions and measured successful outcomes of reduced readmissions.

The care transition from acute care to postacute care setting can be fragmented without appropriate standards of care in place to avoid gaps in transition. Actively screening patients for risk factors is the first step. Communications and expectations of patients and providers must be improved. Patient education and coaching are also key to allow patients the best chance of success in self-management of their care.

We believe Care Transition programs provide best prospect to address these issues and to be successful in reducing readmissions.

There are many validated evidence-based programs/models that have been developed and tested for care transition programs’ effectiveness in reducing readmissions. These include Naylor, RED and BOOST. Also the Institute for Health Care Improvement has issued a report detailing various care transition programs/models and interventions tested and effective in reducing readmissions.¹²⁷

**Relationship to Other Projects:**

This project supports and reinforces 020950401.2.1 Redesign to Improve Patient Experience. Part of redesigning the patient experience includes the discharge planning process, which the Care Transition program will address.

This project supports the focused improvement of 020950401.4.3, RD-2 30-day readmission, as it will enable patients to receive appropriate targeted interventions aimed at preventing the need for hospitalization. It also supports 020950401.4.5, RD-4 Patient-centered health care, as the patient experience will be improved through comprehensive care management assisting patients with discharge to their next care setting.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

Other providers in the RHP will be implementing Care Transitions projects:

- JPS
- UNTHSC
- Wise Regional Health System

This project will participate in the Region’s Learning Collaborative activities. *(See Appendix G for a discussion of the Region’s two proposed learning collaboratives, along with a list of participating provider projects for each.)*

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Medical Center of Arlington has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Medical Center of Arlington defined the population that will be directly impacted by the project as patients admitted with congestive heart failure who are at risk for readmission. The percentage of the population expected to be positively impacted by the project is 5%, which was determined based on studies of similar projects implemented elsewhere. This was approximately 16 CHF readmissions per year, for 5 years would be 80 readmissions. The cost saved per admission was straited between $7,000 to $8,500 in the region. Our cost estimate was $7250 per readmission saved for a total of $590,000 saved. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted by avoiding a hospitalization, there is an avoided financial burden, better health outcomes and improved quality of life. The value calculated was based on a proportion of total value of readmission reduction savings of $590,000. An index value of 3 for five years was valued at $354,000.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases, and the burden on society is reduced. The value calculated was based on a proportion of total value of readmission of $590,000. An index value of 1 for five years was valued at $118,000.

The total value for avoided costs, value to the individual and community was calculated at $1,063,000. The Category 2 Project was valued at 79.11% of total value based on the funding protocol guidance on values share by category.

Project Summary Template to be completed for each Category 1 and 2 project

Official project name:
Implementation of the use of antenatal steroids in prevention of preterm birth and low birth weight

Unique project identifier: 022817305.2.1

Name of provider system: Tarrant County/dba Tarrant County Public Health

Size of provider system/service area: 420 FTEs, 20 sites, providing public health services to 1.9 million in Tarrant County

Provider’s role in region’s health care infrastructure (especially for Medicaid and indigent/uninsured): Tarrant County Public Health services as the public health entity for the county of 1.9 million with the goal to focus on population based services and data.

Project intervention: -Implement the use of antenatal steroids to prevent preterm birth in women with a history of spontaneous preterm birth.

Is project intervention new or an expansion of an existing initiative?: -New

What is regional need for project (Any data? Why should CMS fund this to improve care for Medicaid and underserved of Region 10?): CN.19 Tarrant County has the second highest infant mortality rate in counties with over 10,000 births/year. Most babies that do not survive the first year are born early and are low birth weight. - The high incidence of preterm births and low birth weight in combination with the availability of an intervention to help prevent preterm births in women with a history of preterm birth, makes the implementation of the antenatal steroids a viable option for reducing preterm birth. The expected results are lower immediate costs of Medicaid and long term financial for Medicaid as preterm babies (IT 8.4) and low birth weight babies (IT 8.2) are likely to have life-long physical and developmental concerns,

Who is the target population? Pregnant women with a history of spontaneous preterm birth.

Estimated number of patients to be served over course of waiver period. -The annual average number of preterm births to women with a history of spontaneous preterm birth is 110. Approximately 330 women will be served over the time period of DY3-DY5. Although, not a part of the waiver, some women who do not have a history of preterm, but have a short cervix due to lack of progesterone may benefit from the provider usage as well.

What is the project’s benefit for Medicaid and Uninsured of your Service area? (This is a critical component.) Per the March of Dimes, the cost of a - preterm birth and low birth weight is 10 times that of a - term birth with a birth weight above 2500 grams. There will be cost savings in
the short term as well as less long term concern for the families - when babies have a longer gestation.

What is expected project/intervention benefit as measured by: Category 1 or 2 milestones selected for project? How do they tie into project’s purpose? 
- Implementation of the use of antenatal steroids for pregnant women with a history of spontaneous preterm birth has been proven to help reduce preterm birth, therefore helping to reduce Medicaid costs. Because most preterm babies are also low birth weight, the incidence of low birth weight should be reduced in women who have a history of preterm birth and receive antenatal steroids. Category 3 outcomes selected? How does this tie back to the project’s purpose? Implemented changes in years DY3- DY5 should help reduce the incidence preterm birth by 20% (IT 8.4) and in the incidence of low birth weight by 20% (IT 8.2).

**Project Option 2.7.4** – - Implementation of the use of antenatal steroids in prevention of preterm birth and low birth weight

(Implement innovative evidence-based strategies to reduce low birth weight and preterm birth)  
**Unique Project ID:** 022817305.2.1  
**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/022817305  
**Project Description:**  
Implement innovative evidence-based strategies to reduce low birth weight and preterm birth

- Over 70% of the infant deaths in Tarrant County are short gestation (defined by less than 27 weeks) and low birth weight (defined as a birth weight of less than 2500 grams). The implementation of the use of antenatal steroids in pregnant women with a history of spontaneous preterm birth, to prevent a subsequent preterm birth is an evidenced practice. There is a need to educate providers and women about the use of the antenatal steroids in the prevention of recurrent preterm birth. The measures will include: 1) the number of providers; 2) the outcomes both before and after the education of the providers; 3) the number of women educated in the target population; and 4) the preterm birth rate for Tarrant County. The incidence of preterm birth in Texas in 2009 was 13.0/1000 live births. For Tarrant County in 2010 the incidence was 10.9/1000 live births.¹

**Goals and Relationship to Regional Goals:**  
**Project Goals:**

-The goals of this project include:

---

¹ [http://www.dshs.state.tx.us/vs/reqproc/certified.copy.shtn](http://www.dshs.state.tx.us/vs/reqproc/certified.copy.shtn)
Provide education for providers regarding antenatal steroids for prevention of preterm birth. (Implementation of best practices)
Develop and implement a campaign for women who have a history of spontaneous preterm birth. (Better health for infants).
Monitor preterm birth incidence and vital statistics. (Better health for infants and lower costs)
Monitor low birth weight incidence and vital statistics. (Better health for infants and lower costs)

This project meets the following Regional goals:
This project addresses CMS aims: (1) Better care with the implementation of best practices to prevent spontaneous preterm birth; (2) Better health for infants who are born at a normal gestation; and (3) Lower costs, as reducing the incidence of preterm and low birth weight births will reduce costly hospital stays for infants.

Challenges:

Tarrant County has eleven delivery hospitals. Because most of the prenatal care is provided outside of the hospital systems (with the exception of JPS) it will be necessary to capture the attention of health care providers who deliver at these hospitals in a variety of venues, including in person, via the medical society, and grand rounds. In addition, the population that the antenatal steroids benefits are women with a history of spontaneous preterm birth, reaching this group with the antenatal steroid message is challenging as it has a more narrow focus than all pregnant women or all women of childbearing age. Finally, the vital statistics data to measure the success of the use of the antenatal steroids lags about 2 years. Therefore, data collection will be more labor intensive on the part of public health staff, working with the providers and the delivery hospital systems.

5-Year Expected Outcome for Provider and Patients:

-Our 5-year expected outcome is an increase in the use of antenatal steroids for the prevention of spontaneous preterm birth in pregnant women with a history of preterm birth, when appropriate. The reduction of the incidence of preterm birth (IT 8.4) will be 20%, by the end of DY5. With increased gestational age, the incidence of low birth weight (IT 8.2) should be reduced by 20% as well by the end of DY5.

Starting Point/Baseline:

-The baseline for the number of preterm births comes from the 2010 numbers for Tarrant County births. The total number of births 2010 was 27,885. Of those births, the total number of preterm
births was 3029. Because the antenatal steroid project is targeted to women who have had a previous spontaneous preterm birth, the Texas vital statistics data were further examined to find there are approximately 110 preterm births to women who have had a history of spontaneous preterm birth annually in Tarrant County. In Tarrant County, the 2010 the race/ethnicity breakdown of the preterm births to women with a history of spontaneous preterm birth was: White women had a 28.7% subsequent preterm birth; Black women had a 31.8%; Hispanic women had a 26% of the subsequent preterm births and Other was the category for 25.8% of the preterm births. The 110 pregnant women who have a history of preterm pregnancy also have a history of low birth weight (less than 2500 grams) so that number will serve as the baseline for low birth weight.

**Rationale:**

-Preterm birth is a birth that happens before 37 weeks of gestation. Babies that are born too soon may have many health problems which require NICU treatment, as well as long term physical and developmental concerns. These babies may also suffer a fetal or infant death. Progesterone may help prevent these preterm deliveries and deaths. Progesterone is a hormone that supports a healthy pregnancy. In a normal pregnancy this hormone gradually rises to 300-400 mg per day during the third trimester. This promotes a healthy uterus, supports gestation, inhibits uterine activity, blocks effects of oxytocin and relaxes the myometrium which is the smooth muscles of the uterus.

There have been studies of the use of 17 Alpha-Hydroxyprogesterone Caproate to prevent the recurrent of preterm delivery. In one study 19 centers enrolled 1039 women with a documented history of spontaneous preterm birth at 20 to 36 weeks of gestation in a previous pregnancy. The gestation age at entry was at 15-20 weeks confirmed by ultrasound and needed to be a singleton gestation, with no major fetal anomalies. Of the 1039 women enrolled: 576 refused consent; 463 randomized. Of these, 310 were given 17-P and 153 given placebo. This study concluded that 5-6 women with a previous spontaneous preterm birth would need to be treated to prevent one < 37 weeks.

The use of 17 Alpha-Hydroxyprogesterone Caproate to prevent the recurrent of preterm delivery is now considered an evidenced based practice that should be promoted for the prevention of preterm term birth in pregnant women with a history of spontaneous preterm birth. This progesterone hormone therapy has been approved by the FDA hydroxyprogesterone caproate injection, commonly known as 17P, which is a synthetic form of the hormone produced during

---

2 [http://extra.dshs.state.tx.us/grandrounds/gr‐10‐10‐12.pdf](http://extra.dshs.state.tx.us/grandrounds/gr‐10‐10‐12.pdf)

pregnancy. It will be marketed under the brand name Makena and given in weekly injections to pregnant women between 16 and 20 weeks gestation and continuing until 37 weeks gestation. The hormone would be used on women with a previous preterm pregnancy that had a loss between 20 weeks and 36 weeks 6 days due to spontaneous labor or pPROM. This hormone does not work on twins, triplets or nulliparous women with CL<3 cm. The strategy will be promoted in selected hospital systems in Tarrant County to reduce preterm births in women with previous spontaneous PTB.

**Project Components:**

**This project does not have required components.**

The use of antenatal steroids for the prevention of preterm birth in women who have had a history of preterm birth is an evidenced based practice. The major component of the proposal is to increase knowledge about the use of antenatal steroids with providers and women with a history of spontaneous preterm birth. The provider education will be will be provided by experts in maternal medicine. In addition, a campaign will be developed to inform women in the target population about the availability of antenatal steroids as well as other healthy pregnancy tips. The education will be ongoing for both groups as there will be changes in both populations.

**DY2:** To develop plan to recruit a full-time prematurity prevention coordinator, part-time interviewer and part-time record abstractor. The TCPH maternal health coordinator will train the newly hired staff. Staff will complete training. Provider contact information will be secured from the delivery hospitals. Providers of education regarding the use of antenatal steroids will be secured.

**DY3:** The education for the providers will be conducted throughout the year. The message will focus on the use of antenatal steroids as a mechanism for prevention of preterm birth and low birth weight in women with a history of preterm birth. Plans for the outreach campaign for the target population of the women will be developed.

**DY4:** Provider education will continue. The campaign for the women in the target population will be launched. The focus will be on the use of antenatal steroids as a possibility to discuss with their health care provider for the prevention of preterm birth.

**DY5:** Education for providers and the target population of women will continue.

**Unique community need identification numbers the project addresses:**

• CN.19 – Need for more and earlier onset of prenatal care.

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

- This project is a new project. No federal funds have ever been received for this project.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
- IT 8.4 Reduce Preterm birth rate
- IT 8.2 Reduce low birth weight

Selection of the Category 2 project to implement the use of antenatal steroids for the prevention of preterm birth and low birth weight, in women with a history of preterm birth is listed as an evidenced based practice. Data from Institute of Medicine of the National Academies reveals that a - preterm birth has an associated annual societal economic cost of $51,600 per preterm birth.\(^7\)

Relationship to Other Projects:
• Related Category 1 and 2 projects
• JPS Health Network # 126675104.2.16 Journey to Life: Prenatal Care and Healthy Babies Initiative (Develop and implement a comprehensive Perinatal Services Program that includes preconception, prenatal and interconception care for low-income women of childbearing age in Tarrant County.)

Related Category 4 population-focused improvements: N/A

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
- TCHP is unaware of a learning collaborative for infant health outcomes. However, there are related projects submitted by both JPS and UNTSC. Partnering with these entities would benefit all efforts and can be done easily.

Project Valuation:
• Institute of Medicine of the National Academies

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and

\(^7\) http://nap.edu
outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Tarrant County Public Health defined the population that will be directly impacted by the project as the annual number of pregnant women with a history of spontaneous preterm birth or for the project term approximately 330 individuals. The percentage of the population expected to be positively impacted by the project in DY5 is 20% or approximately 22 full term births. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. The DY5 goal is for the estimated 110 pregnant women with a history of spontaneous preterm birth at least 20% will have infants born full term or approximately 22 full term births. As well, the DY5 goal for low birth weight is a 20% reduction in women who have a history of preterm birth. It is estimated that 22 of the 110 women in DY5 will have a normal birth weight baby greater than 2500 grams.

**Outcome Measure 1: -IT 8.4 Reduce Preterm birth** The 2005 annual United States societal economic cost associated with a preterm birth is $51,600 (22 X $51,600 = $1,135,200). This total value is multiplied by the individual impact of 3 and the community impact of 2 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the actual total outcome valuation of IT-8.4 of $14,757,600. Based on the RHP 10 valuation model Category 2 is 89.27% of the total project value or $13,173,706.

If the Bureau of Labor Statistics Consumer Price Index calculation was applied to the 2005 societal economic costs for 2012 dollars the cost would be $60,660 per preterm birth. In 2012 dollars the total project valuation would be $17,348,760. Therefore the project valuation is discounted by 14.9% to a $14,757,600 total project valuation.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because a full term birth contributes to improved health outcomes and quality of life.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because reducing preterm births reduces the annual societal economic cost associated with preterm birth.
Valuation Reference

Outcome Measure 1: -IT 8.4 Reduce Preterm birth rate

$51,600 economic cost associated with preterm birth. This is the 2005 annual societal economic burden associated with preterm birth in the United States.
Institute of Medicine of the National Academies
Preterm Birth Causes, Consequences, and Prevention 2007 Report

Outcome Measure 2: - IT 8.2 – Reduce low birth weight is valued at zero. As the population that is being addressed is the same population that is being addressed in Outcome Measure IT 8.4. It is expected that the increased gestational age will yield increased birth weights.
**Implement Evidence-Based Strategies to Reduce Preterm Birth and Low Birth Weight** – Reducing Preterm Birth and Low Birth Weight Using Antenatal Steroids

**Tarrant County/ dba Tarrant County Public Health**

- 022817305.3.19
- 022817305.3.21

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1 [P-X]:** [P-X]: Develop plan to recruit a full time - Prematurity Prevention Coordinator, part time interviewer and part time abstractor.

**Metric 1 [P-X.1]:** Written approval from Tarrant County Commissioners Court and Human Resources to hire a full time - Prematurity Prevention Coordinator, part time - interviewer and part time abstractor.

- Baseline/Goal: Hiring one fulltime and 2 part time employees

**Milestone 1 Estimated Incentive Payment:** $1,036,285

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 4 [I-X]:** Train providers on the use of antenatal steroids to prevent preterm birth and low birth weight.

**Metric 1 [I-X.1]:** Training records, curriculum, evaluation and articles.

- Goal: Provide 5 presentations and use 2 other media to educate providers.

**Data Source:** Training Attendance Records and evaluations

**Milestone 4 Estimated Incentive Payment:** $1,621,606

**Milestone 5 [I-X]:** Draft an awareness campaign for women who have had a history of spontaneous preterm birth.

**Metric 1 [I-X.1]:** Draft Campaign materials and evaluation

- Educate women who have a history of preterm birth regarding the antenatal steroid option.

**Milestone 5 Estimated Incentive Payment:** $1,734,741

### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 6 [I-X]:** Continue to provide trainings to providers for the use of antenatal steroids, with adjustments based on evaluations.

**Metric 1 [I-X.1]:** Schedule venues for provider trainings and regular updates.

- Assure that all providers receive the initial training and needed updates.

**Date Source:** Training Attendance records (based on media), evaluations and updated documents.

**Milestone 6 Estimated Incentive Payment:** $1,676,078

### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 8 [I-X]:** Continue to offer provider trainings with adjustments based on evaluations.

**Metric 1 [I-X.1]:** Schedule venues for provider trainings and regular updates.

- Assure that all providers receive the initial training and regular updates.

**Date Source:** Training attendance records (based on media), evaluations and updated documents

**Milestone 8 Estimated Incentive Payment:** $1,676,078

**Milestone 9 [I-X]:** Continue to educate women who have a history of spontaneous preterm birth as to the option from antenatal steroids.

**Metric 1 [X-1]:** Logs outlining outreach activities and outreach evaluation.

- Goal: Continue campaign with at least 5 venues and using 3 types of media.

Project Option 2.6.4 – Implement Evidence-based Strategies for Youth in Targeted Populations
– PRIDE Program

Unique Project ID: 022817305.2.2
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Summary

Provider: Tarrant County Public Health has 420 FTEs, 20 sites, and provides public health services to 1.9 million in Tarrant County. The role in region’s health care infrastructure especially for Medicaid and indigent/uninsured is to provide Public Health STD/HIV services for Tarrant County.

Intervention: Evidence-based Intervention designed to inform and educate youth about Sexually Transmitted Diseases and how to make appropriate choices regarding sexual activities. This is a new project for the Arlington, Texas area.

Need for the project: STD rates continue to rise in Arlington with 51% of new syphilis cases; 73% of chlamydia cases and 35% of HIV cases occurring in 15 – 24 year old youth in 2011.

Target population: The intervention targets minority youth 15 – 24 in the City of Arlington, which has 365,483 population (2010 census). 4-5 local organizations where trained youth leaders administer PRIDE curriculum to 300-500 youth.

Expected patient benefits: Reduce the level of disease (STD’s) in the community by 15% over 2011 levels. Fewer STD infected youth in the community will reduce transmission of STD’s and the complications from untreated infections.

Category 1 or 2 expected patient benefits: Recruit and train STD staff to train the organizational leaders who will educate the youth. Cat. 1 & 2 set the foundation for implementation of group sessions with the youth about STD education.

Category 3 outcomes: Cat. 3 will assess disease trends in the target population to determine if a reduction in youth diagnosed with an STD have decreased over time.
Project Option 2.6.4 – Implement Evidence-based Strategies for Youth in Targeted Populations
   – PRIDE Program

Unique Project ID: 022817305.2.2
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/
022817305

Project Description:
The PRIDE Program is an evidence-based intervention designed to inform and educate youth between the ages of 14-24, in Tarrant County, Texas, about sexually transmitted diseases (STDs) and how to make appropriate choices regarding sexual activities. PRIDE provides a foundation for discussions with an informed individual (youth leader) about the signs and symptoms of different STDs, what to do if an individual acquires an infection, and how to reduce the possibility of contracting an STD. PRIDE uses current group leaders in teen clubs and community organizations as the conduit of information to the youth. The agency group leaders are given training in how to communicate STD information in a non-threatening, non-judgmental manner to youth, engage them in meaningful discussions, develop educational projects that participants can share with peers, and assess and determine if the youth response results in increased awareness of STDs.

STD trends in Tarrant County and Arlington, Texas continue to increase annually. Youth under the age of 24 are the fastest growing group of individuals acquiring STD/HIV infections. Current disease trends list ages 15-24 as having 51% of new syphilis infections, 73% of the chlamydia cases and 35% of the new HIV cases. Syphilis and HIV cases have increased by 20% over the 2010 year. This training of community-based organization (CBO) leaders in the PRIDE Program will help increase STD/HIV awareness, allowing youth to make appropriate sexual health choices.

Goals and Relationship to Regional Goals:
Project Goals:
The Goal of PRIDE is to inform and educate youth regarding the consequences of risky behaviors that may lead to contracting an STD. When youth are aware of the risks and have current knowledge about prevention, they are less likely to become infected with an STD. When youth become infected with an STD, because of their STD knowledge, they are less likely to spread that infection to others. When youth know the correct information and have appropriate options, the rates for STDs will decrease in the Arlington area and throughout Tarrant County. In five years, the overall STD rates should decrease by 15% from baseline 2011 totals.

This project meets the following Regional goals:
The CDC reports that young people have four times the reported gonorrhea rate of the total population and four times the reported chlamydia rate of the total population. CDC reports that in 2009, African-Americans had 8.7 times the reported chlamydia rate of Whites. Women had 2.7 times the reported chlamydia rate as men in 2009. CDC continues to work to reduce the disease incidence in the country.\textsuperscript{135}

**Challenges:**
There are many youth who are not involved in community organizations. The challenge is to insure that STD information also reaches those individuals. The PRIDE program encourages youth to have open discussions with peers who may not be part of the program to spread current accurate STD information. Ultimately, the PRIDE program should be part of the Arlington ISD curriculum. When sufficient numbers of community individuals begin to discuss the STD problem, then there will be a change in the general opinion that STDs are not a problem in most communities.

**5-Year Expected Outcome for Provider and Patients:**
The five-year outcome will be a 15% reduction in STD rates in Arlington and Tarrant County when compared to 2011 reported cases.

**Starting Point/Baseline:**
STD trends in Arlington and Tarrant County, Texas, continue to increase annual. The population (2010 Census) is 365,483 people with 43% White (non-Hispanic), 29% Hispanic and 17% African-American. Youth under the age of 24 are the fastest growing group of individuals acquiring STD/HIV infections. Current disease trends list ages 15-24 as having 51% of new syphilis infections, 73% of the chlamydia cases and 35% of the new HIV cases. This young age group is less likely to seek medical services in other areas of the county, especially since there is a transportation deficit in Arlington. Syphilis and HIV cases have increased by 20% over the previous year.

**Rationale:**

This evidence-based intervention was first developed in Chicago in the 1980’s and used by Chicago and Cleveland public schools for students. Student involvement is key to making this a successful intervention. The PRIDE outcome results have been analyzed and refined by community organizations and Stephen R. Sroka, PhD. (1987)

**Project Components:**
This is a patient-centered project, focusing on a targeted population with specific disease indicators. Disease levels are measurable, allowing for individuals to make appropriate choices for sexual health, based upon perception of risk.

The milestones and metrics for PRIDE are based upon evidence-based interventions developed in the 1980’s. Using group leaders, already known to the youth, allows for a trust and willingness to communicate within the group. Developing a structured curriculum that conveyed accurate STD information, the dangers and consequences of sexual activity in a non-threatening, non-judgmental setting has been proven successful. Identifying venues where youth meet in a structured supervised environment is the key to working with youth. Group leaders are known and accepted by the youth. The organization is responsible for the safety and well-being of each person. The PRIDE curriculum builds an STD information foundation that is communicated between participants.

**Unique community need identification numbers the project addresses:**
- CN.16 – Higher incidence of sexually transmitted diseases in Arlington and Tarrant County

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
There are currently no public initiatives in Arlington, related to STD awareness and education for youth.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
The PRIDE Program is a client-centered project, focusing on a targeted population with specific disease indicators. Disease levels are measurable, for the population as a whole or any sub-set of the disease formula. Reducing STD transmission will reduce STD infections in youth. PRIDE allows individuals to make appropriate choices for sexual health, based upon their perception of risk.

Reducing STD levels in the target population in Arlington will help reduce rates in Tarrant County, Texas and in the United States.
IT-11.1 Improvement in clinical indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider.

The CDC discusses the national problem of STDs and the alarming trends identified in the southern states. Nationally, 1,307,893 cases of chlamydia were reported to CDC for 2010. Between 2006 and 2010 the chlamydia rate for males increased 36.4%. Chlamydia rates are the highest in the south, with Texas over 12.7 per 100,000 population in the 15- to 24-year-old females.

Relationship to Other Projects:
- Related Category 1 and 2 projects:
  - 022817305.2.3 Arlington Clinic Project – STD reduction plan
- Related Category 4 population-focused improvements: N/A

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Early identification and treatment of STDs reduces the risk of complications and hospitalizations for individuals and will reduce medical costs. This program will increase the knowledge levels of the youth, allowing better choices, understanding what is required to reduce individual risk, and providing factual information to seek medical services when certain symptoms are noticed in the individual, friend or partner. Early identification and treatment of STDs reduces the risk of complications and hospitalizations for individuals who are diagnosed with an infection. In 1994 dollars, the cost for chlamydia and associated sequelae in the U.S. was $1,513.9 million with the STD total $5.025.0 million nationally. Hospital costs for treating pelvic inflammatory disease (a complication of gonorrhea or chlamydia) was $4.148. million in direct cost services.

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of Tarrant County minority STDs under age 24. The percentage of the population expected to be positively impacted by the project in DY5 with a 11.11% decrease in chlamydia rates for Tarrant County minority youth ages 15-24 by the end of DY5. That means that a minimum of 537 youth will not contract chlamydia by the end of DY5. The medical cost savings per person is $1,700.42. This total value of $912,279.00 is multiplied by the individual impact of 3 and the community impact of 2 to determine the values per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the project valuation of $11,859,621.00. This actual amount had to be discounted due to Public Health DSRIP available funding to a total value of $5,618,849.00 or a 52.6% valuation discount.

We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because this program will increase the knowledge levels of the youth, allowing better choices, understanding what is required to reduce individual risk, and providing factual information to seek medical services when certain symptoms are noticed in the individual, friend or partner.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because; by reducing the STD rates the benefits are also realized by sexual partners and the community.

Project Option 2.7.6 – Implement evidence-based strategies and referrals for targeted populations to reduce STD rates in Arlington. (STD testing and case analysis)

Unique Project ID: 022817305.2.3
Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Summary

Provider: Tarrant County Public Health has 420 FTEs, 20 sites, and provides public health services to 1.9 million in Tarrant County, plus a small percentage of clients from surrounding counties. Public Health insures the health of the community and is working to reduce the STD rates in the community.

Intervention: Reduce syphilis, gonorrhea, chlamydia and HIV infection in the City of Arlington, through increased availability of clinical and epidemiological services. This is an expansion of STD services for the Arlington, Texas area.

Need for the project: Tarrant County population consist of 26% Medicaid & 23% uninsured residents. Expanded STD prevention and treatment in Arlington will reduce the transmission of STDs and therefore reduce the Medicaid cost and cost to the community. There were 11,621 cases of STD’s reported from Arlington zip code areas.

Target population: Target population is the resident in City of Arlington, 365,483 population (2010 census). The expanded Arlington clinic should provide STD services to 3,500 individuals during the waiver period.

Expected patient benefits: Reduce the level of disease (STD’s) in the community by 15% over 2011 levels. The Medicaid and uninsured population are estimated at 49% of the Tarrant County population.

Category 1 or 2 project benefits/category 3 outcomes: Fewer STD infected individuals in the community and fewer medical complications and conditions due to untreated STD infections. As more clients are seen and diagnosed, the reservoir of untreated infections will be reduced. Disease levels will decrease in minority populations as more clients are serviced in the clinic and educational information is disseminated to the public.
Project Option 2.7.6 – Implement evidence-based strategies and referrals for targeted populations to reduce STD rates in Arlington. (STD testing and case analysis)

Unique Project ID: 022817305.2.3

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Description:
The number of sexually transmitted diseases (STDs) cases diagnosed (syphilis, chlamydia, gonorrhea and HIV) continues to increase in Tarrant County. The Arlington area continues to produce a high number of new STD infections. The Arlington area does not have a full-time STD/HIV medical provider to serve the population daily. Minority populations, Blacks and Hispanics, are disproportionately affected by chlamydia, syphilis, gonorrhea and HIV infections. Implementing a full-service STD/HIV clinic, five days per week, within the City of Arlington, will provide essential STD services and begin to reduce the STD reservoir. The outcome measure is to reduce STD/HIV morbidity by 10% from 2011 STD/HIV levels.

Goals and Relationship to Regional Goals:

Project Goals:
The goal is to reduce STD/HIV morbidity by 10% from 2011 STD/HIV levels by providing STD clinical and epidemiological services to the target populations. Services will include the clinical assessment and the community educational component. STD awareness in the community will help in identifying potential new infections and insuring the possibility of rapid assessment and treatment.

This project meets the following Regional goals:
The CDC reports that young people have four times the reported gonorrhea rate of the total population and four times the reported chlamydia rate of the total population. CDC reports that in 2009, African-Americans had 8.7 times the reported chlamydia rate of Whites. Women had 2.7 times the reported chlamydia rate as men in 2009. CDC continues to work to reduce the disease incidence in the country.

Challenges:
The Arlington area is experiencing an increase in disease trends in minority populations. There is no transportation system for clients to seek care in Fort Worth. This program will allow Arlington residents to receive care in Arlington. It will also allow services on Saturday, a first in the metropolix. Sixty-two percent of the newly diagnosed syphilis cases occurred in the Black population, with an additional 21% Hispanic, means that 83% of the newly diagnosed syphilis cases are occurring in minority populations. Informing the community that STDs are still a
significant problem and that there is a facility specifically for testing and treatment is a major challenge.

5-Year Expected Outcome for Provider and Patients:
By the end of the five-year plan, there will be a measurable reduction in the STD rates of infection. When the pool of infected persons is reduced in Arlington, fewer individuals will be infected with an STD. As more individuals are screened and treated, the rate of infection will decline in the community reducing STDs in Arlington and Tarrant County.

Starting Point/Baseline:
Tarrant County operates a two-day per week STD/HIV clinic in Arlington; daily operations allow an average of 16 clients to be seen each week at that location. The clinic is staffed by using full-time county personnel from the Fort Worth STD/HIV clinic to work in Arlington, reducing the number of clients to be seen in Fort Worth on the Arlington days. There is no increase in patients seen between the two locations. This project will allow Arlington to be open five days per week (including Saturday) with no loss of services in Fort Worth. Additional staff will be added to support the Arlington location with support from disease intervention specialists (DIS) who interview and follow each newly diagnosed individual to insure all potential source or spread candidates are located and brought in for medical assessment and care.

STD trends continue to increase in Arlington ZIP codes. The target for this intervention is the minority populations in the City of Arlington. The current population is 365,438 (2010 Census) with 29% Hispanic and 17% African-American, 8% other (mixed race, Native American, Asian and not listed) for a total minority population of about 54%. Youth under the age of 24 are the fastest growing group of individuals acquiring STD/HIV infections. Current disease trends list ages 15-24 as having 51% of new syphilis infections, 73% of the chlamydia cases and 35% of the new HIV cases. This young age group is less likely to seek medical services in other areas of the county, especially since there is a transportation deficit in Arlington. Syphilis and HIV cases have increased in Arlington by 20% over the previous year.

</tbody>
</table>

Rationale:
The STD rates in Texas continue to climb from the 2000 levels as reported by the CDC. The rates in southern states are some of the highest in the nation. To reduce the rates of STD transmission, according to CDC, it is necessary to reduce the disease reservoir in the community. CDC has demonstrated in programs across the country that full-service STD/HIV clinics play a significant role in the process of identifying and reducing STD infections.
Project Components:
These project components were selected because they are factors that will help reduce the level of STD infections in the Arlington community. This factor has been demonstrated in Centers for Disease Control and Prevention STD/HIV program areas to reduce STD levels.

Community need identification numbers the project addresses:
- CN.16 – Higher incidence rates of syphilis, gonorrhea, HIV and chlamydia

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative because there are no existing federal or state STD programs related to STDs in the City of Arlington.
- CQI – Disease Information data is maintained and assessed quarterly to determine if program indicators are met. Objective and Indicators reports (O&I) are submitted monthly to the State to insure program outcomes meet grant requirements. These O&I reports define level and quality of services received. Clients will be able to rate their visit and provide feedback to the organization that will be utilized to increase positive outcomes and clinic utilization. These findings will be part of the O&I report analysis for program enhancement.

Related Category 3 Outcome Measures:
- IT-11.1 – Improvement in clinical indicators in identified disparity group. This is the number of clients seeking services over initial 2011 service utilization rates. (By increasing the number of minority clients seeking services the cases identified will reduce the reservoir of infection and will Reduce STD rates by 10% in minority populations in the City of Arlington).
- IT-11.1 – Improvement in clinical indicators in identified disparity group. This is the number of new cases of syphilis identified in the clinic compared to the syphilis rates in 2011. (Reduce minority syphilis rate by 10% in minority populations in the City of Arlington).

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.
Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Tarrant County Public Health defined the population that will be directly impacted by the project, as individuals identified as the number of reported Arlington STDs. The percentage of the population expected to be positively impacted by the project in DY5 with a 10% decrease in the Arlington minority chlamydia and gonorrhea rates and syphilis rates are anticipated by the end of DY5. The cost savings for a reduction of 20 minority syphilis cases in 3,000 clients using the Arlington location annually, at a potential savings of $15,000.00 for the prevention of a central nervous system case of syphilis. This total value of $304,500.00 is multiplied by individual impact of 3 and a community impact of 2 to determine values per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total syphilis outcome valuation of $3,958,500.00 project valuation. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

The cost savings for 143 minority gonorrhea and chlamydia cases at a savings of $1,562.29 per case for each case prevented. This total value of $223,564.00 is multiplied by individual impact of 3 and a community impact of 2 to determine values per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total gonorrhea and chlamydia outcome valuation of $2,906,328.00.

The combined category 3 valuation equals $6,864,828.00. The actual project value was discounted due to the amount of total Public Health DSRIP funds available to $3,252,417.00. This is a 52.6% valuation discount.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because; by providing expanded STD treatment in Arlington will reach individuals who may not have been able to receive medical treatment and therefore benefit from the project.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because; reducing the STD rates benefits are also realized by sexual partners and the community.

### Milestone 1 [P-X]: Recruit, hire and train the following full-time positions: a Clinic RN, LVN or MA, Clerk, and Microbiologist to provide STD assessments and treatment for clients seen in the Arlington STD clinic. Train all staff in current TCPH-DHS clinical protocols for clinical assessment and treatment.

**Metric 1 [P-X.1]: Increase clinical services in the second year from 7 to 10 clients per day- 2day operations: to 70 clients per month with 5 day operations.**

- **Baseline/Goal:** Increase the client services from 40 to 100 clients seen per month.
- **Data Source:** AHS STD monthly clinic statistical report.

**Milestone 1 Estimated Incentive Payment (maximum amount): $685,158**

### Milestone 2 [P-2]: Implement targeted marketing campaign to increase awareness and knowledge regarding STD’s Identify 4 community billboards where STD/HIV messages can be displayed within target ZIP codes.)

**Metric 1 [P-2.1]: Document implementation strategy and testing outcomes (Display billboards with STD/HIV messages for 60 days in the high morbidity areas)**

- **Baseline/Goal:** Increase the client services from 40 to 100 clients seen per month.
- **Data Source:** AHS STD monthly clinic statistical report.

**Milestone 2 Estimated Incentive Payment: $714,769**

### Milestone 3 [I-X]: Develop and implement client satisfaction survey for all individuals seen in the clinic. Utilize results to make improvements in AHS clinical services. Begin internal referral system to see case related clients in the area where they reside.

**Metric 1 [X.1] Increase the number of client visits and assess satisfaction of clients for services.**

- **Goal:** 30% of clients surveyed indicate the additional hours were the reason they used the services.
- **Data Source:** AHS quarterly clinic survey.

**Milestone 3 Estimated Incentive Payment: $382,319**

### Milestone 4 [I-7]: Increase access to disease prevention programs using innovative project option

**Metric 1 [I.7.2]: Increase number of encounters as defined by intervention (services and awareness)**

- **Goal:** Increase client utilization by 5%
- **Data Source:** AHS STD monthly clinic statistical report.

**Milestone 4 Estimated Incentive Payment: $369,390**

### Milestone 5 [I-X]: Develop and implement client satisfaction survey for all individuals seen in the clinic. Utilize results to make improvements in AHS clinical services. Begin internal referral system to see case related clients in the area where they reside.

**Metric 1 [X.1] Increase the number of client visits and assess satisfaction of clients for services.**

- **Goal:** 50% of clients surveyed indicate the additional hours were the reason they used the services.
- **Data Source:** AHS quarterly clinic survey.

**Milestone 5 Estimated Incentive Payment: $369,390**

### Milestone 6 [I-7]: Increase access to disease prevention programs using innovative project option

**Metric 1 [I.7.2]: Increase number of encounters as defined by intervention (services and awareness)**

- **Goal:** Increase client utilization by 10%
- **Data Source:** AHS STD monthly clinic statistical report.

**Milestone 6 Estimated Incentive Payment: $369,390**

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.6.2. – Implement Evidence-based Health Promotion Programs- Establish self-management programs and wellness using evidence-based designs : Tarrant County Chronic Disease Self-Management Program

**Unique Project ID:** 022817305.2.4

**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/ 022817305

**Provider:** Tarrant County Public Health has 420 FTEs, 20 sites, and provides public health services to 1.9 million in Tarrant County. Health education resource and provider of epidemiologic support to hospitals and PCPs.

**Intervention:** The purpose of project 2.6.2 is to reduce the number of preventable admissions pertaining to hypertension by implement the evidence-based Stanford Chronic Disease Self-Management Program in the offices of Medicaid providers within the Texas Health Resources system. Preventable hospital and emergency room admissions pertaining to hypertension will be reduced by teaching clients the necessary self-management techniques that will help the clients to control blood pressure. This is a new initiative for Tarrant County Public Health.

**Need for the project:** Tarrant County has 12% of population enrolled in Medicaid programs. Tarrant County residents spent $87 million on preventable hypertension admissions in 5 years. Patients with Medicaid visited emergency department 2 times as much as those with private insurance or uninsured. 25% of Tarrant County adults have been diagnosed with hypertension.

**Target population:** Medicaid and uninsured clients who have been diagnosed with hypertension or diabetes. Estimated 2,600 individuals will be impacted over the period of the waiver.

**Expected patient benefit:** Reduce the number of dollars spent on preventable hypertension related admissions for Medicaid and uninsured clients.

**Category 1 or 2 expected patient benefit/category 3 outcome:** A reduction in preventable admissions related to hypertension is achieved by develop and implement evidence-based project ties into the purpose by ensuring that the program is evidence-based and meets the needs of the Medicaid and uninsured clients who are in the target population. The Stanford Chronic Disease Self-Management program has been shown to decrease the number of emergency room and hospitalizations for those who complete the program. The goal is to enroll 2,600 participants the program and follow up to verify a decrease in hypertension admission rates among program participants. This ties back to the project purpose because we are aiming to reduce the amount of dollars being spent on hospitalizations related to hypertension.
**Project Option 2.6.2.** – Implement Evidence-based Health Promotion Programs- Establish self-management programs and wellness using evidence-based designs: Tarrant County Chronic Disease Self-Management Program

**Unique Project ID:** 022817305.2.4

**Performing Provider Name/TPI:** Tarrant County/dba Tarrant County Public Health/022817305

**Project Description:**
Implement evidence-based, Stanford Chronic Disease Self-management Program for targeted patients who are at risk of potentially preventable admission related to hypertension.

Project 2.6.2 will use a combination of the evidence-based Stanford Chronic Disease Self-Management Program (CDSMP)\(^1\)\(^2\)\(^3\) and the evidence-based practice of using community health workers (CHWs) to help improve patient outcomes and reduce potentially preventable admissions to the hospital or to the emergency department\(^4\). Our project will be a collaboration with Texas Health Resources clinics and hospitals in areas identified by the Tarrant County Behavioral Risk Factor Surveillance System to have the highest rates of diabetes and hypertension in the county.\(^5\) The project will provide CDSMP and CHW support for clients who have disease processes that could potentially lead them to the hospital if they are not managing their illness and using their primary care provider efficiently. This project has evidence-based components that have proven that self-management education and CHWs help to reduce the medical financial burden by improving patient outcomes and improving patient quality of life.\(^1\)\(^4\)\(^6\). Furthermore, Tarrant County Public Health has five Stanford lay leaders who will also participate in the project.

**Target ZIP Codes:**

<table>
<thead>
<tr>
<th>76117</th>
<th>76036</th>
<th>76020</th>
<th>76148</th>
<th>76106</th>
<th>76135</th>

<td>76013</td>
<td>76179</td>
</tr>
</tbody>
</table>

We propose to target ZIP codes in Tarrant County that have the highest percentages of cardiovascular disease as indicated in the Tarrant County Behavioral Risk Factor Surveillance System.

**Goals and Relationship to Regional Goals:**
The primary goals of this project are to develop and implement a CHW-facilitated chronic disease self-management program that works with care providers who have low-income adult patients who have been diagnosed with diabetes and/or hypertension. The primary goal of the project is to provide evidence-based self-management for clients in an effort to help to decrease potentially preventable hypertension admission rates among program participants. According to the Tarrant County BRFSS, one of four adults in the county reports being diagnosed with
hypertension.\textsuperscript{5} According to the TX DSHS PHP Tarrant County residents spent nearly $500 million on preventable cardiac-related hospitalizations.\textsuperscript{8} Additional expected outcomes include a reduction in long- and short-term complications of diabetes that could lead to unnecessary ED visits and potentially preventable hospitalizations,\textsuperscript{1-4} although these outcomes will not be measured during this project. CHW will contact program participants quarterly to reinforce the elements learned in the\textsuperscript{136} CDSMP. This program will be culturally and linguistically appropriate for English- and Spanish-speaking clients.

This project is in line with the Regional goal based on the CMS aim of making health care more patient-centered, and safe. The Stanford Chronic Disease Self-Management Program provides self-management techniques that help to empower program participants. Another Regional goal is to lower cost of care delivery for individuals, families, employers, and the government. Cost of care has been shown to be reduced with use of the fundamentals taught in the Stanford Chronic Disease Self-Management Program. Our project will contribute to the implementation of a CHW program that also imparts health literacy and disease self-management techniques for Tarrant County participants. This innovative project combines two evidence-based programs that have demonstrated success in decreasing health care expenditures, and in improving client health and quality of life.\textsuperscript{1-4}

Project Goals:

- Provide evidence-based self-management for clients in ZIP code areas that are high risk for cardiovascular disease.
- Decrease potentially preventable hypertension admission rates among program participants.

This project meets the following Regional goals:

- Improve the health system by making health care more patient-centered.
- Improve health of the population by supporting proven interventions to address social determinants of health.
- Reduce the cost of the improved care delivery for individuals, families, employers and the government by reducing the number of potentially preventable admissions due to hypertension and stroke.

\textsuperscript{136} Lorig, K, Sobel, D, Ritter, P., Laurent, D., Hobbs, M. Effect of a self-management program on patients with chronic disease. \textit{American College of Physicians}. \texttt{www.acponline.org}.

\textsuperscript{4} U.S. Department of Health and Human Services, Health Resources and Services Administration, August 2011. Community Health Workers Evidence-Based Models Toolbox.
Challenges:
The primary challenge will be to engage the targeted population in completion of the program. A percentage of the targeted population does not have a primary care provider and seeks care at the emergency department. The use of community health workers will enable us to go into the target ZIP code areas, introduce the program and advocate for participation. Currently, Tarrant County Public Health (TCPH) collaborates with the Tarrant County Diabetes Collaboration and with Senior Citizen Services of Tarrant County to provide free diabetes education. The Chronic Disease Prevention division of TCPH also provides prevention education on obesity, hypertension, diabetes, dyslipidemia, osteoporosis, and tobacco prevention. Our strategic plan includes providing culturally sensitive community-based prevention education to the citizens of Tarrant County. We have taken our chronic disease prevention message to local businesses as a part of their worksite wellness plans, we do presentations at faith-based events and participate in city and municipal community and worksite events to provide information on preventing chronic diseases. Because of the increased incidence of hypertension and diabetes, we have created a curriculum on living with these diseases. This project will enable us to do a more extensive job of facing hypertension, diabetes, and related illnesses.

5-Year Expected Outcome for Provider and Patients:
Our five-year outcome is to provide at least 2,600 citizens of Tarrant County with the CHW benefits and CDSMP. These contacts will be recorded in our database of program enrollment and completion. We expect a decrease in the percentage of clients in the target ZIP codes who are admitted to the emergency department or inpatient with uncontrolled hypertension.

Starting Point/Baseline:
This project will be a pilot, in that it does not currently exist in this innovative context. The Texas Department of State Health Services Potentially Preventable Hospitalizations (PPH) report indicates that between 2005 and 2010, Tarrant County adults spent more than $1.2 billion on potentially preventable hospitalizations involving high blood pressure, short-term and long-term diabetes complications. Tarrant County residents spent nearly $87 million on preventable hospitalizations relating to hypertension between 2005-2010. These hospitalizations could have possibly been prevented if the clients had been in follow-up care with a primary care provider or knew how to self-manage the disease processes. Texas is not a participant in the State Emergency Department Databases; therefore, we will establish a baseline of emergency department admissions within our cohort from the THR system. The CDC/NCHS National Health Interview Survey lets us know that adult patients with Medicaid coverage were twice as likely to visit the emergency department at least once in 12 months than those with private
coverage or those who were uninsured. The baseline for hospitalizations and emergency visits will be set within DY2.

**Rationale:**
Tarrant County BRFSS demonstrate that just over 25% of the adults in Tarrant County have been diagnosed with hypertension, 33% have been diagnosed with high cholesterol. According to the Texas DSHS PPH, Tarrant County residents spent nearly $500 million on preventable cardiac-related hospitalizations and nearly $700 million on diabetes-related hospitalizations. These numbers indicate that Tarrant County is in need of self-management programming and CHW assistance with regard to educating citizens about diabetes and hypertension.

**Project Components:**
This project does not have any required components.

**Reasons/Rationale for Selecting the Outcome Measures:**
We selected milestone P-2: Development of evidence-based projects for targeted population based on distilling the needs assessment and determining priority of interventions for the community with a metric: document innovational strategy plan, and milestone P-3: Implement, document and test an evidence-based innovative project for target population with a metric: document implementation strategy and testing outcomes, because TCPH currently has two stand-alone evidence-based programs—Stanford Chronic Disease Self-Management (CDSMP) and Community Health Workers (CHWs). Chronic disease prevention staff have been certified in the Stanford CDSMP and are currently assisting Senior Citizen Services of Tarrant County with their program focused on training seniors to use disease self-management as a means to avoid potentially preventable trips to the emergency department. The Community Health Promotions division uses CHWs to assist with providing general health and wellness education to the community, as well as providing information about benefits that are available to women, infants and children living in Tarrant County. We thought that it would be innovative to combine the foundations of these two programs. We are not currently receiving funding for either of the programs. The combination program, CDSMP and CHW, can be implemented within the first year of funding although these two programs are practiced within different divisions. We thought

8 Department of State Health Services. Potentially Preventable Hospitalizations, Tarrant County. [www.dshs.state.tx.us/ph](http://www.dshs.state.tx.us/ph).
9 Melchio, M. Investigating the outcomes of two chronic disease self-management programs and understanding the correlates of completion for each program. [http://digitalcommons.fiu.edu/dissertations/AAI3517025](http://digitalcommons.fiu.edu/dissertations/AAI3517025).
it innovative to combine the two as a project that would help to decrease the expenditures for hospitalizations relating to diabetes and hypertension, as well as help to improve quality of life for program participants\(^1\). Tarrant County does not currently have a program that combines the efforts of CHW and CDSMP that targets clinic-centered adults. As evidenced by our BRFSS, Tarrant County has a 25% rate of hypertension and nearly 9% rate of diabetes among adults, and has spent more than $1.2 billion in hospitalizations relating to these two diseases.\(^5,8\) The project is needed in order to provide self-management education and community resources guidance and support. Milestone 9 [I-X] will meet the recertification requirement that Stanford has for all who implement their programs.

**Unique community need identification numbers the project addresses:**
- CN 13 – Necessity of patient education programs
- CN 15 – Need for more education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This is a new Initiative, but we have health educators who are certified lay leaders for the Stanford Chronic Disease Self-Management Program. We have not received any local, state or federal funding to provide the program.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:**

IT-2.3- Hypertension Admission Rate – PQ#7-Tarrant County residents spent nearly $87 million on preventable hospitalizations relating to hypertension between 2005-2010.\(^8\) Between 2005 and 2010, the number of PPH increased by 25%.\(^8\) Evidence shows that the CDSMP has helped to decrease the number of hospitalization days, thereby saving medical dollars while helping to sustain individual quality of life.\(^1,2,10\) The program has realized a savings between $390 and $520 per participant over a study period of two years, due in part to participants being hospitalized fewer days in the first six months of the program.\(^2\) This project will help clients self-manage their blood pressure and make appropriate use of the primary care provider setting as opposed to using the ED for management.\(^1\) By the end of DY5 want to see a 35% increase in controlled BP. Per the National Institutes of Health, of all the risk factors for stroke, the most powerful is hypertension. By the end of DY5 the CDSMP is estimated to prevent 35 possible strokes.

**Relationship to Other Projects:**
It appears that the Texas Health Harris Methodist Hospital Azle will develop a Health Education and Lifestyles Program and Chronic Disease Self-Management Program (127304703.2.1) for clients who live in Parker County, and Tarrant County residents living near Parker County. A learning collaborative will be beneficial if they are using a similar program. The master list of projects does not indicate whether they focus on hypertension, as does our program.
Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of participants in the Chronic Disease Self-Management Program (CDSMP) education. The percentage of the population expected to be positively impacted by the project in DY5 is 35%. Of that 35%, 10% will possibly have been hospitalized for a stroke. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because with the CDSMP education the participants will have increased knowledge to assist them in managing their hypertension.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person does not successfully manage hypertension, it can result in lost productivity and increased medical costs to employers.
### IMPLEMENT EVIDENCE-BASED HEALTH PROMOTION PROGRAMS - IT-2.6.2

**Milestone 1** [P-2]: Development of evidence-based projects for targeted population based on distilling the needs assessment and determining priority of interventions for the community.

**Metric 1** [P-2.1]: Document innovative strategy plan (Documentation of hiring and training CHW in the evidence-based programs, Stanford Chronic Disease Self-management Program (CDSMP) and Texas State Certification program for Community Health Workers)

Goal: Eight Certified Community Health Workers who are certified to be Lay Leaders for Stanford CDSMP.

Data Source: Program database and manual

**Milestone 2** [P-3]: Implement, **Milestone 3** [I-6]: Identify 600 more patients in the defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1** [I-6.1]: Documented self-management education for clients.

Goal: 600 program participants.

Data Source: Program participant records.

Milestone 3 Estimated Incentive Payment: $319,780

**Milestone 4** [I-8]: Increase access to health promotion programs and activities using innovative project option. Using Social Media advertisement within targeted communities.

**Metric 1** [I-8.1]: Increase percentage of target population reached (Advertising Campaign that is culturally sensitive)

Goal: Distribution of campaign to three unique ZIP codes

Data Source: Public Information Officer and campaign materials

**Milestone 5** [I-6]: Identify 800 more patients in defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1** [I-6.1]: Documentation of self-management education clients

Goal: 800 program participants

Data Source: Program participant records.

Milestone 5 Estimated Incentive Payment: $342,090

**Milestone 7** [I-6]: Identify 1,000 more patients in defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1** [I-6.1]: Documented self-management education for clients

Goal: 1,000 program participants

Data Source: Program participant records.

Milestone 7 Estimated Incentive Payment (maximum amount): $220,348

**Milestone 8** [I-8.1]: Increase percentage of target population reached (Advertising Campaign that is culturally sensitive)

**Metric 1** [I-8.1]: Increase percentage of target population reached

Goal: Distribution of campaign to Four unique ZIP codes

Data Source: Public Information Officer and campaign materials

**Milestone 9** [I-8.1]: Increase percentage of target population reached

Goal: Distribution of campaign to Five additional unique ZIP codes

Data Source: Public Information Officer

Project Option 2.7.6 – Implement Evidence-based Disease Prevention Programs

Unique Project ID: 022817305.2.5

Performing Provider Name/TPI: Tarrant County/dba Tarrant County Public Health/022817305

Project Description:
This project involves the creation of a medication program to treat for latent TB infection (LTBI) with a drug (rifapentine) recommended by the CDC in December 2011. Recent studies involving rifapentine have shown higher LTBI treatment completion rates; which can be attributed to the regimen consisting of 12, once-weekly doses. Completion of LTBI treatment is essential to prevent individuals from developing active TB Disease.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of the project is to increase the LTBI treatment completion rates for high-risk groups; which will prevent those clients from developing active TB. The rifapentine LTBI database to be created will assist in preventing the loss of patients during treatment and ensure their completion.

This project meets the following Regional goals:
Treating patients diagnosed as LTBI with rifapentine supports the Regional goal by making health care more patient-centered, reliable, accessible, and safe. This is attributed to the fact that the regimen is shorter and more likely to be taken than those currently used.

Challenges:
Tarrant County Public Health TB Division currently maintains a database to follow those diagnosed with LTBI and follow those on treatment. From 2007-2011, completion rates for contacts to active TB cases was 46% and for homeless shelter residents 28%. Treatment with rifapentine not only shortens the duration by 258 doses, but by administering via directly observed therapy (DOT), patients are more likely to comply with treatment. Completion of LTBI treatment will result in prevention of TB.

5-Year Expected Outcome for Provider and Patients:
By the end of DY5, 60% of those offered rifapentine treatment will accept. In addition to the number of people accepting treatment increasing; so will the number of those completing LTBI treatment.

Starting Point/Baseline:
According to the LTBI database maintained by Tarrant County Public Health-TB Division from 2007-2011, treatment completion rates for contacts to active TB cases is 46% and homeless shelter residents 28%.
In 2011, the refugee program changed from administering TB skin tests on their patients to conducting QuantiFERON Gold testing. This change decreased the number of refugees diagnosed with LTBI greatly, but treatment completion rates still remained poor (54%).

**Rationale:**
Current poor LTBI treatment completion rates among groups of people who are at high risk of developing active TB can most often be attributed to the length of current treatments offered. A recent study conducted and published by the CDC shows an improvement in LTBI treatment completion rates with a program that involves the drug rifapentine. This treatment regimen is 12 once-a-week doses under observation; instead of the current nine-month (270 doses) self-administered treatment. Healthy People 2020 also addresses poor LTBI completion rates and shows the current LTBI treatment completion average for contacts to active TB is 68.1% with a 2020 goal of 79%.

**Project Components:**
This project does not have core components.

The milestones and metrics selected are essential in creating and maintaining a rifapentine LTBI treatment program. Once policies and procedures are completed and staff hired/trained, enrollment can begin. The milestones selected not only promote an increase in the number patients completing LTBI treatment, but also decrease the number who refuse treatment or are lost before their regimen is completed.

The process milestone in DY3 will create a database that not only tracks those completing and refusing treatment, but it will allow for staff to identify patients missing multiple doses. This will help prevent them from being lost as a patient, and will also serve as the CQI for the program because these patients can be interviewed to find areas for improvement and identify issues patients may have taking the regimen.

Increasing the number of patients willing to take treatment and decreasing those who do not complete treatment will result in a lower rate of active TB.

**Unique community need identification numbers the project addresses:** CN.21High TB Prevalence
As described above, current LTBI treatment completion rates are poor. Without treatment, the three groups of people targeted have a greater risk of TB development. Two of the groups are mostly underinsured or Medicaid/Medicare (homeless and refugees) and are not likely to complete treatment. The third group is comprised of many in the lower socioeconomic category. TB generally affects those from a lower economic status who pass the disease on to those they
are around. However, the disease can be transmitted anywhere in the county where people are in contact with someone who has active TB.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project enhances the Tarrant County Public Health-TB Division’s LTBI treatment program because it will not only increases the number of individuals willing to take treatment, but will also increase completion rates. Currently LTBI treatment is not conducted with rifapentine and no regimen offered to patients is completed in 12 weeks.

**Related Category 3 Outcome Measures:**

**Outcome Measures**
IT-12.6- Other Outcome Improvement Target
- 022817305.3.9- Primary Care and Primary Prevention-Primary Prevention for Active TB (treating with rifapentine)

**Reasons/ Rationale for Selecting the Outcome Measures:**
- DY3 IT-12.6- LTBI treatment completion rates for contacts, homeless shelter residents and refugees will improve by 20% compared to baseline established in DY2.
- DY4 IT-12.6- LTBI treatment completion rates will improve by 25% compared to DY2.
- DY5 IT-12.6- LTBI treatment completion rates will improve by 30% for contacts, homeless shelter residents and refugees combined compared to DY2.

**Outcome Measures**
IT-2.14- Other Admission Rate
- 022817305.3.17- Potentially Preventable Admissions- Undiagnosed Active Tuberculosis hospital admissions (treating LTBI with Rifapentine to prevent Active TB development)

**Reasons/ Rationale for Selecting the Outcome Measures:**
- DY3 IT-2.14- Undiagnosed, Active TB cases (Tarrant County residents) admitted to hospitals within the County will decrease 1% over the baseline established in DY2.
- DY3 IT-2.14- Undiagnosed, Active TB cases (Tarrant County residents) admitted to hospitals within the County will decrease by 2% over the baseline established in DY2.
- DY3 IT-2.14- Undiagnosed, Active TB cases (Tarrant County residents) admitted to hospitals within the County will decrease by 3% over the baseline established in DY2.
LTBI treatment completion and a decrease in the number of active TB cases should be a goal of the RHP because it is a goal for Healthy People 2020. Without the creation of a rifapentine treatment program both of these goals will be difficult for any TB program to achieve.

The CDC has conducted studies addressing poor LTBI treatment completion rates and has found that with rifapentine adherence to therapy improves. Following all of the studies conducted, in December 2011 the CDC released its recommendations for treating LTBI with rifapentine. The recommendation released also highlighted areas where rifapentine would be a benefit; two of these were patient willingness to take treatment and improving treatment completion rates.

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects**
  - 022817305.1.2- This project also focuses on LTBI treatment completion rates, but focuses on clinic hours. The TB Medication Management (Rifapentine) Program uses a new LTBI treatment regimen that will increase completion rates. The other difference between the two groups is target population. The TB Clinic Expansion project involves all patients diagnosed as LTBI, but the Rifapentine Project focuses on contacts to active TB cases, homeless shelter residents and refugees.

- **Related Category 4 population-focused improvements:** None

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Tarrant County Public Health has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as the number of LTBI clients receiving rifapentine. The percentage of
the population expected to be positively impacted by the project is 30%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model 89.27% of the total project valuation was allocated to Category 1 and 2. The goal by the end of DY5 is potentially preventable TB hospital admissions for the 3% decrease in hospital reported TB cases (among Tarrant County residents). **Outcome Measure 1: 3.IT-5.1** – The cost savings for the 174 additional LTBI clients that complete their LTBI medication treatment is the cost to the medical system to restart the medication treatment after the failure of $1,092 per client (174 X $1,092 = $190,008). This total value of $190,008 is multiplied by individual impact of 3 and community impact of 3 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the actual total outcome valuation of IT-5.1 of $2,717,114.

**Outcome Measure 2: 3.IT-2.14** Based on a 10 year average 59 TB cases per year are hospital reported cases. There is a savings of $20,100 per potentially preventable TB hospital admissions for the 3% decrease in hospital reported TB cases ($20,100 X 2 = $40,200). $40,200 is then multiplied by the individual impact of 3 and the community impact of 3 to determine the value per year. The total value is multiplied by 5 years and a halo effect of 1.3 to determine the IT-2.14 actual total outcome valuation of $574,860. The TB medication project actual total project valuation is $3,291,974 but due to Public Health DSRIP funding availability the project was discounted 60.9% for a total project valuation of $1,287,314. The completion of LTBI medication treatment provides the client with a lifelong health benefit with the prevention of the conversion to an active case of TB. Without the LTBI medication completion a conversion to active TB could occur anytime within the individuals lifetime. In addition to the clients health benefits LTBI medication treatment completion also protects and provides benefits to the clients family members and other close connect individuals.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is does not successfully complete the medication treatment, it is possible for the latent TB to convert to a case of active TB. Once converted to active TB the individual health is affected. If the medication treatment was partially completed, there is an enhanced chance of developing drug-resistant TB. This type of TB is usually treated with IV therapy. Drug-resistant TB is more serious and costly.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person does not successfully complete the medication treatment, it is possible for the latent TB to convert to a case of active TB. Once converted to an active TB case it is possible for the individual to transmit TB to others.
Outcome Measure 1: 3.IT-5.1 – Valuation Reference

Project Summary

Project Option 2.7.2 - Implement innovative evidence-based strategies to reduce tobacco use

Unique Project ID: 022817305.2.8 (Pass 3)
Performing Provider Name: Tarrant County/dba Tarrant County Public Health/022817305

Provider: Tarrant County Public Health has 420 FTEs, 20 sites, and provides public health services to 1.9 million in Tarrant County. Tarrant County Public Health is the county’s public health department and provides health educational programming support for healthcare providers to include hospitals and PCPs.

Intervention: Project option 2.7.2 will use the American Lung Association’s evidence-based Freedom From Smoking curriculum to decrease tobacco use in Tarrant County. This program has demonstrated smoking cessation success. This program is new in Tarrant County. Tarrant County does not have any organized, ongoing tobacco cessation programming for the citizens who are interested in tobacco cessation.

Need for the project: Tarrant County has more than 243,000 self-identified smokers in the county. Tarrant County does not have any organized, ongoing tobacco cessation programming for the citizens who are interested in tobacco cessation. Research shows us that tobacco use is a preventable cause of death and exacerbation of cardiovascular and respiratory diseases as well as causes some cancers.

Target population: Medicaid, un-insured and under-insured county residents who are tobacco users. Estimated 2,400 individuals will be impacted over the period of the waiver.

Expected patient benefits: Tarrant County does not currently have any widespread tobacco cessation programming available. This program would lead to a reduction in the dollars spent on tobacco related illnesses, or exacerbation of chronic illnesses related to tobacco use such as cardiovascular and respiratory illnesses for tobacco users and those who are in contact with the users. Evidence indicates that smokers have a lower Health Related Quality of Life as compared to those who have never smoked and those who have quit. Evidence also shows us that ex-smokers have a significantly higher quality of life score than current smokers.

Category 1 or 2 expected patient benefits/category 3 outcomes: Tobacco cessation and improved results on the Health Related Quality of Life score for at least one year for program participants. The goal is to develop, implement and track evidence-based tobacco intervention project and enroll 2,400 tobacco users into project and follow up to verify % remaining smoke free.
Project Option 2.7.2 -Implement innovative evidence-based strategies to reduce tobacco use

Unique Project ID: 022817305.2.8 (Pass 3)
Performing Provider Name: Tarrant County/dba Tarrant County Public Health/022817305

Project Description:
Implement Evidence-Based Disease Prevention Programs
Tarrant County Public Health will implement project option 2.7.2 by combining the evidence-based, American Lung Association Freedom From Smoking (FFS) program and the evidence-based use of community health workers to teach Tarrant County residents how to stop smoking. The project area indicates that our program should be innovative in its use of evidence-based disease prevention programming. The project will use a combination of face-to-face interventions along with telephone and Internet support as did the Texas Tobacco Cessation Pilot Program in 2009. We will launch a communications campaign to introduce the program to Medicaid enrollees to improve cessation treatment program use.

Goals and Relationship to Regional Goals:

Project Goals:
The goals of project option 2.7.2 are to reduce tobacco use among Tarrant County residents and to improve quality of life of Tarrant County residents as tobacco users decide to learn and implement tobacco cessation. According to the 2009/2010 Tarrant County Behavioral Risk Factor Surveillance System, 18% of Tarrant County adults were classified as current smokers; well above the Healthy People 2020 target of 12%, but just under the current baseline of 20.6%. Our project will be similar to the Texas Tobacco Cessation Pilot Program implemented by the HHSC in 2009, which demonstrated that participants who received face-to-face counseling or telephone intervention had much higher one-year tobacco-cessation rates than did those who were not offered any cessation support. At the end of one year, the face-to-face intervention group went from 97.2% tobacco users to 56.0%, the telephone intervention group went from 96.9% to 66.7% tobacco users and the control group went from 100% to 83.3% tobacco users, which demonstrates a significant reduction in the percentage of tobacco users who participated in an intervention.

Challenges:
Tarrant County has limited face-to-face tobacco-cessation programming. According to the 2009/2010 Tarrant County Behavioral Risk Factor Surveillance System, 18% of Tarrant County adults were classified as current smokers; well above the Healthy People 2020 target of 12%, but just under the current baseline of 20.6%. Evidence indicates that smokers have a lower Health Related Quality of Life as compared to those who have never smoked and those who have quit. Evidence also shows us that ex-smokers have a significantly higher quality of life score than current smokers.

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcomes are: (1) A one-year 25% decrease in tobacco use among program participants and, (2) 60% of the intervention population will experience improvement in the postevaluation of Health Related Quality of Life survey.

Texas Medicaid has begun to step up its actions to help Medicaid recipients stop smoking by offering tobacco-cessation counseling for pregnant clients and certain medications to assist with tobacco cessation at a reduced co-pay or at no cost. Tarrant County Public Health currently works in collaboration with Tobacco Free North Texas and other North Texas agencies that are trying to ensure that tobacco-free legislation becomes a standard practice in the area.

**Starting Point/Baseline:**
This is a new project. The baseline data will be collected from health care providers who care for Medicaid recipients identified as smokers. The clients will be referred to the program and will complete the HRQOL survey prior to program implementation. A postprogram HRQOL survey will be conducted at 30 days postprogram. A comparison between pre- and post-HRQOL will be conducted using an item-by-item comparison for each participant. The baseline data will be established in DY2.

**Rationale:**
Tarrant County has limited face-to-face tobacco-cessation programming. According to the 2009/2010 Tarrant County Behavioral Risk Factor Surveillance System, 18% of Tarrant County adults were classified as current smokers; well above the Healthy People 2020 target of 12%, but just under the current baseline of 20.6%. Evidence indicates that smokers have a lower Health Related Quality of Life as compared to those who have never smoked and those who have quit. Evidence also shows us that ex-smokers have a significantly higher quality of life score than current smokers.

**Project Components:**
Our project does not have any core components.

**Project Milestones and Rationale**
Milestone 1: development of innovative evidence-based project for target population. We selected this milestone because we are combining two evidence-based programs, Freedom From Smoking and Community Health Workers, to create one project. Therefore, it is imperative to fully develop the program and include any additional elements that may be desired by stakeholders and community partners.

Milestone 3: Execution of learning and diffusion strategy for testing, spread and sustainability will be a method of fulfilling part of the CQI requirements. We selected this milestone to ensure that the program is developed appropriately so that it is conducive to enrollment and completion by the target population. A key factor in closing the gap between best practice (such as FFS) and common practice is the ability of the health care providers and public health to spread innovations and new ideas such as program option 2.7.2.

Milestone 3: Identifying the percentage of patients in defined population. We selected this milestone to ensure that we create a sample of program participants large enough to have a
positive impact on the expenditures of medical needs related to tobacco use by decreasing the number of Medicaid tobacco users in Tarrant County, and large enough to ensure valid results.

Milestones 4, 5 & 7: Identify a percent of patients in defined population receiving innovative intervention consistent with evidence-based model. This milestone will help us to ensure that we are identifying and enrolling at an incremental rate that will allow us to implement CQI outcomes to keep the program evolving in the direction that will yield at least a one year smoking cessation rate and an improvement in HRQOL survey scores among program participants.

Milestone 6: Increase access to disease prevention programs using innovative project option. In an effort to ensure that we are reaching the Medicaid and uninsured residents who are in need of tobacco cessation education we will use screening venues, health events and collaborations with community partners to reach a larger sample of our target population.

Unique community need identification number the project addresses:
CN.15 Need for more education, resources and promotion of healthy lifestyles (free and safe places to exercise, health screenings, health education, healthy environments, etc.).

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Medicaid has begun to allow its recipients to access medical tobacco-cessation products for low co-pays and provides counseling services to pregnant women at no cost. We believe that our program will provide another alternative for Medicaid recipients to participate in tobacco-cessation programming.

Related Category 3 Outcome Measures:
Outcome Measures Reasons/Rationale for Selecting the Outcome Measure:

IT. 10.1: Quality Of Life/Functional Status:
Evidence indicates that smokers have a lower Health Related Quality of Life as compared to those who have never smoked and those who have quit. Evidence also shows us that ex-smokers have a significantly higher quality of life score than current smokers. Elements of quality of life include good health status, healthy relationships, personal happiness, socioeconomic stability, all of which we want for Tarrant County citizens.

Relationship to Other Projects:
Related to Category 1 and 2 projects
TCPH#022817305.2.1 Fetal Infant Mortality Review (tobacco cessations helps promote healthy pregnancy outcomes)

Category 4 population-focused improvements: N/A

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
Tarrant County Public Health is unaware of any other similar projects, but UNTHSC is proposing a program, Asthma 411, that could benefit by referring the tobacco-dependent adult relatives of the target population children in their program. Evidence indicates that children with asthma have better health outcomes when they are not in contact with environmental toxins such as smoke, dust and other environmental triggers. This program could also be a beneficial referral for the Tarrant County TB and STD programs in that tobacco-cessation can improve quality of life across the board. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Tarrant County Public Health computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Tarrant County Public Health defined the population that will be directly impacted by the project as individuals identified as Tarrant County smokers with Medicaid who participate in Tarrant County Public Health smoking-cessation classes. The total number of the Tarrant County population expected to be positively impacted by the end of DY5 is approximately 2,400 cessation class participants. The goal by the end of DY5 is 25% of DY4 participants, or approximately 200, will remain smoke-free for one year. Based on the HHSC funding protocol for Public Health Funding and the RHP 10 valuation model, 89.26% of the total project valuation was allocated to Category 1 and 2. 60% or approximately 600, will have an improved HRQOL survey result upon program completion. The 600 participants with improved quality of life times two quality of life values (productivity of $3,961.88 and medical cost of $2,342.56) or 600 X $6,304 equals $3,782,664. This amount is multiplied by individual impact of 5 and community impact of 4 to determine the value per year. The annual total value is multiplied by 5 years and a halo effect of 1.3 to determine the total project valuation. The actual Tobacco Intervention total project valuation for 5 years equals $68,844,485. However, due to the DSRIP Public Health funding available and the project valuation maximum the Tobacco Intervention project was discounted by 67.5% to a total project valuation of $22,405,703.

We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. Dollar valuations for the expected impact are from Penn State, “Potential costs and benefits of smoking cessation for Texas,” Tables 2 and 3, April 30, 2010.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because upon being tobacco free for one year it is assumed the participant will remain smoke free for life. This has great impact on the health improvement, increase in productivity and the reduction in medical cost for a nonsmoker/ex-smoker. We believe this to be the correct number because as the FDA warnings on cigarette packages and advertising state, “cigarettes cause fatal lung disease,” “cigarettes cause cancer,” and “cigarettes cause strokes and heart disease.”
To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because reducing the number of smokers also reduces the harm to nonsmokers in the community from secondhand smoke. The FDA warnings on cigarette packages and advertising state, “tobacco smoke can harm your children” and “smoking during pregnancy can harm your baby.” In addition, it will save community resources and medical costs by reducing smoke-related medical services for both the new non-smokers and those with health issues as a result of the second hand smoke.

**Outcome Measure : IT.10.1: Quality of Life – Valuation Reference**
Productivity cost per smoker $3,961.88
Medical cost per smoker $2,342.56
Penn State, “Potential costs and benefits of smoking cessation for Texas”, Tables 2 and 3, April 30, 2010.

Project Option 2.13.2 – Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting (i.e., the criminal justice system, ED, urgent care etc.) – Detoxification Unit and Service Expansion Project.

**Unique Project ID:** 081599501.2.1  
**Performing Provider Name/TPI:** MHMR of Tarrant County / 081599501

**Provider:** MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities services, serving an 897 square mile area and a population of approximately 1.8 million residents. MHMR of Tarrant County is a Contractor funded by DSHS to provide substance abuse services. We are the only state authorized detoxification unit for medically indigent and Medicaid clients in Region 10. Hospitals and other treatment providers in our 11 county region refer medically indigent and Medicaid clients to the Billy Gregory Center for these specialized services.

**Intervention:** The intervention is set to expand our medically supervised Detoxification unit from 12 to 20 beds. The project will also implement new strategies for post-discharge activities for all of the patients who enter the detoxification unit. Currently, at discharge counselors recommend post-discharge services, but there is no follow up to encourage participation in further services. MHMRTC plans to hire peer specialists charged with helping patients move into services to continue treatment and to stay sober and to continue to work with patients to encourage them to participate. We also plan to hire an APN to provide more and better access to physical health assessments during the patient’s time in the unit.

**Need for Project:** Inpatient detoxification is a critical element of the continuum of care for chemically dependent individuals. For the uninsured, economically disadvantaged population, “access to this continuum of care within a comprehensive service system is essential to prevent them from ‘falling through the cracks,’ as they tend to be revolving-door” (i.e., repeating), high utilizers of publicly-funded services with high morbidity and mortality rates.”138 “Facilitating linkage to follow-up treatment after detoxification to ensure continuity of care was a key element [of the project studied for the article], as research has shown that detoxification alone has limited long-term value.”139 This project will expand encounters to a significant portion of SUD clients in Tarrant County who are currently on the waiting list for services or are currently being admitted to emergency room services with related conditions. The inpatient wait list fluctuates from 20 to over 45 Medicaid eligible and uninsured individuals. Further capacity will also be needed as UNTHSC and Wise Regional Medical center have projects that will result in additional referrals of patients to our detoxification unit.

http://web.ebscohost.com/ehost/pdfviewer/pdfviewer?sid=359390af-460e-4be4-9310-1046dc8b8c72%40sessionmgr4&vid=2&hid=25

139 Id
**Target Population:** Region 10 substance using consumers who are experiencing withdrawal or intoxication. The population will consist primarily of uninsured and Medicaid eligible consumers.

**Category 1 or 2 milestones expected benefit:** The project seeks to provide care to 250 additional patients in DY4 and 300 in DY5 in addition to significantly enhancing services within the continuum of care offered to patients in existing beds (500 per year).

**Category 3 outcomes:**
IT 9.2 Our goal is a 20% reduction in ED visits for patients enrolled in the program.
IT-6.1 Our goal is to have 10% improvement over the baseline of patient satisfaction scores.

**Project Option 2.13.2** – Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting (i.e., the criminal justice system, ED, urgent care etc.) – Detoxification Expansion Project.
Unique Project ID: 081599501.2.1
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Project Description:

We propose an expansion of our medically supervised detoxification unit from 12 beds to 20. The project will also implement new strategies for post-discharge activities for all of the patients who enter the detoxification unit. Currently, at discharge counselors recommend post-discharge services, but there is no follow up to encourage participation in further services. MHMRTC plans to hire peer specialists charged with helping patients move into services to continue treatment and to stay sober and to continue to work with patients to encourage them to participate. We also plan to hire an APN to provide more and better access to physical health assessments during the patient’s time in the unit.

-The team will focus on issues which disproportionally affect this population, including legal issues, mental illness, tobacco use and health conditions directly related to SUD and MH. This provision of care and coordination for Substance Abuse Disorder (SUD) clients in a specialized detoxification unit will improve health quality, reduce health care costs and costs incurred through the legal system in Tarrant County and RHP 10.

During and upon completion of detoxification services, consumers will be referred to the following services, among others:

- Peer recovery coaches will assist clients in accessing needed services currently available (addiction step-down services – intensive residential treatment and outpatient addiction treatment services)
- Transformation waiver project 081599501.2.2 Integrate Primary and BH Care Services by our organization,
- Transformation waiver project 081599501.2.3 Enhance Service Availability of Appropriate Levels of BH Care) in the treatment continuum by our organization, and
- Back to the organization that referred them to our facility, when appropriate.

Goals and Relationship to Regional Goals:

Project Goals:
-To increase MHMRTC’S ability to provide the right care at the right time in the right setting, resulting in more patients being treated in the behavioral health setting rather than emergency departments, inpatient units or ending up incarcerated. Specifically this will increase the number of people receiving detoxification treatment services by 50% in Region 10.
This project meets the following Regional goals:
A goal of the Region is to provide improved access to ongoing preventive primary and behavior health care. This project will contribute to achieving that goal by focusing on a key behavior health populations and increasing the gateway to further treatment and long term wellness.

Challenges:
In order to determine whether we have met our goal of reducing ED visits, we will need data not in our control. Because JPS is a primary provider of ED services to our client base, we will work with them to gather data necessary to establish baselines and to track process.

We also recognize a challenge in following up with patients regarding patient satisfaction scores. Working with our peer recovery coaches, we will develop incentives and methodologies for engagement.

5-Year Expected Outcome for Provider and Patients:
The expected outcome for MHMRTC is the ability to provide additional services to our target population which is historically underserved. Our goal for patients is that the services they receive result in long term sobriety and an improved quality of life.

Starting Point/Baseline:
The detoxification unit currently serves 500 clients annually, none of whom receive post-discharge services as proposed in this project. The total number of clients served in the detoxification unit with the funded expansion will increase from 500 clients annually to 800 clients served annually which equates to an additional 300 clients.

Rationale:
Inpatient detoxification is a critical element of the continuum of care for chemically dependent individuals. For the uninsured, economically disadvantaged population, “access to this continuum of care within a comprehensive service system is essential to prevent them from ‘falling through the cracks,’ as they tend to be revolving-door” (i.e., repeating), high utilizers of publicly-funded services with high morbidity and mortality rates.”140 “Facilitating linkage to follow-up treatment after detoxification to ensure continuity of care was a key element [of the project studied for the article], as research has shown that detoxification alone has limited long-term value.”141

141 Id
Consumers find difficulty in navigating the system and in finding a provider, particularly indigent detoxification care providers. Region 10 has no other state-funded detoxification unit available and the wait list is currently at 45 persons whom have put their name on the list. These numbers do not include the clients who should be admitted to the unit or were on the wait list but due to lack of capacity and time delays end up in less appropriate settings.

-Project Components:
  a. Expansion of the detoxification unit by adding a minimum of eight additional beds
  b. Identify the demographics, diagnoses, housing status, functional status, medical utilization and ED utilization of intended demographic through conducting a needs assessment
  c. Implement revised care model for detoxification services
  d. Use detoxification substance-specific protocols in treatment
  e. Hire and train peer support staff who model and coach successful health and mental health behaviors

Unique community need identification numbers the project addresses:
  • CN.1 – Lack of provider capacity
  • CN.10 – Demand for ED visits is on the rise and EDs are becoming overcrowded due to reduced inpatient capacity and impaired patient flow

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This is an enhancement of an existing project funded through the Department of State Health Services in Texas. During the last legislative session, SUD treatment was included as a Medicaid benefit to low-income individuals in Texas. This project will significantly enhance an existing delivery system reform initiative, focused on treating individuals in the most appropriate level of care at the most cost-effective and efficient manner. Diverting consumers with SUD from hospitals-, legal institutions and mental health hospitals is a part of delivery systems reform in Texas.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:

IT-6.1 Percent improvement over baseline of patient satisfaction scores.

Ford and Zarate indicate in their article, “Closing the Gaps: The Impact of Inpatient Detoxification and Continuity of Care on Client Outcomes,” that psychosocial areas will
improve when treatment services are provided.\textsuperscript{142} Client outcomes were positive, particularly outcomes of clients who completed detoxification treatment services and received follow-up care. Their functioning relative to sobriety, employment, homelessness improved and arrests and days incarcerated decreased as compared to measures prior to clients participating in treatment services. The quality of life improvements resulting from enhanced detoxification services should be reflected in patient satisfaction scores.

\textit{IT- 9.2ED appropriate utilization}

The study about which Ford and Zarate’s article was written resulted in an approximate 19% decrease in ED visits post-discharge from the detoxification unit.

\textbf{Relationship to Other Projects:}
The expansion of detoxification beds in Region 10 is directly related to the expansion of behavioral health capacity (RPH Project 081599501.1.1). Consumers in Region 10 with behavioral health diagnosis of mental illness and or primary health care problems will be served in the appropriate level of care that is cost efficient and effective for both behavioral and primary health- This project is also related to R.N. care management (RHP 081599501.2.3), as it allows more access to specialized services that case managers can utilize for a targeted population, thus preventing the use of services in an inappropriate setting. Essentially, consumers will be able to access a full continuum of care to meet their primary health and behavior health needs.

\textbf{Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:}
The Detoxification Expansion Project participants who reside in Wise County will be referred to the Wise Regional Health System Intensive Outpatient Program (IOP) 130606006.2.3 – as a step-down option to continue substance use disorder services/recovery treatment. Wise Regional Health System proposes to establish a substance abuse division in Wise County for patients requiring substance abuse services.

Upon completion of detoxification services, we will also refer previously homeless dually diagnosed consumers to the University of North Texas Health Science Center (UNTHSC) 138980111.2.2 – Health Navigation and Incentives for Dual Diagnosis Patients project. Conversely, both Wise Regional Health System and UNTHSC will refer clients needing detoxification services, a higher level of care, to our Detoxification Expansion project.

\textsuperscript{142} http://web.ebscohost.com/ehost/pdfviewer/pdfviewer?sid=359390af-460e-4be4-9310-1046dc8b8c72%40sessionmgr4&vid=2&hid=25
At least twice a year, we will participate in learning collaboratives at the regional level. The collaboratives will identify “raise the floor” initiatives which we will implement. We will also participate by bringing our best practices identified through the project.

**Project Valuation:**

**Approach:**

Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time.

Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles: the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system.

In order to set an appropriate incentive RHP 10 agreed that a multiplier of 5 should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the annual value of a single successful intervention at full implementation and multiplying that value by 5. The multiplier of 5 was decided with much discussion by performing providers. The rationale was that to overcome resistance to change, both in the delivery system and the payment system, 5 years of benefits were needed. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

The incentive element of the Region 10 valuation methodology is relevant to all Texas transformation efforts. However, it is particularly relevant to transformation of the mental health care system, where patient experience, population health and costs have previously not received any focus, and where services tend to be provided primarily in emergency situations. Texas ranks 50th in the country in per capita funding for mental health services. Only one-third of the more than 480,000 adults in Texas with serious and persistent mental illness received services through the community mental health
system. Therefore, the most important transformation that can occur in mental health is increased access to services. Until the advent of the waiver, the system has not had funds to experiment with the types of interventions that are being made possible through waiver funding. Incentives for effective implementation and outcomes are important to allow for the identification of successful interventions and the ultimate sustained transformation of the system.

Rationale:
We will be serving 1900 people throughout the waiver period. The full value of this additional capacity will not be limited to the interventions delivered during the waiver period since we intend to permanently operate at the higher capacity as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, cost measures from studies identified reductions from baseline in medical status, psychiatric status, employment, criminal activity, and in treatment. Medicare/Medicaid savings were identified to identify the total value for one successful intervention. At full implementation we will be serving 800 unique patients annually, so the value per successful intervention was computed. We then applied the incentive multiplier of 5 deriving at the full valuation.

**Project Option 2.15.1** – Integrate Primary and Behavioral Health Care Services – MHMR of Tarrant County and Fort Worth North-side Community Health Center (Federally Qualified Health Center) co-located at MHMRTC Homeless/Crisis Services located at: 1350 East Lancaster, Fort Worth, Texas 76102

**Unique Project ID:** 081599501.2.2  
**Performing Provider Name/TPI:** MHMR of Tarrant County / 081599501

**Provider:** MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities services, serving an 897 square mile area and a population of approximately 1.8 million residents. As the Texas Department of State Health Services (DSHS) designated Local Mental Health Authority, MHMRTC functions as a safety net and is mandated to plan, develop policy, coordinate, and allocate and develop resources for mental health services in Tarrant County particularly for persons receiving Medicaid, Medicare, or who are indigent and uninsured.

**Intervention:** MHMRTC will subcontract with the FQHC system to co-locate primary care and behavioral health services at MHMRTC’s homeless/crisis services center located at 1350 East Lancaster, Fort Worth, Texas. The location is in the heart of the homeless/emergency shelter district in Tarrant County. This project will provide access to primary care services for the target population.

**Need for Project:** Texans with severe mental illness who receive services in the state’s public mental health system die 29 years earlier than the general population. Nearly two-thirds of these deaths are caused by treatable physical illness. Approximately 40%, or over 2,800, of the individuals currently served by MHMRTC receive no primary care services from any other source.

**Target Population:** Individuals with severe mental, developmental, and addictions disorders who may also be homeless, and who are not otherwise able to access primary care services. The population will consist primarily of uninsured patients with a small number of Medicaid and other patients.

**Category 1 or 2 milestones expected benefit:** The project seeks to provide integrated primary care and behavioral health treatment to 250 patients in DY4 and 500 in DY5.

**Category 3 outcomes:**
- IT-1.7 Our goal is to reduce by 10% of the baseline the number of impacted patients with high blood pressure.
- IT-1.10 Our goal is to reduce by 10% the number of diabetic patients in the target population with HbA1c >9.0%.
IT-9.2 Our goal is to reduce ED utilization in the served population by 9%.

**Project Option 2.15.1** – Integrate Primary and Behavioral Health Care Services – MHMR of Tarrant County and Fort Worth North-side Community Health Center (Federally Qualified Health Center) co-located at MHMRTC Homeless/Crisis Services located at: 1350 East Lancaster, Fort Worth, Texas 76102

**Unique Project ID:** 081599501.2.2  
**Performing Provider Name/TPI:** MHMR of Tarrant County / 081599501

**Project Description:**
We propose an integrated primary care and behavioral health model which will provide greater access and efficiency in the delivery of primary care services to individuals with severe mental, developmental and addictions disorders and who may also be homeless. This integrated primary care and behavioral health model will co-locate primary care and behavioral health professionals, providing a greater level of efficiency and access as a whole to Tarrant County area Region 10. Utilizing the FQHC system (which will NOT entail the FQHC contributing any federal funding to this project) will result in a greater level of continuity and care coordination between primary
care and behavioral health providers. Space and equipment will be provided for the FQHC by MHMRTC with 1115 Waiver funds. The FQHC will provide staffing and services.

This program located at the MHMRTC East Lancaster location will address the gaps in primary care for individuals with severe mental, developmental and addictions disorders and who may also be homeless. Diabetes and hypertensive patients who are not receiving primary care or behavioral health care through the JPS Health Network (JPS) Network will be identified for needed primary care and behavioral health services at the East Lancaster site, which is in the heart of the homeless/emergency shelter district in Tarrant County. Patients throughout the MHMRTC system, in general and homeless patients, in particular, as well as patients receiving services at the FQHC (not affiliated with JPS) will have access through this site for their primary care and behavioral health needs. MHMRTC currently serves approximately 6,000 individuals with severe mental, developmental and addictions disorders and who may also be homeless. Approximately 40% of the individuals currently served by MHMRTC receive no primary care services from any other source.

This project will be completed by the ongoing community-based case management services provided by qualified mental health professionals and LCDCs. MHMRTC is the only entity in Tarrant County authorized by the Department of State Health Services (DSHS) to provide community-/field-based case management and rehabilitation services, which are crucial in supporting such a vulnerable population with their primary care and behavioral health needs. In addition to providing supportive services and psychosocial rehabilitation for these patients, the case managers (PATH\textsuperscript{143} and Addictions Services Outreach Team) will also engage potential patients from the homeless campsites and shelters providing outreach and referral services, as well as arranging transportation for patients needing to access the 1350 East Lancaster site. This integrated primary care and behavioral health project will be based on the National Council for Community Behavioral Health’s (NCCBH) Four Quadrant Clinical Integration Model.\textsuperscript{144}

Goals and Relationship to Regional Goals:
- Greater compliance in overall preventive health care
- Reduced avoidable emergency department and hospital admissions and
- Improved outcomes related to overall functionality and health status. This will take place through collaboration with a Federally Qualified Health Center (FQHC) and the local mental health authority.

\textsuperscript{143} Projects for Assistance in Transition from Homelessness \url{http://pathprogram.samhsa.gov/}
The project goal is to function at minimum Level 4 collaborative level\(^{145}\) wherein providers will share the same facility and share operations (scheduling appointments, medical records, etc.); regular face-to-face communication; sense of being part of a team to a maximum Level 5 collaborative level wherein providers are part of the same team and system; the patient experiences mental health treatment as part of their regular primary care or vice versa.\(^{146}\)

**This project meets the following Regional goals:**
Region 10 goals are to improve quality and access to care for persons requiring multiple subspecialties (e.g., behavioral health, cardiac, geriatric, etc.). This integrated primary care and behavioral health project seeks to remove gaps in care and maximize quality for the highest number of consumers possible through onsite co-location of primary care and behavior health as well as through providing these same services via telemedicine.

**Challenges:**
- The most significant challenge we will address during the course of the waiver will be our need to rely on other parties for data. This waiver was designed to impact the cost and quality of care by engaging non-hospital providers. We will need to work with hospitals (and potentially other entities) to identify the data needed to support our outcomes and to develop reporting mechanisms. The final challenge related to other parties is the need to contract and share data with the FQHC.

**5-Year Expected Outcome for Provider and Patients:**
The goal of the project is to provide primary care services for patients with serious mental illness. The expected outcome for the provider is that the total health of patients will be managed, resulting in better outcomes. Since physical problems often exacerbate mental health problems, the provider hopes to realize less need on behalf of these patients. The expected outcome for patients is increased functionality and quality of life.

**Starting Point/Baseline:**
MHMR of Tarrant County (MHMRTC) will conduct a needs assessment in order to establish baseline data of the number of people who have physical/behavioral health needs in DY2. Currently, there are 2,824 MHMRTC patients without health insurance. MHMRTC will initiate agreement(s) with Fort Worth Northside Community Health Center (FQHC, not affiliated with JPS) in order to develop primary care and behavioral health services.

**Rationale:**

\(^{145}\) See pg. 318, *RHP Category 2 Planning Protocol*, p. 318. Levels of interaction between physical and behavioral health providers.

Our target population experiences significant medical issues such as obesity, diabetes, high blood pressure, and thyroid conditions, which often go untreated due to unavailable primary care providers. Physical conditions often exacerbate mental health conditions and lead to poor outcomes and prognosis. For example, as many as 75% of individuals with schizophrenia have been found to have high rates of serious physical illnesses, such as diabetes, respiratory, heart and/or bowel problems and high blood pressure (Bazelon Center for Health Law 2004). According to a recent SAMSHA news release, adults with a serious mental illness have higher rates (21.69%) of high blood pressure than those without a mental illness.\(^{147}\)

**Project Components:**

a) Identify sites for integrated care projects, which will benefit a significant number of patients in the community. Examples of selection criteria include proximity/accessibility to target population, physical plant conducive to provider interaction; ability/willingness to integrate and share data electronically; receptivity to integrated team approach. We have determined to co-locate with the FQHC at 1350 East Lancaster, Fort Worth, Tx.  

b) Develop provider agreements whereby co-scheduling and information sharing between physical health and behavioral health providers will be facilitated. This will be accomplished in DY2.  

c) Establish protocols and process for communication, data sharing, and referral between behavioral and physical health providers. Project milestones include this component in DY3.  

d) Recruit a number of specialty providers (physical health, mental health, substance abuse), to provide services in the specified locations. 10 FTEs will be added.  

e) Train physical and behavioral health providers in protocols, effective communication and team approach. Build a shared culture of treatment to include specific protocols and methods of information sharing that include: (1) Regular consultative meetings between physical health and behavioral health practitioners; (2) Case conferences on individualized as-needed basis to discuss individuals served by both types of practitioners; and/or (3) Shared treatment plans co-developed by both physical health and behavioral health practitioners. This will be accomplished as professionals are added.  

f) Acquire data reporting, communication and collection tools (equipment) be used in the integrated setting, which may include an integrated electronic health record system or participation in a health information exchange—depending on the size and scope of the local project. The project anticipates using the data system available to the FQHC. However, we may need to develop a separate system. This need will be identified and a plan developed during DY2. We will also need to negotiate with JPS to track ED usage.  

g) Explore the need for and develop any necessary legal agreements that may be required in a collaborative practice. To be accomplished in DY2.  

\(^{147}\)Substance Abuse and Mental Health Administration. 2012. Adults experiencing mental illness have higher rates of certain chronic illnesses. *SAMHSA New Release.*
h) Arrange for utilities and building services for these settings. The project will be implemented in existing facilities. To the extent that additional space is needed, this will be done as the space is acquired.

i) Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individuals treated in these integrated service settings. The project anticipates using the data system available to the FQHC. However, we may need to develop a separate system. This need will be identified and a plan developed during DY2. We will also need to negotiate with JPS to track ED usage. Data elements will need to be defined and reports will need to be developed.

j) Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying lessons learned, opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. We will be working through our State association to identify best practices and will implement appropriate changes to our project.

The selected milestones and metrics were chosen to allow for assessment mechanisms to determine the scope of primary care needs in our area. Developing a set of standards and best practices will ensure program operations are built upon a solid infrastructure for the best service delivery. The milestones and metrics were also chosen to identify a concrete target percentage number to allow for ongoing performance measures. In DYs 3-5, face-to-face learning meetings/seminars will be attended, at least twice per year, for the purpose of continuous quality improvement. Integration of services and coordination of care will commence in DY3-5.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.10 – Overuse of emergency department (ED) services
- CN.11 – Need for more care coordination
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project represents a new initiative to integrate primary care and behavioral health services for the impacted population

**Related Category 3 Outcome Measures:**
Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:

IT-1.7 Controlling high blood pressure (NCQU-HEDIS 2012, NQF 0018)\(^{148}\) – stand-alone measure.
Nationally, 21.6% of individuals 18 or older with serious mental illness have high blood pressure, compared to 17.7% of the population that does not have a similar illness\(^{149}\) Control of high blood pressure in the target population will be an indication that the integration of primary care services has been successful.

IT-1.10 Diabetes Care; HbA1c poor control (>9.0%) – NQF 0059.
Individuals with severe mental illnesses suffer a higher incidence of diabetes. Moreover, drugs used to treat mental illness are often associated with significant increases in fasting glucose concentrations.\(^9\) Control of HbA1c in the target population will be an indication that the integration of primary care and behavioral health services has been successful.

IT-9.2 ED Appropriate Utilization
Individuals with serious mental illness have at least one ED visit during a year far exceeds use by those without serious mental illness. (47.6% vs. 30.5% nationally)\(^{10}\) Reductions in ED visits will be an indication that the integration of primary care and behavioral health services has been successful.

Relationship to Other Projects:
All of MHMRTC’s project address the expansion of behavioral health services and/or the integration of services to better serve a co-morbid population. It is expected that as the projects progress, we will refine each of the projects to better serve populations. It is also expected that efficiencies will be identified that will enhance our ability to serve a larger percentage of the population that currently is unable to find appropriate care. In particular, the projects that will have an impact on this project are:
-(1) 081599501.1.1 Expand Behavioral Health Capacity
(2) 081599501.2.1 Expand Detox Capacity-(3) 081599501.2.3 RN Care Management.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

-JPS and MHMR are both planning to implement integrated health projects; each will serve distinct client populations. The MHMRTC project will serve only those clients receiving services

\(^{149}\) [http://www.samhsa.gov/data/2k12/NSDUH103/SR103AdultsAMI2012.pdf](http://www.samhsa.gov/data/2k12/NSDUH103/SR103AdultsAMI2012.pdf)

\(^9\) [http://clinical.diabetesjournals.org/content/24/1/18.full](http://clinical.diabetesjournals.org/content/24/1/18.full)

\(^{10}\) [http://www.samhsa.gov/data/2k12/NSDUH103/SR103AdultsAMI2012.pdf](http://www.samhsa.gov/data/2k12/NSDUH103/SR103AdultsAMI2012.pdf)
with MHMRTC while partnering with the FQHC to offer primary care treatment at the East Lancaster site. The JPS project will serve clients receiving primary care or behavioral health services at current JPS sites. Each entity offers a distinct array of mutually exclusive services for the project. MHMRTC is focused on serving individuals with severe mental, developmental, and addiction disorders who may be homeless. MHMRTC has engaged in planning efforts with JPS to assure we are not duplicating efforts and adequately coordinating treatment and patient continuity. MHMRTC currently has staff co-located at JPS who may be utilized to verify patient medical home to assure seamless unduplicated services. Patients with more complicated medical needs will be referred to JPS as deemed clinically appropriate. We also plan to conduct a needs assessment in DY2 in order to further develop a process for patient identification, coordination and to assure that patients receive seamless integrated care.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) MHMR of Tarrant County will also be working with other Community Centers in learning collaborative to select a small amount of outcome measures for category 3, based on the valuation studies conducted by health care economists at the UT Austin and UT Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project.

**Project Valuation:**

**Approach:**

Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles: the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system.

In order to set an appropriate incentive RHP 10 agreed that a multiplier of 5 should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the annual value of a single successful intervention at full implementation and multiplying that value by 5. The multiplier of 5 was decided with much discussion by performing providers. The
rationale was that to overcome resistance to change, both in the delivery system and the payment system, 5 years of benefits were needed. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

The incentive element of the Region 10 valuation methodology is relevant to all Texas transformation efforts. However, it is particularly relevant to transformation of the mental health care system, where patient experience, population health and costs have previously not received any focus, and where services tend to be provided primarily in emergency situations. Texas ranks 50th in the country in per capita funding for mental health services. Only one-third of the more than 480,000 adults in Texas with serious and persistent mental illness received services through the community mental health system. Therefore, the most important transformation that can occur in mental health is increased access to services. Until the advent of the waiver, the system has not had funds to experiment with the types of interventions that are being made possible through waiver funding. Incentives for effective implementation and outcomes are important to allow for the identification of successful interventions and the ultimate sustained transformation of the system.

Rationale:
The calculation of the value of successful interventions was based on an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying all of our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The QALY value results in significant values related to mental health interventions. These patients are intensive users of the health care system and are most often not functional in society. Incremental improvements in their status have an enormous impact on all three elements of the triple aim.

Project Option 2.19.1 – Develop care management function that integrates primary and behavioral health needs of individuals (RN Care Management)

Unique Project ID: 081599501.2.1
Performing Provider Name/TPI: MHMR of Tarrant County / 081599501

Provider: MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities (IDD) services, serving an 897 square mile area and a population of approximately 1.8 million residents. As the Department of Aging and Disability Services (DADS) designated local Intellectual and Developmental Disability (IDD) authority for the local service area (LSA) consisting of Tarrant County, MHMRTC is delegated by DADS to function as a safety net and be responsible for planning, policy development, coordination, including coordination with criminal justice entities, resource allocation, and resource development for and oversight of IDD services in the most appropriate and available setting to meet individual needs in the LSA.

Intervention: Implement a RN care coordination model for IDD consumers with chronic disease. RNs will provide the needed link to assist patients and caregivers with understanding and follow-through related to chronic disease management. Activities will include:

- Consulting with health care providers
- Aid in communication between the health care provider and the patient
- Assistance with linking to preventive services
- Care coordination teams will provide a variety of disease management guidelines and techniques to engage the patient and family.
- Community based interventions, including home visits and telehealth
- Behavioral supports for caregivers
- Development and maintenance of a chronic disease registry data base

Need for Project: IDD patients are 4 times as likely to have a chronic disease than the rest of the population, have a shorter life expectancy and experience persistent problems in accessing health services. All chronically ill patients must deal with the deficiencies in the health care system’s management of chronic disease including:

- Rushed practitioners not following established practice guidelines
- Lack of care coordination
- Lack of active follow up to ensure the best outcomes
- Patients inadequately trained to manage their illness

These problems are exacerbated in the IDD population because of communication problems and problems with understanding what is needed to manage disease. Without proper understanding, chronic conditions are likely to become acute episodes resulting in hospitalization, disability and premature death.

Target Population: IDD patients with chronic disease. MHMRTC currently services 1,100 IDD clients. We will need to determine the number of IDD clients with chronic disease. However,

we expect to serve 480 clients during the waiver period. Currently 80% of people served by MHMRTC have Medicaid and the 20% without Medicaid are typically children (eligibility is based on parent income) or people who do not qualify for Medicaid because of citizenship status.

**Category 1 or 2 milestones expected benefit:**
In DY4, we will provide RN care coordination to 300 patients.
In DY5 we will add 180 patients to that population for a total annual population beginning in DY5 of 480.

**Category 3 outcomes:**
IT-10.1 Quality of Life. Our goal is to achieve 10% improvement over baseline of quality of life scores as measured by the AQoL or another validated quality of life assessment tool for the IDD population.
IT-9.2 ED Appropriate Utilization. Our goal is to reduce ED visits by 15%
IT-2.13 Other admissions rate (inpatient admissions for IDD clients in RN care management). Our goal is to reduce inpatient admissions by 40%.

**Project Option 2.19.1** – Develop care management function that integrates primary and behavioral health needs of individuals (RN Care Management)
Unique Project ID: 081599501.2.3
Performing Provider Name/TPI: MHMR of Tarrant County (MHMRTC) / 081599501

Project Description:
Our team of RNs will use a care management model, such as Wagner’s chronic care model, to develop the project and select criteria to identify the intellectual and developmental disability (IDD) patients who benefit from disease management. We plan to use a team care coordination model with RNs and behaviorists to provide a variety of disease management guidelines and techniques to engage the patient and family. Community-based interventions, including home visits and telehealth, have been found to be effective in improving treatment adherence and reducing psychiatric hospitalizations. This leads to increased patient engagement and allows RNs to measure stages of patient activation, enabling intervention and teaching with IDD patients who lack the skills to self-manage. We propose to bolster care management by providing behavioral supports to caregivers of the IDD patients to help reduce their levels of stress.

Research shows the following barriers are particularly problematic within the developmental disability population with primary care providers: communication difficulties between patients, families and health care professionals; problems in obtaining patient histories; difficulties in problem determination; no continuity of care; lack of understanding of medications or self-care; and primary care providers’ lack of skills, knowledge, training and expertise with the IDD population.

The RN ensures the health care provider understands the issues of the IDD patient, assists with linking the patient for preventive services, and consults with the health care providers. RN care coordination provides the needed link to assist the patient with understanding and follow-through related to chronic disease management.

Goals and Relationship to Regional Goals:

Project Goals:
Developing and implementing a RN care management project allows MHMRTC to meet several goals.

- Better care for our IDD patients through increased primary and specialist care referrals and access, which results in increased preventive care as well as better care coordination.

---

154 Jansen, ibid.
155 Craig, ibid.
among providers. A Region 10 stakeholder survey shows providers do not feel there is strong care coordination among primary care, specialty care and hospitals.

- Decrease emergency department (ED) utilization and decrease psychiatric hospitalization by expanding access to behaviorists at our psychiatric clinic. This leads to better health in Tarrant County because the entire IDD community in the area uses our specialty IDD psychiatric clinic. RN care management addresses a need cited by community stakeholders to achieve better integration of primary care and mental health care services through models for mental health integration.

- Disease management, which leads to decreased costs in use of the ED and medical hospitalization, improved functionality and better quality of life. The purpose of the project is to ensure IDD patients see their doctors, understand their medical conditions and get help with their behaviors. This leads to reduced cost of care, improved health and increased patient satisfaction.\(^{156}\)

This project meets the following Regional goals:
This project addresses goals of Region 10 and the triple aim by improving health of the IDD patient by enabling the health care provider to understand the issues of the IDD patient, assisting with linking the patient for preventive services, addressing chronic medical and psychiatric issues through disease management, decreases costs for the Region due to fewer hospitalizations and ED use and improves quality of life for the IDD patient and family.

Challenges:
The most significant challenge for this project will be hiring enough RNs with the skills to address their special needs. We are in the process of developing a RN care management recruitment brochure, and have contemplated a tuition assistance program.

5-Year Expected Outcome for Provider and Patients:
The outcomes will lead to increased referrals and access to primary and specialty care, reduced ED use and hospitalizations related to psychiatric issues as well as chronic medical conditions, as recorded in our chronic disease registry data base and claims data.

Starting Point/Baseline:
Currently MHMRTC does not utilize an RN care management program for the 1,100 IDD clients we serve. The project requires a needs assessment to determine baseline number of IDD clients with chronic disease to be targeted for disease and care management. A health risk screening tool, such as HRSTonline.com, will be utilized to prioritize need and gather baseline data on primary care referral needs. The baseline time period is DY2. This project will target a minimum of 43% of the IDD population identified by DY5.

**Rationale:**

IDD patients have unique needs related to their behaviors and potential lack of understanding of the care needed for their chronic health conditions. Without understanding of the care ordered, and regular follow-up of the primary and behavioral care, these chronic conditions are likely to become acute episodes resulting in hospitalization, disability and premature death.\(^{157}\) IDD patients often have multiple chronic conditions. Medical Expenditures Panel Survey (2012)\(^ {158}\) shows a higher rate for chronic disease in developmental disabilities:

<table>
<thead>
<tr>
<th>Chronic condition</th>
<th>No disability %</th>
<th>IDD%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arthritis</td>
<td>9.7</td>
<td>26.7</td>

<td>16.7</td>
<td>22.4</td>
</tr>
<tr>
<td>Stroke</td>
<td>0.7</td>
<td>14.2</td>
</tr>
</tbody>
</table>

In Tarrant County the prevalence rates for these conditions is increased based on data from Texas Price Point (Texas Hospital Association, 2012).\(^ {159}\) Lack of understanding related to the care ordered and lack of follow up with primary care leads to a large cost for our community in IDD hospitalizations related to chronic conditions.

---

\(^{157}\) Jansen, ibid.

Review of this data shows without regular care, these IDD patients’ health issues escalate to acute episodes and poorer health status, including hospitalization, and decreased quality of life. This is a challenge for MHMRTC and our community.

-Project Components:
  a. Conduct data matching to identify individuals with co-occurring disorders who are:
     1. Not receiving primary care
     2. Not receiving specialty care according to professionally accepted practice guidelines
     3. Over-utilizing ER services based on analysis of comparative data on other populations
     4. Over-utilizing crisis response services
     5. Becoming involved with the criminal justice system due to uncontrolled/unmanaged symptoms
  b. Review chronic care management best practices such as Wagner’s Chronic Care Model and select practices compatible with organization readiness for adoption and implementation
  c. Identification of BH case managers and disease care managers to receive assignment of these individuals
  d. Develop protocols for coordinating care; identify community resources and services available for supporting people with co-occurring disorders
  e. Identify and implement specific disease management guidelines for high prevalence disorders, e.g. cardiovascular disease, diabetes, depression, asthma
  f. Train staff in protocols and guidelines
  g. Develop registries to track client outcomes
  h. Review the intervention(s) impact on quality of care and integration of care and identify “lessons learned,” opportunities to scale all or part of the intervention(s) to a broader patient population, and identify key challenges associated with expansion of the intervention(s), including special considerations for safety-net populations.

All of the core components of this project are addressed by process milestones in DY2 and 3. This includes working with Region 10 agencies for data matching, as well as protocol development, disease management guidelines, staff hiring and training, and particularly choosing how to use a chronic disease registry. We need to understand if our EHR will work or if we need to implement elements in another type of registry.- We plan to have Wagner’s chronic care model guide our project development.

-We plan to hire 12 FTE nursing personnel to be trained in care management protocols; two FTE board certified behavior analysts, as well as four FTE staff to manage the project and implement
use of disease management software. The RN care manager caseload ratio will start at 1:25, based on acuity and need of the client.\textsuperscript{160} Clients just discharged from the hospital require intensive coordination; once they have received ongoing care coordination may need less intense care.

Continuous quality improvement will be ongoing, identifying gaps and sharing lessons learned in best practice treatment through the disease registry. We have included milestones in DY4 and DY5 to track our CQI efforts. As a result, in DY5 we will measure an increased use of routine preventive and primary care by 50\% as well as measuring 480 patients who receive disease-specific training instructions.

**Unique community need identification numbers the project addresses:**

- CN. 5 – Insufficient integration of mental health care in the primary care medical care system
- CN. 11 – Need for more care coordination
- CN. 13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome measures:**

*IT-10.1 Quality of Life (stand alone measure)*

By the end of the Waiver, MHMRTC will show a 10\% improvement in quality of life scores as measured by the AQoL or another validated quality of life assessment tool for the IDD population. -The RN care management project is designed to help improve symptoms and function, two essential components of quality of life. According to the National Quality Forum, care coordination is foundational to quality health services, including quality of life.\textsuperscript{161} When symptoms and function are improved, the patient will have decreased ED visits and decreased hospitalizations. A “feet to the street” integrated care management model has been used, which showed improved health outcomes and patient satisfaction as well as reduction in inpatient and ED services.\textsuperscript{162} They also demonstrated a decrease in homelessness, an increase in medical home assignment and very high patient satisfaction.

\textsuperscript{160} Craig, ibid.
**IT-9.2 ED appropriate utilization.** IDD patients with chronic disease experience all of the deficiencies of the health care system with respect to chronic disease management. Those deficiencies are exacerbated in this population due to communication problems, leading to unnecessary acute episodes. Our goal is to reduce ED utilization by 15%.

**IT-2.13 Other admissions rate.** IDD patients with chronic disease experience all of the deficiencies of the health care system with respect to chronic disease management. Those deficiencies are exacerbated in this population due to communication problems, leading to unnecessary acute episodes. Our goal is to reduce inpatient hospitalizations in this population by 40%.

**Relationship to Other Projects:**

081599501.1.2 Crisis stabilization services for IDD population with co-occurring mental illness. Both projects address an IDD population that has co-occurring complications. Because many individuals with chronic diseases also have mental illness, there may be duplications in the populations that will be addressed as they are identified.

Projects 081599501.1.1 Expand behavioral health. This project adds capacity with respect to mental health professionals and will provide a resource as needed.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

The Baylor, JPS and MHMR care coordination projects serve distinct client populations in Tarrant County. Baylor and JPS projects focus on primary care patients, registered in their clinics, with mental health (MH) needs and MH patients with primary care needs. The MHMR project focuses on MHMR intellectual developmental disabilities patients with chronic disease, who benefit from disease management. We will link these patients into a primary care system.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) MHMR of Tarrant County will also be working with other Community Centers in learning collaboratives to select a small amount of outcome measures for category 3, based on the valuation studies conducted by health care economists at the UT Austin and UT Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project.

**Project Valuation:**

Approach:
Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation.
of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing our the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system. In order to set an appropriate incentive RHP 10 agreed that a multiplier should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the value of a single successful intervention and multiplying by the anticipated interventions per year at full implementation. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

Rationale:
The calculation of the value of successful interventions for this project was based on an extensive literature review utilizing studies in which similar interventions were implemented and the impacts to the healthcare system were recorded.

Our target population of 1,100 clients will be impacted by this project as RN care coordination services will be available to all. Of that population, 480 are expected to come into services during the waiver period. The full value of these intensive supports will not be limited to the interventions delivered during the waiver period since we intend to permanently operate a RN Care Coordination model as we move to transform the system rather than make temporary changes for the sake of the waiver.

For this project, cost savings have been identified in several areas including $9,964 savings versus the inpatient setting, savings with regard to the level of claims expenditures in the amount of $6,359, and $483 of net Medicare/Medicaid savings totaling $16,806 for each consumer. At full implementation we will be serving 480 additional people annually, yielding a value of $8,066,880. We then applied the incentive multiplier of 5 deriving a full valuation of $40,334,400. Due to our funding limitation in Pass 1, we had to discount each of our Pass 1 projects. The discounted value of this project is $21,521,621, of which $19,224,968 has been spread to Category 2 and $2,299,653 has been spread to Category 3 to adhere to the value spread regulation in the funding and mechanics protocol.

The performing provider has determined that tracking quality of life, ED utilization, and inpatient admissions with the population served by the intervention will validate that the project is achieving its goals, thus justifying the value computed through the study.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add milestone bundle amounts over Years 2-5): $19,224,968
Project Option 2.13.2 – Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting (i.e., the criminal justice system, ED, urgent care etc.) – Substance Use Disorder (SUD) Outpatient Integration.

Unique Project ID: 081599501.2.4 (Pass 2)
Performing Provider Name/TPI: MHMR of Tarrant County/081599501

Provider: MHMRTC is the Local Mental Health Authority (LMHA) providing mental health, early childhood, addiction and intellectual developmental disabilities services, serving an 897 square mile area and a population of approximately 1.8 million residents. MHMRTC is a contractor funded by the Department of State Health Services (DSHS) to provide substance abuse services. Hospitals, physicians, and other providers from an 11 county region refer medically indigent and Medicaid clients to Addiction Services (AdS). Activities undertaken to address any substance-related disorder as well as prevention activities include the provision of screening, assessment, referral and treatment for chemical dependency and chemical dependency counseling.

Intervention: This project provides for the integration of substance abuse services and mental health services. The intervention is a 6 – 12 month program that includes SUD screening, assessment, individual and group counseling, and peer support services within our existing adult mental health outpatient clinics. The purpose of this project is to implement the recently developed MHMRTC SUD outpatient program at our 11 mental health clinic locations. It will also expand the services currently provided to include peer support services.

Need for project: Approximately 50% of the mentally ill, medically indigent population served at MHMRTC sites has SUD. Many mentally ill individuals go untreated and undiagnosed for co-occurring substance use disorders due to the lack of substance abuse treatment professionals in mental health and primary care clinics. As a result, these patients suffer many health and legal crises, particularly when mental health medications are combined with street drugs and/or alcohol.

Target population: Mentally ill, medically indigent consumers who are served at our mental health locations and who also suffer with SUD. Estimated number to be served over the course of the waiver period is 1,350. Approximately 100% of our consumers are either Medicaid eligible or indigent

Category 1 or 2 milestones expected benefit: The project seeks to provide 250 unique patients encountered in DY3, 375 in DY4 and 725 in DY5, for a total of 1,350 during the waiver period.
Category 3 outcomes:  IT-9.1  Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons. Our goal is to decrease incarcerations by 10% in the population receiving treatment.
IT-9.2  ED appropriate utilization. Our goal is to decrease ED visits by 10% in the population receiving treatment.
IT-10.7  Functional status assessment for addiction severity: ASI. Our goal is to demonstrate improved functional status in 35% of the population discharged from treatment.

Project Option 2.13.2 – Provide an intervention for a targeted behavioral health population to prevent unnecessary use of services in a specific setting (i.e., the criminal justice system, ED, urgent care etc.) – Substance Use Disorder (SUD) Outpatient Integration.

Unique Project ID: 081599501.2.4 (Pass 2)
Performing Provider Name/TPI: MHMR of Tarrant County/081599501

Project Description:
Expansion of the existing MHMRTC substance use disorder (SUD) outpatient program currently available at only two substance abuse clinics to approximately 11 mental health sites in the MHMRTC network. MHMRTC will add licensed chemical dependency counselors (includes LCDC, LPC and LCSW) and peer support staff at each of these locations.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of this project is to increase MHMRTC outpatient sites’ ability to provide the right care, at the right time, in the right setting. Through the proposed project, consumers with SUD will have access to a more efficient preventive and proactive care through the increased
availability of outpatient substance abuse services within existing mental health settings. The five-year target goal is to substantially improve MHMRTC addiction services care capacity as evidenced by a 50% increase in SUD assessments and outpatient service utilization in Tarrant and surrounding counties.

This project meets the following Regional goals:
The goal of this project is to avert ED visits (and resulting inpatient admissions); to avert disruptive and deleterious events such as criminal justice system involvement; to promote wellness and adherence to medication and other treatments; and to promote recovery in the community. This can be done by providing community-based interventions for individuals to prevent them from cycling through multiple systems, such as the criminal justice system; the general acute and specialty psychiatric inpatient system; and the mental health system.

Challenges:
Through the Addiction Severity Index (ASI), we will be able to measure the effectiveness of the project at increasing functional status and reducing incarcerations. However, in order to establish the success of this project with respect to ED visits, we will need to coordinate our data needs with hospitals. Because the majority of the patients that will be included in this project receive services at JPS, we will negotiate with that hospital to obtain data.

5-Year Expected Outcome for Provider and Patients:
The goal of the project is to provide integrated care for patients suffering with both mental health problems and SUD. The expected outcome for the provider is that there will be less physical and mental health crises involving these patients, allowing resources to be committed to prevention and treatment. The expected outcome for patients is increased functionality and quality of life through less time spent in acute care, emergency care, and life-restricted settings (e.g. jail and nursing homes).

Starting Point/Baseline:
MHMRTC Addiction Services (AdS) outpatient clinics currently serve 1,500 consumers annually. The total number of consumers served across treatment services with the funding expansion will increase the number served by approximately 90% (1,350-) by the end of project period.

Rationale:
Approximately 50% of the mentally ill, medically indigent population served at MHMR of Tarrant County’s Mental Health division (6,000 actively enrolled into services) have SUD and would benefit from/need substance abuse treatment services.

-A significant number of mental health consumers use street drugs to treat psychiatric symptoms. Many crises occur when mental health medications are combined with street drugs and or alcohol. Many mentally ill individuals go untreated and undiagnosed for co-occurring substance
use disorders due to the lack of substance abuse treatment professionals in mental health and primary care clinics. Currently, patients with co-occurring psychiatric and SUD in Tarrant County have to go to one of two locations for substance abuse assessment and treatment. Expansion of the proposed services will allow mental health consumers with co-occurring psychiatric and substance abuse issues to receive behavioral health services in one location that they are familiar with instead of traveling to two separate locations.

**Project Components:**

- **a) Cognitive behavioral therapy intervention, 12-step recovery, motivational interviewing techniques, Matrix model and Seeking Safety are interventions that will be utilized.**\(^{163}\) These are evidence-based models used successfully with adults with co-occurring substance abuse and mental disorders. The Addiction Severity Index (ASI) is also an evidence-based assessment tool\(^{164}\) used nationwide to assess the level of substance abuse and chemical dependence in consumers.\(^{165}\) It will be administered at intake, six-month update/reassessment and when clients exit treatment programming. The ASI will be completed electronically in our electronic documenting system – Clinical Management for Behavioral Health Services (CMBHS). Functional status outcomes will be aggregated from ASI indicators.

- **b) Peer support services will be provided. The goal is to model successful behaviors. Services will be provided by certified peer specialists who are in recovery from mental illness and/or substance abuse disorders and are supervised by mental health professionals.**

- **c) Finally, the Four Quadrant model\(^{166}\) will be utilized to identify the population. It is based on the 1998 consensus document on mental health and substance abuse/addiction integration service. The severity for each disorder is divided into Four Quadrants: (1) Low mental health-low substance abuse, served in primary care; (2) High mental health-low substance abuse, served in the mental health system by staff who have substance abuse competency; (3) Low mental health-high substance abuse, served in the substance abuse system by staff who have mental health competency; and (4) High mental health-high substance abuse, served by fully integrated mental health and substance abuse program. The targeted population is that group that falls into quadrants 2 and 4.**

**Unique community need identification numbers the project addresses:**

CN.1 – Lack of provider capacity

\(^{163}\) (Najavits, Seeking Safety: An Evidence-Based Model for Substance Abuse and Trauma/PTSD, 2002)

\(^{164}\) (Najavits, For Debate Studies of the reliability and validity of the Addiction Severity Index, 2002)

\(^{165}\) (Paul M.G. Emmelkamp, 2006)

\(^{166}\) (Mauer, 2006)
CN.10 – Demand for ED visits is on the rise and EDs are becoming overcrowded due to reduced inpatient capacity and impaired patient flow.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

This is an enhancement of an existing project funded through the Department of State Health Services (DSHS) in Texas. During the last legislative session, substance abuse treatment was included as a Medicaid benefit to low-income individuals in Texas. This project will significantly enhance an existing delivery system reform initiative, focused on treating individuals in the most appropriate level of care at the most cost effective and efficient manner. Diverting consumers with SUD from emergency rooms, legal institutions and mental health hospitals is a part of delivery systems reform in Texas.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

*IT-9.1* Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons. A study conducted by the National Center on Addiction and Substance Abuse at Columbia University found that 24.4% of prison and jail inmates have both mental illness and substance abuse problems.167

*IT-9.2* ED appropriate utilization. In a report to Congress, SAMHSA reported that the combination of mental illness and substance abuse disorder can result in poor response to traditional treatments and increases the risk for other serious medical problems. As a result, individuals with co-occurring disorders often require high-cost services such as inpatient and emergency room care.168 In 2007, 1 in 8 emergency room visits was related to mental health or substance abuse. Almost 12% of those visits were for co-occurring disorders.169

*IT-10.7* Functional status assessment for addiction severity: ASI. The ASI is an indicator of the severity of a patient’s SUD. If the program reduces that severity, the resulting impacts on the individual, the health care system and the community will also be reduced.

**Relationship to Other Projects:**

All of MHMRTC’s projects address the expansion of behavioral health services and/or the integration of services to better serve a co-morbid population. It is expected that as the projects progress, we will refine each of the projects to better serve populations. It is also expected that efficiencies will be identified that will enhance our ability to serve a larger percentage of the population that currently is unable to find appropriate care. In particular, the projects that will have an impact on this project are:

169 [http://www.hcup-us.ahrq.gov/reports/statbriefs/sb92.jsp](http://www.hcup-us.ahrq.gov/reports/statbriefs/sb92.jsp)
Regional Healthcare Partnership

Region 10

(1) 081599501.1.1 Expand Behavioral Health Capacity
(2) 081599501.2.1 Expand Detox Capacity
(3) 081599501.2.3 RN Care Management.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

The Detoxification Expansion Project participants will be referred to the proposed substance use disorder (SUD) outpatient integration project 081599501.2.4 and the Wise Regional Health System Intensive Outpatient Program (IOP) 130606006.2.3, as a stepdown option to continue substance use disorder services/recovery treatment.

This project will participate in the Region’s learning collaborative. Please refer to Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of all participating provider projects for each collaborative. MHMR of Tarrant County will also be working with other Community Centers in learning collaborative to select a small amount of outcome measures for category 3, based on the valuation studies conducted by health care economists at the UT Austin and UT Houston. The collaborative will develop a strategy for collection of that data through HIEs or other shared data sources in local communities. Centers are currently in the process of engaging a consultant to provide leadership and consultation for this project.

**Project Valuation:**

Approach:

Performing providers in Region 10 recognize that the outcomes of our projects represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the outcomes connected to each project. In RHP 10, performing providers collaborated to identify the proper method for the computation of value for our projects. In order to align with the Triple Aim, a method has been devised for identifying three sets of valuation factors: factors related to the patient experience, the community benefit, and savings to the healthcare system. In order to calculate the ultimate valuation, performing providers considered the waiver goal to transform the health care delivery system and agreed that the waiver was designed to create significant incentives over a relatively short period of time. Our agreed upon basis for valuing the incentive portion of our valuation takes into account three basic principles; the investment to get the projects off the ground, value associated with the services delivered for a reasonable time until the reimbursement system adapts to the transformation, and an incentive for the performing provider to accelerate transformation to the delivery system.

In order to set an appropriate incentive RHP 10 agreed that a multiplier of 5 should be applied to the annual value of benefits provided to the consumer at full implementation by calculating the
annual value of a single successful intervention at full implementation and multiplying that value by 5. The multiplier of 5 was decided with much discussion by performing providers. The rationale was that to overcome resistance to change, both in the delivery system and the payment system, 5 years of benefits were needed. The full outline of our regional valuation methodology and principles can be found in section V.B. of the RHP plan.

The incentive element of the Region 10 valuation methodology is relevant to all Texas transformation efforts. However, it is particularly relevant to transformation of the mental health care system, where patient experience, population health and costs have previously not received any focus, and where services tend to be provided primarily in emergency situations. Texas ranks 50th in the country in per capita funding for mental health services. Only one-third of the more than 480,000 adults in Texas with serious and persistent mental illness received services through the community mental health system. Therefore, the most important transformation that can occur in mental health is increased access to services. Until the advent of the waiver, the system has not had funds to experiment with the types of interventions that are being made possible through waiver funding. Incentives for effective implementation and outcomes are important to allow for the identification of successful interventions and the ultimate sustained transformation of the system.

Rationale:
The calculation of the value of successful interventions for this project used an economic evaluation model and extensive literature review conducted by professors H. Shelton Brown, Ph.D at the UT Houston School of Public Health and Thomas Bohman, Ph.D of the UT Austin Center for Social Work Research. The model uses cost-utility analysis (CUA) to measure the cost of the program in dollars and the health consequences in utility-weighted units satisfying our valuation factors regarding patient experience, community benefit, and savings to the health care system. This valuation uses a quality-adjusted life years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

The QALY value results in significant values related to mental health interventions. These patients are intensive users of the health care system and are most often not functional in society. Incremental improvements in their status have an enormous impact on all three elements of the triple aim.

- Data Source: Clinical Management for Behavioral Health Services (CMBHS) Assessment (ASI).

**Milestone 1 Estimated Incentive Payment (maximum amount):** $2,022,729

### Milestone 2 [P-2]: Design community-based specialized interventions for target populations. Interventions may include substance abuse services

**Milestone 3 [I-X]: Improvement milestone of target population reached**
- Metric 1 [I-X-1]: Number of targeted individuals enrolled/ served in the project.
  - Goal: Total number of unique patients encountered in the clinic for reporting period 250
  - Data Source: Clinical Management for Behavioral Health Services (CMBHS) Assessment (ASI).

**Milestone 3 Estimated Incentive Payment:** $2,110,331

**Milestone 4 [P-7]: Participate in face to face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing**

**Milestone 5 [I-X]: Improvement milestone of target population reached.**
- Metric 1 [I-X-1]: Number of targeted individuals enrolled/ served in the project.
  - Goal: Total number of unique patients encountered in the clinic for reporting period 375.
  - Data Source: Registry, EHR, claims or other Performing Provider source.

**Milestone 5 Estimated Incentive Payment:** $2,260,253

**Milestone 6 [P-7]: Participate in face to face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing**

**Milestone 7 [I-X]: Improvement milestone of target population reached.**
- Metric 1 [I-X-1]: Number of targeted individuals enrolled/ served in the project.
  - Goal: Total number of unique patients encountered in the clinic for reporting period 725.
  - Data Source: Registry, EHR, claims or other Performing Provider source.

**Milestone 7 Estimated Incentive Payment:** $2,183,820

**Milestone 8 [P-7]: Participate in face to face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing.**

**Milestone 9 [P-7]: Participate in face to face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing.**

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

**Unique Project ID:** 094105602.2.1

**Performing Provider Name/TPI:** North Hills Hospital /094105602

**Provider:** North Hills Hospital is a 176 bed acute care hospital in Tarrant County Texas serving a primary and secondary service are of 540,000. North Hills Hospital serves 16% inpatient Medicaid and Uninsured and 48 % ED patients are Medicaid and uninsured.

**Intervention:** This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Process improvement would be an expansion/enhancement.

**Need for the project:** Mortality for sepsis nationally is >30%. Regional readmissions for sepsis are was 22% in 2011 with mortality for readmission at 10.5%. Sepsis was also top 50% of reasons patients readmitted for each of the 10 index conditions and a higher mortality rate for readmission than all other conditions. Readmission for sepsis can occur due to early discharge, improper antibiotic treatment and lack of continuation of medication .(DFW Hospital Council data)

**Target population:** The target population is patients presenting to ED and all patients diagnosed with sepsis shock, severe sepsis. Approximately 40% of patients to be screened are Medicaid and indigent. It is estimated currently 11% of our patients treated for sepsis are Medicaid eligible or indigent. Estimated number of patients to be served over course of waiver period: With improvement in diagnosis a key element of the program, this number is expected to increase to estimated 689. Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

**Category 1 or 2 expected patient benefits:** The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence-based care with improved the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with severe sepsis and septic shock. We expect to diagnose and treat 689 sepsis patients (estimated at DY 1- 126 DY2-131, DY 3-137, DY 4- 144 DY 5-151). 125 patients were diagnosed in DY 1 with the implementation of the sepsis program. However only 6 patients were properly treated with the evidence based care plan from the program. Patients that may not diagnosed/diagnosed timely or not receive evidence based treatment may have resulted in death or disability. The program will have great benefit to
patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.

**Category 3 outcomes:** The outcomes selected reflect the effectiveness of implementing evidence-based care such as reduction in mortality and decreased length of stay.

- IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis, estimated DY 1 mortality was 27% and improvement of 25% by DY 5, morality would be 20%.
- IT -4.9 Our goal is the reduce the Average length of stay of patients with sepsis. Estimated DY 1 ALOS was 7.3, a reduction goal by DY 5 of 2 days to ALOS of 5.3.
Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

Unique Project ID: 094105602.2.1
Performing Provider Name/TPI: North Hills Hospital /094105602

Project Description:
The project will design and implement a process improvement plan to increase the utilization and compliance with sepsis resuscitation and management bundles to improve patient outcomes.

North Hills Hospital is committed to continuous quality improvement so all our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for emergency department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient who screens positive for severe sepsis or septic shock and is hypotensive.

North Hills Hospital will also track primary endpoints of mortality and ICU LOS. Process and other measures will be tracked that include percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous renal replacement therapy. Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate > 4 mmol/L (36 mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of sepsis resuscitations and management bundles remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

Goals and Relationship to Regional Goals:
Project Goals:
The goal of this project is to implement process improvement plan to improve safety and quality for those patients with sepsis. We will:

1. Achieve 90% compliance with the sepsis resuscitation and management bundles in patients admitted to the ICU.
2. Substantially improve early sepsis identification, reduce sepsis-related mortality by 25% from baseline.
3. Develop effective and fully implemented measurement and reporting system supporting compliance with the sepsis resuscitation and management bundles.
4. Continue to work with Emergency Medical Services to improve the delivery of care provided to patients with suspected infection.
5. Improve identification of sepsis patients housewide by implementing nursing admission screening and shift assessments for sepsis screening.
6. Improve identification of sepsis, compliance with current sepsis resuscitation and management bundles in the emergency department.

This project meets the following Regional goals:
This project supports the Regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence-based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of posthospital care in addition to quality-adjusted life gained.

Challenges:
According to CDC 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis each year, which includes diagnoses of severe sepsis and septic shock, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the contributing factors contributing to the design of evidence-based standardized care sets and subsequent adoption of those tools will contribute greatly to reducing variation and associated cost. Early recognition and management of sepsis results in lives saved.

5-Year Expected Outcome for Provider and Patients:
We expect to reach 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate >4mmol/L (36 mg/dl). We also expect to be 90% compliant with application of the sepsis bundles for patients who meet specified criteria.

**Starting Point/Baseline:**
The number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would average 125 per year for a total of 689 patient over course of the waiver. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012. However, the number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles has not been determined. In DY 1 the hospital diagnosed 126 patients with sepsis protocol. Although the number of patients diagnosed looks on target for similar size hospitals, the program implementation is not in compliance with evidence based treatment. Early data collection indicates compliance with sepsis bundles is a low as 3%.

**Rationale:**
According to CDC 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis each year, which includes diagnoses of severe sepsis and septic shock, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS, which has improved. We are in the early stages of implementation of the program components and we still face the challenge of successful implementation. Also, additional interventions will be implemented in the future (e.g., shift assessments on all in-house patients). To be successful we need to eliminate/correct processes that create time delays, non-adherence to order set and failure to identify/diagnose sepsis. We have been as low as 10% in compliance in implementing sepsis bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

**Project Components:**
The project components to report metrics number of patient’s diagnosis correctly and for sepsis bundle compliance are necessary to measure the success of implementing the sepsis improvement plan.

A sepsis improvement plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, inpatient units, EMS), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay, compliance with sepsis diagnosis and protocols for sepsis bundles are critical. In implementation, it is necessary to examine the plan, understand what is working and what is not, identify barriers and make corrective action. Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvement.

**Unique community need identification numbers the project addresses:**
- CN 11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Sepsis resuscitation and management bundle program kicked off in 2012 as a hospital-specific program. Applying process improvement methodologies to the sepsis program will greatly enhance the chances of success in implementing the plan and reducing mortality and average length of stay.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**
We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and
harm attributable to sepsis. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

*IT*-4.8 Sepsis mortality *(Stand-alone measure)*

By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease length of stay, reduce health care cost and mortality. Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care Medicine; IDSA Guidelines for appropriate antibiotic selection.

*IT*-4.9 Average length of stay *(Non-stand-alone measure)*

By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early treatment and decrease complications with resulting length of stay in ICU and overall LOS.

**Relationship to Other Projects:**
This project supports the population-focused improvements 094105602.4.4, RD-3 Potentially Preventable Complications (PPCs). Improved quality with evidence-based care for sepsis increases education, training, and screening that will reduce preventable complications in the hospital setting.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
1. The following providers are also proposing projects to address sepsis resuscitation and management improvement:
   - JPS
   - Plaza Medical Center Fort Worth
   - Medical Center of Arlington
   - Huguley Memorial Medical Center
   - Texas Health Harris Methodist HEB

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and
outcomes by computing the total value of the Category 3 outcomes connected to each project. North Hills Hospital has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

North Hills Hospital defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 4%, which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 21. The estimated pricing for morbidity of $10,000 per life was used. This reflected such considerations a costs for care, lost wages, and quality of life. This totaled approximately $218,700 for 5 years.

The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 7.3 days per patient. This was estimated at total of reduced in patient days by DY 5 of 650. The estimated cost per day for a sepsis patient is $828. This totaled approximately $544,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $218,700.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 3. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $326,000.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of mortality reduction at $210,700.

To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $326,000.
The total value of the project then was estimated at $1,844,000. Approximately 79% of the total value was assigned to Category 2 project and the remaining 9% of value assigned to Category 3 outcome for Sepsis Mortality and 11.8% assigned to Category 3 outcome for reduced Average Length of Stay.

Attachment 1

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.4.1– Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

Unique Project ID: 094193202.2.1
Performing Provider Name/TPI: Plaza Medical Center Fort Worth /094193202

Provider: Plaza Medical Center Fort Worth is a bed acute care hospital. 11% of inpatients are Medicaid and uninsured, while 42 % ED patients are Medicaid and uninsured.

Intervention: The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose is to change the organizational culture and impact patient safety and quality with improved patient experience. This is would be a new intervention.

Need for the project: Patient experience scores reflect a deficiency in key areas that are critical for patient safety and quality of care. These include communication with physicians and nurses, communication regarding medications and discharge process. Patients who are Medicaid eligible or uninsured are most vulnerable to communication matters due to greater language and cultural barriers. These patients also face greater obstacles for discharge planning with lack of resources and support in post-acute care. Underserved and Medicaid patients will benefit to greater degree with improvement in processes that make for a better patient experience.

Target population: Target population is all patients served by hospital. Estimated number of patients to be served over course of waiver period: This would be difficult to quantify since the all patients are targeted priority on Inpatients, we would estimate 8500 a year or 34,000 patients over the course of the waiver will be impacted. We do actively survey 100 patients a month/1200 a year. Patients who are Medicaid eligible or uninsured are most vulnerable to communication matters due to greater language and cultural barriers. These patients also face greater obstacles for discharge planning with lack of resources and support in post-acute care. Underserved and Medicaid patients will benefit to greater degree with improvement in processes that make for a better patient experience.

Category 1 or 2 expected patient benefits: The project seeks to improvement in patient satisfaction scores as measured by HCAHPS Grand Composite. This will be a benefit to patients from better communication with nurses and doctors, better medication management, pain management and discharge planning. Studies have shown with improved patient experience, the quality of care patients experience also improves. This will result in reduce preventable complications such as infections, less readmissions and reduced medication errors. It is estimated patients impacted will be DY 2-8500, DY 3-8670, DY 4-9100, DY5-9560.

Category 3 outcomes: IT-6.1 Our goal is to improve Percent Improvement over baseline of patient satisfaction scores from 64% currently to 75% by DY5. Yes improvement in scores is part of the purpose of project.
Project Option 2.4.1– Implement a strategic improvement program for patient satisfaction (Redesign to Improve Patient Experience)

Unique Project ID: 094193202.2.1
Performing Provider Name/TPI: Plaza Medical Center Fort Worth /094193202

Project Description:
Plaza Medical Center Fort Worth is proposing a project to establish baseline HCAHPS scores and implement a patient/family experience strategic plan.

A steering committee will be formed and workgroups of the committee will work on process improvements for patient experience targets. Evaluation will be performed and documented to measure implementation progress, results and make adjustments to improvement plans. As part of the strategic plan, patient experience will be an integral part of employee orientation. A communication plan on work being done to improve the patient experience will be developed and implemented to ensure all employees and physicians are included on progress and initiatives. Studies have shown that improved patient experience can improve patient health outcome and quality.

Goals and Relationship to Regional Goals:

Project Goals:
The goal of the project is to implement process improvement plans that target specific patient experiences. The purpose of performing this project is the engage all stakeholder such as leader and employees that can be the high level role to drive the patient experience improvement across the hospital for a cultural change at the organizational level.

This project meets the following Regional goals:
A major goal of the Region is to pursue the triple aim of health care by improving patient experience of care, improve health of populations and reduce the cost of health care. Redesigning the patient experience in the Region will impact the health of our community by keeping patients engaged in the health care system.

Challenges:
The hospital has been participating in HCAHPS to measure patient experience in hospital setting. Implemented training plans have not improved scores. Plaza Medical Center Fort Worth has achieved grand composite score of 70% for 2010Q3-2011Q2 and 70% for 2010Q4-2011Q3, which is consistently been below the CMS national average. The scores summarize:

- How well nurses and doctors communicate with patients
- How responsive hospital staff are to patients’ needs
- How well hospital staff help patients manage pain
- How well the staff communicates with patients about medicines, and whether key information is provided at discharge
- Cleanliness and quietness of patients’ rooms
- Patients’ overall rating of the hospital and whether patients would recommend the hospital to family and friends

The project will address targeted patient experiences with that have not been improved by other initiatives.

**5-Year Expected Outcome for Provider and Patients:**
We expected at end of Waiver period we will be > 75\textsuperscript{th} percentile on grand composite scores for CMS HCAHPS.

**Starting Point/Baseline:**
Plaza Medical Center Fort Worth has achieved grand composite score of 70\% in 2010Q3-2011Q2 and 70\% 2010Q4-2011Q3, which has consistently been below the CMS national average.

**Rationale:**
Patient experience scores are measured internally and reported quarterly from a Gallup Survey. These scores are shared with senior leaders and staff in various manners, including Dashboards and reports. Various committees work on departmental and process issues but a coordinated, systemwide approach is lacking. A patient/family experience strategic plan will eliminate duplication of time and effort and provide a roadmap for improvement and best practice. Engaging patients and families in the process will strengthen the organization’s resolve to get better and stay better.

The overall approach to redesigning patient experience will be centered on cultural change at the organizational level. This will involve clinicians, patients and their families or caregivers. An organizational strategy will be developed so that we manage patient experience and create avenues to implement the strategic plan/vision. This project option is best for organizational integration, which is critical to successful patient experiences.

**Project Components:**
All core components will be implemented.

a) Organizational integration and prioritization of patient experience
b) Data and performance measurement will be collected by utilizing patient experience of care measures from the Hospital Consumer Assessment of Healthcare Providers and
Systems (HCAHPS) in addition to CAHPS and/or other systems and methodologies to measure patient experience;
c) Implementing processes to improve patients’ experience in getting through to the clinical practice;
d) Develop a process to certify independent survey vendors that will be capable of administering the patient experience of care survey in accordance with the standardized sampling and survey administration procedures.

Establishing a steering committee with high-level leadership is necessary to drive cultural change to impact patient experiences. A communication plan will be developed to inform all employees and physicians of the work of the steering committee and results to better integrate the process and changes into the culture. Process improvements needed will be identified and analyzed with Lean Six Sigma tools. The work groups will be empowered to implement changes identified and report back to the steering committee. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event.

Evaluation, control and sustain activities are necessary for continuous quality improvements. Evaluation of the implemented improvements and testing are necessary for continuous quality improvements. We will measure the impact of the improvements implemented from CMS HCAHPS scores.

Unique community need identification numbers the project addresses:
- CN.10 – Overuse of the emergency department services
- CN.11 – Need for more care coordination
- CN.12 – Need for more culturally competent care to address unmet needs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative. This is a new initiative for Plaza Medical Center Fort Worth; it currently does not have structure or feedback.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:

IT-6.1 Percent improvement over baseline of patient satisfaction scores

An organizational strategy will be developed so that the hospital will manage patient experience and create avenues to implement the strategic plan/vision. Performance will be measured, among other factors, by the extent to which patient experience improves systematically.
In October 2005, the Joint Commission’s Journal on Quality and Patient Safety published a series of case studies of health care institutions’ efforts to improve both quality and safety. One of these was from Lehigh Valley Hospital in Allentown, Penn., which used active engagement of patients and families in attempting to improve patient safety.\(^{170}\)

Weingart and colleagues (2006) examined inpatients’ reports of service incidents — deficiencies in service quality such as waits/delays, poor communication, poor care coordination, lack of respect for personal preferences, or environmental issues. They found that roughly 40% of patients reported at least one incident and that reporting of incidents was associated with diminished patient satisfaction.\(^{171}\)

Also, Kaldenberg and Trucano (2007) examined facility-level relationships between hospital-acquired infection (HAI) rates and patient perceptions of specific aspects of hospital quality in the State of Pennsylvania. Specifically, they chose three questions from an inpatient survey thought to measure practices that, when poorly executed, could create a more infection-prone environment: ratings of cleanliness; of the skill of the person who took the patient’s blood; and of nurses’ response to the call button. All three were found to be significantly, negatively correlated with HAI rates.\(^{172}\)

**Relationship to Other Projects:**
This project supports 094193202.4.5 RD-4 Patient-centered health care. The project will implement training and improvement work on experience targets aimed to increasing patient satisfaction with the hospital, nurses and physicians that will result in a better patient experience.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
The other providers proposing similar projects:
- JPS
- Medical Center of Arlington
- Glen Rose Medical Center

---

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Plaza Medical Center Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Plaza Medical Center Fort Worth defined the population that will be directly impacted by the project as patients with Medicare who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients surveyed, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. It was estimated based on CMS published penalties that in 4 years for not achieving satisfactory patient experience levels, 1.5% of Medicare revenues were in jeopardy. The rate per Medicare case of $11,759 was used to calculate the estimated loss of revenues using these penalty % for DY 2- 0.50%, DY 3- 0.75%, DY 4-0.94%, and DY 5 -1.05% . This totaled $2,161,220.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduced costs. This was estimated a portion of potential revenue value and totaled $1,396,542. To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or quality of life is improved, productivity is increased, and there is a reduced burden on society. This was estimated a portion of potential revenue value and totaled $1,294,779.

The total value of the project was calculated at $4,852,541. Approximately 79% of the project value was assigned to the Category 2 project, $3,836,901 and 21% to the Category 3 project, $1,015,640.

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

Unique Project ID: 094193202.2.2
Performing Provider Name/TPI: Plaza Medical Center Fort Worth /094193202

Provider: Plaza Medical Center is a 217 bed acute care hospital in Fort Worth Texas serving a primary and secondary service area population of 1.1 million. Plaza Medical Center serves 11% inpatient Medicaid and Uninsured and 42% ED patients are Medicaid and uninsured.

Intervention: This project will implement process improvement methodologies in a sepsis evidenced based care program to reduce sepsis complications. Sepsis Resuscitation and Management Bundle program was kicked off in 2012 as a hospital specific program. Process improvement would be an expansion/enhancement.

Need for the project: Mortality for sepsis nationally is >30%. Regional readmissions for sepsis are was 22% in 2011 with mortality for readmission at 10.5%. Sepsis was also top 50% of reasons patients readmitted for each of the 10 index conditions and a higher mortality rate for readmission than all other conditions. Readmission for sepsis can occur due to early discharge, improper antibiotic treatment and lack of continuation of medication (DFW Hospital Council data)

Target population: The target population is patients presenting to ED and all patients diagnosed with sepsis shock, severe sepsis. Approximately 40% of patients to be screened are Medicaid and indigent. It is estimated currently 5% of our patients treated for sepsis are Medicaid eligible or indigent. However with improvement in diagnosis a key element of the program, this number is expected to increase. Estimated number of patients to be served over course of waiver period: Based on current processes over only 580 patients (116 patients per year). However with improved diagnosis this is expected to increase to 850 patients (average 198 patients per year). Patients who are Medicaid eligible or uninsured will benefit as they more often use the ED and their illness is farther progressed when presenting to ED along with greater complexity of co-morbid diseases. Due to lack of access to medical care patients tend to delay seeking care which can lead to harmful results. The quicker diagnosis of sepsis and evidence-based care will prevent greater mortality and disability from sepsis.

Category 1 or 2 expected patient benefits: The project seeks to increase the timeliness of correctly diagnosing sepsis in order the begin evidence-based care with improved the compliance with Sepsis Bundle and Resuscitation for patients diagnosed with severe sepsis and septic shock.

We expect to diagnose and treat 837 sepsis patients (estimated at DY 1- 58 DY2-180, DY 3-189, DY 4- 200 DY 5-210) Only 58 patients were diagnosed and treated in DY 1 with the implementation of the sepsis program. That means up to 120 patients a year may not diagnosed or diagnosed timely and may have resulted in death or disability. The program will have great benefit to patients to reduce harm from lack of proper and timely diagnosis and/or lack of evidence based treatment.
Category 3 outcomes: The outcomes selected reflect the effectiveness of implementing evidence-based care such as reduction in mortality and decreased length of stay.
IT-4.8 Our goal is to reduce the Sepsis Mortality of patients diagnosed with sepsis. Estimated DY 1 mortality was 48% however a baseline rate with appropriate sample size will be measured in DY 2. We estimate an improvement of 25% by DY 5, mortality would be 24%.

IT -4.9 Our goal is to reduce the Average length of stay of patients with sepsis. Estimated DY 1 ALOS was 8.7, a reduction goal by DY 5 of 2 days to ALOS of 6.7.

Project Option 2.8.11– Apply Process Improvement Methodology to Improve Quality/Efficiency (Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications)

Unique Project ID: 094193202.2.2
Performing Provider Name/TPI: Plaza Medical Center Fort Worth /094193202

Project Description:
The project will design and implement a process improvement plan to increase the utilization and compliance with sepsis resuscitation and management bundles to improve patient outcomes.

Plaza Medical Center Fort Worth is committed to continuous quality improvement so all of our patients receive the safest and highest quality health care possible. We are implementing a standardized, evidence-based program for early detection and resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and harm attributable to sepsis. Our processes and interventions are based upon evidence-based care models, which include a sepsis resuscitation bundle for emergency department (ED) patients and a sepsis management bundle for ongoing care. Rapid diagnosis and management are cornerstones to successful outcomes.

The ICU and ED plans for improvements in sepsis identification and treatment includes, revising the electronic nurse sepsis screening at triage, implementing an electronic nurse sepsis screen to aid in early detection of inpatients, staff education regarding sepsis screening, and refining the Rapid Response Team (RRT) processes to include sepsis screening and initial resuscitation. This allows the RRT to begin fluid resuscitation on the in-house patient who screens positive for severe sepsis or septic shock and is hypotensive.

Plaza Medical Center Fort Worth will also track primary endpoints of mortality and ICU LOS. Process and other measures will be tracked that include, percentage of patients initiated on vasopressors and mean days of vasopressor use, percentage of patients initiated on the mechanical ventilator and mean ventilator days, and initiation of hemodialysis or continuous renal replacement therapy.
Our target population is any patient diagnosis of severe sepsis, septic shock, and/or lactate >4mmol/L (36mg/dl).

Although great work has been done to implement protocols and interventions, utilization and compliance of sepsis resuscitations and management bundles still remains a challenge. Continuous quality improvement through data collection, analysis and review will be the basis for accelerating change through multidisciplinary teams.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to implement process improvement plan to improve safety and quality for those patients with sepsis. We will:

1. Achieve 90% compliance with the sepsis resuscitation and management bundles in patients admitted to the ICU.
2. Substantially improve early sepsis identification, reduce sepsis-related mortality by 25% from baseline
3. Effective and fully implemented measurement and reporting system supporting compliance with the sepsis resuscitation and management bundles.
4. Continue to work with Emergency Medical Services to improve the delivery of care provided to patients with suspected infection
5. Improve identification of sepsis patient’s housewide by implementing nursing admission screening and shift assessments for sepsis screening
6. Improve identification of sepsis, compliance from TBD with current sepsis resuscitation and management bundles in the emergency department.

**This project meets the following Regional goals:**
This project supports the Regional goals to improve the patient care experience, health outcomes for the population and the per capita cost of care. Specifically, this project will improve the early diagnosis of patients with severe sepsis and septic shock so that evidence-based care can be delivered. Improved recovery of patients with severe sepsis and septic shock will reduce unnecessary death and harm and reduce cost of post hospital care in addition to quality-adjusted life gained.

**Challenges:**
According to 2007 CDC statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic
shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Proactive analysis of the contributing factors contributing to the design of evidence-based standardized care sets and subsequent adoption of those tools will contribute greatly to reducing variation and associated cost. Early recognition and management of sepsis results in lives saved.

5-Year Expected outcome for Provider and Patients:
We expect to reach 100% compliance in identification/diagnosing of patients with severe sepsis, septic shock, and/or lactate>4mmol/L (36mg/dl). We also expect to be 90% compliance with application of the sepsis bundles for patients who meet specified criteria.

Starting Point/Baseline:
The number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles based on expected sepsis claims from similar size hospital and mature sepsis programs would be 180 to 210 per year for a total of 837 patients over course of the waiver. Active implementation of sepsis resuscitation and management bundles and data collection is beginning in 2012 (DY 1). Only an estimate 58 patients were diagnosed and treated for sepsis with the initiation of the program in DY 1. However, the number of patients with severe sepsis, septic shock and/or lactate>4mmol/L (36mg/dl) that would qualify for sepsis resuscitation and management bundles has not been determined since hospital is not implementing with the program with much success. Early data collection indicates compliance with sepsis bundles is a low as 50%.

Rationale:
According to CDC 2007 statistics, septicemia is the 10th leading cause of death in the United States. The eighth leading cause of death is influenza and pneumonia combined, and pneumonia is a leading source of severe sepsis and septic shock. Septicemia, influenza, and pneumonia deaths in 2007 contributed to over 80,000 deaths. Preliminary data for 2009 CDC statistics shows a slight decline of 1.8% in deaths from septicemia. In the United States, there are approximately 750,000 new cases of sepsis, which includes diagnoses of severe sepsis and septic shock, each year, and mortality from severe sepsis and septic shock have consistently been reported to be over 20-25% for severe sepsis and as high as 70% for septic shock.

Our internal data shows a mortality rate as high as 60%. Identification and treatment protocols have been developed and implemented to impact mortality and ICU LOS which has improved. We are in the early stages of implementation of the program components and we still face the challenge of successful implementation. Also, additional interventions will be implemented in the future (shift assessments on all in-house patients, etc.). To be successful we need to work on eliminating/correcting processes that create time delays, non adherence to order set and, failure
to identify/diagnose sepsis. We have been as low as 50% in compliance in implementing sepsis bundles. We believe in order to continue to see improvement from initial implementation, continuous quality improvement through data collection, analysis and review will accelerate change through our multidisciplinary teams.

**Project Components:**
The project components to report metrics number of patient’s diagnosis correctly and for sepsis bundle compliance are necessary to measure the success of implementing the sepsis improvement plan.

A sepsis improvement plan must have key elements to be successful. A project plan is necessary to identify and engage all stakeholders (ED, inpatient units, EMS), understand current status, resources, baselines, roles and responsibilities, expectations of individuals and outcomes. In order to have an impact on reduction in mortality and average length of stay, compliance with sepsis diagnosis and protocols for sepsis bundles are critical. In implementation, it is necessary to examine the plan, understand what is working and what is not, identify barriers and make corrective action. Continuous quality improvement (CQI) activities will be conducted to ensure successful implementation. In DY2 and DY 3, milestones to implement a program to improve efficiencies and/or reduce program variation are essential to the success of sepsis program. The practice strategy for PDSA and CQI will be a Lean Six Sigma DMAIC approach. A Value Stream Mapping will allow us to document the current state of the program implemented in 2012. The Value Stream Mapping and metric results will determine where variation exits and which processes are constraints to the success of the program. This will help us identify the priority for processes improvement events to be conducted. The team will conduct events utilizing tools to find root causes of variations or process delays. Changes will be implemented with appropriate tools to update the program process. To sustain results of changes implemented, audits at 6 months and 12 months will be utilized for each process improvement event. Each year a Value Stream Mapping can be utilized to validate change, document current state and continue the cycle of process improvement.

**Unique community need identification numbers the project addresses:**
- CN 11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
Sepsis resuscitation and management bundle program kicked off in 2012 as a hospital-specific program. Applying process improvement methodologies to the sepsis program will greatly enhance the chances of success in implementing the plan and seeing reduction in mortality and average length of stay.
Related Category 3 Outcome Measures:

Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:
We are implementing a standardized, evidence-based program for early detection and
resuscitation of patients with severe sepsis and septic shock to reduce unnecessary death and
harm attributable to sepsis. Continuous quality improvement through data collection, analysis
and review will be the basis for accelerating change through multidisciplinary teams.

*IT-4.8 Sepsis mortality (Stand-alone measure)*

By identifying the presence of sepsis early on in the course of care, we have the opportunity to
initiate early treatment and decrease length of stay, reduce health care cost and mortality.
Institute for Healthcare Improvement; Surviving Sepsis Campaign; Society of Critical Care
Medicine; IDSA Guidelines for appropriate antibiotic selection.

*IT-4.9 Average length of stay (Non-stand-alone measure)*

By identifying the presence of sepsis early on in the course of care, we have the opportunity to
initiate early treatment and decrease complications with resulting length of stay in ICU and
overall LOS.

Relationship to Other Projects:
This project supports the population-focused improvements 094193202.4.4, RD-3 Potentially
Preventable Complications (PPCs). Improved quality with evidence-based care for sepsis
increases education, training, and screening that will reduce preventable complications in the
hospital setting.

Relationship to Other Performing Providers’ Projects and Plan for Learning
Collaborative:
The following providers are also proposing projects to address sepsis resuscitation and
management improvement:
- JPS
- North Hills Hospital
- Medical Center of Arlington
- Huguley Memorial Medical Center
- Texas Health Harris Methodist HEB

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along
with a list of participating provider projects for each.) Though this project does not fit into the
two learning collaboratives, over time the Region anticipates time the region anticipates that new
learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Plaza Medical Center Fort Worth has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Plaza Medical Center Fort Worth defined the population that will be directly impacted by the project as patients diagnosed with sepsis. There were 2 outcomes for this project, sepsis mortality and average length of stay for sepsis patients. The percentage of the population expected to be positively impacted by the project for mortality is 3.5%, which was determined based on outcome target for reduction in mortality by 25% from baseline by DY 5. This was estimated at total of reduced deaths/lives saved of 31. The estimated pricing for morality of $10,000 per life was used. This reflected such considerations costs for care, lost wages, and quality of life. This totaled approximately $315,000 for 5 years.

The total sepsis population is expected to be positively impacted by the project for a reduction in length of stay of 2 days from baseline average of 8.7 days per patient. This was estimated at total of reduced in patient days by DY 5 of 1017. The estimated cost per day for a sepsis patient is $750. This totaled approximately $763,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for mortality is a 5. We believe this to be the correct number because when a person is positively impacted, mortality will decrease, reducing costs and resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced mortality was $315,000.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project for reduced length stay is a 1. We believe this to be the correct number because when length of stay is reduced, there is less risk for complications resulting in better health outcomes and improved quality of life. The total value estimated as proportion of reduced length of stay is $152,685.

To determine the value to the community of each individual positively impacted by reduced mortality, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced.
This value was estimated as a proportion of mortality reduction at $252,000. To determine the value to the community of each individual positively impacted by reduced length of stay, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improves, productivity increases and the burden on society is reduced. This value was estimated as a proportion of length of stay reduction at $145,385.

The total value of the project then was estimated at $1,943,133. Approximately 79% of the total value was assigned to Category 2 project and the remaining 6.3% of value assigned to Category 3 outcome for Sepsis Mortality and 14.69% assigned to Category 3 outcome for reduced Average Length of Stay.

Project Summary

**Project Option 2.8.4** – Reduction in 30-day Hospital Readmission Rates (Potentially Preventable Readmissions) [CHF Project]

**Unique Project ID:** 109574702.2.1  
**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702

Huguley Memorial Medical Center is a 213 bed acute care hospital serving southern Tarrant and northern Johnson counties with two intensive care units, progressive care unit, open heart surgery center, behavioral health center and emergency department available 24 hours a day, seven days a week. More than 350 primary care and specialty care physicians provide a wide range of inpatient and outpatient services.

As a non-profit faith-based health care provider, we have a unique concern for the poor and vulnerable in our community. Of the patients we serve, 12% are uninsured and 15% have Medicaid coverage.

This CHF Project intervention is new and targets any patient with a primary or secondary diagnosis of heart failure. The project incorporates performance improvement methodologies and evidence-based interventions to decrease 30-day readmissions through medication management, weight monitoring and dietary education/management and appropriate primary care placement and follow-up.

For 2011 our CHF 30-day all cause readmission rate was 21% (350 inpatients with CHF diagnosis with 73 all cause readmissions). We expect to serve and impact 1,750 CHF patients with this project over the Waiver period, many of whom will be uninsured or have Medicaid coverage.

Many of the uninsured or Medicaid patients we serve are lacking in resources and awareness specific to how they can positively impact their health status. This involves engaging in follow-up activities to include filling and taking their prescriptions, following diet and weight management plans developed by the hospital dietitian, and engaging in follow up care with their primary care provider. Often, these critical components in restoring and maintaining good health are ignored due to financial or logistical limitations that for the time, may be beyond the patients control.

The CHF Project seeks to provide the above counseling, coaching, and intervention to 100 patients in DY4 and 200 patients in DY5.

Our goal is to reduce the 30-day potentially preventable all-cause readmission rate from 21% to 15% by DY5.
Project Option 2.8.4 – Reduction in 30-day Hospital Readmission Rates (Potentially Preventable Readmissions) [CHF Project]

**Unique Project ID:** 109574702.2.1  
**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702

**Project Description:**

**Project Area:** Apply Process Improvement Methodology to Improve Quality/Efficiency  
**Project Intervention:** Reduction in 30-Day Hospital Readmission Rates (Potentially Preventable Readmissions)

The CHF Project is the implementation of an innovative and evidence-based intervention that will lead to reductions in 30-day readmissions for our hospital.

The project will be initiated with a Plan Do Study Act (PDSA) initiative that will involve the following activities:

- Identify and prioritize areas and processes to be improved upon  
- Identify the target and metrics for measuring the impact of the process improvements  
- Comparing and analyzing data specific to the target area for improvement in outcomes  
- Identification of operational procedures for improvement of overall efficiencies in care management  
- Training of providers and staff  
- Interaction with other RHP providers engaged in the same areas and interventions

Post-acute patient monitoring might include:

- Obtaining prescription medications for patients who cannot afford them  
- Providing a scales to patients who may not own one to allow them to properly and consistently monitor their weight  
- Engaging the assistance of a dietitian to provide education on the appropriate diet  
- Assisting the patient with securing a primary care physician  
- Assisting the patient with securing transportation to follow up appointments in the event transportation is a barrier  
- Collaborating with the Area Agency on Aging (United Way) – helping fill gaps identified above

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of the project is to improve delivery of care to the underserved, including those with government-funded insurance, the uninsured and undocumented patient population that we serve from Southern Tarrant and Northern Johnson counties, resulting in improved management of their CHF with a corresponding reduction in readmissions to the hospital.
Regional Healthcare Partnership

The Center for Medicare and Medicaid Services has identified readmission rates for CHF patients as an area of focus and we are required to monitor and report to CMS on this statistic.\textsuperscript{viii} In addition, our corporate ownership has made reducing readmission rates for CHF a priority. \textbf{This project meets the following Regional goals:}

A major goal of Region 10 is to improve the quality and efficiency of care that is delivered to the uninsured, underinsured and economically disadvantaged population in our service area. This population is often less prepared and able to effectively combat the challenges associated with a disease such as CHF.

This project will focus on hospital care, discharge education and postdischarge follow-up in order to ensure this target patient population is well positioned to respond proactively to changes necessary to avoid readmission.

\textbf{Challenges:}
Many patients are affected by the following circumstances which create a unique challenge to implementing this project successfully:

- Lack of understanding and education specific to their disease and how they can play a role in self-managing it
- Lack of adequate financial resources to fully engage in the postacute follow-up activities prescribed by their physician
- General compliance – some of these patients enter the postacute environment and are clear and up-front in their resolve to ignore specifically prescribed postacute follow-up activities prescribed by their physician
- Owning a scale to weigh themselves
- Having adequate transportation to get to appointments or retrieve medications
- Affording prescription medication
- Having a consistent and continuous relationship with a primary care physician such that there is the opportunity for ongoing, consistent care coordination
- Lack of understanding and financial resources for basic quality nutrition habits that positively contribute to improvements in their disease

\textbf{5-Year Expected Outcome for Provider and Patients:}
Improved health of patients with CHF as evidenced by a 20% reduction in hospital 30-day, all-cause readmission rates by the end of the five year period.

\textbf{Starting Point/Baseline:}
For 2011 our CHF 30-day all-cause readmission rate is 20.96% (350 inpatients with CHF diagnosis with 73 all-cause readmissions.)

**Rationale:**
The target population includes individuals with a diagnosis of heart disease who are at risk for readmission due to inadequate monitoring or management of their chronic disease, specifically, CHF patients in our community who are underserved, and/or beneficiaries of government-funded insurance.

In 2011 report, patients admitted for congestive heart failure (CHF) had the highest number of readmissions of 22.6%. Heart failure was also the number one reason for readmission for both the Medicare and uninsured patient. There were 13,272 hospitalizations in North Texas of heart failure patients who were followed by readmissions in 2011.

**Project Components:**
- In 2004 alone, Medicare heart failure readmissions totaled 17.4 billion dollars and heart failure was the number one cause of readmissions for both medical and surgical discharges.  
- It is estimated that 1 million heart failure patients are re-hospitalized each year.  
- Successful efforts to reduce preventable admission rates will improve quality of care and simultaneously decrease costs.  
- Peer-reviewed evidence-based literature supports that post-discharge care – including pre-discharge planning, home based follow-up and patient education – has shown to lower heart failure readmission rates.  
- Our milestones measure an increased population receiving chronic care management through proven, effective model of care: (1) we are establishing a multidisciplinary team approach for identification of/intervention with patient at risk for readmission, patient education and post-acute monitoring and (2) we are improving quality of life while decreasing cost of care as evidenced by decreasing the number of patients requiring readmission to the hospital within 30 days of discharge. The metrics will look at those aspects in the care that best serves our population and prevents readmissions.  
- Huguley will incorporate CQI by conducting Plan, Do, Study, Act (PDSA) cycles and process improvement evaluations.

**Unique community need identification numbers the project addresses:**
- CN 11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project is a new initiative and we have not received any other federal funding for it.

**Related Category 3 Outcome Measures:**
Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:
IT-3.2 Congestive Heart Failure 30-day readmission rate (Stand-alone Measure)
• Numerator: The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index heart failure admission. If an index admission has more than 1 readmission, only the first is counted as a readmission.

• Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of heart failure and with complete claims history for the 12 months prior to admissions.

Relationship to Other Projects:

• Describe the related Category 1 and 2 projects with the unique RHP project identification number based on the requirements above: n/a

• Describe the related Category 4 population-focused improvements with the unique RHP project identification number based on the requirements above: 4.2.1 Congestive Heart Failure (HF): 30-day readmissions

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

• Approach/Methodology: For every CHF admission avoided, $9,203 in cost is saved by the health care system.\textsuperscript{173} The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• Rationale/Justification: CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

\textsuperscript{173} Texas Department of State Health Services with a 30% ccr assumption. 
http://www.dshs.state.tx.us/ph/county.shtm
Community benefits were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Project Option 2.8.11– Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications (sepsis resuscitation bundle)

Unique Project ID: 109574702.2.2
Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702

Huguley Memorial Medical Center is a 213 bed acute care hospital serving southern Tarrant and northern Johnson counties with two intensive care units, progressive care unit, open heart surgery center, behavioral health center and emergency department available 24 hours a day, seven days a week. More than 350 primary care and specialty care physicians provide a wide range of inpatient and outpatient services.

As a non-profit faith-based health care provider, we have a unique concern for the poor and vulnerable in our community. Of the patients we serve, 12% are uninsured and 15% have Medicaid coverage.

The sepsis resuscitation bundle project is new and initially targets any patient who presents in our emergency department with sepsis, symptoms of sepsis, or a potential diagnosis of sepsis. By DY4, the sepsis resuscitation bundle will be implemented and applied to all patients who access care at our hospital with sepsis. The project incorporates performance improvement methodologies and evidence-based interventions to implement the sepsis resuscitation bundle earlier in the care and treatment of the patient and in so doing, reduce both mortality and length of stay for patients with sepsis.

We expect to serve at least 2,000 patients with this project over the Waiver period. In 2011 alone, 28% of our patients diagnosed with sepsis were self-pay. With the implementation of the sepsis resuscitation bundle, all sepsis patients will benefit; however, a large number of them will be uninsured or have Medicaid coverage.

The sepsis resuscitation bundle project focuses on early detection of sepsis or symptoms exhibited by septic patients, and then to implement the complete bundle within 6 hours of sepsis identification. This initiative is expected to positively impact 200 patients in DY3, 300 patients in DY4, and 400 patients in DY5.

Our goal is to implement the sepsis resuscitation bundle 85% of the time for all sepsis patients, and reduce the sepsis mortality rate by 15% by DY5.
Project Option 2.8.11– Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications (sepsis resuscitation bundle)

Unique Project ID: 109574702.2.2
Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702

Project Description:
This project incorporates the development and implementation of an evidence-based early detection and treatment plan for patients with sepsis (sepsis resuscitation bundle). Specific symptoms will be identified as target symptoms and when those are exhibited it triggers the use of the sepsis resuscitation bundle (bundle) for the patient. When sepsis remains undetected for a period of time, the likelihood of complications and increased risk of mortality increases rapidly.

The project will incorporate a sepsis team that will monitor results for the project and will report those results to key stakeholders including physicians, staff, governing board, the Learning Collaborative members, and the community

Goals and Relationship to Regional Goals:
Project Goals:
The goal of the project is to develop and implement an evidence-based bundle to ensure faster and more appropriate treatment of underserved patients including those with government-funded insurance, the uninsured and undocumented patients with identified sepsis in our hospital. This project will be initiated in the emergency department (ED) and will subsequently be incorporated in the treatment of inpatients.

We will initiate Plan Do Study Act (PDSA) in order to determine specific process opportunities and set the course for the project. We will employ continuous quality improvement through the comparing and analyzing clinical quality day and deploy action plans for improvement for identified issues.

The goal by DY5 is to achieve 90% compliance with the identification of sepsis and the application of the sepsis resuscitation bundle for our ED patients who meet the specified criteria thereby improving efficiency and reducing program variation.

The goal by DY5 is to achieve 80% compliance with the identification of sepsis and the application of the sepsis resuscitation bundle for our inpatients who meet the specified criteria thereby improving efficiency and reducing program variation.
Meeting this goal will improve the health outcomes of the patients we serve from Southern Tarrant and Northern Johnson counties, ultimately reducing sepsis-related complications and mortality.

This project meets the following Regional goals:

Region 10 is committed to improving the patient experience, reducing the cost of care and reducing mortality rates. Implementation of the sepsis resuscitation bundle will have a positive impact on all goals.

**Challenges:**
To effectively improve the health outcomes of the underserved, government-funded insurance and undocumented patient populations we serve through implementation of the sepsis resuscitation bundle, we must:

- Increase the speed and accuracy of early detection of the septic patient;
- Educate and train physicians and staff related to the early identification and treatment of sepsis;
- Change physician and clinician practice habits related to the treatment of sepsis;
- Work with all health care disciplines for a teamwork approach for the identification and treatment of this disease process;
- Educating the community on early detection and treatment of the infection process.

**5-Year Expected Outcome for Provider and Patients:**
Our five-year goal is to reduce the number of sepsis-related deaths by 15% and implement the early detection and sepsis resuscitation bundle 85% of the time housewide.

**Starting Point/Baseline:**
- Jan-Sept 2012 data shows Huguley had 44,189 encounters in our ED of which 244 were diagnosed with sepsis.
- Training will involve 500 clinical staff to include nurses, techs, and physicians.

**Rationale:**
Reasons for selecting this project option:

- Sepsis is the tenth leading cause of death in the U.S.\textsuperscript{xix}
- 750,000 new cases of sepsis occur each year with 210,000 fatalities. \textsuperscript{xx}
- Estimated $14.6B spent on hospitalization for septicemia in 2008.\textsuperscript{2}
- Inflation adjusted cost for septicemia increased 11.9% annually from 1997-2008. \textsuperscript{xxi}
- Hospitalizations for sepsis more than doubled from 2000-2008 yet overall hospitalizations remained flat during the period. \textsuperscript{xxii}
- Sepsis patient ALOS is 75% longer than other hospital conditions
Death is eight times more likely for septic patients versus patients with other conditions.\textsuperscript{xxiii} Surviving septic patients are 50\% less likely to be discharged home; 2 times more likely to be discharged to another short term acute care setting and three times more likely to be discharged to a long-term care setting.\textsuperscript{5}

Project Components:
- In 2008, the Surviving Sepsis Campaign was initiated, focusing on early recognition and implementation of an early sepsis resuscitation bundle. The implementation of this sepsis resuscitation bundle has been proven to save lives in the U.S.\textsuperscript{xxiv}
- The mortality rate of severe sepsis is equal to that of acute MI, is over four times greater than that of breast cancer and is more than five times greater that that of AIDS.

Unique community need identification numbers the project addresses:
CN 11 – Need for More Care Coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other Federal funding for it.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:
IT 4.8 Sepsis Mortality (stand-alone measure)
- Numerator: Number of patients expiring during current month hospitalization with sepsis, severe sepsis or septic shock and/or an infection and organ dysfunction.
- Denominator: Number of patients identified that month with sepsis, severe sepsis or septic shock and/or an infection and organ dysfunction.

Mortality rates from severe sepsis are on a similar scale to lung, breast, and colon cancer, and it is one of the leading causes of death in the intensive care unit. Due to its aggressive, multifactorial nature, sepsis is a rapid killer. Death is common among sepsis patients, with around 30\% of patients dying within the first month of diagnosis and 50\% dying within six months. The 28-day mortality rate in sepsis patients is comparable to the 1960s hospital mortality rate for patients of acute myocardial infarction (AMI).

The focus on reducing sepsis mortality could have an impact our entire patient population so the benefits are widespread. In 2011, 28\% of our patients with a sepsis diagnosis were self-pay so there is a clear opportunity to improve the health of our low-income population.

Relationship to Other Projects:
Related Category 1 and 2 projects with the unique RHP project identification number based on the requirements above: n/a

Related Category 4 population-focused improvements with the unique RHP project identification number based on the requirements above: 4.3.35

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

Decreased mortality rate does not bring any direct health care cost savings. Lives saved are utilized to calculate individual and community costs. The total valuation is calculated by summing up individual and community costs.

Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
### Implement an innovative and evidence-based intervention that will lead to reductions in sepsis complications (sepsis resuscitation bundle)

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $666,988*
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.1 – Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)

Unique Project ID: 112677302.2.1

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth / 112677302

Provider:
THFW is a 726 bed tertiary care medical center serving all of North Central Texas. THFW is the largest hospital and has the busiest ED in North Central Texas. In 2011, THFW admitted 26,319 Medicaid patient days (3,976 discharges) and 12,468 Uninsured patient days (2,667 discharges).

Intervention: The goal of this project is to provide seamless care for low income and uninsured residents of Tarrant County living with diabetes to improve health outcomes and self-management competency, prevent unnecessarily reduced quality of life, and decrease inappropriately high reliance on acute and emergent care community resources. Linking diabetes patients that present to the ED or as inpatients to a primary care physician is a new initiative, and could significantly enhance the number of patients who have access to diabetes education and support.

Need of the project: The uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable hospitalizations. Few, if any, of the hospital’s low income / uninsured patients with diabetes enroll in available outpatient DSMT programs because the cost is prohibitive and programs require physician referral, pre-registration and payment of fees. Medicaid does not pay for outpatient Diabetes Self-Management training. THFW data indicates that of the patients readmitted within 30 day for diabetes, about 13% have Medicaid and an additional 6% are self-pay or uninsured.

Target population: Our target population is low income / uninsured community members with diabetes who are not currently being managed and are seen frequently in the ED and have multiple admissions. Our 5 year goal is to provide diabetes management resources and education to at least 500 unique patients.

Expected patient benefits: A major goal of the region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to that goal by linking low income / uninsured residents of Tarrant County to a medical home and available Diabetes Self-management Education / Support resources to actively engage them in their self-care and reduce the likelihood of an acute condition that would require ED care and / or inpatient admission.

Category 1 or 2 expected patient benefits: Development of a comprehensive care management program with a formalized multidisciplinary CARE team, combined with development / implementation of a program to assist patients to better self-manage their chronic condition will lead to improved access to care and an increased percentage of patients with self-management goals. These patients, linked to a medical home and actively engaged in their self-care, will experience improved health outcomes and rely less on acute and emergent care community resources. Anticipate serving approximately 100 patients in DY 3 and increasing by 5% annually.

Category 3 outcomes: Diabetes patients who benefit from this program will demonstrate improvement in HbA1c, compared to their initial or baseline value, thereby decreasing the percentage of patients age 18-75 with HbA1c >9%. By providing access to care and assistance in self-management of their disease, risk of admission and readmission is reduced, thereby improving the Diabetes 30 day readmission rate and saving an estimated $8,297 cost for every
inpatient admission avoided. Anticipate improvement in 30 patients in DY 3 and annual incremental growth.

**Project Option 2.2.1 – Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)**

**Unique Project ID:** 112677302.2.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Project Description:**
A CARE team of clinical and support staff (such as nurse navigators, diabetes care managers, case managers) will link low-income and uninsured diabetes patients identified through the ED, inpatient stays, or community outreach partnerships to a medical home and diabetes management resources for ongoing coaching and education to help them learn to effectively manage their diabetes and take an active role in reducing the negative toll that diabetes would otherwise have on their lives.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this project is to provide seamless care for low-income and uninsured residents of Tarrant County living with diabetes to
- improve health outcomes and self-management competency,
- prevent unnecessarily reduced quality of life, and
- Decrease inappropriately high reliance on acute and emergent care community resources.

Our proposed intervention will improve access to diabetes care management support (i.e. a medical home for primary care, lab work, and medication management) and help these people with diabetes better self-manage their disease through education and peer support in an outpatient community-based setting.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project will contribute to achieving that goal by linking low income, uninsured residents of Tarrant County to a medical home and improving access to diabetes self-management education and support in a community-based setting.

**Challenges:**
Higher than the national average of 8%, 9.7% adults 18 years and older in Texas are diagnosed with diabetes, i.e. (1.8 million adults). Among the elderly population (older than 65 years old), the rate is 23%, and among adults 45-64, the rate is 14%.174 While chronic conditions are a growing concern for all U.S. populations, the uninsured and Medicaid beneficiaries with chronic conditions are at the greatest risk of unnecessary disease-related complications and avoidable

hospitalizations. Those who are uninsured or without access to appropriate care have been widely reported in clinical research literature as having the greatest difficulty in managing chronic conditions due to lack of a medical home, minimal or no primary care access, limited or no access to medications necessary for disease management, and limited or no access to regular lab work.\textsuperscript{175}

One out of 12 adult individuals in Tarrant County has been diagnosed with diabetes. In 2011, 1294 patients presented to the THFW ED with a principal diagnosis of diabetes, and 562 were admitted for inpatient management. In 2011, THFW had 9399 encounters for diabetes listed as a primary or secondary diagnosis. Of those, 1344 were readmitted within 30 days, a rate of 14.2%. Of these readmissions, 13.29% had Medicaid or managed care Medicaid and 5.05% were uninsured /self-pay. YTD 2012, 744 patients have presented to the THFW ED with a primary diagnosis of diabetes, and 326 have been admitted. So far in 2012, THFW has had 7208 encounters for diabetes, with 1010 readmissions within 30 days, a rate of 14.01%. Of these readmissions, 12.97% had Medicaid or managed care Medicaid and 6.63% were uninsured / self-pay. The missing link, coordinated access to resources and self-management education, perpetuates the cycle of avoidable hospitalizations and readmissions.

\textbf{5-Year Expected Outcome for Provider and Patients:}

Our five year goal is to provide diabetes management resources to at least 500 unique patients. Patients referred to our programs will self-select goals that will help them better manage their chronic condition(s) / diabetes.

\textbf{Starting Point/Baseline:}

Some components of this program already exist. THFW offers ADA-recognized diabetes self-management training (DSMT) programs at two sites. These programs are staffed by experienced certified diabetes educators (nurses and dietitians) skilled in facilitating behavior change. Unfortunately, few, if any, of the hospital’s low-income, uninsured patients with diabetes enroll in the outpatient DSMT programs because the cost is prohibitive and programs require physician referral, pre-registration, and payment of fees. Medicaid does not pay for outpatient diabetes self-Management training. Additional resources such as the hospital’s diabetes support group and the THR Ask-a-Diabetes Educator website are underutilized because both patients and providers are unaware of their existence. Preparation has begun for implementation of a chronic disease self-management program through the faith community. The THFW ambulatory outpatient clinic, staffed by a part-time nurse practitioner, RN, and PCT, provides interim care for low-income/uninsured patients until they can either be seen by their provider postdischarge or find a medical home. More than half of the patients seen in the clinic have diabetes.

\textsuperscript{175} See Cardiovascular Disease Risk Among the Poor and Homeless – What We Know So Far by Charlotte A. Jones et. al. Curr. Cardio. Rev. 2009, January; 5(1):69-77; The Centers for Disease Control 2011 National Fact Sheet on Diabetes
Our CARE team will break through these barriers by coordinating access to resources and education. Collaboration with highly skilled nurse case managers in an expanded patient care navigation program will connect at-risk patients with diabetes to a medical home and available outpatient resources to actively engage them in their self-care, and reduce the likelihood of an acute condition requiring ED care and/or inpatient admission.

**Rationale:**
In the past, our system has focused on providing high-quality inpatient and emergency services. However, technological advances and recognition of the inadequacies of a reactive inpatient-centered system of care, particularly for those living with chronic illness, requires a system make-over in which primary care access is the basis for ensuring ongoing, coordinated care for patients. So that patients can stay healthy and out of the hospital, we have selected this project to link patients to a medical home. Additionally, we have focused this project on a population disproportionately affected by the lack of primary care – economically disadvantaged and underserved adults living with a chronic disease.

**Project Components:**
Our project includes all the components listed, including
- A clinically-led and mission-driven CARE team, including non-physician health professionals and diabetes care navigators who work together to provide seamless care until program participants are established in a medical home
- Access to team members in person, by phone, or electronically by email or the THR Ask-A-Diabetes Educator website
- Disease-specific education and self-management support designed to increase personal engagement and empower participants to make lifestyle changes to stay healthy and self-manage their chronic condition
- Peer support opportunities in addition to opportunities for participants to become auxiliary support resources for other participants, others within their communities, and members of their families.

These project targets low-income / uninsured community members with diabetes who are not currently being managed who are seen frequently in the ED and who have multiple inpatient admissions. Our milestones measure improvements in access to care resulting from a coordinated approach that links these patients to available resources and education to improve clinical outcomes and reduce avoidable hospital readmissions.

THFW will incorporate CQI by conducting Plan, Do, Study, Act (PDSA) cycles and process improvement evaluations.
Unique community need identification numbers the project addresses:

- CN 8 – Lack of access to health care due to financial barriers (i.e., lack of affordable care)
- CN 11 – Need for more care coordination
- CN 13 – Necessity of patient education programs

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
Linking diabetes patients who present to the ED or inpatients to a primary care physician is a new initiative. This project could significantly enhance the number of patients who have accessibility to diabetic education. This project has not received any other federal funding.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/ Rationale for Selecting the Outcome Measures:

IT-1.10 Diabetes Care: HbA1c poor control (>9%) NQF 0059 (Stand alone measure)

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
- Denominator: Members 18-75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

Data Source: EHR, Registry, Claims, Administrative clinical data

Rationale/Evidence:

Diabetes is one of the most costly and highly prevalent chronic diseases in the United States. Complications from the disease cost the country nearly $100 billion annually. Many complications, such as amputation, blindness, and kidney failure, can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars.

IT-3.3 Diabetes 30-day readmission rate

- Numerator: The number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index diabetes admission. If an index admission has more than one readmission, only the first is counted as a readmission.
- Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of diabetes and with a complete claims history for the 12 months prior to admission.

Relationship to Other Projects:
• **Related Category 1 and 2 projects:** This project relates to project 2.9.1 Establish/Expand Patient Care Navigation Program. The patient navigation program assists with the identification of at-risk patients who might benefit from closer monitoring. The navigator would refer the patient to the Diabetes Clinic for management of their disease.

• **Related Category 4 Population-focused improvements:** RD.1: Potentially Preventable Admissions RD.1.2: Diabetes Admission Rate should improve for at-risk patients who would not otherwise be able to access care to manage their diabetes. Diabetics whose disease is managed will decrease their risk of developing complications from their disease that would result in hospital admissions. RD 2: 30 Readmission Rate – RD 2.2 Diabetes 30-day Readmissions are Category 3 Outcome Measures selected as an anticipated outcomes to measure the effectiveness of this project. By providing access to care and assistance in self-management of their disease, risk of admission and readmission are reduced.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
• **Approach/Methodology:** For every inpatient admission avoided, $8,297 in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

• **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

---

DSRIP Project Summary: Region 10 Category 2

**Project Option 2.2.1** – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases (Improving Management of Heart Failure (HF))

**Unique Project ID:** 112677302.2.2  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Provider:** THFW is a 726 bed tertiary care medical center serving all of North Central Texas. THFW is the largest hospital and has the busiest Emergency Department in North Central Texas. In 2011, THFW admitted 3,976 Medicaid patient discharges and 2,667 Uninsured patient discharges.

**Intervention:** The project purpose is to decrease the rate of Heart Failure patient hospital admissions and readmissions. This project will increase the number of Medicaid and unfunded patients than the newly existing clinic is able to serve prior to this initiation of the DSRIP CHF project. It is the expansion of a new but existing initiative.

**Need of the project:** This project was chosen because at THFW there is a high volume of CHF inpatient admissions (historically between 950 and 1000 annually). It was also identified during care team rounds that a significant number of CHF readmits within 30 days have not been seen by a physician prior to returning. It is the intent of the project to increase the heart patients’ ability to manage their own care in collaboration with their providers with a decrease in the rate of readmissions within 30 days and CHF admissions overall.

**Target population:** The uninsured and the underinsured, and those who do not have current access to a primary or appropriate specialty physician within a 1-2 week period following discharge. Patients will be served by at least 5000 clinic visits and contacts during the course of the waiver.

**Expected patient benefits:** The expected patient benefits are timely access to a physician post discharge, follow up regarding compliance with discharge medications, diet and other positive lifestyle behaviors, teaching and interventions to promote these behaviors, and post discharge clinic as a bridge to a stable healthcare home.

**Category 1 or 2 expected patient benefits:** Expand development of program and expand and document interaction types between patient and healthcare team beyond one-to-one visits to include such interactions as group visits, telephone visits, and other interaction types; Develop and implement programs to assist patients to better self-manage their Heart Failure; Increase hours of clinic to increase capacity for visits; Participate in face to face learning seminars at least twice per year with other providers and the RHP to promote collaborative learning and increased performance; Apply Chronic Care Model to Heart Failure (Wagner Chronic Care Model); Implement CHF specific or MCC (that includes CHF) Medical Home; Improvement in access to care of patients receiving CHF/chronic care management services using innovative project option; Apply the Chronic Care Model to Heart Failure populations which are prevalent locally.

**Category 3 outcomes:** Our project goal is to implement programs that will improve the health of patients with heart failure as evidenced at the conclusion of the 5 year time period by a
Regional Healthcare Partnership

reduction in Heart Failure hospital admission rate by 5% and 30 day all cause hospital readmission rate by 15%.

**Project Option 2.2.1 – Expand Chronic Care Management Models – Redesign the outpatient delivery system to coordinate care for patients with chronic diseases (Improving Management of Heart Failure (HF))**

**Unique Project ID:** 112677302.2.2  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Project Description:**
Prevention of potentially avoidable heart failure readmissions through improved identification of patients at high risk for readmission and decrease of total annual CHF readmissions, targeted interventions to address specific needs of the individual, and post-acute care monitoring of patient at high risk for readmission. Central to this process is a post-discharge CHF Clinic staffed by an advanced practice registered nurse (APRN). The clinic will also be staffed by an RN and nurse technician to promote optimal functioning. This clinic is not meant to provide long-term continuous care to these patients, but to bridge the gap between discharge and the first available appointment with their own physician or a newly assigned physician. The clinic and the processes in which the staff engage will also help bridge the gap between the inpatient and the outpatient experience and management of the continuum of care. Other areas that the APRN and RN may choose and be able to interact with are post-discharge telephonic assessments and/or some home visits with a care transition coach or clinician in ways that fit the entire spectrum of patient management. Patients released from the hospital setting who are deemed at high risk for not following up with a physician in a timely manner have been identified as a key population to see in this clinic. This is determined while the patient is still in the hospital as either an inpatient or outpatient (e.g., in the ED).

**Goals and Relationship to Regional Goals:**
**Project Goals:**
The primary project goal is to improve the health of low-income, underserved HF patients through more effective disease management along the continuum of care with particular emphasis on transitions through the post-acute phase. Goals are to (1) reduce overall need for HF patient hospital admission and (2) reduce HF patient hospital readmissions within 30 days of discharge. The process goals support the operation and expansion of the newly opened Post-discharge CHF Clinic. This area was chosen because at our facility (THFW) there is a high volume of CHF inpatients (historically between 950 and 1,000 a year). It was also identified during care team rounds that a significant number of CHF readmissions within 30 days have not been seen by a physician prior to returning. This is either due to physician offices not being set up to see patients in a timely manner or patients not having resources to access a physician. Both of these issues can be addressed when they come to the Post-discharge HF clinic.
This project meets the following Regional goals:
N/A

Challenges:
We must communicate with physicians to inform them that the purpose of seeing their current patients in the post-discharge CHF clinic is to bridge the gap between discharge and the patient’s follow-up visit in the physician’s office or clinic. There is no intent to take patients away from their practice. Another challenge is the prevention of missed appointments at the clinic. Some similar clinics in other settings have had as many as 60% of their patients not show up to their first appointment.¹⁷⁷

5-Year Expected Outcome for Provider and Patients:
The five-year expected metric outcome will be at least a 5% decrease in 30-day readmits.

Regional Goals were identified through The “Checkup for Tarrant County,” prepared in 2009 from 2008 data, which showed the following demographics related to heart disease:
Cardiovascular disease is identified in Tarrant County as having higher rates than in the state or the U.S. This data translates to a need to address high risk for readmit populations within the realm of heart disease, as evidenced by its early inclusion by CMS in disease outcome indicators, specifically congestive heart failure. This report provides further evidence of the need for interventions within the hospital’s geographic area, showing areas of poverty within Central and South East Tarrant County, which are also adjacent to the area in which THFW Harris Methodist Hospital is located.

Starting Point/Baseline:
Currently the CHF 30-day readmission rate at Texas Health Fort Worth is 22%

Rationale:
The reasons for selecting the project was the large number of CHF patients seen in this inter-city, tertiary hospital located in an area with a population that has a higher percentage of cardiac disease than the state and national average. This area also has a significant population within the poverty level who are underserved and uninsured.¹⁷⁸

Project Components:
This option was selected to meet the need for more timely post-discharge follow-up for heart failure patients, the majority of whom are unable to get appointments in less than two weeks or more, do not have medical follow-up due to ability to pay, and are uninsured or underinsured. The post-discharge CHF Clinic also revisits and reinforces teaching done prior to inpatient discharge, and determines whether the patient and family understand discharge orders and

medications. Reinforcement post-discharge enhances retention of dietary and medication information that is so important for patient compliance with lifestyle changes to decrease readmissions.

Our project contains all of the required core components including:

1. Design and implement care teams that are tailored to the patient’s health care needs, including non-physician health professionals, such as pharmacists doing medication management; case managers providing care outside of the clinic setting via phone, email, and home visits; nutritionists offering culturally and linguistically appropriate education; and health coaches helping patients to navigate the health care system.

2. Ensure that patients can access their care teams in person, by phone or email.

3. Increase patient engagement, such as through patient education, group visits, self-management support, improved patient-provider communication techniques, and coordination with community resources.

4. Implement projects to empower patients to make lifestyle changes to stay healthy and self-manage their chronic conditions.

5. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. THFW will incorporate CQI by conducting Plan, Do, Study, Act (PDSA) cycles and process improvement evaluations.

CMS has already identified readmissions of CHF patients within 30 days as an important metric, and it is one that our facility is familiar with regarding gathering data for reporting, tracking our successes and benchmarking ourselves against other facilities. The milestones will track the development and progression of the clinic as it expands to meet the needs of these patients. Our milestones were selected to advance the development of the chronic care management program designed to assist our target population. Milestones include (1) identifying/hiring and training a multidisciplinary team, (2) developing and implementing a plan for the HF clinic based on the Wagner’s Chronic Care Model, (3) establishing a multidisciplinary team approach to the identification of and intervention with patients at risk for ineffective management of their HF, (4) collaborating with area health care providers to assure effective management of the high-risk HF patient along the health care continuum, (5) increasing the number of at-risk patients in the program, and (6) implementing interventions key to improving the patient’s health (weight monitoring, medication management, self-management), thus reducing risk for hospital admission or readmission. These milestones and metrics will measure the number of patients receiving ongoing chronic care management through an evidence-based, coordinated model (rather than not receiving care, or receiving fragmented care).

**Unique community need identification numbers the project addresses:**

179 Wagner Chronic Care Model.  
• CN.1 – Lack of provider capacity
• CN. 3 – Shortage of specialty care
• CN 8 – Lack of access to health care due to financial barriers

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This plan will enhance our new start-up CHF Clinic initiative. Currently the clinic is open for patient visits three days a week for 4 hours each day. The APRN is part time and the backup staff is an RN and use technician with access to the hospital services and case managers.

**Related Category 3 Outcome Measures:**

**Outcome Measures**

• IT-3.2 Congestive Heart Failure 30-day readmission rate (Stand-alone measure)
• IT-2.1 Congestive Heart Failure Admission rate (CHF) - PQI #8 (Stand-alone measure)

**Relationship to Other Projects:**

• Related Category 1 and 2 projects

• **Related Category 4 population-focused improvements**: RD.1: Potentially Preventable Admissions RD.1.1: Congestive Heart Failure Admission rate and RD 2: 30 Readmission Rate: RD 2.1 Congestive Heart Failure (HF) 30-day Readmissions is
Category 3 Outcome Measures selected to evaluate the effectiveness of this project. This project also impacts RD.4 Patient-centered Health care: RD.4.2 Medication Management as enhanced inpatient screening and discharge processes will verify completion of medication reconciliation and assist patient in understanding and/or obtaining necessary medications prior to discharge.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $9,203 in cost is saved by the health care system.\(^{180}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $1,415,617*
DSRIP Project Summary: Region 10 Category 2

Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

**Unique Project ID:** 112677302.2.3

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth (THFW) / 112677302

**Provider:** THFW is a 726 bed tertiary care medical center serving all of North Central Texas. THFW is the largest hospital and has the busiest ED in North Central Texas. In 2011, THFW treated 26,319 Medicaid patients days (3,976 discharges) and 12,468 Uninsured patients days (2,667 discharges).

**Intervention:** Goals for the project include improved management of patient health care needs resulting in a reduction of inappropriate ED utilization for non-emergent conditions and increased navigation of patients to appropriate health care resources, including establishing a PCP. This project is a new collaborative initiative.

**Need of the project:** A regional healthcare group exposed many patients who are exploiting hospital emergency services across the county and beyond. Many patients are getting inappropriate and duplicative care inside the Texas Health Resource system and other hospitals, too.

**Target Population:** In 2011 THFW served 29,736 uninsured outpatient encounters and 24,496 Medicaid outpatient encounters. The patients with the highest utilization of services are the target population. PD navigators could touch 300 patients per month based on utilization numbers from June 2012 cited below under “Rationale.”

**Expected patient benefits:** Professional nurse navigators will help at risk, disadvantaged community members obtain access to preventive, primary and chronic healthcare services in order to more effectively manage their health. ED CM Navigator will coordinate with chronic disease managers in the Diabetic Management Program and the CHF Management Program. Several other acute hospitals in the RHP (JPS, Baylor All Saints, THHEB, THSW and THAM) will also have ED CM Navigator programs. THFW will collaborate intensely with these facilities to manage this complex population. Based on current collaborative engagement with JPS the program:

1. Enrolls patients into the JPS connection
2. Redirects and make appointments for patients at FQHCs
3. Navigates patients to PCP medical homes
4. Refers patients to MHMR services
5. Enlists patients into charity medication services with the pharmaceutical companies
6. Enrolls patients into community services

**Expected project / intervention benefit measurement:** Reduce emergency department visits for CHF, Diabetes, ESRD, CV/Hypertension, Behavioral Health/Substance Abuse, COPD and Asthma resulting in reduced claims data and revenue loss.
Category 1 or 2 expected patient benefits: Metric 1[P-2.3]: Frequency of contact with care navigators for high risk patients. The need for contact should increase according to the complexity, compliance and health status of the patient.

Category 3 outcomes: 3.IT-9.2 Right Care, Right Setting: ED appropriate utilization (Stand-alone measure) Reduce Emergency Department visits for target conditions CHF, Diabetes, ESRD, CV/Hypertension, Behavioral Health/Substance Abuse, COPD, Asthma. Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management).
Project Option 2.9.1 – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

Unique Project ID: 112677302.2.3
Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth (THFW) / 112677302

Project Description:
Assign highly skilled nurse case managers to lead a collaborative process of assessment, planning, facilitation and advocacy for options and services to meet an individual’s health needs through communication and available resources to promote quality cost-effective outcomes. The project will implement an ED-based case management program to identify patients who are frequent users of the ED and assist them in more effective and appropriate utilization of health care resources. The ED RN case manager /nurse navigator will work with patients and a multidisciplinary health care team to:

- Navigate patients to obtain necessary community resources to meet identified patient needs.
- Facilitate obtaining a PCP or enroll in nurse practitioner run chronic disease management clinic to more effectively manage their disease on an ongoing basis.
- Intervene as necessary to provide education and monitor identified patients postdischarge to encourage compliance with follow-up plan for receiving ongoing care/support for their health care needs.
- Facilitate arrangements for care, as appropriate, at a lower level, such as an outpatient clinic or skilled facility to avoid hospital admission and reduce risk of ongoing utilization of ED for non-emergent care needs.

Goals and Relationship to Regional Goals:
Project Goals:
Goals for the project include a reduction in inappropriate utilization of ED for non-emergent conditions and increase in the navigation of patients to appropriate health care resources, including establishment with a PCP. It is anticipated that improved management of health needs through navigation of these at-risk patients to appropriate resources and to development of an established relationship with a health care provider who can monitor and manage their health on an ongoing basis would reduce the number of potentially avoidable hospitalizations/ED visits and lower overall health care costs.

This project meets the following Regional goals:
A major goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. This project would contribute to achieving that goal by implementing a RN navigator based in the ED to help at risk, disadvantaged community members obtain access to
preventive, primary and chronic health care services in order to more effectively manage their health.

Challenges:
Eighty-five percent of the U.S. health care dollar is spent on people with chronic conditions. Sixty percent of most costly patients have chronic conditions and functional limitations. Patients with two or more chronic conditions and functional impairments spend three times more than patients with two or more chronic conditions and no functional impairments. Patients with two or more chronic conditions and activity limitations were seven times more likely to be among the top 5% most costly patients. Reduce the amount of these patients who show up in the Emergency Department and find lower cost of care centers for patients.

5-Year Expected outcome for Provider and Patients:
Goal is to reduce inappropriate utilization of the emergency department or hospitalization by 5% over the five-year time period.

Starting Point/Baseline:
We have six-years of data with high utilization patients and attempted interventions. This population has no management and frequently uses multiple providers who are unaware of each other causing duplication of services. These patients have multiple health issues which often include a psychiatric diagnosis also. Utilization of the THFW hospital ED has increased 1.7% in patient volume between 2010 and 2011. Estimates for 2012 (109,000 visits) indicate an additional 12.4% increase in volume will be noted from 2011 to 2012.

Rationale:
An analysis of the 8,934 June 2012 THFW ED patient visits indicated that 45.4 % (4020 patients) of the patients presenting for care in the ED were unfunded or Medicaid. Of this unfunded or Medicaid population, 40% (1608 patients) had diagnoses that did not require emergency care, including conditions such as chronic back pain, prescription refills, follow-up exams or dental disorder. Additional diagnoses, such as limb pain or urinary tract infection might have been managed at a lower level of care making the potential avoidable ED admissions even greater.

Project Components:
All required core project components are included in the project:
- Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.
- Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.
- Connect patients to primary and preventive care.
• Increase access to care management and/or chronic care management, including education in chronic disease self-management.
• Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.
• CQI component is also included in Milestone 3

Our process milestones and metrics advance development of our project to move patients at risk of receiving fragmented care into a program that provides continuity to more effectively manage their disease or obtain care at the appropriate level. This includes participating with other providers in the RHP to continually evaluate and learn how to improve our effectiveness. Milestones/metrics measure an increasing population receiving assistance through the navigator program and include: (1) hiring and training staff including RN case managers to cover the ED 7 days a week who coordinate a multidisciplinary team including social workers, RNs and physicians/nurse practitioners to more effectively address anticipated needs considering both social and clinical (2) developing policies, procedures and data collection tools to effectively run the program and monitor effectiveness to (3) increase the number of patients served under this model by 20% over the five-year period. These milestones and metrics will measure the volume of at-risk patients navigated to receive care at the appropriate level for ongoing management of their health through an effective, coordinated model (rather than receiving fragmented care).

Unique community need identification numbers the project addresses:
• C CN.10 – Overuse of emergency department (ED) services.
• CN.11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/rationale for selecting the outcome measures:

IT-9.2 ED appropriate utilization (Stand-alone measure) Reduce Emergency Department visits for target conditions: CHF, Diabetes, ESRD, CV/Hypertension, Behavioral Health/Substance Abuse, COPD, Asthma

Implementation of this project should assist in getting the patient the care they require in the right setting for that care, avoiding unnecessary emergency department visits. (See data discussed in Section 4.a). Studies have demonstrated the effectiveness of establishment with a
PCP and case management/navigation program to improve management of patient health and reduce risk of avoidable readmissions.\textsuperscript{181} RN Navigators assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health. The anticipated outcome is improved health with better quality of life and decreased end organ damage. Patients with effectively managed disease will and a dedicated health care provider will have less need to utilize the ED for emergent conditions or to obtain access to health care providers.

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects**
  - 112677302.1.1: Wellness for Life – Mobile Health Unit
  - 112677302.2.1: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Diabetes
  - 112677302.2.2: Prevention of potentially avoidable heart failure readmissions through improved identification of patients at high risk for readmission, targeted interventions to address specific needs of the individual, and post-acute care monitoring of patient at high risk for readmission.

- **Related Category 4 Population-focused improvements**
  - RD1: Potentially Preventable Admissions 1. Congestive Heart Failure Admission Rate; 2. Diabetes Admission Rate; 3. Behavioral Health and Substance Abuse Admission Rate; 4. Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate
  - RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)
  - The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

The program would create unified agreement on goals and measurements across the region. CQI’s to be measured would be patient enrollment, utilization of a common tool, and tracking patient compliance.

**Project Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $507 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

---

**Goal:** Patients using the ED as high users or for episodic care. The navigation program is accountable for making PCP or medical home appointments and ensuring continuity of care. Especially for disenfranchised or medically complex patients, navigation is about guiding people through and across the HC system, from provider to provider, ensuring they can get to and make multiple appointments, get prescriptions filled, access to community services for people with special needs (such as getting cancer patients access to support groups), etc. the patient navigator represents the liaison between primary, secondary, tertiary and quaternary health care.

**Metric [P-5.1]:** Collect and report on all the types of patient navigator services provided.
- **Baseline/Goal:** Data collection completed with at least one report produced

**Milestone 4 [I-6]:** Increase number of PCP referrals for patients without a medical home who use the ED, urgent care, and/or hospital services.
- **Metric 1 [I-6.2]:** Percent of patients without a primary care provider (PCP) who received education about a primary care provider in the ED
  - **Goal:** 80% of identified patients
  - **Data source:** Administrative data on patient encounters and scheduling records from patient navigator program

**Milestone 6 Estimated Incentive Payment:** $1,013,931

**Milestone 8 Estimated Incentive Payment:** $875,261

**Goal:** 20% reduction
- **Data Source:** Claims and EHR/registry

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add milestone bundle amounts over Years 2-5): $7,660,302*
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.8.11 – Sepsis: Implement an innovative and evidence-based intervention that will lead to reductions in Sepsis Complications (mortality, prevalence and incidence) for providers that have demonstrated need or unsatisfactory performance in this area.

**Unique Project ID:** 112677302.2.4

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth / 112677302

**Provider:** THFW is a 726 bed tertiary care medical center serving all of North Central Texas. THFW is the largest hospital and has the busiest ED in North Central Texas. In 2011, THFW had 26,319 Medicaid patient days (3,976 discharges) and 12,468 Uninsured patient days (2,667 discharges)

**Intervention:** Early intervention and treatment of Sepsis patient entering through the ED. This is a new initiative.

**Target population:** Sepsis patients in hospital’s primary service area. Estimated 3200 (based on the 2011 THFW 816 sepsis patients) patients will be served over course of waiver period.

**Expected patient benefits:** Mortality and length of stay for Sepsis patients will decrease.

**Category 1 or 2 expected patient benefits:** Milestone 2 [P-2] Identifies and targets metric to measure impact of Performance Improvement methodology and establish baseline. Identification of metric for measurement will guide the improvement process to decrease the length of stay of sepsis patients and mortality. Milestone 3 [P-3] compares and analyzes clinical/quality data and identify at least one area for improvement and establish baseline. CNS will evaluate the data to find the area being missed in the treatment and approach to care when implementing the bundle.

**Category 3 outcomes:** Process Milestone 2 [P-2] Establishes baseline rates to determine frequency of bundle usage; affecting mortality, and establish baseline. Identifying rates of bundle usage will allow for improvements to increase the rates resulting in better treatment to decrease the mortality and length of stay of patients.
Project Option 2.8.11 – Sepsis: Implement an innovative and evidence-based intervention that will lead to reductions in Sepsis Complications (mortality, prevalence and incidence) for providers that have demonstrated need or unsatisfactory performance in this area.

Unique Project ID: 112677302.2.4

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth / 112677302

Project Description:
Early recognition of severe sepsis and septic shock followed by uniform, consistent early implementation of an evidence-based sepsis resuscitation bundle will decrease mortality. In DY2 this project will target the specific workflow and processes (P-1) in the emergency department (ED) focusing on early diagnosis, initial management and prompt transfer to ICU. Once it is identified that a patient has severe sepsis, we need early implementation of the sepsis resuscitation bundle as defined by Surviving Sepsis Guidelines 2012 (IHI) and Dellinger, Surviving Sepsis Campaign International Guidelines for Management of Severe Sepsis and Septic Shock, Critical Care Medicine 2008. Through a PDSA process in DY2, comparisons and analysis of current process will be completed, allowing for operational procedures needing improvement to be identified and defined in conjunction with other departments (laboratory, pharmacy, clinical nurse specialist) (P-3, P-4). In DY3, target metrics will be identified to measure the impact of the process changes, establishing a baseline (P-2) as well as a dashboard for reviewing trends and improvements (P-10). The implementation of a sepsis clinical nurse specialist (CNS) position in DY3 will permit service line ownership of program implementation (P-6) to monitor and communicate process efficiencies. The CNS will be responsible for the training and education of departments involved in the process change (P-8). The project will also allow leveraging the EMR by embedding a sepsis bundle checklist for clinicians (P-6). Dissemination of information (DY4 and DY5) will occur through, but not limited to communication channels of the Critical Care Committee and ED service line meetings.

Goals and Relationship to Regional Goals:
Project Goals:
THFW has already developed an EMR severe sepsis order set based on the above guidelines and has, over the past three years, sponsored various educational programs. However, we have never measured whether the sepsis bundle is consistently used, whether all components of the bundle are implemented, and whether outcomes improve with its use.

This project meets the following Regional goals:
Implementation of and hardwiring an evidence-based sepsis resuscitation bundle has been proven to decrease mortality and morbidity. As such, this project seeks to promote the triple aim of health care reform, namely, to improve clinical outcomes and the patient experience while lowering per capita costs of care.

Challenges:
Since THFW has already focused on early recognition of sepsis and does have a severe sepsis bundle (although it is not known how frequently it is used), we may find that our mortality rate may not drop precipitously or as much as the 25% quoted in the literature, especially since it is well under the national/state rate at an estimated 17.6%.
Additionally, a challenge for the organization will be education of various staff. The turnover of nursing staff in the emergency department will pose a challenge as well, requiring repeated educational events. As well, education of various physicians in differing specialties will be challenging.

5-Year Expected outcome for Provider and Patients:
Our clinical and medical staff will be better informed of necessity for early diagnosis and treatment of sepsis. Implementation and hardwiring of sepsis resuscitation bundle through the use of a CNS will be accomplished. The Sepsis bundle checklist will be embedded in EMR. Mortality secondary to sepsis will decrease from 17.6% to 15.6%. Additionally the length of stay will decrease from 8.4 days to 6.6 days by DY5.

Starting Point/Baseline:
In 2011 approximately 850 patients were seen for a diagnosis of sepsis. An estimated mortality rate of this population at THFW was 17.6%. However, in DY2 a true baseline for the project will be established.

Rationale:
Implementation of and hardwiring an evidence-based sepsis resuscitation bundle has been proven to decrease mortality and morbidity. The state of Texas has mandated that all hospitals ensure that these evidence-based guidelines are implemented. Mortality rates from severe sepsis are on a similar scale to lung, breast and colon cancer, and are one of the leading causes of death in the ICU. Thirty percent of patients die within the first month of diagnosis. Given our increasing number of elderly and chronically ill patients, the incidence of severe sepsis is expected to increase. Elderly patients are at increased risk of sepsis because they are at higher risk of infections secondary to aging, comorbidities, increased institutionalization and increased use of invasive surgical techniques.

Project Components:
We have selected the early implementation of the entire severe sepsis resuscitation bundle because there is overwhelming evidence in peer-reviewed literature that all of them together are considered a best practice. When the timing and sequence are followed, mortality decreases. The resuscitation bundle combines evidence-based tools/goals that must be completed within the first six hours of identification of severe sepsis. The elements include: measuring a serum, lactate, obtaining blood cultures prior to antibiotic administration, broad-spectrum antibiotic within three hours of ED admission and within one hour of non-ED admission, treat hypotension and/or
elevated lactate with fluids; and in the event of persistent hypotension, despite fluid resuscitation and/or lactate >4mmol/liter, maintain adequate central venous pressure and central venous O2 saturation.

Milestones and metrics chosen predicated on our performance improvement model of PDSA and methodology in tracking compliance. The milestones will determine whether we are decreasing mortality, which is the ultimate goal.

THFW will incorporate CQI by conducting Plan, Do, Study, Act (PDSA) cycles and process improvement evaluations.

**Unique community need identification numbers the project addresses:**
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project has been internationally and nationally recommended ever since the 2008 Surviving Sepsis provided overwhelming evidence that by implementing the sepsis resuscitation bundle within 6 hours of identifying a patient with severe sepsis or septic shock, mortality rates drop dramatically.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**IT-4.8 Sepsis Mortality** (Stand-alone measure)
- Numerator: Number of patients expiring during current-month hospitalization with sepsis, severe sepsis or septic shock, and/or an infection and organ dysfunction.
- Denominator: Number of patients identified that month with sepsis, severe sepsis or septic shock, and/or an infection and organ dysfunction.
- Data Source: Chart abstraction and EPSI evidence has shown that early identification and implementation of a sepsis resuscitation bundle will decrease mortality dramatically. Given the fact that the elderly are more prone to infections and, therefore, severe sepsis and septic shock, and given the fact that many of our elderly have very low incomes, this project will decrease morbidity/mortality.

Potentially Preventable Complications and Health Care Acquired Conditions – **IT-4.9 Average length of stay** (will decrease from 8.4 days to 6.6 days).
Relationship to Other Projects:

- Related Category 1 and 2 projects
  - 109574702.2.2: Huguley Memorial Medical Center (HMMC) has proposed a similar project. Our intent is to participate in a learning collaborative with HMMC to share best practices and discuss lessons learned.
- Related Category 4 Population-focused improvements
  - RD1: Potentially Preventable Admissions 1. Congestive Heart Failure Admission Rate; 2. Diabetes Admission Rate; 3. Behavioral Health and Substance Abuse Admission Rate; 4. Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate
  - RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)
  - The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

- Approach/Methodology: Decreased mortality rate does not bring any direct health care cost savings. Lives saved are utilized to calculate individual and community costs. The total valuation is calculated by summing individual and community costs.
- Rationale/Justification: Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Milestone 1** [P-1]: Target specific workflows, processes and/or clinical are as to improve.  
Metric 1 [P-1.1]: Performing Provider review and prioritization of areas or processes to improve upon  
Data Source: EPIC, EPSi, chart review  
Milestone 1 Estimated Incentive Payment: $356,754

**Milestone 2** [P-2]: Identify/target metric to measure impact of Performance Improvement methodology and establish baseline  
Metric [P-2.1]: Define timelines for each part of the resuscitation bundle; define data elements to be collected; determine baseline  
Data Source: Chart review  
Milestone 2 Estimated Incentive Payment: $356,754

**Milestone 3** [P-3]: Compare and analyze clinical/quality data and  
Milestone 6 [P-6]: Implement a program to improve efficiencies and/or reduce program variation  
Metric 1 [P-6.1]: Performance improvement events  
Goal: Hire CNS to guide sepsis service line  
Data Source: Human Resources, Internal database populated by chart abstraction  
Milestone 6 Estimated Incentive Payment: $863,538

**Milestone 7** [P-8]: Train providers/staff in process improvement.  
Metric 1 [P-8.1]: Number of providers/staff trained  
Goal: TBD based on educational need assessment  
Data source: Educational class rosters

**Milestone 8** [I-13]: Progress toward target/goal  
Metric 1 [I-13.1]: Number or percent of severe sepsis or septic shock having entire sepsis resuscitation bundle implemented within 6 hours  
Goal: 60% over baseline  
Data Source: Internal database  
Milestone 8 Estimated Incentive Payment: $910,774

**Milestone 9** [I-16]: Improve quality and efficiency using innovative project option  
Metric 1 [I-16.1]: Potential improvement in LOS/cost/case if achieve targets on I-13  
Goal: 7.2 days (patients receiving bundle)  
Data Source: EPSI (cost accounting system)/internal database  
Milestone 9 Estimated Incentive Payment: $910,774

**Milestone 10** [I-13]: Progress toward target/goal  
Metric 1 [I-13.1]: Number or percent of severe sepsis or septic shock having entire sepsis resuscitation bundle implemented within 6 hours  
Goal: 70% over baseline  
Data Source: Internal database  
Milestone 10 Estimated Incentive Payment: $735,408

**Milestone 11** [I-16]: Improve quality and efficiency using innovative project option  
Metric 1 [I-16.1]: Potential improvement in LOS/cost/case if achieve targets on I-13  
Goal: 6.6 days (patients receiving bundle)  
Data Source: EPSI (cost accounting system)/internal database  
Milestone 11 Estimated Incentive Payment: $735,408

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.7.1: Implement Evidence-based Disease Prevention Programs (Mobile Prevention, Early Detection and Transitions Project for Rural Cancer Screenings)

Unique Project ID: 112677302.2.5

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Fort Worth / 112677302

Provider: THFW is a 726 bed tertiary care medical center serving all of North Central Texas. THFW is the largest hospital and has the busiest ED in North Central Texas. In 2011, THFW had 26,219 Medicaid patient days (3,976 discharges) and 12,468 Uninsured patient days (2,667 discharges).

Intervention: To facilitate access to high quality early cancer detection screening services (breast, colon and cervical cancer) to medically underserved counties (excluding Tarrant County) in Region 10 (RHP 10). The proposal utilizes mobile health services and requires the creation of a robust system for facilitating care transition into specialty care, including genetics counseling and primary care through the use of Registered Nurse Patient Navigators as indicated based on initial patient assessment, prevention and cancer screening activities. The established mobile service travels to rural communities 41 times annually, providing an average of 721 digital screening mammograms. Cervical and colorectal (FOBT) cancer screenings, subsequent referral and follow-up to specialty care and the transitional care component to primary care as indicated will be new initiatives.

Need of the project: RHP 10 Counties (excluding Tarrant) have a need for breast, cervical and colon cancer early detection services. Number of women age 40-69 not having a mammogram in past 24 months is 31,942. Number of women age 21 – 64 not having a Pap test in 3 years is 33,271. Number of adults age 50 -64 not having a blood stool test in 2 years is 113,595.

Target population: The following will be targeted for this project: low income, uninsured, culturally and geographically isolated persons in 8 rural counties (Ellis, Erath, Hood, Johnson, Navarro, Parker, Somerville and Wise) of Region 10. Estimated 14,389 patients will be served over course of waiver period.

Expected patient benefits: This project bridges the gap in prevention, early detection and transitional care to primary and specialty care among low income, uninsured, culturally and geographically isolated communities in the rural counties of Region 10. Mobile health services and the key component of using RN Patient Navigators for facilitating care transition into primary and specialty care will improve patient care, foster a healthier community and reduce costs through high quality and culturally competent prevention and early detection cancer screening activities.

Category 1 or 2 expected patient benefits: Development of a system for facilitating care transitions into specialty care and the ability to overcome geographic barriers to reach patients. A network of primary care and specialty providers will also be developed.

Category 3 outcomes:
   a. IT-12.1 Breast Cancer Screening (HEDIS 2012)
   b. IT-12.2 Cervical Cancer Screening (HEDIS 2012)
   c. IT-12.3 Colorectal Cancer Screening (HEDIS 2012)
Project Option - 2.7.1: Implement Evidence-based Disease Prevention Programs (Mobile Prevention, Early Detection and Transitions Project for Rural Cancer Screenings)

Unique Project ID: 112677302.2.5

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Fort Worth / 112677302

Project Description:
The proposal is to create an expansion of the current Wellness for Life Mobile Cancer Screening Service (WFL Mobile Service) - to facilitate access to - high-quality early cancer detection screening services to medically underserved counties (excluding Tarrant County) in Region 10 (RHP 10). The cancer screenings that will be performed are screening mammography, cervical cancer screening and colon cancer screening (fecal occult blood test). The proposal requires the creation of a robust system for facilitating care transition into specialty and primary care through the use of RN patient navigators as indicated based on initial patient assessment, prevention and cancer screening activities. There are only 14 screening mammography facilities, one Texas Breast and Cervical Cancer contractor, and only one Federally Qualified Health Center serving a population of 621,895.1-3 Families living under the federal poverty level range from 8.7% in Wise County to 14.9% in Navarro County. Families headed by females are particularly vulnerable, with poverty rates ranging between 26.2% in Wise County to 37.8% in Erath County. The Hispanic population is the largest minority group in the Region, and now numbers over 100,000 (18%) and is growing.4 - A network of primary care and specialty care providers will be engaged as collaborators in the targeted geographic areas of Region 10. Patients identified as in need of primary care will be navigated to primary care by the RN Patient Navigator. Patients in need of specialty care as a result of cancer screening will be navigated to specialty care by the RN patient navigator thereby reducing the time to diagnosis of cancer. We propose to dedicate a mobile health team and mobile coach, equipped with digital screening mammography, comprehensive examination room and satellite communications to travel to distant locations delivering lifesaving services and RN patient navigation facilitated referrals to those without ready access to primary and specialty care. Screening services provided to patients who are eligible for federal funding will not be charged to this project.

Goals and Relationship to Regional Goals:

Project Goals:
An expansion of the current Wellness for Life Mobile Cancer Screening Service (WFL Mobile Service) is proposed to extend the reach of - early cancer detection screening services to medically underserved counties (excluding Tarrant County) in Region 10 (RHP 10). - The 5-year goals of this project are: 1) to establish an early cancer detection screenings program in targeted geographic areas of RHP 10 through expansion of mobile health services, including the addition of RN Patient Navigation. - 2.) Establish a collaborative network of primary care providers and specialty care providers in the targeted geographic areas of RHP 10. 3) Establish a tracking
A proposed program will lead to a system of better health, better care at reduced costs. This project meets the following regional goals:

The aims of the Region are: better care for patients, better health of communities and reduced cost per capita. This project bridges the gap in primary care and specialty care services; specifically early cancer detection services within communities, where people live, work and worship in rural settings. It addresses economic and geographic isolation barriers to these services. By taking a systems approach in collaboration with Moncrief Cancer Institute and a network of primary and specialty care providers, comprehensive mammography (screening and diagnostic) specialty care and primary care is accessible to rural communities and allows people to be screened and obtain appropriate follow-up care in their communities. Patients in need of primary care are identified and navigated to primary care. Satellite technology systems allow for transferring mammographic images from distant locations.

Challenges:

The counties in RHP 10 are also located in Texas Health Service 03, which is one of two Regions in the state with the highest age-adjusted rates for female breast cancer. Thirty-eight percent of screening mammography-eligible women did not graduate from high school and 40.8% earn less than $25,000 per year. An estimated 63,000 women ages 40-60 do not have health insurance in Tarrant, Parker, Hood and Johnson counties combined. There is a lack of awareness of the availability of low-cost or free screenings. Transportation, scheduling and availability of screening and care are barriers to screening in rural areas and small towns.

Cervical cancer is considered to be a serious threat to Texas women. The rates of women diagnosed with and dying from cervical cancer in Texas are higher than those of the United States overall. Thirty-nine percent of cervical screening-eligible women did not graduate from high school and 33.9% earn less $25,000 per year.

Colorectal cancer is the third most common cancer diagnosed in men and women and the second leading cause of deaths overall. Blacks have the highest incidence and mortality followed by non-Hispanic whites and Hispanics. There are higher colorectal cancer incidence rates in rural counties. Seventy-nine percent of screening-eligible adults for colorectal cancer graduated from high school and 81.9% earn less than $25,000 per year.

This project was selected because a mobile health program is ideally suited to travel to rural communities where specialty cancer screening services are lacking. The project builds on a two-year record of making comprehensive breast health services accessible in rural areas of North Texas.
In 2010, a joint program between Texas Health Resources and Moncrief Cancer Institute created a systems approach to comprehensive breast health services targeting women in rural medically underserved counties (Montague, Denton, Wise, Hood, Johnson and Parker). This program, Breast Screening and Patient Navigation (BSPAN), provides comprehensive mammography (screening and diagnostic), clinical breast examination and appropriate patient navigation services. The BSPAN program leverages various funding sources for eligible patients including federal, state, and non-profit agencies. Between June 2010 and June 2012, the WFL Mobile mammography team performed 1,224 screening mammograms and detected 14 breast cancers through this program. The positive detection rate of 11.4 breast cancers per 1,000 screened patients exceeds the national rate of by 65%.10

5-Year Expected Outcome for Provider and Patients:
The five-year expected outcome of this project is to provide early detection breast, cervical and colorectal cancer screenings to eligible participants in RHP 10 (excluding Tarrant County) with a dedicated mobile cancer screening team. The target number of screenings by the end of the Waiver is: 11,298 screening mammograms, 4,752 cervical cancer screenings, and 563 processed fecal occult blood tests. The number of patients navigated to primary care and specialty care will be tracked and reported.

Starting Point/Baseline:
With its current capacity, the established WFL Mobile service travels to rural communities 41 times annually, providing an average of 721 screening mammograms. Cervical and colorectal cancer screenings will be a new initiative in the rural communities for this project. Each year in Tarrant County, the WFL Mobile service performs 500 cervical cancer screenings and distributes 100 fecal occult blood (FOBT) test kits per mobile health team annually. It utilizes two mobile health/mammography coaches and two mobile health teams. A collaborative network of breast health facilities is in the process of being established by Moncrief Cancer Institute in four RHP 10 counties. A collaborative network of primary care and other specialties does not exist and will need to be created. A tracking system for patient navigation and follow-up is limited and will be enhanced through the use of RN Patient Navigators and a new electronic data system.

The project will require a registered nurse patient navigator, community outreach coordinator, data manager, mobile coach admissions/driver, family nurse practitioner and a mammography technologist. Current staffing is 8.2 FTEs and would increase to - 14.2 FTEs with the addition of a third fully equipped mobile coach and support staff.

DY2: Increase capacity with a third mobile health coach and hire/train a third health team. A specialty care gap assessment based on community need will be performed on each of the eight targeted counties in RHP 10. Administrative run-up will be required to establish a collaborative network of primary and specialty care providers in the target area. A community outreach
coordinator will develop new community relations and identify new locations in rural areas for mobile health visits. Develop new data collection system. Baseline encounters: 738 screening mammograms, 0 cervical cancer screenings, 0 colon cancer screenings.

DY3 – DY5: Increase the number of visits to a rural community in RHP 10 to at least 176 annually. Target number of encounters per year: 3,520 screening mammograms, 1,584 cervical cancer screenings, 188 colorectal cancer screenings (FOBT). The number of patients in need of primary care and referred and followed (phone, electronic media and mail) by the RN Patient Navigator for the purposes of establishing a medical home will be tracked. The number of patients referred and followed (phone, electronic media, and mail contact) by the RN Patient Navigator to specialty care based on screening results will be tracked. Language interpreters will be utilized by phone or in-person as needed to enhance communication with monolingual patients.

Rationale:
The RHP 10 Community Needs Assessment identified a shortage of specialty care. The Region is facing a 22 to 36% growth in provider demand across all specialties. The specialties with the greatest growth in demand are obstetrics/gynecology, vascular health, urology, hematology/oncology, cardiology, and nephrology. Table 1 below illustrates the need for breast, cervical and colorectal cancer screening services within the target population.

Project Components:
Expanding the WFL Mobile Cancer Screening Service by adding a third mobile health coach and team will increase - access to early detection of breast, cervical and colorectal cancer in rural counties of RHP 10. Patient navigation, follow-up and tracking will insure timely transition to
specialty care and primary care. The direct cost of these services can be reduced through improved efficiency with satellite communications.

Our milestones measure an increased rural population receiving early detection cancer screening services and facilitated transition of care to primary and specialty care. (1) we are identifying new medically underserved communities, and (2) expanding early detection cancer screening capacity by adding one multidisciplinary health team and one fully equipped mobile coach/vehicle, and (3) facilitate transition of care to primary and specialty services by a RN Patient Navigator and a new collaborative network of primary care and specialty care providers.

Unique community need identification numbers the project addresses:
- CN.3 – Shortage of specialty care
- CN.7 – Need to address geographic barriers that impede access to care
- CN.8 – Lack of access to health care due to financial barriers

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project builds on a current initiative to introduce a systems approach to comprehensive breast health services targeting rural communities. The Breast Screening Patient Navigation (BSPAN) is funded by the Cancer Prevention Research Institute of Texas. Cervical and colorectal cancer screening outside of Tarrant County is a new initiative. No federal funding has been received for this project. A system for facilitating care transition into primary and specialty care through the use of mobile health and RN Patient Navigators targeting rural communities significantly enhances the current initiative which is limited to breast cancer screening at this time.

Satellite technology reduces labor costs, and has the potential to reduce the time to diagnostic procedures and diagnosis, improving patient care.

Mobile cancer screening makes facilitated access to primary and specialty care possible in rural medically underserved communities.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
RHP 10 has identified a shortage of specialty care across all disciplines. People with positive screening tests are subsequently investigated with diagnostic tests and those with confirmed disease are offered appropriate treatment and follow-up. Breast, cervical and colorectal cancer screenings will be performed, targeting low-income and medically underserved populations. The objective is to reduce incidence of and/or death from cancer by detecting early preclinical disease when treatment may be easier and more effective than for advanced cancer diagnosed after the symptoms occur. The following three outcome measures are selected:
• IT-12.1 Breast Cancer Screening (HEDIS 2012) Non-stand-alone measure. Our goal is to perform 11,298 breast cancer screenings by the end of the Waiver. Breast cancer is a significant health problem in North Texas. Estimates from the 2010 Behavioral Risk Factor Surveillance System indicate that 31,942 screen-eligible women in the target population have not had a mammogram within the past two years (Public Health Administration Region 2/3).

• IT-12.2 Cervical Cancer Screening (HEDIS 2012) Non-stand-alone measure. Our goal is to perform 4,752 cervical cancer screenings among low-income, culturally and geographically isolated populations by the end of the Waiver. Estimates from the 2010 Behavioral Risk Factor Surveillance System indicate that 33,271 screen-eligible women in the target population have not had a Pap test within the past three years (Public Health Administration Region 2/3).

• IT-12.3 Colorectal Cancer Screening (HEDIS 2012) Non-stand-alone measure. Our goal is to distribute 880 colorectal cancer screening (fecal occult blood test) kits and process 563 by the end of the Waiver. Based on current Tarrant County experience, we anticipate a 64% fecal occult blood test return rate compared to the return rate by direct mail (30%).

Relationship to Other Projects:
• Related Category 1 and 2 projects: There are no related Category 1 or 2 projects.

• Related Category 4 population-focused improvements: TBD

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
• Approach/Methodology: For every patient affected by early detection of colorectal cancer screening, $24,756 is saved by the health care system. The average length of stay is multiplied by the total affected population to determine the total days saved. Total days saved are used to calculate individual and community costs. The total valuation is calculated by summing health care, individual, and community costs.

• Rationale/Justification: Colorectal cancer screening outcome improvement targets are dependent on the target population served, size (e.g., if an MHU is at maximum capacity, rates can only decrease), and current processes in place. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Milestone 1 [P-1]:** Development of Innovative evidence-based project for targeted population.

**Metric 1 [P-1.1]:** Document innovational strategy and plan: Documentation of gap assessment.

- Develop a network of collaborating primary and specialty care providers.
- Expand mobile health capacity through the addition of a mobile vehicle and multidisciplinary team.
- Enhance patient care referral and follow-up.

Demonstrate improvement over prior reporting period (baseline for DY2)

**Baseline/Goal:** Develop baseline need in target population.

**Data Source:** Documented plan for expansion to eight counties in RHP 10.

**Milestone 1 Estimated Incentive Payment** (maximum amount): $520,503

**Milestone 3 [I-5]:** Identify 738 patients in defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1 [I-5.1] -Numerator:** Number of individuals of target population reached by the innovative project.

**Baseline/Goal:** - 90% of maximum capacity of the unit (max cap = 5,292).

**Data Source:** EHR

Milestone 3 Estimated Incentive Payment: $1,007,919

**Milestone 4 [I-5.1]:** Identify 5,292 patients in defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1 [I-5.1] -Numerator:** Number of individuals of target population reached by the innovative project.

**Baseline/Goal:** - 95% of maximum capacity of the unit (max cap = 5,292).

**Goal:** - 95% of maximum capacity of the unit (max cap = 5,292).

**Data Source:** EHR

Milestone 4 Estimated Incentive Payment: $1,063,053

**Milestone 5 [I-5.1]:** Identify 5,292 patients in defined population receiving innovative intervention consistent with evidence-based model.

**Metric 1 [I-5.1] -Numerator:** Number of individuals of target population reached by the innovative project.

**Baseline/Goal:** - 100% of maximum capacity of the unit (max cap = 5,292).

**Goal:** - 100% of maximum capacity of the unit (max cap = 5,292).

**Data Source:** EHR

Milestone 5 Estimated Incentive Payment: $858,365

**Project Option 2.2.1** – Redesign the Outpatient Delivery System to Coordinate Care for Patients with Diabetes  
**Unique Project ID:** 120726804.2.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Southwest Fort Worth (THSW) / 120726804

**Provider:** A full-service facility with a steadfast commitment to quality. The hospital has more than 630 physicians on the medical staff, 24-hour emergency services and 222 licensed beds. The hospital offers comprehensive acute-care services, 24-hour emergency services, advanced technology, a progressive rehabilitation program, surgical services and traditional and progressive options in maternity care.

**Intervention:** This project will increase patient engagement through outpatient education and self-management for the diabetic population therefore increasing the wellness of the diabetic. This is a new project for THSW.

**Need of the project:** Currently, the uninsured diabetic population is not being served. One in every 12 individuals age 18 or older in Tarrant County has a diagnosis of diabetes. As the age of the community increases, the percentage of diabetes increases. From the community needs assessment data 28% of those individuals who report that they cannot work, have a diagnosis of diabetes. This disease impacts a large percentage of the community and can be a financial burden. Chronic diseases such as diabetes can be managed with education and support.

**Target population:** The target population includes newly diagnosed diabetic patients and those experiencing frequent Emergency Department visits due to high blood glucose levels. It is estimated that 1,113 patients will be served over the waiver period. This is an increase of approximately 15%. Currently there are no programs in this area for the uninsured to receive management and education on a regular basis.

**Category 3 outcomes:**

a. Potentially Preventable Re-admissions - 30 Day Readmission Rates (PPRs)-IT.3.3 Diabetes 30-day readmission rate. The proposed program will help low income and uninsured clients with diabetes to better self-manage their disease through disease education and provide them with appropriate access to chronic care management support resources.

b. Primary Care and Chronic Disease Management: Diabetes care: HbA1c poor control (>9.0%)

c. Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g. if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g. keeping lower acuity patients under observation instead of admitting them).
**Project Option 2.2.1** – Redesign the Outpatient Delivery System to Coordinate Care for Patients with Diabetes

**Unique Project ID:** 120726804.2.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Southwest Fort Worth (THSW) / 120726804

**Project Description:**
This project will increase patient engagement through outpatient education and self-management. Diabetes patients will be identified through the ED, inpatient stays, or community outreach partnerships we will provide them with information about our diabetes management program and help them find a medical home and provide innovative services to manage and monitor patient progress. We will identify lessons learned and key challenges to the implementation of the program to improve processes going forward.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The goal of this program is to establish an outpatient diabetes education and management program to assist all clients identified with diabetes to be empowered to make informed decisions and develop self-management skills. Relying on an empirically validated, evidence-based self-management educational and clinical support approach, our goal is to improve the health outcomes and self-management competency of the THSW community. The proposed program will help low income and uninsured clients with diabetes to better self-manage their disease through disease education and provide them with appropriate access to chronic care management support resources.

- Partner with hospitalists to utilize protocols: A1C>8, history of DKA, > one admission in the last 12 months as criteria for referrals to outpatient diabetes education.
- Create the role of an inpatient diabetes educator to identify patients with the same criteria as above, and/or who do not currently have a medical home, and/or have not received diabetes education within the last five years, and any others appropriate for education.
- Develop a comprehensive care management program.

**Challenges:**
Historically underserved patients have not been effectively educated on how to manage their diabetes. Moreover, they have not been followed to measure their outcomes and long term goals. This program will link diabetes patients who present to THSW and the diabetes management resources that will provide seamless care for the Medicaid, managed Medicaid, and uninsured patient population.

**5-Year Expected Outcome for Provider and Patients:**
The five-year expected outcome is to reduce readmissions of chronic diabetes patients and reduce ED visits as outlined below.
• Increase usage of the aforementioned criteria by primary care clinicians, case managers, and diabetes educators.
• Patients referred to the program will self-select goals that will be monitored routinely throughout the program with a 50% compliance rate at program completion.
• Enrollment growth rate of 55% over baseline of Medicaid, Medicare, and uninsured patients with a diabetes diagnosis in the self-management program by the end of the Waiver period.

Starting Point/Baseline:
Currently THSW refers patients to an outpatient diabetes education program provided by Texas Health Harris Methodist Hospital Fort Worth. A diabetes educator and a nutritionist met with approximately 195 clients in 2011. The clients seen are rarely under age 18, with 10-29% ages 19-40, 39-51% 41-64, and 28-45% over 65. These are insured clients who are referred by their primary care physician.

Rationale:
• One in every 12 individuals age 18 or older in Tarrant County has a diabetes diagnosis. As the age of community increases the percentage of diabetes increases. From the Community Needs Assessment data 28% of those individuals who report that they cannot work have a diagnosis of diabetes; therefore this disease impacts a large percentage of the community and can be a financial burden. The number of patients in our EDs and hospitals with a primary diagnosis of diabetes is a small percentage of our outpatient diabetes management programs. Therefore there needs to be a link from ED and inpatient to outpatient resources and education.
• The Chronic Care Model, developed by Ed Wagner and colleagues at the MacColl Institute, has helped hundreds of providers improve care for people with chronic conditions. Fifteen randomized trials of system change interventions include Diabetes Cochrane Collaborative Review and JAMA Re-review, which looked at about 40 studies, mostly randomized trials, with interventions classified as decision support, delivery system design, information systems, or self-management support; 19 of 20 studies included a self-management component that improved care, and all five studies with interventions in all four domains had positive impacts on patients.xxv

Project Components:
The care team will be designed and implemented based on the needs of the diabetic patient. An advanced practice nurse or care coordinator will work with the ED nurse navigator and inpatient health care providers to identify patients and guide the patient journey. The team will be available to the client by email. Through diabetes education, the client will increase engagement and self-management skills. The clients will be provided with the tools and resources to make
appropriate choices regarding their chronic disease. The team will identify lessons learned and barriers or challenges associated with the expansion of the program.

The milestones were identified to measure our development and implementation of the program. The advancement of the program is reliant on the appropriate development and implementation.

**Unique community need identification numbers the project addresses:**

Diabetes is one of the top 10 causes of morbidity and mortality in Tarrant County. Currently, the Diabetes Outpatient program for THSW is conducted by Texas Health Ft. Worth and reaches 200 insured patients annually. Approximately 56% of the inpatient population and 55% of the outpatient population at THSW is covered by Medicare/Medicaid or is uninsured, indicating a need for innovation and creativity to reach this population. Since a large percentage of THSW patients have limited access to insurance and other resources, it is paramount that we intervene by educating the people in the community we serve.

There is a necessity for patient education programs. (CN13) Many community residents lack basic health literacy and healthy lifestyle knowledge. Lack of adequate health education impacts a person's ability to understand the medical information and recognize early symptoms of disease. Factors of low health literacy include education level and socio-economic status. Region 10 has a smaller percentage of the population that did not receive a high school diploma (16.9% versus 14.4% of the population, respectively). Region 10 also has a smaller percentage the population living at or below the 100% federal poverty level (12.9% versus 13.8%, respectively), yet the rate is nearly 20% of the population in two counties in Region 10. There is a need for more care coordination (CN11). All counties identified it as a system gap and need. Barriers include complexity of coordination, lack of staff, lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists. There is a lack of access to health care due to financial barriers (i.e. lack of affordable care). (CN8) Providers overwhelmingly list lack of coverage/financial hardship as a major barrier for low-income patients.

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

THSW does not currently and will not receive any funding for this project or any other project.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**IT-1.10 Diabetes care: HbA1c poor control (>9.0%) (stand-alone)**

By the end of the Waiver, our goal is to have ≤15% of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). Baseline was established from an
intervention population of 167 and will be readjusted based on changes if any in DY3 (See attached narrative)

**IT-3.3 Diabetes 30-day readmission rate (stand-alone)**
By the end of the Waiver, our goal is to decrease readmission rate of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%) by 15%.
Baseline for intervention population is 471 and will be adjusted in DY3 if needed (See attached narrative)

**Relationship to Other Projects:**
- **Related Category 1 and 2 projects:** Patient-centered health care (emergency department): ED patient navigator will coordinate patient journey from admission to discharge and through outpatient diabetes education.
- **Related Category 4 population-focused improvements** Potentially Preventable Admissions (Diabetes Admission Rates and CHF). Our project focuses on providing diabetes education to empower the patient to self-manage their disease thus avoiding hospitalization for diabetes or other complications that could occur.
  - i. 15-Day Readmission (Diabetes: 15-day readmission): Our project focuses on self-management of diabetes thus reducing the likelihood of readmission.
  - ii. Potentially Preventable Complications (diabetes specific): Knowledge gained through diabetes education provided by a diabetes care team will properly equip the patient to avoid complications.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
- **Approach/Methodology:** For every inpatient admission avoided, $9,640 in cost is saved by the health care system.\(^{183}\) Health care costs are calculated by multiplying $9,640 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.
- **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current

\(^{183}\) Based on 2011 historical inpatient diabetes admissions data for Texas Health Southwest
processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Year 2** (10/1/2012 – 9/30/2013)

**Milestone 1** [P-3]: Develop a comprehensive care management program

**Metric 1** [P-3.1]: Documentation of care management program using the Wagner Chronic Care Model

- **Goal**: Complete implementation of outpatient clinic for heart failure patients to receive ongoing care. Includes procurement of equipment and supplies to run clinic.
- **Data Source**: Program description

**Milestone 1 Estimated Incentive Payment (maximum amount)**: $14,079

**Process Milestone 2** [P-2]: Train staff in the Chronic Care Model, including the essential components of a delivery system that supports high-quality clinical and chronic disease care

**Metric 1** [P-2.1]: Increase percent of staff trained

- **a) Numerator**: number of relevant staff trained in the Chronic Care Model

**Milestone 4** [P-9]: Develop program to identify and manage chronic care patients needing further clinical intervention

**Metric 1** [P-9.1]: Increase the number of patients identified as needing screening test, preventive tests, or other clinical services

**Milestone 6** Estimated Incentive Payment: $13,631

**Process Milestone 6** [I-18]: Improve the percentage of patients with self-management goals

**Metric 1** [I-18.1]:

- **Numerator**: number of patients with diabetes X goal to reduce HbA1c below 9.0%
- **Denominator**: Total number of patients with type 1 or 2 diabetes

**Milestone 6 Estimated Incentive Payment**: $11,609

**Year 3** (10/1/2013 – 9/30/2014)

**Milestone 3** [P-4]: Formalize multidisciplinary teams, pursuant to the chronic care model defined by the Wagner Chronic Care Model or similar

**Metric 1** [P-4.1]: Increase the number of multidisciplinary teams (e.g., teams may include physicians, mid-level practitioners, dieticians, licensed clinical social workers, psychiatrists, and other providers) or number of clinic sites with formalized teams

**Data Source**: Team Rosters

**Baseline/Goal**: develop 1 multidisciplinary team

**Milestone 3 Estimated Incentive Payment**: $13,631

**Year 4** (10/1/2014 – 9/30/2015)

**Milestone 5** [I-17]: Apply the Care Model to targeted chronic disease, which are prevalent locally

**Metric 1** [I-17.1]: 5% additional patients receive care under the Care Model for diabetes.

- **Chronic disease diabetes**
- **Data source**: registry
- **Goal**: 5% increase over baseline

**Milestone 5 Estimated Incentive Payment**: $14,377

**Year 5** (10/1/2015 – 9/30/2016)

**Milestone 7** [I-17]: Apply the Care Model to targeted chronic disease, which are prevalent locally

**Metric 1** [I-17.1]: 5% additional patients receive care under the Care Model for diabetes.

- **Chronic disease diabetes**
- **Data source**: registry
- **Goal**: 5% increase over DY4

**Milestone 7 Estimated Incentive Payment**: $11,609

**Year 6**

**Process Milestone 8** [I-18]: Improve the percentage of patients with self-management goals

**Metric 1** [I-18.1]:

- **Numerator**: number of patients with diabetes X goal to reduce HbA1c below 9.0%
- **Denominator**: Total number of patients with type 1 or 2 diabetes

**Data source**: registry

**Goal**: 90%

**Data Source**: registry

**Milestone 8 Estimated Incentive Payment**: $9,886

#### Year 2 (10/1/2012 – 9/30/2013)
- Milestone 2: Estimated Incentive Payment (maximum amount): $14,079
- Identified as needing screening test, preventive tests, or other clinical services
- Data source: Clinic registry
- Baseline/Goal: Increase # of patients identified by 5% over baseline

#### Year 3 (10/1/2013 – 9/30/2014)
- Milestone 4: Estimated Incentive Payment: $13,631
- Identified as needing screening test, preventive tests, or other clinical services
- Data source: Clinic registry
- Baseline/Goal: Increase # of patients identified by 5% over baseline

#### Year 4 (10/1/2014 – 9/30/2015)
- Payment: $14,377
- Identified as needing screening test, preventive tests, or other clinical services
- Data source: Clinic registry
- Baseline/Goal: Increase # of patients identified by 5% over baseline

#### Year 5 (10/1/2015 – 9/30/2016)
- Payment: $11,609
- Identified as needing screening test, preventive tests, or other clinical services
- Data source: Clinic registry
- Baseline/Goal: Increase # of patients identified by 5% over baseline

#### TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add milestone bundle amounts over Years 2-5): $107,392
**Project Option 2.8.11** – Sepsis: Implement an innovative and evidence-based intervention that will lead to reductions in Sepsis Complications (mortality, prevalence and incidence) for providers that have demonstrated need or unsatisfactory performance in this area.

**Unique Project ID:** 120726804.2.2  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest (THSW) / 120726804

**Provider:** A full-service facility with a steadfast commitment to quality. The hospital has more than 630 physicians on the medical staff, 24-hour emergency services and 222 licensed beds. The hospital offers comprehensive acute-care services, 24-hour emergency services, advanced technology, surgical services and traditional and progressive options in maternity care.  
**Intervention:** Early intervention and treatment of Sepsis patient entering through the ED. This is a new project for THSW.  
**Need for the project:** Mortality rates from severe sepsis are on a similar scale to lung, breast and colon cancer, and are one of the leading causes of death in the ICU. Thirty percent of patients die within the first month of diagnosis. Given our increasing number of elderly and chronically ill patients, the incidence of severe sepsis is expected to increase in this region.  
**Target population:** Patients with a primary diagnosis of sepsis  
a. Estimated number of patients to be served over course of waiver period: Approx 1000. Currently there are no programs in this area for the uninsured to receive management and education on a regular basis. 23% of the local area adult residents have no health insurance. Of those, approx 18% did not seek the care of a physician due to cost. This program creates processes which decrease mortality and ultimately leads to more efficient and cost effective care or CMS patients by reducing length of stay. Currently, THSW’s ED visit volume reflects a 31% Medicaid/unfunded rate. It is anticipated the sepsis rate would correspond to the overall ED rate.

**Category 1 and 2 expected patient benefit:** Milestone 2 [P-2] Identifies target metrics to measure impact of Performance Improvement methodology and establish baseline. Identification of metric for measurement will guide the improvement process to decrease the length of stay of sepsis patients and mortality. Milestone 3 [P-3] compares and analyzes clinical/quality data and will identify at least one area for improvement and establish baseline. CNS will evaluate the data to find the area being missed in the treatment and approach to care when implementing the bundle. In DY 4, it is anticipated 118 patients will benefit from the bundle implementation increasing to 150 in DY 5.

**Category 3 outcomes:** Process Milestone 2 [P-2] establishes baseline rates to determine frequency of bundle usage; affecting mortality, and establishing baseline. Identifying rates of bundle usage will allow for improvements to increase the rates resulting in better treatment to decrease the mortality and length of stay of patients.
Project Option 2.8.11 – Sepsis: Implement an innovative and evidence-based intervention that will lead to reductions in Sepsis Complications (mortality, prevalence and incidence) for providers that have demonstrated need or unsatisfactory performance in this area.

Unique Project ID: 120726804.2.2
Performing Provider Name/TPI: Texas Health Harris Methodist Southwest (THSW) / 120726804

Project Description:
Early recognition of severe sepsis and septic shock followed by uniform, consistent early implementation of an evidence-based sepsis resuscitation bundle will decrease mortality. In the ED we will focus on early diagnosis, initial management and prompt transfer to ICU, utilizing enhanced lab biomarker technology and embed a 24/7 ED-based pharmacists in order to expedite early administration of antibiotics. THSW will also leverage EMR to embed a sepsis bundle checklist for clinicians. We have also identified an opportunity for earlier recognition of severe sepsis on our inpatient medical-surgical units. Part of this project will be to enhance education of all clinicians in early recognition of sepsis. Once it is identified that a patient has severe sepsis we need early implementation of the sepsis resuscitation bundle as defined by Surviving Sepsis Guidelines 2012 (IHI) and Dellinger, RP et Surviving Sepsis Campaign International Guidelines for Management of Severe Sepsis and Septic Shock, Critical Care Medicine 2008.

The other part of the project is to develop a system for continuous data collection analysis and disseminate of performance along with PDSA Performance Improvement model.

Goals and Relationship to Regional Goals:
Project Goals:
THSW has begun the data collection phase and preliminary implementation of a sepsis protocol based on the above guidelines and has, over the past year, sponsored various educational programs for ED nursing staff and physician partners. Our primary focus moving forward will be to implement the protocol in the EHR, measure whether or not the sepsis protocol is consistently used, whether or not all components of the protocol are implemented, and whether or not outcomes improve with its use. In 2011 we had 169 patients with a primary diagnosis of sepsis (this includes patients who had sepsis along with severe sepsis or septic shock) with an overall mortality rate of 13.6%. The goal is to prospectively identify severe sepsis and septic shock early, determine our baseline rate of sepsis protocol implementation, educate in use of the protocol, increase compliance rate and thereby decrease mortality.

This project meets the following Regional goals:
Implementation of and hardwiring an evidence-based sepsis resuscitation protocol has been proven to decrease mortality and morbidity. The state of Texas has mandated that all hospitals ensure that these evidence-based guidelines are implemented. Mortality rates from severe sepsis
are on a similar scale to lung, breast and colon cancer, and are one of the leading causes of death in the ICU. Thirty percent of patients die within the first month of diagnosis. Given our increasing number of elderly and chronically ill patients, the incidence of severe sepsis is expected to increase. Older people are at increased risk of sepsis because they are at higher risk of infections secondary to aging, comorbidities, increased institutionalization and increased use of invasive surgical techniques.

**Challenges:**
Although still a challenge, THSW has focused on early recognition of sepsis and has a severe sepsis protocol (bundle). Early recognition in the triage phase is a challenge faced as well as rapidly progressing through the treatment process and initial implementation of the sepsis bundle. Physician willingness to diagnose based on the 4-tier sepsis model (SIRS, Sepsis, Severe Sepsis and Septic Shock) acts as a barrier to accurately reflecting the total population of sepsis patients and patients presenting to the ED late in the course of illness results in higher acuity levels and mortality.

**5-Year Expected Outcome for Provider and Patients:**
Our clinical and medical staff will be better informed of necessity for early diagnosis and treatment of sepsis. Implementation and hardwiring of sepsis resuscitation protocol will be accomplished. Sepsis protocol/order sets will be embedded in EMR. Mortality secondary to sepsis will decrease.

**Starting Point/Baseline:**
In 2011, 169 patients had a primary diagnosis of sepsis coded. Mortality rate was 13.6%

**Rationale:**
Implementation of and hardwiring an evidence-based sepsis resuscitation protocol has been proven to decrease mortality and morbidity. The state of Texas has mandated that all hospitals ensure that these evidence-based guidelines are implemented. Mortality rates from severe sepsis are on a similar scale to lung, breast and colon cancer, and are one of the leading causes of death in the ICU. Thirty percent of patients die within the first month of diagnosis. Given our increasing number of elderly and chronically ill patients, the incidence of severe sepsis is expected to increase. Older people are at increased risk of sepsis because they are at higher risk of infections secondary to aging, comorbidities, increased institutionalization and increased use of invasive surgical techniques.

**Project Components:**
We have selected the early implementation of the entire Severe Sepsis Resuscitation Protocol because there is overwhelming evidence in peer reviewed literature that all of them together are considered a best practice. That when the timing and sequence are followed, mortality
decreases. The resuscitation bundle is combined evidence-based tools/goals that must be completed within the first 6 hours of identification of severe sepsis. The elements include: measuring a serum, lactate, obtaining blood cultures prior to antibiotic administration, broad spectrum antibiotic within 3 hours of ED admission and within 1 hour of non-ED admission, treat hypotension and/or elevated lactate with fluids; and in the event of persistent hypotension, despite fluid resuscitation and/or lactate >4mmol/Liter, maintain adequate central venous pressure and central venous O2 saturation.

Milestones and metrics chosen predicated on our Performance Improvement model of PDSA and methodology in tracking compliance. The milestones will determine whether we are decreasing mortality, which is the ultimate goal.

Continuous quality improvement will be conducted using the Plan, Do, Study, Act (PDSA) model. ED sepsis data is collected daily and reported for analysis on a monthly basis to the ED physicians and staff. Based on findings, opportunities for improvement are identified and plans are enacted to insure compliance with the bundle.

Unique community need identification numbers the project addresses:

- CN 11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project has been internationally and nationally recommended ever since the 2008 Surviving Sepsis provided overwhelming evidence that by implementing the sepsis resuscitation bundle within 6 hours of identifying a patient with severe sepsis or septic shock, mortality rates drop dramatically.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:

Potentially Preventable Complications and Health Care Acquired Conditions – IT-4.8

Sepsis Mortality (Stand-alone measure)

- Numerator: Number of patients expiring during current-month hospitalization with sepsis, severe sepsis or septic shock, and/or an infection and organ dysfunction.

- Denominator: Number of patients identified that month with sepsis, severe sepsis or septic shock, and/or an infection and organ dysfunction.

- Data Source: Chart abstraction and EPSI evidence has shown that early identification and implementation of a sepsis resuscitation bundle will decrease mortality dramatically. Given the fact that the elderly are more prone to infections and, therefore, severe sepsis and septic shock, and given the fact that many of our elderly have very low incomes, this project will decrease morbidity/mortality.

Potentially Preventable Complications and Health Care Acquired Conditions – IT-4.9

Average length of stay (Non stand-alone measure)
Relationship to Other Projects:

- Related Category 1 and 2 projects
  - 109574702.2.2: Huguley Memorial Medical Center (HMMC) has proposed a similar project. Our intent is to participate in a learning collaborative with HMMC to share best practices and discuss lessons learned.

- Related Category 4 Population-focused improvements:
  - RD1: Potentially Preventable Admissions 1. Congestive Heart Failure Admission Rate; 2. Diabetes Admission Rate; 3. Behavioral Health and Substance Abuse Admission Rate; 4. Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate
  - RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)
  - The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:

- Approach/Methodology: Decreased mortality rate does not bring any direct health care cost savings. Lives saved are utilized to calculate individual and community costs. The total valuation is calculated by summing up individual and community costs.

- Rationale/Justification: Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

| Texas Health Harris Methodist Hospital Southwest | 1363269-08 |
**Project Option 2.9.1** – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

**Unique Project ID:** 120726804.2.3  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Hospital / 120726804

**Provider:** A full-service facility with a steadfast commitment to quality. The hospital has more than 630 physicians on the medical staff, 24-hour emergency services and 222 licensed beds. The hospital offers comprehensive acute-care services, 24-hour emergency services, advanced technology, a progressive rehabilitation program, surgical services and traditional and progressive options in maternity care.

**Intervention:** This project proposes to implement an Emergency Department Case Management Program (EDCM) using skilled case managers (Navigators) to identify high risk population patients (those who are unfunded, underfunded, or have Medicaid) requiring intervention and guidance in the use of care settings in primary care, non-emergent clinics, and community-based resources.

**Need for the project:** In Region 10, there is a need for more care coordination to reduce the need for emergency services. 

**Target population:** At this time the EDCM does not exist at THSW. For 2012, it is estimated 61,991 THSW ED visits will occur. Of this total, 20% of the ED admissions meet the identified population criteria (Unfunded/Medicaid) yielding an estimated total of 12,386 potential EDCM clients for 2012. Of the potential 12,386 Unfunded/Medicaid clients; 10.5% (n=1301) required services that would have been prevented with the use of an ED Navigator to provide for:

- Enrollment with a PCP for initial care of medical condition and ongoing follow up.
- Referral to specialized medical clinics such as the JPS Sickle Cell Clinic, THFW Wound Care clinic, and Healing Wings clinic for AIDS patients.
- Referral to urgent care centers for non-emergent conditions.
- Referral to social agencies such as the Catholic Charities, Lutheran Social Services, Cabellero Cathleen, and The Girls Service League.
- Referral to disease specific teaching and assistance agencies such as the Diabetes Club, Breast and Cervical Cancer Control Program, Preventative Medicine Clinic, or the Cancer Care Services Center.
- Follow up (by the ED Navigator) with individual patients/families to ensure ongoing compliance with treatment plan and efficacy of referral activities.

**Category 1 or 2 expected patient benefits:** Patients will benefit from Naviations services by showing increase in referrals to a primary care provider and also experience a reduction in ED use as a result. Anticipated number of patients enrolled in Navigator services will increase in:

- DY 2 - 1301
- DY 3 - 1366
- DY 4 - 1405
- DY 5 - 1457
**Category 3 outcomes:** The outcome for this project is tracking ED-appropriate utilization in these target conditions: CHF, Diabetes, ESRD, CV/Hypertension, Behavioral Health/Substance Abuse, COPD, and Asthma.
**Project Option 2.9.1** – Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)

**Unique Project ID:** 120726804.2.3  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Hospital / 120726804

**Project Description:**
This project proposes to implement an Emergency Department Case Management Program (EDCM) using skilled case managers (Navigators) to identify high risk population patients (those who are unfunded, underfunded, or have Medicaid) requiring intervention and guidance in the use of care settings in primary care, non-emergent clinics, and community-based resources. The Emergency Department (ED) Navigator will use the collaborative processes of assessment, planning, facilitation, advocacy and patient follow up to meet the identified population’s health needs via communication and education to:

- Obtain the necessary community resources to meet identified patient needs.
- Facilitate finding and obtaining a primary care provider (PCP).
- Enroll in chronic disease management clinics/support groups.
- Provide education and monitoring of identified patients postdischarge.
- Encourage compliance with ongoing care/support for their health care needs.
- Facilitate arrangements for care at a less resource intensive level.
- Reduce the risk of ongoing utilization of ED for non-emergent care needs.

Of the potential 12,386 Unfunded/Medicaid clients; 10.5% (n=1301) required services that would have been prevented with the use of an ED Navigator to provide for:

- Enrollment with a PCP for initial care of medical condition and ongoing follow up.
- Referral to specialized medical clinics such as the JPS Sickle Cell Clinic, THFW Wound Care clinic, and Healing Wings clinic for AIDS patients.
- Referral to urgent care centers for non-emergent conditions.
- Referral to social agencies such as the Catholic Charities, Lutheran Social Services, Cabellero Cathleen, and The Girls Service League.
- Referral to disease specific teaching and assistance agencies such as the Diabetes Club, Breast and Cervical Cancer Control Program, Preventative Medicine Clinic, or the Cancer Care Services Center.
- Follow up (by the ED Navigator) with individual patients/families to ensure ongoing compliance with treatment plan and efficacy of referral activities.
Goals and Relationship to Regional Goals:

Project Goals:

The goal of the project is to reduce the number of non-emergent ED visits and the number of potential hospitalizations for the identified population. This is made problematic as the growing demand for ED services are expected to account to an additional 68 million visits per year (Holtz-Eakin & Ramlet, 2010). In light of these findings, the focus for the EDCM should be:

- A reduction in non-emergent ED utilization.
- Assistance in establishing a medical home.
- Ensuring the use of appropriate health care resources.
- A reduction in the number of hospitalizations.

This project meets the following Regional goals:
The EDCM will be designed to align with the goals of the DSRIP Waiver and CMS triple aims by improving the health of individual, improving the health of the identified population and the increasing quality of care while reducing the costs associated with these improvements.

Challenges:

While ED costs are expected to outpace reimbursement by $6.8 billion by 2019 (Bamezai, Melnick, Nawathe, 2005) the heaviest financial burden will be those with chronic conditions that account for an estimated $0.85 of every dollar spent on health care. Additionally, data from National Adult Literacy Survey (NALS) finds that 16.9% of the population in Region 10 did not receive their high school diploma and 12.9% live at or below the 100% federal poverty level; thus the EDCM must also address the issues of lack of education, chronic disease and poor primary care access for low-income and uninsured residents in Region 10.

Additional challenges will result from a limited number of physicians willing to accept the identified population (Unfunded/Medicaid). In addition to geographic disadvantages as many resources are at least 10 miles distant which already aggravates the transportation issues found within this population.

5-Year Expected Outcome for Provider and Patients:

- Complete project planning including identification and hiring of staff, and development of policies/procedures and processes.
- Develop and test reporting and monitoring process to evaluate EDCM efficacy and establish the baseline.
- In DY3, our goal is to reduce the number of avoidable inpatient admissions by 5%, by conducting PDSA performance improvement projects to work toward further reductions in non-emergent ED admissions while disseminating information to key stakeholders regarding our progress.
In DY4, our goal is to reduce the number of avoidable patient admissions by 8% from baseline

In DY5, our goal is to reduce number of avoidable patient admissions by 12% from baseline.

Starting Point/Baseline:
At this time the EDCM does not exist at THSW. For 2012, it is estimated 61,991 THSW ED visits will occur. Of this total, 20% of the ED admissions meet the identified population criteria (unfunded/Medicaid) yielding an estimated total of 12,386 potential EDCM clients for 2012.

Rationale:
An analysis of ED utilization at THSW shows that a majority of the patients presenting for care in the ED were unfunded or Medicaid. Of this disadvantaged low income target population, over half had diagnoses that did not require emergency care, including conditions such as chronic back pain, prescription refills, follow-up exams or dental disorder. Additional diagnoses, such as limb pain or urinary tract infection might have been managed at a lower level of care or prevented with appropriate primary care. This program will guide the disenfranchised medically complex patient more appropriately through and across our system, from provider to provider, ensuring they can get to and make multiple appointments, get prescriptions filled, access community services for people with special needs (such as getting cancer patients access to support groups), etc. The patient navigator represents the liaison between primary, secondary, tertiary and quaternary health care

Project Components:
All required core project components, which are listed below, are included in the project:

i. Identify frequent ED users and use navigators as part of a preventable ED reduction program. Train health care navigators in cultural competency.

ii. Deploy innovative health care personnel, such as case managers/workers, community health workers and other types of health professionals as patient navigators.

iii. Connect patients to primary and preventive care.

iv. Increase access to care management and/or chronic care management, including education in chronic disease self-management.

v. Conduct quality improvement for project using methods such as rapid cycle improvement. Activities may include, but are not limited to, identifying project impacts, identifying “lessons learned,” opportunities to scale all or part of the project to a broader patient population, and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations.

The EDCM milestones and metrics will engage the identified population to provide education on how to manage their chronic disease(s), obtain timely follow up and receive appropriate levels of care. To ensure the effectiveness of the EDCM, THSW will actively participate with other RHP providers to evaluate and improve the program’s efficacy. Milestones and metrics will measure
Navigators’ assistance provided via the EDCM to the identified high-need population and will include:

i. Hiring and training navigators to cover the ED 7 days a week during peak ED admission hours to coordinate the EDCM.

ii. Developing policies, procedures and data collection tools to effectively administer and monitor the effectiveness of the EDCM.

iii. Increasing the identified population served per year (DY3 through DY5).

iv. Measuring the total at-risk clients receiving navigation services to ensure the identified population’s access to appropriate levels of care for ongoing management of their health care needs.

Unique community need identification numbers the project addresses:

- CN.10 – Overuse of emergency department (ED) services.
- CN.11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:

This project is a new initiative and we have not received any other federal funding for it.

Related Category 3 Outcome Measures:

Outcome Measures and Reasons/rationale for selecting the outcome measures:

IT-9.2 Right Care, Right Setting – ED appropriate utilization (Stand-alone measure)

This project will reduce inappropriate ED visits for the following target conditions: CHF, diabetes, ESRD, CV/hypertension, behavioral health/substance abuse, COPD, asthma

This project provides navigation services so the patient gets the right care, in the right setting and in a timely fashion, avoiding unnecessary ED visits and avoidable hospital admissions. (See data discussed in the rational section). Many studies have demonstrated the effectiveness of case management/navigation program to improve management of patient health, reduce risk of avoidable readmissions and provide better primary care access.\textsuperscript{184} RN Navigators will assist patients in obtaining resources necessary to more effectively manage their chronic condition or maintain their health. Patients with effectively managed disease and access to a dedicated health care provider will be less likely to utilize the ED for non-emergent conditions and will manage their health through primary and non-emergency health care providers. The program also assists

\textsuperscript{184} Emergency Department Case Management The Dyad Team of Nurse Case Manager and Social Worker Improve Discharge Planning and Patient and Staff Satisfaction While Decreasing Inappropriate Admissions and Costs:A Literature Review Darlene P. Bristow, MSN, RN, CCRN; Charlotte A. Herrick, PhD, RN Lippincott’s Case Management Vol. 7, No. 3, 121-128

in avoiding inpatient hospitalizations by providing patients with more appropriate alternatives to receive care and coordinating the necessary services from the ED.

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects:**
  - This project is related to project 2.2 Expand Chronic Care Management Models. The ED case manager will utilize the chronic care clinics as a resource to refer patients needing assistance with management of their chronic condition.

- **Related Category 4 population-focused improvements**
  - RD1: Potentially Preventable Admissions 1. Congestive Heart Failure Admission Rate; 2. Diabetes Admission Rate; 3. Behavioral Health and Substance Abuse Admission Rate; 4. Chronic Obstructive Pulmonary Disease Admission Rate; 5. Hypertension Admission Rate
  - RD-5 Emergency Department: 1. Admit decision time to ED departure time for admitted patients (NQF 0497)
  - The ED Case Management program will help navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care. Through the navigation of patients to available resources, patient admissions can be avoided increasing the availability of inpatient beds for those in need of hospitalization. Increased bed availability impacts ED patient throughout and improves time for ED patients to receive their inpatient bed.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

- **Approach/Methodology:** For every inappropriate inpatient admission avoided, $9,302 in cost is saved by the health care system.\(^{185}\) The average length of stay per inpatient admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inappropriate inpatient admissions outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent inappropriate inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

---

\(^{185}\) Based on 2011 historical ED visits data for Texas Health Arlington Memorial
Community benefits were calculated using lost productivity (net of lost wages), lost in payroll taxes, and lost sales tax. Individual benefits were calculated using: lost wages, caretaker expense and extension of life (if applicable).

The patient navigation program is accountable for making PCP or medical home appointments and ensuring continuity of care. Especially for disenfranchised or medically complex patients, navigation is about guiding people through and across the HC system, from provider to provider, ensuring they can get to and make multiple appointments, get prescriptions filled, access to community services for people with special needs (such as getting cancer patients access to support groups), etc. The patient navigator represents the liaison between primary, secondary, tertiary and quaternary health care.

**Metric 1 [P-5.1]:** Collect and report on all the types of patient navigator services provided.

- Baseline/Goal: Data collection completed with at least one report produced
- Data Source: Provider developed database

**Milestone 4 Estimated Incentive Payment (maximum amount):**

$186,340

**Milestone 5 [P-3]:** Provide care management/navigation services to targeted patients.

**Metric [P-3.1]:** Increase percent of targeted patients enrolled in the program.

- Goal: 5% improvement (n=1366) over baseline
- Data Source: Claims and EHR/registry

**Milestone 5 Estimated Incentive Payment:**

$196,534

**Goal:** 8% improvement (n=1405) over baseline

**Data Source:** Claims and EHR/registry

**Milestone 7 Estimated Incentive Payment:**

$196,534

**Goal:** 12% improvement (n=1457) over baseline

**Data Source:** Claims and EHR/registry

**Milestone 9 Estimated Incentive Payment:**

$158,692
### Project Components: 2.9.1 (a-e)

**Establish/Expand a Patient Care Navigation Program – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care (Emergency Department Care Management)**

Attachment 1
Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.1 – Health e Care NTSP & THPG Extensivist Clinics

**Unique Project ID:** 120726804.2.4

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest – North Texas Specialty Physicians & Texas Health Physician Group/ 120726804

**Provider:** A full-service facility with a steadfast commitment to quality. The hospital has more than 630 physicians on the medical staff, 24-hour emergency services and 222 licensed beds. The hospital offers comprehensive acute-care services, 24-hour emergency services, advanced technology, a progressive rehabilitation program, surgical services and traditional and progressive options in maternity care.

**Intervention:** The Extensivist Clinic is an outpatient primary care clinic in the Project Area designed to deliver an innovative coordinated care approach to at-risk populations with chronic conditions. This is a new Initiative

**Need of the project:** Tarrant County Public Health Department Behavioral Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, CHF, and high blood pressure.

**Target population:** The target population for this project is Medicare and Medicaid beneficiaries with Chronic Conditions. Estimated 5000 patients will be served over course of waiver period.

**Expected patient benefits:** This project provides an innovative approach to chronic care management in the region which includes improved access and coordinated care approach of at-risk target population that is patient-centered, culturally competent and disease-focused. Improvement in % of Medicare, Medicaid patients with chronic conditions accessing care at Extensivist clinic and subsequent improvement in admission, readmissions rates for target population with diagnosis heart failure and acute myocardial infarction.

**Category 1 or 2 expected patient benefits:** Clinic development and implementation milestones tie to project goal for expanding chronic care access in Region.

**Category 3 outcomes:** Category 3 metrics align to improvements in target population outcomes specifically admission and readmission rates for patients with chronic conditions heart failure and acute myocardial infarction.
Project Option 2.2.1 – Health e Care NTSP & THPG Extensivist Clinics

Unique Project ID: 120726804.2.4

Performing Provider Name/TPI: Texas Health Harris Methodist Southwest – North Texas Specialty Physicians & Texas Health Physician’s Group / 120726804

Project Description:
The Extensivist Clinic is an outpatient primary care clinic under development in the Project Area designed to deliver an innovative coordinated care approach to at-risk populations with chronic conditions. These populations include those who are currently underserved, underinsured and/or insured in governmental programs. This clinic model will embrace a patient-centered coordinated care approach with a goal to achieve better care overall. Key components of the care model include dedicated primary care teams, multidisciplinary care management support, collaboration with community providers, specialists and other partners in care to ensure patient-centered care, treatment and services for optimal health outcomes.

Goals and Relationship to Regional Goals:

Project Goals:
The Extensivist model is designed to address primary, secondary and tertiary prevention strategies with an overreaching goal to reduce the burden of disease and gaps in care for patients with chronic conditions. Goals include ensuring access to care and better coordinated care through an evidence-based, patient-centered approach for improved health outcomes.

This project meets the following Regional goals:
The Regional Goals include Expanding Chronic Care Management Models to support high-quality clinical and disease focused care for improved outcomes and reduced cost of care. This project provides an innovative model for chronic care management in the Region.

Challenges:
The Extensivist model proposes to improve care through an expanded Chronic Care model that includes better communication and coordination of care use of innovative technology for timely communication and clinical information exchange. Key issues to address include early identification and evidence-based interventions to those at highest risk for chronic disease. The Extensivist model will ensure intensive day- to- day management of patients through all levels of service and places of care. The clinical team will include board certified primary care physicians, advanced practice nursing professionals, physician assistants, care managers, social workers, care logistic managers and other allied health care providers to ensure a multidisciplinary approach to care that is patient-centered and outcomes oriented. Pharmacists will support medication management and reconciliation across-systems of care, social workers will address socio-economic needs, advance care planning needs and provide interventions and assistance.
with community support services as identified. Advance practice nurses will integrate health promotion and disease prevention interventions and ensure patient education and support for better patient self-management of chronic conditions. Embedded care logistic managers will assist with key aspects of care management to ensure timely and coordinated preventive care. The Sandlot HIE will support fully integrated electronic clinical information exchange. The Extensivist model is comprehensive and consistent with goals of the national IHI Triple Aim to improve the experience of care, improve the health of populations and reduce per capita cost of care.

5-Year Expected Outcome for Provider and Patients:
The expected outcomes of this project are:

- Apply the Extensivist Chronic Care model to targeted patients with chronic conditions including CHF, MI.
- Improve access to chronic care by 10% from baseline for patients with MCCs/chronic conditions in project area.
- Improve the outcomes as demonstrated by HEDIS measures and potentially preventable admission rate reduction for heart failure patients by 15%, readmissions rates that are reduced for CHF and AMI by 20% from baseline.

Starting Point/Baseline:

- The targeted population is Medicare and Medicaid with Chronic Conditions at an estimated number of 50,000.
- The number of dual eligible clients currently identified with diagnosis heart failure and acute myocardial infarction is 2600.
- Percent of providers trained in this project is 0% for DY1.
- Time period of baseline is 10/01/2012 through 09/30/2013.

This is a new initiative with implementation set for DY2.

Rationale:
Tarrant County Public Health Department Behavioral Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, CHF, and high blood pressure.

The Extensivist clinic model supports an evidence-based approach to care for clinical and quality improvements in at-risk populations with chronic conditions. This model enhances continuity of care and provides a multifaceted approach to care that is patient-centered and outcomes oriented.
Project Components:

**Project Option 2.2.1** is redesign the outpatient delivery system to coordinate care for patients with chronic diseases.

The reasons for selecting the core components for this project are as follows:

- Extensivist model that employs board-certified primary care physician, physician assistants, advance practice nurses, pharmacists, care managers, social workers, and care logistic managers will ensure comprehensive approach to care management of target population that is patient-centered, culturally competent and disease focused.
- The comprehensive approach of the Extensivist staffing model will increase patient access through in-person, telephonic and electronic outreach, home visits and communication interventions.
- Developing and deploying two chronic care programs in the Extensivist model will promote an expanded approach to interventions and patient engagement for improved self-management of chronic condition.
- Utilizing evidence-based interventions beyond the one-to one office visits will increase patient interactions and promote motivation for lifestyle change and improved self-management.
- Applying the Chronic care model to targeted diseases of CHF and AMI will impact the high prevalence in Region.

In DY2 we will develop two Chronic Care Extensivist Clinics and hire/train multidisciplinary providers including 2 primary care physician board-certified in internal medicine.

- Process Metric 1: - (P-1) (P-4) Two clinics opened. Multidisciplinary team hired to support model.
- Rationale: Introducing two multidisciplinary Chronic Care Extensivist clinics in the Region is expected to increase access for patients with chronic conditions.

In DY2 we will develop a program to identify and manage chronic care patients needing further clinical interventions.

- Process Metric 3: Two chronic care programs developed to identify and manage chronic care patients.
- Rationale: Early identification and management of chronic conditions will ensure the implementation of prevention strategies for improved outcomes.

In DY2 we will establish baseline measures: patients eligible for program including those with MCCs CHF and AMI. Baseline measures will include HEDIS, PAA, and PPR for CHF and AMI.

- Process Metric 4: Establish baseline metrics of patients with chronic conditions related to HEDIS, PAA, and PAR for CHF and AMI.
In DY3, we will expand and document interventions types beyond the traditional one-to-one in office visits for identified chronic care patients.

- Process Metric 5: Number of intervention types developed beyond the traditional one-to-one office visits for chronic care patients.
- Rationale: Care management that includes individualized interventions has demonstrated positive health outcomes in both quality of care and associated costs.

In DY4 we will apply this model to targeted patients with MCCs including CHF, AMI and increase the access as noted by 5% additional patients in target group.

- Metric 6 [I-17.1]: 5% additional patients in target group with CHF, AMI and other MCCs receive care in the Extensivist Clinic model.

In DY5 we will improve access to care for patients with chronic conditions/MCC through the Extensivist Clinic model.

- Metric 7 [I-21.1]: 10% increase in number of patient served in Extensivist Clinics with MCC, CHF, and AMI.
- Rationale: Research supports the expected outcomes of innovative models like the Extensivist clinic model for chronic conditions.

**Unique community need identification numbers the project addresses:**
- CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**
This project enhances access and contributes to the Region identified need for expansion of chronic care models and improved care coordination. This model utilizes state of the art information systems for timely capture and communication of key clinical information. The Sandlot HIE will contribute to better coordination of care and communication among caregivers. The Sandlot portal for electronic exchange of key clinical information aligns with national goals for patient safety around communication among caregivers.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:**

**IT-3.5 Acute Myocardial Infarction (AMI) 30-day readmission rate**
By the end of the Waiver, our goal is to decrease 30-day (all-cause) readmission for acute myocardial infarction (AMI) by 20% from baseline.
• Initial data pull from CMS claims indicates that the baseline rate for readmission due to AMI may be as high as 24.5% in target population.
• Rationale: This outcome measure is aligned with TMF Health Quality Institute Partnership for Patients in Texas to focus on avoidable readmissions. Recent research indicates 17.6% of beneficiaries are rehospitalized within 30 days of a hospital discharge and nearly 76% of those readmissions may be preventable. Better coordinated care and timely follow-up have been demonstrated to improve transitions of care and reduce 30-day readmissions for patients with chronic conditions.

Potentially Preventable Complications – Congestive Heart Failure IT-3.2 (CHF) 30-day readmission rate
By the end of the Waiver, our goal is to decrease 30-day (all-cause) readmission for congestive heart failure by 20% from baseline.
• Initial data pull from CMS claims indicates that the baseline rate for readmission due to AMI may be as high as 20% in target population.
• Rationale: This outcome measure is aligned with TMF Health Quality Institute Partnership for Patients in Texas to focus on avoidable readmissions. Recent research indicates 17.6% of beneficiaries are rehospitalized within 30 days of a hospital discharge and nearly 76% of those readmissions may be preventable. Better coordinated care and timely follow-up have been demonstrated to improve transitions of care and reduce 30-day readmissions for patients with chronic conditions.

Potentially Preventable Admissions – IT-2.1 Congestive Heart Failure Admission rate (CHF)
By the end of the Waiver, our goal is to decrease 30-day admission (all-cause) for heart failure patients by 15% from baseline.
• An initial data pull from our database shows that the baseline rate may be as high as 20%.
• Rationale: Tarrant County Public Health Department Behavioral Risk Factor Surveillance System 2009/2010 notes that among Tarrant County adults in 2007, heart disease ranked as the leading cause of death for both men and women. Also, during the years 2000 to 2005, Tarrant County residents spent about $500 million on preventable hospitalizations due to angina, CHF, and high blood pressure.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.
Project Valuation:

- **Approach/Methodology:** For every CHF admission avoided, $9,203 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax.

- **Individual benefits** were calculated using lost wages, caretaker expense and extension of life (if applicable).
  - The number of patients with Medicare and/or Medicaid and chronic conditions is estimated to be 50,000.
  - Based on claims data from 2011, the total number of dual eligible beneficiary with CHF and AMI diagnosis is estimated to be 2,672.
  - The project scope addresses chronic care management of at risk beneficiaries in Region including moderate to high-risk patients with diagnosis of heart failure and acute myocardial infarction.
  - The estimated baseline readmission rate for CHF is currently at 20%.
  - The estimated baseline readmission rates for AMI is 24.5%
  - Tarrant County spends about $500 million on preventable hospitalizations.
  - A coordinated approach to improving care transitions and chronic care management is a priority for reduction of medical costs in at risk patients.

186 Texas Department of State Health Services with a 30% ccr assumption.

Project Option 2.2.1 – Redesign the Outpatient Delivery System to Coordinate Care for Patients with Diabetes

Unique Project ID: 121794503.2.1

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Stephenville / 121794503

Provider: Texas Health Harris Methodist Hospital Stephenville (THS) is a 98 bed hospital in Stephenville, Texas serving a 1,870square mile area and a population of 51,677. Texas Health Harris Methodist Hospital Stephenville (THS) is the only hospital in Erath County, and provides community services, including inpatient and outpatient surgery, women's services, diagnostic imaging, inpatient physical therapy, and outpatient wound care.

Intervention: This project will identify patients who do not have a medical home and others appropriate for diabetes education, but who lack funds to pay for outpatient diabetes education classes. These patients will be referred to comprehensive outpatient diabetes education classes offered by Texas Health Stephenville free of charge. This project is a new initiative. We have not received any funds from the USDHHS.

Need of the project: There are no other outpatient diabetes education programs available to Medicaid and unfunded/indigent individuals in our area. This program will help improve access to care to promote participants’ self-management of their diabetes. By funding program, CMS will lower the cost burden that keeps these patients from receiving this type of care and education.

Target population: Patients with type 1 or type 2 diabetes, pre-diabetes, or gestational diabetes are the targeted population. The project seeks to provide diabetes education to 75-100 participants in DY 2 and increase the number of participants in DY 3, DY4 and DY5 by an additional 5% per year.

Category 1 or 2 expected patient benefits: A comprehensive care management program will be developed to capture strategies for reaching the Medicaid and Uninsured population and embrace up-to-date best practices to optimize effectiveness of program. Staffs will be trained on how to properly deliver the developed program to develop the foundation for growing a good reputation for the program in the community that will, in turn, eventually help promote awareness of program’s availability and value. Program to assist patients to better self-manage their diabetes will be implemented to reduce the number of complications these patients have to, in turn, reduce the related financial drain to the health care system as a whole. By expanding and documenting interaction types between patient and health care team beyond one-to-one visits to include group visits, telephone visits, and other interaction types, program effectiveness will increase by increasing the various mechanisms of available message delivery to patients. Applying the Care Model to the locally prevalent targeted diabetes population and improving the percentage of patients with self-management goals will increase the number of lives in the community that the program positively impacts.

Category 3 outcomes: 1.10 Diabetes care: HbA1c poor control (> 9.0%) – This translates into a lower likelihood of having diabetes-related complications, such as a hospital admission. IT-3.3 Diabetes 30-day readmission rate - reducing the number of readmissions mitigates financial drain for the patient as well as the health care system.
Project Option 2.2.1 – Redesign the Outpatient Delivery System to Coordinate Care for Patients with Diabetes

Unique Project ID: 121794503.2.1
Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Stephenville / 121794503

Project Description:
Physicians refer to the THS Outpatient Diabetes Education Program contingent on a diagnosis of diabetes type 1 or 2, pre-diabetes, or gestational diabetes. The program lasts for 3 months during which a series of educational classes are provided, both group and individual, with assessment at the end of the third month to measure effectiveness/success. Second, inpatient clinical education efforts will be made to:

- Identify patients with the same criteria as above to facilitate a physician referral to the THS Outpatient Diabetes Education Program upon discharge.
- Identify patients who do not currently have a medical home and others appropriate for diabetes education, but who lack funds to pay for the above mentioned multisession classes. These patients will be referred to the free diabetes classes offered by the THS Outpatient Diabetes Education Program.

There are no other diabetes programs available in our area. This program will help improve access to care to promote participants’ self-management of their diabetes.

Goals and Relationship to Regional Goals:
Project Goals:
There are no other diabetes programs available in our area. This program will help improve access to care to promote self-management of their chronic disease.

In the community, we anticipate an increased number of referrals from the identified patient population, a decrease in ED usage and a decrease in admissions/readmissions for diabetes related diagnoses.

Goals include an enrollment growth rate of 5% over baseline (established in DY2) of Medicaid, Managed Medicaid, and uninsured patients with a diabetes diagnosis in the self-management program by the end of the Waiver period.

Individually, patients will self-manage their diabetes with the skills obtained through diabetes education. Patients will verbalize understanding of diabetes disease process, nutrition, medications, monitoring, goal setting and problem solving, psychosocial adjustment, physical activity, acute and chronic complications and preconception and pregnancy care, if applicable. Patients referred to the free program will self-select goals that will be monitored routinely.
throughout the program with an expected 80% success rate at completion of the program, i.e., the participants will meet their self-selected goals 80% of the time or more.

This project meets the following Regional goals:
A goal of the Region is to provide improved access to ongoing preventive, primary and chronic care. We aim to improve access to care, promote improved quality of care, and improve health outcomes. This project relates to this goal because it will provide our community with a disease management program to help people with diabetes, regardless of their income.

Challenges:
Historically, underserved patients have not been effectively educated on how to manage their diabetes. Some challenges this population encounters to receive proper education to manage their disease include the inability to pay, transportation limitations, Medicaid does not cover the service in a hospital and there are no other programs in the area. Moreover, they have not been tracked to measure their outcomes and long term goals. This program will link diabetes patients who present to the ED or are admitted to a primary care physician and diabetes management resources to provide seamless care for the Medicaid, managed Medicaid, and uninsured patient population.

5-Year Expected Outcome for Provider and Patients:
- Patients referred to the program will self-select goals that will be monitored routinely throughout the program with an 80% success rate at completion of the program.
- Enrollment growth rate of 5% over baseline (established in DY2) of Medicaid, Managed Medicaid, and uninsured patients with a diabetes diagnosis in the self-management program by the end of the Waiver period.

Starting Point/Baseline:
Texas Health Hospital Stephenville is the project’s primary provider. The project will begin with establishing baseline data in DY2 (January 2013 through September 2012, with extrapolation for the full 12 months). Current enrollment in our diabetes classes is approximately 75-100 people per year, and we expect an increase in enrollment. Erath County is the geographic area we are trying to reach. Our target population is adults with diabetes, pre-diabetes, and gestational diabetes.

Rationale:
One in every nine individuals age 18 or older in Erath County has a diabetes diagnosis. As the age of community increases, the percentage of diabetes increases. The number of patients in our EDs and hospitals with a primary diagnosis of diabetes is a small percentage of our outpatient diabetes management programs. Therefore, there needs to be a link from ED and inpatient to outpatient resources and education.
The Chronic Care Model, developed by Ed Wagner and colleagues at the MacColl Institute\textsuperscript{187}, has helped hundreds of providers improve care for people with chronic conditions. Fifteen randomized trials of system change interventions include Diabetes Cochrane Collaborative Review and JAMA Re-review, which looked at about 40 studies, mostly randomized trials, with interventions classified as decision support, delivery system design, information systems, or self-management support; 19 of 20 studies included a self-management component that improved care, and all five studies with interventions in all four domains had positive impacts on patients.

**Project Components:**
Our project includes all of the components listed in the project option 2.2.1. We have a multidisciplinary care team which includes dietitians, nurses, physicians, and potentially other disciplines such as pharmacy and physical therapy. The participants have access to the care team through a variety of methods including email, phone, and in person. The participants will receive instruction from staff in a series of free weekly classes which include, among other topics, diabetes survival skills, meal planning, complications, pathophysiology, goal setting, medications, monitoring, coping skills, pregnancy care and exercise. Participants may enroll in the classes at any week as they do not have to be taken in a specific order. Patients are empowered to develop diabetes self-management skills to help manage their disease through goal setting and classroom instruction. Quality improvement projects are ongoing.

In our service area the Hispanic community makes up approximately 20% of the population and is the fastest growing ethnicity in Erath County where Stephenville is located. Hispanic people are about 1.5 times more likely to develop diabetes than non-Hispanic white people. In the current Texas Health Harris Methodist Stephenville Hospital Outpatient Diabetes Education Program, approximately 80-85% of those served are Caucasian, thus indicating a need for innovation and creativity to reach the Hispanic population.

Another area of opportunity is cost of managing diabetes. Since a large percentage of THR patients have limited access to insurance and other resources, it is paramount that we intervene by educating the people in the community we serve.

**Unique community need identification numbers the project addresses:**
- CN.10 – Overuse of emergency department services
- CN.12 – Need for more culturally competent care to address unmet needs
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:**

\textsuperscript{187} Source: The Chronic Care Model website. Please see [http://www.improvingchroniccare.org](http://www.improvingchroniccare.org) for more information.
This project is a new initiative. We have not received any funds from the USDHHS.

**Related Category 3 Outcome Measures:**

**Outcome Measures:**

1.10 Diabetes care: HbA1c poor control (>9.0%)
   a) Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or 2) who had hemoglobin A1C (HbA1c) control > 9.0%
   b) Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and 2)

3.3 Diabetes 30-day readmission rate
   a) Numerator: number of readmissions (for patients 18 years and older), for any cause, within 30 days of discharge from the index diabetes admission. If an index admission has more than one readmission, only the first is counted as a readmission.
   b) Denominator: The number of admissions (for patients 18 years and older), for patients discharged from the hospital with a principal diagnosis of diabetes and with a complete claims history for the 12 months prior to admission.

**Reasons/Rationale for Selecting the Outcome Measures:**

The chronic care model has six elements for effective care for chronic disease and our program includes elements of this model. Programs that incorporate at least one element of the model have a beneficial effect on outcome measures. In their meta-analysis, diabetes interventions led to a reduction in A1C in patients with diabetes.\(^1\) In the Diabetes Prevention Program study, lifestyle interventions reduced the incidence of diabetes by about 58% over three years in people with pre-diabetes.\(^2\) Diabetes management with an A1C goal of < 7% has protective effects on patients with type 1 diabetes and promotes micro and macrovascular complication prevention.\(^3\) There is also a correlation between glycemic control and the cost of medical care with increase in medical charges for every 1% increase in A1C above 7%.\(^4\)

**Relationship to Other Projects:**

- **Related Category 1 and 2 projects:** There are no other diabetes programs available in our area. This program will help improve access to care to promote self-management of a participant’s chronic disease. We are located in a remote part of Region 10 and there is no identified overlap between our entity’s project and other projects in Region 10.

---

• **Related Category 4 population-focused improvements** RD.1: Potentially Preventable Admissions RD.1.2: Diabetes Admission Rate should improve for at-risk patients who would not otherwise be able to access care to manage their diabetes. Diabetics whose disease is managed will decrease their risk of developing complications from their disease that would result in hospital admissions. RD 2: 30 Readmission Rate – RD 2.2 Diabetes 30-day Readmissions are Category 3 Outcome Measures selected as an anticipated outcomes to measure the effectiveness of this project. By providing access to care and assistance in self-management of their disease, risk of admission and readmission are reduced.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**

• **Approach:** For every inpatient admission avoided, $8,297\(^{192}\) in cost is saved by the health care system. Health care costs are calculated by multiplying $8,297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

\(^{192}\) Assumes a cost-to-revenue of 30%. Texas Department of State Health Services. [http://www.dshs.state.tx.us/ph/county.shtm](http://www.dshs.state.tx.us/ph/county.shtm)

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.2.2 – JPS Diabetes Chronic Care Management

**Unique Project ID:** 126675104.2.1  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Provider:** JPS is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS is also Fort Worth’s only acute psychiatric care facility.

**Intervention:** The project will improve diabetes clinical outcomes and self-management skills in a patient-centered medical home. This is a new intervention based on Wagner’s chronic care model interwoven into a new medical home setting.

**Need for the project:** The region has noted a lack of care coordination. With a diabetes prevalence rate of 9.7% in Texas and 8.3% in Tarrant County, this is a disease that should be addressed.

**Target population:** There are about 17,000 diabetic patients in our current primary care setting. We estimate that we will positively impact about 50% of the target population. Both Medicaid and county-sponsored uninsured patients are in our ambulatory clinics. We will focus on those patients with diabetes who will receive education and focused clinical interventions to improve clinical outcomes.

**Category 1 or 2 expected patient benefit:** Milestones include developing a comprehensive program using multi-disciplinary teams implemented at first in one clinic. We will spread the program to 3 additional clinics with defined training. Increasing number of patients will treated in this model and with a focus on creating self-management goals. All of these milestones will create capacity for bringing patients into a diabetes chronic disease model to improve self-management skills and clinical outcomes.

**Category 3 outcomes:** Clinical outcomes have been chosen to decrease diabetic complications and include improving hemoglobin A1C control, Blood pressure control, and completing foot examinations.
Project Option 2.2.2 – JPS Diabetes Chronic Care Management

Unique Project ID: 126675104.2.1
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
JPS Health Network will improve diabetes management for our medical home patients by implementing Wagner’s chronic care model.193 This comprehensive disease management program to be rolled out in each of our primary care clinics will include evidence-based protocols and team-based, coordinated care delivered in a patient-centered medical home that will enable patients to access their care teams in person, phone or email. We will use registry implementation, focused prevention services, and self-management education to enhance patients’ medical home access. We will engage patients in peer to peer education, psychosocial support groups and motivating classes. We will improve physician/patient communication and goal-setting through strategic visits and active multidisciplinary planning and execution. The Plan-Do-Study-Act (PDSA) method will be used to roll out our care model; measurement and feedback will be used to improve program quality. We expect to use our experience in developing and implementing this program to address other chronic diseases.

Goals and Relationship to Regional Goals:
Chronic disease management will enable us to meet our five-year goals of improving quality outcomes for our diabetic medical home patients while reducing health care costs.

Project Goals:
- Empower our patients to take an active part in their own care;
- Decrease complications and improve quality of life through evidence-based interventions and age-appropriate prevention; and
- Improve care coordination through planning, coaching and navigation with the medical home team.

This project meets the following Regional goals: This project addresses specific specialty and primary care access and chronic care management issues for a vulnerable patient population: low-income individuals with diabetes.

193 Improving Chronic Illness Care created the Chronic Care Model, the well-documented and tested leading model for treating chronic diseases, which summarizes the basic elements for improving care in health systems. These elements are the community, the health system, self-management support, delivery system design, decision support and clinical information systems. By using evidence-based change concepts within each element in combination with one another, patients are better-informed and then take an active part in their care, while patient care teams have the resources and expertise they need to better manage the chronic illnesses of their patients. The results are more productive interactions between patients and their care teams, and better clinical outcomes for patients with chronic diseases. See http://www.improvingchroniccare.org/index.php?p=The_Chronic_Care_Model&s=2 for detailed information about the Care Model.
Challenges:
About 17,000 JPS Health Network medical home patients and 12% of our frequent ED/hospital users are diabetic. Many of these patients are seen sporadically within our network, receiving care that varies and may not meet evidence-based guidelines. Only a small percentage sees a primary care doctor regularly. Developing an improved chronic care management approach will improve their continuity of care and lead to improvement in diabetes indicators. For example, 19% of diabetic patients have a hemoglobin A1c (HbA1c) > 9 (indicator of blood sugar levels out of control or poor glycemic control). Similarly, only 35% of those patients had eye exams that year. Developing a program of standardized care and improved patient engagement will improve patient’s glycemic control levels and reduce their ED visits, inpatient admissions, disability and premature death. Similarly, encouraging regular eye exams will benefit this population.

5-Year Expected Outcome for Provider and Patients:
JPS Health Network will implement an evidence-based chronic care model for the approximately 17,000 patients with diabetes seen annually in our clinics. By the end of the Waiver period, 40% of those patients will have received care under the care model and 30% will have self-management goals. We will be able to improve clinical outcomes for diabetes patients, including specific metrics such as Hemoglobin A1c (HbA1c), BP control, interval eye and foot exams, and renal function monitoring to mitigate or prevent complications.

Starting Point/Baseline:
In fiscal year 2011, we served 17,041 diabetic patients who used JPS Health Network clinics for primary care. Our current diabetes case management program relies primarily on individual diabetes case managers located in primary clinics. We case managed 2038 diabetic patients in 2011. At this time most of our case management consists of one-on-one education and with inconsistent results. Group visits have been sustained in a few clinics but are not universally appreciated. On average we were able to decrease HbA1c of the case managed patients by 0.5% after six months of case management in 2011. Fifty-one percent of the time this diabetic population had eye exams and 66% of the time had foot exams. BP values have not been documented electronically until this year. The average HbA1c for these individuals under our present approach is 9.2.

Rationale:
Diabetes is one of 10 major causes of morbidity in our Region. Diabetes prevalence in Tarrant County is at 8.3%, according to the latest Behavioral Risk Factor Surveillance System (BRFSS) report in 2007, a 2% increase from the same survey in 2006. The 2010 statewide BRFSS result

195 Texas Behavioral Risk Factor Surveillance System, 2007. Center for Health Statistics, Texas Department of State Health Services
for Texas was 9.7% in 2010. This project makes sense for our community because we will better manage individuals with diabetes and offer improved appropriate treatment in the medical home.

**Project Components:**
We have incorporated all core components in this outpatient delivery system redesign to coordinate care for patients with chronic diseases. This comprehensive disease management program will include team-based care in a patient-centered medical home. Our team will include a clinical pharmacist, a nurse coach, a population care manager with the patient’s personal practitioner (C2Milestone 2,P-4). The program will be rolled out first in one clinic (C2Milestone 4,P-1) and then spread to three more clinics after evaluating and improving the model. The medical home team will provide access to patients in person, phone or through our electronic medical record portal. We will use registry implementation, focused prevention services, and self-management education to enhance the health of our patients. We will engage patients in peer to peer education including through group visits, psychosocial support groups and motivating classes. We will improve physician/patient communication and self-management goal-setting (C2Milestone 8, I-18) through strategic visits and active multidisciplinary planning and execution. Metrics and milestones designated for the diabetes chronic disease management program will be used. Initially, we will create a stakeholder group to review the current state and determine a timeline for the project and its implementation. (C3, Milestone 1, P-1) We will validate our baseline for each measure. (C3, Milestone 2, P-2) The data system will be tested for accuracy. (C3, Milestone 3, P-3) We will pilot the program in one clinic with data collected pre- and post-patient interventions before rolling it out to additional clinics. The Plan-Do-Study-Act (PDSA) method will be used to evaluate and adjust our care model; measurement and feedback will be used to improve program quality. (C3 Milestone 4,P-5) Clinical results, registry use, and barriers will be identified and learning with best practices will be embedded in the program. Stakeholders will be kept informed. (C3 Milestone 5, P-5) The process will be expanded to every medical home and will become a framework for focus on other chronic diseases. According to the Region 10 needs assessment survey, all counties in the Region identified lack of coordination as a major area for system improvement. Barriers identified included complexity of coordination, lack of staff, and lack of financial integration, fragmented system service, and “practicing in silos”. Providers did not feel that there was strong care coordination between primary care providers, hospitals, and specialists. Other health behaviors contributing to diabetes prevalence and management in Region 10 are adult obesity (30%) and lack of physical activity (28%). Region 10 had a lower rate of health screening than the nation and the state as a whole.

**Unique community need identification numbers the project addresses:**

196 Texas Behavioral Risk Factor Surveillance System, 2010. Center for Health Statistics, Texas Department of State Health Services
CN.11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
We will create a medical home in 15 clinics and roll out chronic disease management in each clinic to provide patient with improved access to behavioral and medical services in an ambulatory setting. We will re-position some staff to focus on network transitions, and use the registry to manage patients at the right intensity. With tools such as EPIC and Crimson Population risk management and with a team-based approach, we will optimize care and open up access for diabetic patients in our clinics. Physicians will have the support needed to offer evidence-based care, assistance with following through on individualized care plans, and high-quality education. Physicians in the inpatient and ED/urgent care setting and patients themselves will feel the impact and will appreciate being quickly navigated to the appropriate level of care. The new diabetes management program will track diabetes patients through a registry to ensure appropriate service delivery and risk stratification for intensity. Improved transitions from the inpatient setting will help prevent readmissions and transitions from the outpatient setting will inform the inpatient team of particular patient needs. Diabetes patients will be linked with appropriate education and medication management with a clinical pharmacist. In the new medical homes, clinical teams will develop a plan for each patient’s care, driven by an RN coach and led by a physician. Medical home service delivery will include 24-hour access to clinical decision making as well as delivery of acute, chronic, and preventive care.

No federal funds have been received or are associated with this program.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
- IT-1.10 Diabetes Care: HbA1c poor control (>9.0%) Stand-alone measure
Diabetic patients must maintain glucose control because it impacts many physiologic systems. Proven methods to impact control include self-management skills and pharmaceutical treatment. In the hospital’s fiscal year 2011, 8% of JPS medical home patients with diabetes and low income had anHbA1c > 9. When the same population was evaluated recently, 25% of the patients had anHbA1c > 9. We think this worsening control is multi-factorial, but our current clinical system did not help our patients maintain their control of the glucose levels. The chronic care model (CCM) has been shown to improve the Diabetes Knowledge Test and the Diabetes Empowerment Score as documented in a randomized control trial in an underserved urban community. Self-monitoring of glucose and A1C were also improved in this population.197 Similar intermediate outcome goals including improved hemoglobin HbA1c were also confirmed.

in a two-year CCM study according to Chin et al through the Health Disparities Collaborative.\textsuperscript{198} The development of a strong chronic disease management program with registry capabilities can impact the patient’s glucose control through education, case finding through analysis of our diabetic population, and targeted interventions. Wagner, in his paper on the IHI breakthrough series collaborative for Chronic Illness Care noted improvement of HbA1c by about 20% over a 13-month period.\textsuperscript{199} We will also decrease the patients with HbA1c > 9 by 20% in our diabetic population after implementing a diabetes chronic care program.

- IT-1.11 BP control (Diabetes Care: BP control 140/80) Stand alone
- Control of blood pressure (BP) in the diabetic patient has been determined to be the most important factor to target to avoid coronary artery disease, chronic kidney disease, and retinal disease. Aggressive management will be needed in many patients to bring their BP down to this goal. We had not collected BP data on our patients in our paper charts. We will need to collect and validate data to document our baseline. The Study of Cardiovascular Risk Intervention by Pharmacists-Hypertension (SCRIP-HTN) study using a team approach with a pharmacist and nurse care manager brought the BP down 14% with a six-month intervention.\textsuperscript{200} By the end of our five-year project, we will decrease the number of our patients with BP >140/80 by 30% from the baseline determined in our baseline using a similar team-based approach.

- IT-1.13 Diabetes Care: Foot Exam Non-stand-alone
The economic cost of a diabetic foot ulcer is estimated at $7,000 to $10,000; the per person cost of amputation is estimated at $65,000. However, a yearly foot exam looking for vascular, neurologic and foot abnormalities can prevent a foot ulcer. The IHI collaborative project described by Dr. Wagner in the Journal of Quality Improvement, noted a 50% increase in the number of foot exams done in the 13 month collaborative.\textsuperscript{7} By the end of the five-year project, we will increase the number of diabetic patients receiving a yearly foot exam to 50% more from baseline.

**Relationship to Other Projects:**
In four hospitals throughout Tarrant County, and in Erath County, patients will receive coordinated diabetic outpatient care. These efforts will reinforce each other and encourage community resource development. A Tarrant county program to reduce smoking in diabetic patients will be an additional community resource for our diabetic patients.

Across the JPS Health Network system, patient-centered medical home transformation will provide critical support to the diabetic chronic disease program with delivery of acute, chronic and preventive services including mammogram, Pap smears, and pneumonia vaccinations. (IT 3.12.1, 12.2, 12.4). The diabetes chronic care management project will be reinforced with the expansion of specialty eye care (1.9.2) and yearly eye exams. The call center project will expand access and enhance medical advice (IT.1.6) will assist our diabetic patients to receive clinical decision support 24 hours per day and may help the diabetic patient (often with comorbidities) avoid an ED visit or an admission for an ambulatory sensitive condition. (IT2.12) The patient experience improvement program will address the needs of the diabetic patient who may have anxiety or otherwise need encouragement to complete self-management goals. (IT-6.1) Diabetics may suffer from depression, and our chronic management program will include screening to identify depression. Patients exhibiting criteria for depression will be provided virtual psychiatric and clinical services. (IT-2.16) Several behavioral health and primary care collaborative projects will assist our chronic disease management patient through integration of primary care and behavioral health care in medical home locations (2.15.1). Also, as the diabetes chronic care program will facilitate care management for improved outcomes and support, we will now add an additional care management resource that will integrate primary and behavioral health needs with a focus on the whole person. (2.19.1)

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates time the region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

JPS Health Network defined the population that will be directly impacted by the project as 17,000 JPS Medical Home patients with diabetes. The percentage of the population expected to be positively impacted by the project is 50%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her ability to control diabetes is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, - the community has a whole is not significantly impacted.

---

126675104.2.1 2.2.2 2.2.2 Apply evidence-based care management model to patients identified as having high-risk health care needs
Project Option 2.1.1 – Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards.

Unique Project ID: 126675104.2.2
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The project is designed to implement the patient-centered medical home model in the primary care clinics at JPS Health Network. This project represents a new initiative.

Need for the project: The implementation of Patient-centered medical homes has been shown to improve health outcomes and reduce unnecessary costs of care such as potentially avoidable ED visits.

Target population: Current and future enrolled JPS Connection patients under 75 years of age. Our current medical home population is estimated at 68,000. Implementation of the PCMH is targeted to reach all the current and prospective future medical home patients. Not all of our Connection patients currently seek service in the medical home. About 25-50 new patients are enrolled each week. Two of the Category 3 outcomes for this project are targeted at females enrolled in the medical home within certain age groups. For those projects, the categories have some overlapping patients but the targeted interventions are different (pap smears and mammograms). Currently the estimated female population between ages 21 and 69 years.

Expected patient benefits: The project is designed to improve health outcomes and enhance access to care in the primary care clinics.

Category 1 or 2 expected patient benefits: -The project milestones include all of the following required core components:

1. Utilizing a gap analysis to assess and/or measure readiness for NCQA PCMH readiness
2. Conduct feasibility studies to determine necessary steps to achieve PCMH status.
3. Conducting educational sessions for primary care physician offices, hospital boards of directors, medical staff and senior leadership on the elements of PCMH, its rationale and vision.
4. Conducting quality improvement for the project using rapid cycle, lessons learned, etc.

Patients will benefit from a coordinated care delivery system with the patient centered medical home as the center of that system. A patient-centered focus on wellness with 24/7 access to care teams and other resources will build a healthier community.

Category 3 outcomes: Category 3 outcomes include improving compliance with preventive screening tests including pap smears and mammograms and reducing avoidable admissions. Using the current baseline data, JPS will work to reduce PQI Ambulatory Care Sensitive Conditions (IT 2.12) from 1104 to less than 875 potentially preventable admissions. Using
referral tracking systems and improved emphasis on wellness, the medical home team will work to increase compliance with preventive screening for eligible females in the medical homes. For females eligible for mammograms, the project will increase compliance to 50% of our 22,600 plus eligible females. The project will increase compliance to 40% for our 15,600 females that are eligible in this age group.

**Project Option 2.1.1** – Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards.
Unique Project ID: 126675104.2.2
Performing Provider Name/TPI: JPS Health Network/126675104

Project Description:
JPS Health Network will implement a Patient-Centered Medical Home (PCMH) model in all 14 of its community-based primary care sites over the next five years. In doing so, JPS Health Network will move from a provider-based care system to a team-based care system. We will assess gaps in policy and practice as compared with the NCQA hospital-affiliated Medical Home Certification Program. Staff, providers and patients will be trained in PCMH principles and JPS culture will be adapted throughout to ensure staff commitment at all levels. Each medical home will include a learning center where patients and other community members can learn about healthy lifestyle options and ways that they can improve their health. JPS Health Network roles and job descriptions will be modified to support team-based care. These community-based care teams will consist of providers, navigators, health coaches, clinical pharmacists, population health managers, behavioral health specialists, and others to be determined based upon patient care needs. The teams will provide ongoing preventive, chronic and acute care at the medical home site delivered in person, by telephone and by home visits when necessary. We will partner with community agencies that conduct home visits. (See project 126675104 2.12)

Medical homes will provide comprehensive and timely primary care services and coordinate patients’ other health care needs. Provider teams will focus care on wellness and preventive health care by developing care plans that include a strong emphasis on self-management of chronic conditions. Same day access for acute care visits will be a key component of creating timely access for patients receiving care in the medical home. A welcome clinic for patients newly enrolled in the JPS Connections program will be implemented to assist patients in assignment to a medical home and first visit within 60 days. The Connections program is designed for the working poor of Tarrant County – working-age low-income adults that do not qualify for Medicaid, Medicare or Chip benefits. Currently, this group of patients represents more than half of our medical home population. We will work closely to develop and right-size PCMH team members to support medical home infrastructure once patient panels are determined. This PCMH program is a first critical step in a broad 10-year commitment by JPS to consolidate its existing 14 primary care sites into four large ambulatory care centers strategically located around Tarrant County to serve as the base of its patient medical homes. The transformation of the medical home in our safety net system will improve health quality and reduce health care costs for the county and RHP 10.

Goals and Relationship to Regional Goals:
Project Goals:

201 1https://www.pcpcc.net
The five year goals of this project include the following key components: Improving the timely assignment of patients to medical home teams, ensuring that patients receive care from their assigned medical home team, and improving the number of medical home patients receiving preventive services as clinically indicated. The medical home model will be implemented at all 14 sites with a goal to achieve PCMH certification at 7 of 14 sites by a nationally recognized agency such as the Joint Commission or NCQA.\textsuperscript{202,203} JPS will use the Safety Net Medical Home Initiative Implementation Guide published by the Commonwealth Fund to transform our care delivery model.\textsuperscript{204} JPS expects to reduce potentially preventable admissions to our ED and inpatient service. With a focus on preventive care and tracking of preventive care compliance, JPS will expect an increase in the number of patients receiving timely preventive services.\textsuperscript{205}

This project meets the following Regional goals: A major Regional goal is to improve access to timely care at the right place and reduce the cost of care. When a patient cannot get timely access to medical care, they seek care outside their medical home. Some of our patients are seeking urgent or emergent care in other hospital systems.

Challenges:
JPS Health Network has 14 medical home sites delivering primary care services spread across Tarrant County. There are inconsistencies across the sites in terms of phone answering, message delivery and response timeliness and processes, based on patient satisfaction survey results and complaints received by our Office of Patient and Family Experience. Further, even though same day walk-in slots are available at all clinics, staff are not offering them to patients consistently. This lack of timely access to medical advice or care is a major reason our patients seek care in the ED or Urgent Care. Another problem to be resolved by the PCMH project and other JPS patient-centered initiatives will be reducing wait times to first appointment in their medical home. At this time, wait times are variable and can be as lengthy as 130 days at certain sites; and patients are told to seek care in the urgent care center while waiting for a first visit in the medical home. Additionally, JPS has implemented an evening nurse triage line for our medical home patients. Of 450 phone calls averaged each month, 10\% of those patients are sent to the ED after speaking to the nurse. The other callers report that they would have sought care in the ED or urgent care center for even prescription refills if the nurse call line had not been available.

Implementation of a Patient-Centered Medical Home (PCMH) across our clinical sites will increase our competence in delivering coordinated care across our system and managing a complex population of patients with a high incidence of chronic disease and psychosocial issues that impact patients’ ability to manage their chronic disease outside the physician’s office on their own. A system of well-coordinated resources such as health coaches, social workers,
navigators, behavioral health teams, dietitians and clinical pharmacists linked to community resources will have a greater impact on wellness for this unique population.

5-Year Expected outcome for Provider and Patients:
The project’s five year expected outcomes are to decrease inpatient admissions by 20% based on PQI admissions data. For this intervention, the JPS Connection enrolled patients will be targeted. We also expect increased compliance with preventive breast and cervical cancer screening treatment protocols by 30% over baseline for the defined population.

Starting Point/Baseline:
More than 120,000 patients received care in one of our primary care clinics in FY2011. This project will serve both current and prospective patients seeking care in any of our Medical Home sites. About half of all Medical Home patients in JPS 2011 are working poor Tarrant County citizens enrolled in our Connections program. A total of 121,000 Connections patients received care in our outpatient clinics during FY2011. In a review of the records of a sample of about 500 Connections patients (excluding the homeless and those with a primary diagnosis of mental illness), we determined that they have on average visited our ED/inpatient more than four times this year. About 10% of this sample has at least two chronic conditions: diabetes and hypertension. The sample accounted for more than 2,200 visits of which 43% could be considered potentially avoidable based on the New York University Avoidable Algorithm. In looking at a broader sample of hospital admissions that had potentially preventable admissions for FY2011, we had 2,291 PPAs based on prevention quality indicators (PQI). This indicator set is related to the quality of community-based health care systems.

There are 100 primary care providers currently providing care at 14 primary care clinic sites. We anticipate hiring at least 4.0 FTE physician providers, 4.0 mid-levels, 6.0 clinical pharmacists, 7.0 social workers, 2.0 registered dietitians, and additional LVNs, navigators and RN coaches to support team-based staffing models. The final number of team members will depend on the number of providers and panel size and panel accuity. A project to determine panel size is currently in progress. Team members will be trained in team-based care and the medical home model. Managers, directors and providers will be trained in LEAN methods of reducing waste. All team members will be trained in health literacy and communication skills to embrace the patient as a shared partner in health outcomes.

Rationale:
We have selected this project because primary care expansion and capacity have been shown to link directly with the health of a community. The lack of access to quality primary care services

\[206\] Potentially avoidable ED encounters were identified using the New York University (NYU) Avoidable ED Algorithm
\[207\] Prevention Quality Indicators. www.qualityindicators.ahrq.gov
has been directly linked to increases in potentially preventable admissions. The PCMH model has been shown by other organizations to allow for better management of both acute and chronic conditions, thus reducing costs.\textsuperscript{2} Additionally, Patient-Centered Medical Homes have been shown to reduce overall costs in total health care expenditures for patients enrolled in the PCMH.\textsuperscript{208} Implementing the PCMH model will directly impact the health of our patients, improve patient satisfaction and reduce costs. Right care will be provided at the right time in the right place.

**Project Components:**
All required core components are included in this project. In order to increase timely access to primary preventive care, the PCMH model of care will be implemented in our community-based primary care clinics. This project will improve coordination of care across our system and community. Our milestones measure our implementation of the components of the PCMH, making sure that the patients are directed to medical homes for their first appointment in a timely manner and ensuring that compliance with preventive medical care is tracked and encouraged across the system. As a result of these improvement milestones we expect to increase capacity of the community-based primary care system in RHP 10. The milestones chosen ensure that we reach our five year target to reduce potentially preventable PQI hospitalizations for ambulatory care sensitive conditions. In an initial data pull from our EMR, members of our Medical Home population had 1,104 PQI admissions in hospital fiscal year 2011.

**Unique community need identification numbers the project addresses:**
- CN.1 – Lack of provider capacity
- CN.2 – Shortage of primary care services
- CN.4 – Lack of access to mental health services
- CN.10 – Overuse of ED services
- CN.11 – Need for more care coordination
- CN.15 – Need for more education, resources and promotion of healthy lifestyles

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** This is a new project and we have received not received any other federal funding for this project.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**IT-2.12** PQI Composite Measures for potentially preventable hospital admissions for Ambulatory Care Sensitive Conditions

Overuse of the ED has been identified as a key priority in the Region 10 community health needs assessment. A 2012 publication from the Patient-Centered Primary Care Collaborative (PCPCC) details the early cost and quality results of 34 PCMH initiatives across the United States. Almost all participants have shown a reduction in admissions and most have shown a reduction in cost per member. Additional evidence of improved health outcomes is outlined in a report by Grumbach and Grundy. Both publications have compiled the results of many medical home initiatives over a period of several years. As these reviews are both updated, the authors are finding consistency in their findings. Medical home interventions are noted to improve quality of care and patient experience as well as reduce admissions.

**IT-12.1 Breast Cancer Screening**
We have selected this outcome measure because of the greater compliance with preventive screening due to enrollment in a medical home delivery model.

**IT-12.2 Cervical Cancer Screening**
In a report by the Commonwealth Fund, patients with a medical home reported greater compliance with routine preventive screenings largely due to the system of reminders and care coordination that is essential to the medical home delivery model. Both breast cancer screening and cervical cancer screening have been shown to limit disease severity thereby improving outcomes for women.

**Relationship to Other Projects:**
**Related Category 1 and 2 projects:**
The following projects and interventions support the PCMH in the network:
- Project 126675104.1.2 is a 24/7 call center with nurse advice available to direct patients to the right place for care.
- Project 126675104.2.5 will enhance care coordination for better transitions from the hospital and ED to the medical home.
- Project 126675104.2.11 relates to improving the patient experience in the community health clinics.

The following projects will have a subset of shared reporting outcomes:
- Project 126675104.2.8 will assist with managing a targeted group of patients who have had four or more ED/inpatient admissions. The Category 3 outcomes related to ED utilization will be reported in that project.
- Project 126675104.2.12 will provide maternal medical homes.
- Project 126675104.2.4 will provide care transitions for patients with CHF. The subset of medical home patients who are represented in this project will have Category 3 outcomes reported in that project.

**Related Category 4 population-focused improvements**

RD 1.3 – This project will measure compliance with pneumonia vaccination for those patients empaneled in the PCMH.
RD2.7 – Patients getting care in a patient-centered medical home are less likely to seek care in the Emergency Department.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as Tarrant County patients seeking primary care. The percentage of the population expected to be positively impacted by the project is 15%, an estimate which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, their access primary care will be increased as well as improved clinical outcomes associated with early detection of high risk cancers.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her cost to and dependence on the community should be diminished and increase access to inpatient beds will be available if less hospitalizations occur as a result of ambulatory care sensitive conditions.

Project Option 2.12.2 – Implement/Expand Care Transitions Programs- Care Connections for the Homeless

Unique Project ID: 126675104.2.3
Performing Provider Name/TPI: JPS Health Network / 126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: This project will improve care transition and health outcomes for the Tarrant County population designated as Homeless. Multi-disciplinary teams of medical, behavioral health, advanced practices, paramedics, and care transition support staff will be deployed to provide services to individuals living on the streets, shelters, or in supportive housing. This project is a new initiative and has no other federal funding. This program will coordinate/supplement other federally-funded program (i.e. rental assistance from HUD or Supplemental Supportive Services for Veterans’ Families from the VA) but will not supplant existing dollars.

Need for the project: The 2011 point in time count of the Homeless was 2,169 and the “annualized” HUD estimate of people experiencing Homelessness was 4,847. Receiving integrated health and support services tailored to the needs of the Homeless population is vital for improved health outcomes in this vulnerable population.

Target population: The target Homeless population for this project includes persons in Tarrant County living unsheltered including in cars, abandoned buildings, under bridges, etc., in emergency shelters and tenants in supporting housing. This project is estimated to serve 2,100 unduplicated patients in the Homeless population in the reporting period.

Expected patient benefit: Care Connections for the Homeless will improve access to care and improve overall health status of Tarrant County’s Medicaid, self-pay, and uninsured Homeless individuals. A seamless network of care will improve ED appropriate utilization, improve health outcomes and reduce financial costs through reduced ED visits and hospital admissions.

Category 1 or 2 expected patient benefits: 2,100 unduplicated Homeless patients will be served with the goal of (I-11) – improving the number of Homeless patients receiving standardized care according to the approved clinical protocol and care transition policies, and (I-10) identifying the top chronic conditions and other patient characteristics or socioeconomic factors that are common causes of avoidable readmissions.

Category 3 outcomes:
- IT 1.10 Our goal is to reduce Homeless individuals identified as diabetic that have HbA1c poor control (>9.0%) by 10% in DY4 and 15% in DY5.
- IT 1.18 Our goal is to increase access to follow-up after hospitalization for mental illness by 15% in DY4 and 20% in DY5.
- IT 9.2 Our goal is to reduce ED visits for target conditions by 10% in DY4 and 15% in DY5.
Project Option 2.12.2 – Implement/Expand Care Transitions Programs- Care Connections for the Homeless

Unique Project ID: 126675104.2.3
Performing Provider Name/TPI: JPS Health Network / 126675104

Project Description:
Care Connections for the Homeless will improve care transitions and health outcomes for Tarrant County patients who are homeless210 and ensure they receive integrated health and human services tailored to their life circumstances to both improve their health and quality of life, and prevent hospital readmissions. People who are homeless constitute a significant number of inappropriate, potentially preventable, cyclical and expensive ambulance transports and admissions to emergency services (medical and psychiatric) and inpatient care.211 By improving access to better coordinated and holistic care, the Care Connections for the Homeless program will achieve the triple aim of providing better care, improving health, and reducing costs.

Multidisciplinary teams of medical, behavioral health, advance practice paramedics, and social services professionals will be deployed along with peer specialists to provide services to individuals living on the street, in shelters, or in supportive housing. The teams will coordinate and provide care transitions and follow-up care after hospital admissions and ED visits 24 hours per day, seven days per week in the location that best meets the needs of the individual, i.e., in a shelter, hotel, supportive housing program, community clinic, or on the streets. Robust social services will be concurrently delivered. This project also will develop an innovative solution for the supervised administration of medicines in emergency shelters to improve treatment compliance and medication adherence. Care team delivery protocols will be based on evidence and best practices cited by the Substance Abuse and Mental Health Services Administration (SAMHSA),212 the U.S. Department of Health and Human Services,213 the U.S. Department of Housing and Urban Development,214 and the academic literature.215 Ongoing and transitional care (especially postdischarge) will include outreach and engagement, screenings and assessments,

210 The target “homeless” population for this project includes persons in Tarrant County living unsheltered (including in cars, abandoned buildings, under bridges, etc.), in emergency shelters and tenants in supportive housing.
211 Add citation from JPS population data pulled by Evan.

215 http://www.urban.org/housing/homeless.cfm
primary care (including acute and chronic conditions), behavioral health care, crisis intervention and care coordination, as well as resources for medication adherence, translation, transportation, motel respite, and specialty care services. Supportive services for the formerly homeless in supportive housing have significantly reduced service utilization and other costs at JPS Health Network.\textsuperscript{216} Thus, a key project component is concurrent and coordinated delivery of allied social services tailored to those who are homeless. This project includes our collaborative partners: JPS Health Network, homeless clinics, MedStar ambulance services, the City of Fort Worth, supportive housing (rental assistance) programs, Mental Health Mental Retardation of Tarrant County, and Tarrant County Medical Society’s Project Access.\textsuperscript{217}

**Goals and Relationship to Regional Goals:**

**Project Goals:**
The overall goal of Care Connections for the Homeless is to transform the fragmented and under resourced health care system for homeless individuals by creating a coordinated, right-sized network of health care and allied human services delivered in convenient locations. Our purpose is to better serve individuals living on the street, in emergency shelters or in supportive housing and to achieve measurable improvements for people who are homeless.

This project meets the following Regional goals:
This project meets a number of Regional goals aligned with the goals of the Waiver and CMS’ triple aim. Specifically, by serving the most vulnerable persons at their most vulnerable time, this project will reduce morbidity and mortality as well as financial and human costs, including a reduction in ED visits and subsequent hospitalizations.

**Challenges:**

JPS Health Network and its partner agencies provide an array of hospital services and primary care, behavioral health care, crisis intervention, and social services for homeless people. However, transitions between types and systems of care pose significant challenges for homeless individuals. They present with limited personal resources, decreased medical and social supports, as well as numerous circumstantial barriers to treatment compliance, medication adherence and access to willing specialty providers.

**5-Year Expected Outcome for Provider and Patients:**
Care Connections will develop a seamless, integrated network of care enabling homeless patients to access and transition between appropriate levels of care. This project addresses fragmented,

\textsuperscript{216} In a cohort of supportive housing tenants, post-housing service reductions “were largest for urgent care (64%), psychiatric ER (50%), and medical ER (45%).” Petrovich, J. and Spence-Almaguer, E., *Evaluation of Directions Home Supportive Housing and the Use of Critical Service Systems: Preliminary Results:* August 10, 2010; [http://www.DirectionsHome.org](http://www.DirectionsHome.org)

\textsuperscript{217} The Tarrant County Homeless Coalition, the United Way of Tarrant County and the City of Fort Worth work together to encourage and facilitate collaboration among more than 90 agencies who deliver a wide range of housing, social services, employment, and emergency shelter.
incomplete and uncoordinated systems faced by patients and will provide better-quality and better-coordinated care for homeless patients, resulting in improved individual and community health as well as lowered cost. During the Waiver period Care Connections will serve a target, point-in-time population of 2,100.218 Clinical objectives include: reduced Emergency Department visits for target conditions from baseline by 15%; increased access to follow up after hospitalization for mental illness by 20% from established baseline; and, reduced baseline number of homeless individuals identified as diabetic with HbA1c poor control (>9.0%) by 15%.

**Starting Point/Baseline:**
Those who are homeless have numerous health problems and complex, frequently acute, chronic and/ or communicable disease.219 In Tarrant County, medical care for the homeless is delivered through hospitals, EDs, hospital-affiliated primary care clinics, charity clinics, advanced practice paramedics, and clinics conducted by students and faculty of an academic medical center. Behavioral health care is principally delivered through the JPS Health Network Hospital, Mental Health Authority, Recovery Resource Council, NGO-based counselors, Recovery Support Networks, and faith congregations. The 2011 point-in-time count of the homeless was 2,169 and the “annualized” HUD estimate of people experiencing homelessness was 4,847.220 In FY 2011, JPS Health Network identified 233 homeless frequent hospital utilizers (four or more encounters per year in the emergency department and/or as inpatient admissions). Incurred charges in 2011 for these homeless individuals was $10,174,589.

**Rationale:**
The evidenced-based, multidisciplinary, and timely interventions at the heart of the Care Connections will improve the health of a vulnerable and high acuity population, enable the provision of better patient-centered care and prevent increased health care costs and preventable hospital readmissions. Transitions between care present optimal opportunities for the strategic and integrated delivery of health care, behavioral health care and allied social services with this highly mobile, underserved population. Consistent with national statistics, the medical needs of the homeless in Tarrant County are numerous and complex, frequently acute, chronic and/ or communicable while services are in short supply, poorly coordinated and insufficiently integrated.221 For example, one study reported that the delivery of services to people living in supportive housing reduced their JPS Health Network services utilization by substantial amounts.

---

218 Using a HUD-proscribed algorithm with point-in-time count data, the Tarrant County Homeless Coalition estimates that 4,847 people experienced homelessness in Tarrant County over the course of calendar year 2011: [http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx](http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx)

219 Cardarelli, K; Carlson, E; Jackson, R; Ward, K; A Plan for the Delivery of Health Care to the Homeless: A report prepared for Tarrant County Commissioner Roy Brooks by The Blue Ribbon Task Force on Health Care for the Homeless; Center for Community Health University of North Texas Health Science Center, 2008.

220 Tarrant County Homeless Coalition, 2011; Annualized estimates are derived by the application of a HUD-proscribed algorithm to point-in-time count data: [http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx](http://ahomewithhope.org/homeless-facts/homeless-statistics.aspx)
in numerous categories, including, urgent care, 64%, psychiatric ED, 50%; and medical ED, 45%. 222

Project Components:

The JPS Health Network and Region 10 implement and continuously improve pilot interventions in care transitions for the homeless (2.12.2) to address known challenges facing these vulnerable patients, such as medication storage and adherence. By investing strategically in partnerships, this initiative leverages and better coordinates existing community resources. The interventions at the heart of this program will be piloted to identify which work best for people who are homeless. Project milestones and metrics address this population’s high burden of disease and include: (1) Establishing a care transitions program specific to the homeless; (2) increasing the percentage of the homeless population receiving standardized care; and (3) identifying and reporting on the top chronic conditions prevalent among program participants. In total these milestones ensure clear linkages among providers and support personnel to improve care transitions, increase the quality and availability of care, positively impact health outcomes and prevent avoidable readmissions and inappropriate ED utilization.

The project will include a focus on continuous quality improvement by:

- Completing rapid cycle improvement initiatives that will focus on identifying the medical needs of the Tarrant County homeless community and removing barriers to maintaining health and providing health care services to the homeless.
- Identifying project impacts through the measurement of homeless patients seen for potentially preventable admissions to the emergency department
- “Lessons learned” will be utilized to identify barriers to care with special considerations for safety-net populations
- Identifying key challenges and process opportunities associated with expansion of access points that provide care to the homeless community.

Unique community need identification numbers the project addresses:

- CN.1 – Lack of provider capacity
- CN.4 – Lack of access to mental health services
- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.10 – Overuse of ED services
- CN.11 – Need for more care coordination

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and has no other federal funding from the U.S. Department of Health and Human Services. The program will coordinate with and supplement other federally-
funded programs (such as rental assistance from HUD or Supplemental Supportive Services for Veterans Families from the VA) but will not supplant existing dollars.

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**Outcome Measure 1:** IT-9.2 ED appropriate utilization.

**Rationale:** This project will reduce avoidable ED visits by those who are homeless. In FY2011, 232 homeless patients had 4 or more ED visits and/or inpatient admissions at the JPS Health Network totaling 1,967 visits and $10,174,589.81 in charges. Homeless adults visit EDs nearly four times more than the general population and are among the highest repeat visitors. Our aim in creating a team that: (1) networks with discharge planners, social services, primary care, behavioral health care, crisis intervention and supportive services, (2) coordinates discharges from the hospital – both ED and inpatient, (3) identifies the homeless persons immediately, (4) makes contact, (5) assesses social and medical needs, (6) provides critical medication support, (7) provides and coordinates timely care is improved access and transitions along with better health and reduced inappropriate ED utilization.

**Outcome Measure 2:** IT-1.18 Follow-Up After Hospitalization for Mental Illness.

**Rationale:** The identified population cannot adequately access primary or secondary mental health services, comply with medication schedules, or consistently obtain prescribed medications. Mental health disorders increase the risks of and the tendency toward homelessness. An opportunity exists to identify this subpopulation of homeless and provide coordinated, collaborative posthospital care. JPS Health Network, in FY 2011, identified 937 homeless patients with mental illness who had at least one ED or inpatient visit that year. JPS Health Network also identified 233 homeless persons who were frequent hospital utilizers (>4 visits/year), and of this group, those with mental health diagnoses (including substance abuse) numbered 214, and incurred charges of $9,583,258. By coordinating with all partnering mental health agencies serving the homeless, the city emergency medical services, and the discharge planners at JPS Health Network, the Care Teams will identify and reach out to the homeless population upon discharge from JPS inpatient and ED. Medications and other psychosocial and medical needs will be addressed upon discharge, with intermediate follow up and referrals scheduled and supported.

**Outcome Measure 3:** IT-1.10 Diabetes care: HbA1c-poor control.

**Rationale:** Diabetes – a common chronic disease – in combination with homelessness, magnifies the documented poor health and welfare of the individuals affected, and increases social service demands, medical costs, and disability. The Tarrant County homeless population includes a disproportionate number of patients with diabetes due to higher numbers of subpopulations with higher prevalence of diabetes: Hispanic, African-Americans, and American Indians. The homeless are lacking medical and social services to manage diabetes and its complications. In FY 2011, JPS Health Network identified 35 homeless persons diagnosed with diabetes.

---

Regional Healthcare Partnership

Related to Other Projects:
This project works in tandem with other important JPS Health Network initiatives: Expand Behavioral Health Care Capacity (126675104.1.1), which ensures followup after hospitalization for mental illness; (2) JPS Health Network Family-Centered Medical Home (126675104.2.2), which focuses on improving quality outcomes for the diabetic population; (3) JPS Health Network -MedStar Patient Navigation Program (126675104.2.-8), which will reduce all ED visits and reduce ED visits for target conditions; and Community Connect (126675104.2.1), which improves diabetic care by reducing HbA1c poor control and by improving the vaccination status for older adults. This project also addresses RD-1, Potentially Preventable Admissions; RD-2.3, Behavioral Health and Substance Abuse 30-day readmission; and, RD-2.7, All-cause Admission.

Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:
The Care Connections for the Homeless project will be closely coordinated with the University of North Texas Health Science Center’s (UNTHSC) “Health Navigation and Incentives for Dual Diagnosis Patients.” The UNTHSC project will address a different set of outcomes for a subset of the Care Connections for the Homeless project: supportive housing tenants who have co-occurring mental health and substance abuse problems. Because of their complexity, this group has special needs that may benefit from the more intensive UNTHSC project, which specifically targets those with substance abuse and mental health problems, and measures outcomes related to both aspects. Staff of the UNTHSC project will regularly meet with and actively cross-refer patients for the unique services delivered by the Care Connections for the Homeless and vice versa.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

Project Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)
JPS Health Network defined the population that will be directly impacted by the project as homeless patients in Tarrant County. The percentage of the population expected to be positively impacted by the project is 15%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when people are positively impacted, their ability sustain themselves is not significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, his or her dependence on the community for health care needs is significantly reduced.

#### Milestone 1 [P-4]:

**Conduct an assessment and establish linkages with community-based organizations to create a support network for targeted patients postdischarge.**

**Metric 1 [P-4.1]:** Care transition assessment

- **Baseline/Goal:** Conduct a care transitions assessment for the Homeless population
- **Data Source:**

**Milestone 1 Estimated Incentive Payment:** $295,256

#### Milestone 2 [P-7]:

**Develop a staffing and implementation plan to accomplish the goals/objectives of the care transitions program.**

**Metric 1 [P-7.1]:** Document the staffing plan.

- **Baseline/Goal:**
- **Data Source:**

**Milestone 2 Estimated Incentive Payment:** $295,257

#### Milestone 3 [P-2]:

**Implement standardized care transition processes**

**Metric 1 [P-2.1]:** Care transition policies and procedures

- **Baseline/Goal:** Submission of protocols and establishment of baseline data on number in population receiving standardized care according to approved clinical protocols and care transition policies.
- **Data Source:** EPIC, EMR, HIE, spreadsheets, policies and procedures

**Milestone 3 Estimated Incentive Payment:** $603,954

#### Milestone 4 [I-11]:

**Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transition policies.**

**Metric 1 [I-11.1]:** Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines

- **Goal:** 1,500 unduplicated patients in the Homeless population will be served through this program that receive standardized care according to the approved clinical protocols and care transition policies from established baseline.
- **Data Source:**

**Milestone 4 Estimated Incentive Payment:** $323,045

#### Milestone 5 [I-10]:

**Identify the top chronic conditions and other patient**

**Milestone 5 Estimated Incentive Payment:** $266,863

#### Milestone 6 [I-11]:

**Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transition policies.**

**Metric 1 [I-11.1]:** Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines

- **Goal:** 2,100 unduplicated patients in the Homeless population served through this program that receive standardized care according to the approved clinical protocols and care transition policies from established baseline.
- **Data Source:**

**Milestone 6 Estimated Incentive Payment:** $266,863

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.12.1 – Coordinated CHF Program

Unique Project ID: 126675104.2.4
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The purpose is to reduce readmissions; reduce length of stay and to improve quality outcomes for the congestive heart failure population. The project intervention is a new initiative.

Need for the project: JPS Health Network is addressing the region needs of a growing chronic care population through increased access and more appropriate utilization of clinical resources. JPS has identified a population of patients that utilizes the emergency department for exasperation of CHF symptoms causing an increase in ED utilization and an increase in inpatient admissions including 30-day readmissions. We anticipate that this program will have significant positive impact on this population as the program is designed to be coordinated with the JPS multi-disciplinary team Patient Centered Medical Home.

Target population: The target population is approximately 4,000 patients that annually visit the ED with a primary or secondary diagnosis of congestive heart failure. The benefit for the uninsured and Medicaid population of our service area is to offer alternative resources outside of the ED and to have those resources available before the patient’s condition is critical enough to require an admission or ED visit and to integrate them into a primary care model for long-term benefits. Our target volume of 250 patients in DY3, 400 patients in DY4 and 400 patients in DY5 will be receiving care as evidenced by best practices. Our systems will be integrated to assure early identification of this at risk population and to assure long term continuity of care. Our process will be to link patients at discharge to our CHF Clinic as part of our discharge planning. This will be a key component of our program. Processes of the program also include analyzing readmission rates with our multidisciplinary cross continuum of care team along with a review of metrics and the implementation of PDCA initiatives.

Category 1 and 2 expected patient benefits: Milestones P-1.1, P-5.1, P-7.1, P-2.1, P-12.1, I-10.1, I-11.1, I-12.1 were selected. Each milestone selected was due to their natural progression to project implementation or a natural result of implementing integrated care components.

Category 3 outcomes. Outcomes I-10.1, I-11.1 and I-12.1 were selected. There is an evidence base to suggest that integrated care will have positive impact on each of those outcome areas.
Project Option 2.12.1 – Coordinated CHF Program

**Unique Project ID:** 126675104.2.4  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Project Description:**
We are implementing an outpatient congestive heart failure (CHF) clinic program. Inpatients with CHF who are at high risk of readmission for CHF will be enrolled in the program, which we have named Care Transitions. While the patient is in the hospital, the program will focus on readiness for discharge and inpatient counseling with a CHF physician specialist in order to prepare the patient to successfully manage their condition out of the hospital. Upon discharge, the program will connect patients with ongoing outpatient care that includes continuous CHF management at the dedicated CHF clinic, including monthly outpatient visits with medication management and lab work, and routine quarterly/annual visits for patients with implanted devices. The project also provides ongoing, regular outpatient monitoring, including remote telephone monitoring, for enhanced identification of patient symptoms. CHF program participants will also receive general posthospitalization follow up and nutrition education and services. Patients will have access to a clinical pharmacist who will regularly review the patient’s medication program so that patients can stay healthy and out of the hospital. The end result will be a reduced rate of unnecessary readmissions and improved quality of life for CHF patients.

Our dedicated CHF clinic will increase access to a cardiology specialist and specially trained support staff including a specialist in remote monitoring after discharge for those of the targeted CHF patients who receive device implants. After this program is implemented, CHF patients who, in the absence of this program readmit to the hospital due to lack of understanding of their disease and no community-based resources, will have the clinical and support resources to keep them healthy and in the community. The program’s readmission avoidance/frequent user component includes a detailed specific patient education effort about medication and dietary management of their disease. A physician assistant will support and provide day to day oversight of this aspect of the program. The physician assistant will also identify all inpatients admitted to JPS Health Network with a diagnosis of CHF to ensure each patient has clinic appointments scheduled for post hospital follow up and receives patient education prior to discharge. We anticipate that this CHF program will have a significant positive impact on individuals with congestive heart failure. This program will work in tandem with JPS Health Network’s coordinated multidisciplinary team Patient-Centered Medical Home project.

**Goals and Relationship to Regional Goals:**

**Project Goals:**
A dedicated CHF clinic with remote monitoring capability will focus on reducing the incidence of unnecessary ED visits and inpatient admissions of identified CHF patients through disease-specific counseling that includes medication management and dietary management as well as ongoing telephonic counseling and appointment scheduling assistance.

This project meets the following Regional goals:
The project relates to Regional goals by addressing the needs of a growing chronic care patient population through increased access to care and more appropriate utilization of clinical resources with an emphasis on patient self-management and outpatient chronic disease management. This project is an aspect of JPS Health Network’s Patient-Centered Medical Home initiative – ensuring that this chronic need population is brought into a patient-centered approach that focuses on appropriate chronic disease management and support.

Challenges:
JPS Health Network has an identified CHF patient population that relies unnecessarily on the emergency department for management of their CHF symptoms. The challenge for this project will be to retrain both our clinical teams and our CHF patient population to alter this care-seeking behavior to ensure more appropriate ongoing management of CHF patients.

5-Year Expected Outcome for Provider and Patients:
Our five year outcome is to improve JPS Health Network CHF clinical capacity and improve the clinical experience and treatment received by CHF patients. We expect a 25% volume increase in outpatient encounters compared to baseline. We also expect increased remote monitoring capacity (an estimated 3600 annual remote monitoring encounters); a 50% reduction in ED utilization from our baseline of 263 annual visits; and a reduced inpatient LOS for patients with primary diagnosis of CHF from baseline of 7.1 to 5.5. The end result will be a reduction in unnecessary ED utilization and a reduction in inpatient admissions including 30-day readmissions.

Starting Point/Baseline:
Patients with a primary or secondary diagnosis of CHF account for approximately 4,000 annual emergency department visits at JPS Health Network. In addition, JPS Health Network has over 2,200 annual inpatient admissions for CHF as the primary diagnosis. In 2010 Tarrant County had 3,271 avoidable admissions with a diagnosis of congestive heart failure. The incidence of CHF related illnesses continues to be a major cost driver for our health care system (19% of CHF patients account for 46% of the visits).

Rationale:
With high emergency department utilization patterns for patients with congestive heart disease we have selected this project as an opportunity to improve the health status of these patients with
early intervention. This program will allow patients to have access to an outpatient congestive heart failure clinic and to be monitored remotely allowing the physician to identify early clinical changes for the patient and reducing the need for an emergency department visit.

**Project Components:**
This project contains all of the core components including disease-specific education and self-management support. A clinically led and mission-driven coordinated multidisciplinary team of pharmacists, cardiologists, technicians and primary care physicians that work together to improve communication and seamless care of this specific patient population. The project would utilize technology with remote monitoring of this high risk population and provide routine quarterly/annual visits for patients with implanted devices and monthly visits for patients with medications with lab work provided. It will also offer disease-specific education for patients and families to better understand the disease and the management of the disease. As part of our implementation of the CFH clinic, we will be (a) reviewing best practices in cardiology, IHI and the Institute of Medicine. Our process will include (e) bridging discharge planning by our dedicated physician assistant to our outpatient program. We will be (c)(d) establishing an integrated IT system with our Emergency Room and inpatient services to assure we identify at risk patients and to assure continuity of care of this population as part of our learning collaborative. Our (f) multi-disciplinary cross-continuum team will be (b) analyzing our readmissions utilizing the STAAR tool and focused interventions with our patients. This team will also review performance metrics and develop PDCA performance improvement projects as needed. The milestones we have selected include the hiring of staff for a congestive heart failure clinic, including a residency trained pharmacist in medication management; a device specialist with experience in remote monitoring of patients with implantable devices with congestive heart failure chips allowing early identification of physical changes; a mid-level provider to work with the physician in the inpatient setting to begin the education process and referral to the outpatient clinic; an additional nurse and medical assistant to augment the congestive heart failure physician; and a case manager to work in conjunction with the inpatient physicians to set up a case management structure for tracking and monitoring this population. In addition, the milestones include the implementation of a remote device monitoring system; setting up a dedicated congestive heart failure clinic in current clinical space; developing an education program for patients with congestive heart failure including patient families; developing an education program for primary care physicians and emergency physicians regarding the service that includes identification of congestive heart failure patients who utilize the emergency department so that that patient population can be readily targeted in the first phase of the program and brought into chronic disease management for their CHF disease.

**Unique community need identification numbers the project addresses:**
- CN. 11 – Inefficient care coordination
- CN. 3 – Shortage of specialty care services
Regional Healthcare Partnership

- CN. 1 – Lack of provider capacity
- CN.10 – Overuse of emergency services
- CN.13 – Necessity of patient education programs

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** This is a new initiative and is not receiving any other federal funding.

**Related Category 3 Outcome Measures:**
**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

**IT-3.2 Congestive Heart Failure 30-day readmission rate (stand-alone measure)**
By the end of the Waiver, our goal is reduce readmission rates for the CHF population by 5% for all patients admitted with a primary diagnosis of CHF. CHF readmission rate for our facility is 18% and a dedicated focus on this population will improve the overall health of the community especially low-income patients without access to this specialized care.

**IT-6.1 Percent improvement over baseline of patient satisfaction scores**
By the end of the Waiver, our goal is to determine baseline patient satisfaction score and reach a 10% improvement overall. Patients who are satisfied with their care are more likely to participate in the overall plan of care and follow the direction of the physician especially regarding medication management and dietary restrictions both categories that are critical in the management of the congestive heart failure patient.

**Relationship to Other Projects:**
Our integrated approach to CHF management continues with the relationship to the community MedStar program (- 126675104.2.8), which is an alternate disposition program that will also positively impact the CHF population. Our community EMS provider is developing a program that will send a clinical provider to specific patients who contact the EMS provider, such as patients with CHF symptoms, and who need a resource for clinical care. This provider will have direct access to schedule patients directly into the CHF clinic as appropriate. In addition, they will have access to the providers for consultation to determine the best course of action for any specific patient. This method of care transitions will decrease the utilization of the emergency department by giving direct access to outpatient appointments. The integrated Patient-Centered Medical Home Model program (Unique RHP Project Identifier number 126675104.2.2) under development across JPS Health Network’s ambulatory care sites will also augment the CHF clinic. Many patients are admitted through the emergency department without a primary care provider. Patients discharged from the emergency department or hospital that are followed in the CHF clinic will also be assigned a primary care provider during their first post hospital visit to improve the coordination of care. In addition, through the use of the EMR our primary care providers will be able to access all documentation from the CHF clinic which will improve clinical coordination. This project also will work alongside two additional JPS Health Network...
projects, our call center project (126675104.1.2), and our project to improve patient experience (126675104.2.11).

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

(See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.) Though this project does not fit into the two learning collaboratives, over time the Region anticipates that new learning collaboratives may develop as a result of providers’ desire to share their experiences and learn from other DSRIP projects.

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project.

JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as JPS Health Network congestive heart failure patients. The percentage of the population expected to be positively impacted by the project is 7%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her quality of life is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 1. We believe this to be the correct number because when a person is positively impacted, the dependence on the community is not significantly improved.
### Regional Healthcare Partnership

| Milestone 1 [P-1]: Develop or implement best practices or evidence-based protocols (such as Partnership for Patients) for effectively communicating with patients and families during and post-discharge to improve adherence to discharge and follow-up care instructions |
| Metric 1 [P-1.1]: Care transitions protocols |
| Baseline/Goal: Development of necessary CHF protocols |
| Data Source: Documentation of protocols |
| Milestone 1 Estimated Incentive Payment (maximum amount): $88,911 |

| Milestone 2 [P-5]: Using a validated risk assessment tool, create a patient identification system. |
| Metric 1 [P-5.1]: Patient stratification system |
| Baseline/Goal: identify 80% of target CHF population |
| Data Source: EMR medical records |
| Milestone 2 Estimated Incentive |

| Milestone 3 [P-6]: Implement standardized care transition processes |
| Metric 1 [P-6.1]: Care transitions policies and procedures. |
| Baseline/Goal: 100% adherence to necessary CHF protocols |
| Data Source: EMR or program records |
| Milestone 3 Estimated Incentive Payment (maximum amount): $272,803 |

- 126675104.3.20 IT-6.1

| Milestone 4 [P-2]: Implement standardized care transition processes |
| Metric 1 [P-2.1]: Care transitions policies and procedures. |
| Baseline/Goal: Development of necessary CHF protocols |
| Data Source: Documentation of protocols |
| Milestone 4 Estimated Incentive Payment (maximum amount): $272,803 |

| Milestone 5 [P-12]: Participate in face-to-face learning (i.e. meetings or seminars) at least twice per year with other providers and the RHP to promote collaborative learning around shared or similar projects. At each face-to-face meeting, all providers should identify and agree upon several improvements (simple initiatives that all providers can do to “raise the floor” for performance). Each participating provider should publicly commit to implementing these improvements. |
| Metric 1 [P-12.1]: Participate in semi-annual face-to-face meetings or seminars organized by the RHP. |
| Baseline/Goal: participate in two meetings per year |
| Data Source: Learning Collaborative meeting agendas and meeting minutes |
| Milestone 5 Estimated Incentive Payment (maximum amount): $72,959 |

| Milestone 6 [I-10]: Identify the top chronic conditions (e.g., heart failure and pneumonia) and other patient |
| Milestone 6 Estimated Incentive Payment (maximum amount): $72,959 |

| Milestone 7 [I-11]: Improve the percentage of patients in defined population receiving standardized care according to the approved clinical protocols and care transitions policies |
| Metric 1 [I-11.1]: Number over time of those patients in target population receiving standardized, evidence-based interventions per approved clinical protocols and guidelines |
| Baseline/Goal: 90% of CHF patients |
| Data Source: EMR |
| Milestone 7 Estimated Incentive Payment (maximum amount): $120,541 |

| Milestone 8 [I-12]: Reduce the percentage of high users of ED services with ambulatory care sensitive conditions |
| Metric 1 [I-12.1]: Identify high users with ambulatory care sensitive conditions. |
| Baseline/Goal: 40% reduction in... |

Project Summary Template to be completed for each Category 1 and 2 project

Project Option 2.12.1 – Implement/Expand Care Transitions Programs – Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions

Unique Project ID: 126675104.2.5  
Performing Provider Name/TPI: JPS Health Network/126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The project purpose is to implement a comprehensive, safe and effective discharge planning and discharge support program. Interventions will include hospital visits, home visits, care transitioning to various care settings, patient/family role coaching, preparing for doctor’s visits, education related to medications, responding to red flags, obtaining follow up appointments, etc. This project is a new initiative.

Need for the project: All counties in Region 10 identified more care coordination as a system cap and need. EDs are over used. There were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1000 persons. The 2007 national ED visit rate was 390.5 per 1000 persons, increasing 23% since 1997, but lower than the ED visit rate of Region 10.

Target population: Medicaid and uninsured patients discharged from JPS Health Network inpatient or ED settings that are transitioning to a medical home. Estimated number of patients to be served over the waiver period: 5,000 patients will receive care coordination from trained staff that will aid in decreasing unnecessary hospital readmissions and ED visits; most of which are preventable and come at a cost both to the patient's health and function. Patients will receive personalized coaching and training/education specifically designed to help them better manage their health.

Category 1 and 2 expected patient benefits: Care coordination services that benefit the patient: discharge planning (hospital visits), support post-discharge (home visits), patient/family education, assistance with coordinating appointments/care, medication management, self-care management, health maintenance, etc. The project seeks to provide to each patient, at least four (4) care coordination services. 3,500 patients served and included in a registry in DY4 and 5,000 patients in DY5. The volume of services /visits in DY4 is expected to be at least 14,000 and in DY5 the volume of services/visits is 20,000.

Category 3 outcomes: IT- 3.1 All cause 30 day readmission rate.  10% reduction over baseline (< 1850 admission encounters) in DY4 and in DY5, 15% reduction (<1750 admission encounters). IT-9.2 ED appropriate utilization: 5% - decrease in ED utilization - over baseline in DY4 and 10% - decrease in ED utilization - over baseline in DY5.
Project Option 2.12.1 – Implement/Expand Care Transitions Programs – Develop, implement and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions

**Unique Project ID:** 126675104.2.5  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Project Description:**
JPS Health Network proposes to create a network-wide care transitions program to reduce avoidable inpatient admissions and readmissions, reduce inappropriate emergency department (ED) utilization and connect patients in need of primary and preventive health care to their medical home. The program will provide intensive case management to avoid all-cause readmissions, ensure effective care coordination/navigation, promote effective transfer to post acute care agencies, improve access to preventive health care and discharge planning with post discharge support, based on the evidenced-based model, The Care Transitions Intervention™ program, developed by Dr. Eric Coleman. The case management staff will work with an interdisciplinary team to identify the most appropriate transition care setting.

Three major teams will be established and all will utilize an integrated electronic medical record (EMR) so that continuity of care is enabled. (1) The inpatient care management team will lead care coordinating transitions with physicians, nurses, social workers, and other members of the health care team to facilitate the progression of care from hospital admission through discharge. Prior to discharge, early in the course of care, the team will complete an initial discharge assessment to include issues related to funding, medical home assignment, psychosocial needs, and ongoing medical needs. The team will function as patient advocates as they collaborate with community agencies to aid in transitioning patients to long-term care facilities, home care, hospice, etc. Additionally the staff will assist high risk, complex patients by reinforcing discharge plans and initiate a collaborative hand-off to the medical home health

---

224 A proven method for reducing avoidable readmissions is to improve transitional care, which ensures proper coordination and continuity of care as patients move between various locations or levels of care within one organization. A leading model for this work is The Care Transitions Intervention™, which has been adopted by over 170 leading health care organizations nationwide. Through this approach, Eric Coleman, MD, a nationally recognized readmissions expert, says that there are four pillars that provide a core set of medical directions that the patient should have: medication self-management, follow-up appointment with the primary care physician or specialist, a knowledge of "red flag" or warning signs of symptoms and how to respond to them, and a personal health record that is a portable core set of medical directions including a medication list and associated allergies, an advance directive, treatment preference, and room for patient questions and concerns.

In addition to these four pillars, studies show that care transitions intervention coaching can result in a significant reduction in 30-day hospital readmits, as well as a potential reduction in 90-day and 180-day readmits. Care transitions coaches could help patients by modeling behavior to resolve discrepancies, respond to red flags and obtain a timely follow-up appointment, and also help the patient practice for their next encounter with his/her provider and identify two or three questions to discuss. Enhancing the role of patients and caregivers, measuring the quality and safety of care transitions, and using health information technology to promote safe care transitions also play a role in preventing avoidable readmissions. For more information, please see: [http://www.caretransitions.org](http://www.caretransitions.org).
coach, home care, community homeless projects, federally qualified health centers (FQHCs), skilled care facilities, etc. The program will identify a patient’s need for a primary care home and will help establish primary care linkages. If the patient requires intensive care management a hand-off will also be completed to the outpatient care management team. (2) Outpatient Care Management team will reinforce The Care Transitions Intervention™ model and provide case management until the patient is well established in primary care and refer to community resources as needed. The foundational components of the transitions intervention model are: medication self-management, follow-up appointment with the primary care provider (PCP) or specialist, warning signs or symptoms and how to respond to them, and a personal portable health record. The standards of practice and scope of services of the case manager are those outlined by the American Case Management Association.225 Patient risk stratification and identification tools will be used to inform case management staff of urgency and intensity for follow-up. Registries will aid providers in addressing acute, chronic and preventive care needs for patients empaneled in the medical homes. Patients in the registries will benefit from a care management team that will reach out to them when gaps in care are identified. An individualized care management plan will be developed to aid the patient in achieving their personal health goals. Patients will benefit from receiving at least four (4) care coordination services. For the 3,500 patients that will be included in the registry in DY4, the volume of services/visits is expected to be at least 14,000 and in DY 5 the 5,000 patients in the registry will receive at least 20,000 services/visits. The registry patients will also benefit from receiving care based on standardized protocols. These registries, along with the EMR, will also support establishing an integrated information system so that continuity of care for patients is enabled. (3) ED Care Management Team will facilitate patient throughput from the ED to the appropriate care setting. The team will serve as a point of contact for referring patients to community resources and assisting with accessing clinical and support care services. This team will provide post discharge contact/follow-up. The team will also provide ED discharged patients with care coordination and hand-off to the most appropriate care setting. If the patient is admitted to the hospital, the ED transition staff will hand off to the inpatient care management team.

**Goals and Relationship to Regional Goals:**

**Project Goals:**

Project goals are to utilize a best practice model to design and implement a comprehensive discharge planning and discharge support program that systematically helps high risk patients’ access health care resources appropriately thereby decreasing potentially avoidable inpatient admissions, reducing ED encounters and increasing use of the medical home. The project will be specific to the population served and will conduct an analysis of key drivers of 30-day hospital readmissions and the development of a system that will identify those potentially at risk for needing acute care services within 30-60 days. A community-based agency team will be

---

225 American Case Management Association, Standards of Practice and Scope of Services for Hospital/Health System Case Management. [http://www.acmaweb.org](http://www.acmaweb.org).
developed to support the transitions across the continuum and provide a consistent, safe and effective transition process from one provider to another with a strong emphasis on engaging patients and improving their access to the medical home for on-going primary and preventive health care instead of the ED. A quality improvement process will identify changes that need to be implemented. This project will provide patients with services to improve disease self-management and reduce errors and complications with serious medical consequences.

This project meets the following Regional goals:
This project meets a number of Regional goals aligned with the Waiver and the Institute for Healthcare Improvement’s Triple Aim. Through the use of effective and efficient intensive case management services in the ED, inpatient and outpatient settings this program will improve the patient experience, improve the health of the population, and will reduce the cost of care by transitioning patients to the right care in the right setting.

Challenges: Patients seeking services within the JPS Health Network system often present with multiple disease processes and significant psychosocial barriers that impact their ability to seek health care consistently and timely. Upon discharge from the ED and the hospital, patients often leave without fully understanding how to take their medications, the discharge plans or follow-up care instructions. As a result, many patients are readmitted within 30 days. A 2012 patient survey revealed that 33% of the patients perceive they can “never access care” or only “sometimes access care” in the primary care clinics. JPS Health Network has an extreme caseload size at this time, which makes effective and efficient discharge planning very difficult. (Currently, case managers cover between 36-54 beds at JPS Health Network except in Women’s services where there are approximately 126 beds to cover. However, the American Case Management Association 2011 hospital survey reveals that in 60% of the hospitals (same size as JPS Health Network) case managers have an average bed coverage of 25 or less.226) Additionally, JPS Health Network case managers cover beds on multiple floors which further impacts their ability to be readily available to assess, evaluate and initiate care transition in a timely manner. The project addresses these challenges by providing an evidence-based program for care transitions and by hiring staff to implement the program.

5-Year Expected Outcome for Provider and Patients:
By the end of the Waiver period, we will reduce the all-cause readmission rate by 15% of the baseline validated in DY2

Starting Point/Baseline:

Regional Healthcare Partnership

JPS Health Network does not have an evidence-based care transitions program. Discharge planning is not comprehensive and post discharge support is not consistent. There are no established transitions of care discharge planning, hand-off processes, guidelines and policies/procedures. Of the 32,833 patients discharged from JPS Health Network in FY 2011, a total of 2,948 patients were identified as having diabetes, a potentially preventable admission diagnosis. The same analysis also showed that 71% of inpatients are admitted from the ED. FY 2011 data also showed that over 37,000 unique patients had at least one potentially avoidable ED encounter and; 1,352 unique patients had four or more inpatient or ED encounters. This subset of patients also had a total of 1,039 inpatient admissions with 161 potentially avoidable admissions. Current project baselines will be validated in DY2.

**Rationale:**
JPS Health Network seeks to improve clinical outcomes and reduce cost of care by providing well coordinated, accessible, and standardized care. The Region 10 community health needs assessment cited ED overuse, reduced inpatient capacity and impaired patient flow as significant barriers. Admissions and readmissions are major contributors to both reduced inpatient capacity and impaired patient flows; JPS Health Network has a readmission rate of 13% for its low-income, uninsured population. Milestones for this project include: (1) Establish a process for hospital based case managers to follow up with identified patients hospitalized that addresses the top chronic conditions and provides standardized discharge instructions and patient education. Topics will include activity, diet, medications, follow up care, etc.; (2) Develop a staffing plan; (3) Create a patient identification system using a validated risk assessment tool; (4) Implement a case-management-related registry; (5) Implement standard care transition processes in specified patient populations; and, (6) Increase the number or percentage of patients in the case-management-related registry. These milestones and the associated metrics create an evidence-based program with standardized protocols that align with the Hospital Readmissions Reduction Program, under the Affordable Care Act.

**Project Components:** All required core components will be included in the project. Additionally, core components C, D and E are also addressed as milestones.

a. A review of best practice models such as RED, STAAR, BOOST, Coleman, etc. will be completed. From the review a best practice model will be chosen as the infrastructure for the project. Interventions from other best practice models will also be used if deemed to be effective with the targeted populations.

b. Care Management staff will complete an assessment interview on readmitted patients to identify reasons (key drivers) for readmissions and conduct chart reviews using an approved tool. This data analysis of key drivers will be used to develop strategies and interventions specific to the population.

c. EPIC (electronic medical record) and a provider health record hotline will be used to aid in integrating information health systems so that continuity of care, communication and coordination of care across the continuum is enabled. Agencies that are providing post-hospital care will be provided these avenues of accessing necessary information.
d. Population risk management data and inpatient risk assessment information will be analyzed to identify patients most at risk for needing acute care within 30-60 days. The patients identified through this process will be enrolled in the care transition program and given special attention related to discharge planning, discharge support after leaving the hospital setting, etc. Patient registries and defined standardized protocols will be used to develop a systematic process for care transition.

e. The Care Management team will initiate the discharge planning program and complete a discharge assessment to include issues related to funding, medical home assignment, psychosocial needs, and ongoing medical needs. The program will also include patient/family education related to medication and self-management, follow up appointments, warning signs, etc. If the patient requires intensive care management a hand-off will be completed to the Outpatient Care Management team that will reinforce the program evidence-based care transitions model and provide discharge support and care management until the patient is well established in primary care.

f. A community-based cross-continuum team will be developed to support care transitions and provide a consistent, safe and effective process from one provider to another with a strong emphasis on engaging patients and improving their access to the medical home for on-going primary and preventive health care instead of the ED or readmission. The team will be comprised of representatives from various community clinics, hospitals, home health agencies, etc.

g. A comprehensive quality improvement program will be implemented. EMR registries, risk stratification, patient identification processes, and dashboard reporting are designed into the project as mechanisms for consistent monitoring and improvement. Learning collaboratives, plan-do-study cycles, etc. are also included in the project.

Unique community need identification numbers the project addresses:
- CN11 – Need for more care coordination
- CN10 – Overuse of emergency department (ED) services

How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:
This project is a new initiative and has not received any other federal funding.

Related Category 3 Outcome Measures:
Outcome Measure 1: IT-3.1 All-cause 30-day readmission rate NQF 1789 (Stand-alone measure) – All JPS Health Network patients enrolled in case management registry

Rationale: This outcome measure was chosen because JPS Health Network does not yet have a systematic process to reduce the risk for potentially preventable hospital readmissions. This measure has also been recognized as an opportunity for improvement at the national (Affordable Care Act) and local level (needs assessment). The Region 10 community health needs assessment indicated there are inpatient capacity issues and impaired patient flow concerns.
These problems correlate with excessive admissions and readmissions. CMS supports the link between care transitions program and the reduction of readmissions.\footnote{Centers for Medicare and Medicaid Services (CMS) office of Research, Development, and Information, National Conference on Care Transitions Transcript. Retrieved from http://www.cms.gov/medicare/demonstration-projects/demoprojectsevalrpts/downloads/cctp transcript.pdf} By DY4, it is expected that readmissions will be reduced by 10% and at the end of the Waiver period by 15%.

**Outcome Measure 2:** IT-9.2 ED-appropriate utilization

**Rationale:** This outcome measure was chosen because JPS Health Network does not yet have a systematic process to reduce inappropriate ED utilization. The Region 10 community health needs assessment indicated that regional stakeholders felt their patient population had to resort to the ED for routine care because of access and capacity issues. These problems correlate with excessive admissions and readmissions. By the end of the waiver, when a systematic process has been established, it is expected that ED appropriate utilization will be increased.

**Relationship to Other Projects:**

This project supports the following projects through hand-off collaboration and coordination of care interventions: Community Connect, Care Connection for the Homeless, MedStar and Patient-Centered Medical Home implementation. It will target patients who receive care in the ED rather than a more appropriate delivery setting as well as inpatient readmissions. This project also supports the primary and preventive care interventions of the Patient-Centered Medical Home with a focus on patients with diabetes. This program will also work closely with the JPS Health Network Congestive Heart Failure Program to ensure that the Congestive Heart Failure 30-day readmission rate is captured and valued in that project. The Care Transition project will refer (hand-off) patients to Community Connect which will reinforce efforts to decrease the inappropriate use of the ED and provide primary care. Care Connection for the Homeless will provide care transition and delivery to the homeless population and will accept collaborative referrals. Patient-Centered Medical Home implementation is designed to establish fourteen (14) medical homes intended to provide primary and preventive health care. The Care Transition project will inform the medical home provider when there are gaps in care for the targeted population and make medical appointments for patients to receive health care. The MedStar program will provide nurse triage and by way of referral provide care management and support to avoid admissions and readmissions.

The Category 4 Reporting domain is RD-2.7- All-Cause: 30-day readmissions

By implementing The Care Transitions Intervention™ evidence-based model, the project will aid in reducing avoidable readmissions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as discharged patients from JPS Health Network inpatients or ED settings. The percentage of the population expected to be positively impacted by the project is 15%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, because their instances of being readmitted to the ED or an inpatient bed will be reduced.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, dependence on the community and the cost of care are significantly reduced.

**Year 2 (10/1/2012 – 9/30/2013)**

**Milestone 1 [P-3]:** Establish a process for hospital-based case managers to follow up with identified patients hospitalized related to the top chronic conditions to provide standardized discharge instructions and patient education, which addresses activity, diet, medications, follow-up care, weight and worsening symptoms; and where appropriate additional patient education and/or coaching as identified during discharge. This project will use The Care Transitions Intervention model. The project will impact current staffing of 31 positions.

**Metric 1 [P-3.1]:** Care transitions protocols

- Baseline/Goal: JPS Health Network does not have a care transitions program or protocols/ By end of DY2 Care transition materials for discharge instructions and patient education will be complete.
- Data Source: Care transitions protocols

**Milestone 3 [P-5]:** Using a validated risk assessment tool, create a patient identification system.

**Metric 1 [P-5.1]:** Patient stratification system (reports for ED utilizers, gaps in preventive health care and at-risk patients for readmissions within 30 days).

- Baseline/Goal: JPS Health Network does not use a validated risk assessment tool/ By end of DY3 a validated risk assessment tool will be used.
- Data Source: Risk assessment tool

**Milestone 4 [P-9]:** Implement a case-management-related registry

**Metric 1 [P-9.1]:** Documentation of registry implementation, registry reports and EMR reports that support

**Year 3 (10/1/2013 – 9/30/2014)**

**Milestone 5 [I-13]:** Increase the number or percent of patients in the case-management-related registry

**Metric 1 [I-13]:** Increase in the number or percentage of patients in the case-management-related registry;

- Note: Patients may be targeted from ED and inpatient areas
- Goal: 3,500 patients will be in the case management registry by DY4. (3,500 is 14% of the population)
- Data Source: EMR, registries

**Milestone 5 Estimated Incentive Payment:** $1,145,067

**Year 4 (10/1/2014 – 9/30/2015)**

**Milestone 6 [I-14]:** Implement standard care transition processes in specified patient populations.

- Specified population- 3,500 patients

**Year 5 (10/1/2015 – 9/30/2016)**

**Milestone 7 [I-13]:** Increase the number or percent of patients in the case-management-related registry

**Metric 1 [I-13]:** Increase in the number or percentage of patients in the case-management-related registry;

- Note: Patients may be targeted from ED and inpatient areas
- Goal: 5,000 patients will be in the case management registry by end of DY5. (5,000 is 20% of the population)
- Data Source: EMR, registries

**Milestone 7 Estimated Incentive Payment:** $945,925

**Milestone 8 [I-14]:** Implement standard care transition processes in specified patient populations.

- Specified population- 5,000 patients

**Year 2 (10/1/2012 – 9/30/2013)**

- **Metric 1 [P-7.1]:** Documentation of the staffing plan.
  - **Baseline/Goal:** Completion of written staffing plan.
  - **Data Source:** Staffing plan with increase of case management staff.

**Milestone 2 Estimated Incentive Payment:** $1,046,566

**Milestone 2 [P-7]:** Develop a staffing and implementation plan to accomplish the goals/objectives of the care transitions program.
Current hospital based case management staff is 31.
Plan to hire 4 additional staff (2 for the ED and 2 for the inpatient setting).

**Metric 1 [I-14.1]:** Measure adherence to processes:
Goal: By end of DY4 process adherence will be measured to determine if patients are receiving care according to standardized protocols in the specified populations.
50% (1,750) of registry patients will receive care according to protocols.

**Data Source:** EMR, registries

**Milestone 5 Estimated Incentive Payment:** $1,145,067

**Year 3 (10/1/2013 – 9/30/2014)**

- **Metric 1 [I-14.1]:** Measure adherence to processes:
  - Goal: By end of DY4 process adherence will be measured to determine if patients are receiving care according to standardized protocols in the specified populations.

**75% (3,750) of registry patients will receive care according to protocols.**

**Data Source:** EMR, registries

**Milestone 8 Estimated Incentive Payment:** $945,925

**Year 4 (10/1/2014 – 9/30/2015)**

- **Metric 1 [I-14.1]:** Measure adherence to processes:
  - Goal: By end of DY5 process adherence will be measured to determine if patients are receiving care according to standardized protocols in the specified populations.

**75% (3,750) of registry patients will receive care according to protocols.**

**Data Source:** EMR, registries

**Milestone 5 Estimated Incentive Payment:** $1,145,067

**Year 5 (10/1/2015 – 9/30/2016)**

- **Metric 1 [I-14.1]:** Measure adherence to processes:
  - Goal: By end of DY5 process adherence will be measured to determine if patients are receiving care according to standardized protocols in the specified populations.

**75% (3,750) of registry patients will receive care according to protocols.**

**Data Source:** EMR, registries

**Milestone 8 Estimated Incentive Payment:** $945,925

**Note:** An integrated information system will be established for the medical home population. Registry reports demonstrating case management functionality will be established for the medical home population. Data Source: Registry reports demonstrating case management functionality.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** 
(add milestone bundle amounts over Years 2-5): $8,415,894
Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: The goal of this project is to provide more fully integrated behavioral health services embedded within the primary care medical home so that patients receive whole-person care through their medical home team. Behavioral health care will be integrated into the fabric of primary care services. Clinical algorithms will be developed and implemented in primary care to ensure that those patients with high medical needs but low behavioral health needs can still receive quality medical interventions for depression and anxiety. This project is a new initiative that will be implemented in our four clinics with existing co-located behavioral health services to increase the level of integration and provide new components of integrated care.

Need for the project: This project addresses the following community needs: a) CN.4 Lack of access to mental health services, b) CN.5 Insufficient integration of mental health care in primary care medical care system, and c) CN.11 Need for more care coordination.

Target population: The population who will be served by both primary and behavioral health care in an integrated fashion is a combined total of 5,567 for all 4 years (DY2 = 557, DY3 = 1670, DY4 = 1670, and DY5 = 1670). Medicaid and the uninsured of our service area will benefit from behavioral healthcare being integrated into the fabric of the primary care services as evidenced by utilization of the Four-Quadrant model, clinical algorithms, both physical and behavioral healthcare at locations, treatment plans with primary care and behavioral health expertise, and depression screening being commonplace in clinics where behavioral health services are co-located.

Category 1 or 2 expected patient benefit: Milestones P-3.1, P-3.2, P-3.3, P-6.1, P-6.2, P-X1.1, P-X2.1, P-X2.2, PX2.3, P-X3.1, I-8.1, and I-9.1 were selected. Each milestone selected was due to their natural progression to project implementation or a natural result of implementing integrated care components.

Category 3 outcomes: Outcomes IT-1.8, IT-1.9, IT-1.10, and IT-1.11 were selected. There is an evidence base to suggest that integrated care will have positive impact on each of those outcome areas.
Project Option 2.15.1 – Design, implement, and evaluate projects that provide integrated primary and behavioral health care services

Unique Project ID: 126675104.2.6
Performing Provider Name/TPI: JPS Health Network / 126675104

Project Description:
This project will utilize aspects of the Four Quadrant model\(^{228}\), IMPACT model\(^{229}\), and Wagner’s Chronic Care Model\(^{230}\) as a foundation to ensure patients receive appropriately integrated behavioral health care. This project will develop and implement a set of standards to be used for integrated services to ensure effective information sharing and proper handling of referrals of behavioral health clients to physical health providers and vice versa. Additionally, five embedded behavioral health specialists who will be masters’ level social workers (LMSWs) or registered nurses (RNs) with experience in psychiatric service delivery will be established. The embedded behavioral health care managers will serve five primary roles: (1) be the liaison with primary care to ensure integrated care, (2) provide immediate access to a behavioral health provider by delivering behavioral health in the primary care setting on a stat basis, (3) provide brief, solution focused counseling services in primary care settings, (4) manage the referral process and case load balance between primary care referrals and stable behavioral health patients transitioning back to primary care providers as appropriate, and (5) serve as a behavioral health care manager as needed. The five embedded behavioral health specialists will be located in primary care clinics where we have co-located outpatient behavioral health services and one behavioral health specialist will serve as a resource to JPS Health Network satellite and clinics currently without current co-located services. The minimum number of patients who will be served by both primary and behavioral health care in an integrated fashion is a combined total of 5,567 for all 4 years (DY2 = 557, DY3 = 1670, DY4 = 1670, and DY5 = 1670). In addition, this project will improve the competency of primary care providers in screening, identification and

\(^{228}\) The Four Quadrant model is a model for the proposed integration of clinical mental health and behavioral health services. The emphasis is on the prevalence of concurrent disorders (e.g., depression and alcoholism). The Four Quadrant model is based on the 1998 consensus document on mental health and substance abuse/addiction integration service. The severity for each disorder is divided into Four Quadrants: (1) Low mental health – low substance abuse, served in primary care; (2) High mental health – low substance abuse, served in the mental health system by staff who have substance abuse competency; (3) Low mental health – high substance abuse, served in the substance abuse system by staff who have mental health competency; and (4) High mental health – high substance abuse, served by a fully integrated mental health and substance abuse program. The Four Quadrant model is not intended to be prescriptive about what happens in each quadrant, but to serve as a conceptual framework for collaborative planning in each local system.

\(^{229}\) The IMPACT model has five key components: (1) collaborative care, (2) depression case manager, (3) designated psychiatrist, (4) outcome measurement, and (5) stepped care. For more information, please see the IMPACT website at the University of Washington at [http://impact-uw.org/about/key.html](http://impact-uw.org/about/key.html).

\(^{230}\) See [http://www.improvingchroniccare.org/index.php?p/The_Chronic_Care_Model&s=2](http://www.improvingchroniccare.org/index.php?p/The_Chronic_Care_Model&s=2) for detailed information about the Chronic Care Model.
treating depression and anxiety by developing medication algorithms utilizing best practices and evidence-based resources.

**Goals and Relationship to Regional Goals:**

**Project Goals:** The goal of this project is to provide more fully integrated behavioral health services embedded within the primary care medical home so that patients receive whole-person care through their medical home team. Behavioral health care will be integrated into the fabric of the primary care services. Clinical algorithms will be developed and implemented in primary care to ensure that those patients with high medical needs but low behavioral health needs can still receive quality medical interventions for depression and anxiety.

**Challenges:**
Currently, JPS Health Network has co-located behavioral services in four locations, but there is no significant coordination or integration of services. JPS Health Network lacks a coordinated system of care for individuals with both physical and mental health problems that results in fragmented and uncoordinated care efforts. Patients often remain in treatment with a psychiatrist because they have historically received medication refills from this setting while primary care patients who increasingly need integrated services cannot be served due to limited specialty psychiatric capacity. Additionally, primary care providers lack the time or knowledge to effectively address behavioral health issues outside an effective team.

**5-Year Expected Outcome for Provider and Patients:**
At the end of the Waiver period, behavioral health care will be integrated into the fabric of the primary care services by utilizing evidence-based strategies and patients will be assigned appropriate interventions by a clinically integrated team by utilizing the Four-Quadrant model based on their needs. At least eight providers will achieve Level 4 integration with 6 of those providers achieving Level 5 integration. Over 3.5% (or 5,567) of patients will receive both physical and behavioral health care at established locations and 1% (or 1,590) will have treatment plans implemented with both primary care and behavioral health expertise. Depression screening for more than 5000 primary care patients will occur in clinics where behavioral health services are co-located. The target percentage of patients screened will be reassessed - in DY3.

---

231 Primary care physicians who will retain management of identified behavioral health needs can utilize the project that provides virtual psychiatric and clinical guidance for assistance to medication management strategies, evidence-based treatments, and timely communication with psychiatrists as necessary.

232 The Institute of Medicine found a strong link between behavioral health issues and general health, especially chronic illnesses. Behavioral health patients who have significant chronic physical illnesses often go untreated and suffer poorer health outcomes than patients without behavioral health diagnoses. Additionally, patients with both behavioral and physical conditions generate significantly higher medical costs than patients with only one set of conditions, and treatment of the behavioral health conditions lowers those costs, particularly if diagnosed early. People with chronic mental illnesses and comorbid physical health problems such as cardiovascular or pulmonary disease, diabetes, or arthritis many times present first in primary care. Mental health problems exacerbate the disability associated with physical disorders as evidence by research documenting people with serious mental illness treated by the public mental health system die on the average 25 years earlier than the general population; they live to 51, on average, compared with 76 for Americans overall. Additionally, they are 3.4 times more likely to die of heart disease, 6.6 times more likely to die of pneumonia and influenza, and 5 times more likely to die of other respiratory ailments. Other research has found that 60% of premature deaths in persons with schizophrenia were due to medical conditions such as pulmonary disease, and infectious and cardiovascular diseases.
**Starting Point/Baseline:**
The current system would be described as having Level 3 integration – Basic Collaboration On-Site. In FY 2011, 2.69% (or 4,273) of JPS Health Network patients had encounters in both behavioral health and primary care locations. None of these patients had treatment plans developed with joint expertise. Additionally, there are no protocols guiding the treatment and/or referral processes. Having embedded behavioral health specialists will result in an increase in routine visits from the baseline established in DY2 and an increase or decrease use of specialty care according to practice guidelines from the baseline establish in DY2. (Note: JPS Health Network must establish a baseline to determine if the measure should be an increase or decrease).

**Rationale:**
This project was selected because JPS Health Network treats a large group of patients whose care is complicated by co-occurring mental health problems. AHRQ research highlights the significant evidence base available supporting the integration of behavioral health care with primary care: The studies reviewed tended to show positive results for symptom severity, treatment response, and remission when compared to usual care. Anxiety disorder studies also exhibited a consistently similar pattern.\(^{233}\) AHRQ’s statement aligns with the significant evidence base supporting integrated care as a best practice.\(^{234,235}\)

**Project Components:**
Core Component A - The focus of this project is to enhance the level of integration from Level 3 to Levels 4 or 5 at each site, not to establish co-location.
Core Component B - Provider agreements will not need to be developed as this project will target inner-organization integration and agreements that already exist and allow for co-scheduling and information sharing.
Core Component D - Additional providers or provider days will be recruited or identified as necessary to accomplish project goals.

\(^{234}\) Supporting research includes:

\(^{235}\) Data from the epidemiological survey, National Comorbidity Survey Replication, from 2001-2003 found that 25% of American adults meet at least one diagnosis for mental illness at any given time and more than half of those report one or more chronic medical conditions. This same survey found that more than 68% of adults with a pre-existing mental disorder reported having at least one general medical condition. There is also significant evidence reported by SAMHSA that supports the use of integrated care as evidence-based and best practice. This evidence is contained on the SAMHSA-HRSA Center for Integrated Solutions website.
Core Component E - We will train both physical and behavioral health providers in protocols, communication, and treatment through a team approach with attending physicians as well as primary care and psychiatry resident physicians with regular consultative meetings, case conferences, and shared treatment plans.

Core Component F - Our organization already uses an EMR among primary and behavioral health care providers. However, we will still ensure the data reporting, communication, and collection tools are available to facilitate effective integrated care.

Core Component G - There is no need for further exploration of legal agreements as we already have a provider agreement established.

Core Component H - There is no need for arrangement of utilities so those components will not be addressed.

Core Component I - The components related to data collection are already identified as milestones within the project.

Core Component J - The components related quality improvement is already identified as milestones within the project.

Milestones include (1) the development and implementation of a set of standards to be used for integrated services to ensure effective information sharing, proper handling of referrals of behavioral health clients to physical health providers and vice versa; (2) identification of the number and types of referrals that are made between providers at the location; (3) evaluation and continuously improved integration of primary and behavioral health services with demonstrated plan, do, study act quality improvement cycles; (4) development and implementation of data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings; (5) eight providers will achieve Level 4 of interaction (close collaboration in a partially integrated system) and six providers will achieve Level 5 of interaction (close collaboration in a fully integrated system); (6) 3.5% of Individuals receiving both physical and behavioral health care at the established locations and (7) 1% of individuals with a treatment plan developed and implemented with primary care and behavioral health expertise. Additionally, custom milestones and improvement targets have been created to accommodate the desired outcome of implementing a common practice of screening primary care patients for depression.

Unique community need identification numbers the project addresses:

- CN.5 – Insufficient integration of mental health care in the primary care medical care system
- CN.4 – Lack of access to mental health services
- CN.11 – Lack of care coordination
How the project represents a new initiative or significantly enhances an existing delivery system reform initiative: This is a new initiative and we have not received any other federal funding for its implementation.

Related Category 3 Outcome Measures:
Outcome Measures and Reasons/Rationale for Selecting the Outcome Measures:
IT-1.8 Depression management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134) was selected because CMS has stated the evidence is adequate to conclude that screening for depression in adults, which is recommended with a grade of B by the U.S. Preventive Services Task Force (USPSTF), is reasonable and necessary for the prevention or early detection of illness or disability, and is appropriate for individuals entitled to benefits under Part A or enrolled under Part B.236 Compared with usual care, screening for depression can improve outcomes, particularly when screening is coupled with system changes that help ensure adequate treatment and follow-up. The virtual psychiatric and clinical guidance service will improve depression screening and the effectiveness of follow-up plans as well as treatment.

IT-1.10 Diabetes care: HbA1c poor control (>9.0%)17- NQF 0059 was selected because integrated care will be utilized to improve the identification of patients with diabetes and behavioral health issue to improve adherence to treatment plans and foster better patient engagement.

IT-1.11 Diabetes care: BP control <140/80mm Hg)18 – NQF 0061 was selected because integrated care will be utilized to improve the identification of patients with diabetes and behavioral health issue to improve adherence to treatment plans and foster better patient engagement.

Relationship to Other Projects:
- Project 126675104.1.1 – This project’s purpose is to establish extended operating hours at a select number of local mental health clinics or other community-based settings in areas of the Region where access to care is likely to be limited. New patients will benefit from integrated care projects aimed at improving whole health.
- Project 126675104.2.7 – Established to design, implement, and evaluate interventions to improve care transitions from the inpatient setting for individuals with mental health and/or substance abuse disorders (Behavioral Health Discharge Management Program). BH Discharge Care Managers will be able to utilize the integrated services as a tool to better manage patients post-discharge.
- This project is related to RD-1.3 Potentially preventable admissions Behavioral Health and Substance Abuse Admission rate (based on other selected PPA primary diagnoses). This reporting measure was selected because it is anticipated this project will reduce

---

236 Centers for Medicare and Medicaid Services (CMS) http://www.cms.gov/medicare-coverage-database/details/nca-proposed-decision-memo.aspx?&NcaName=Screening%2520for%2520Depression%2520in%2520Adults&bc=AACAAAAAIAAAA &NCAId=251.
potentially preventable admissions by behavioral health patients for medical conditions by improving the care and adherence to treatment recommendations through integration of care.

- Project 126675104.2.2– Develop, implement, and evaluate action plans to enhance/eliminate gaps in the development of various aspects of PCMH standards. The behavioral health expertise and team members will work in a collaborative and integrated fashion to contribute and build upon the successes of the JPS Health Network Patient-Centered Medical Home (PCMH) model. The projects will work to gain synergy but will focus on the unique improvements and outcomes established for each project.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**

This integrated care project will collaborate with MHMR of Tarrant County’s projects. It is anticipated the substance use disorder treatment and detox expansion will be utilized significantly as patients with these issues are more readily identified because of the integration of care. In fact, it is anticipated MHMR employees will provide SBIRT services to the patients who receive primary care services within the JPS Health Network integrated care clinics. The JPS Health Network and MHMR integrated health projects will each serve distinct client populations. The MHMRTC project will only serve those clients registered to receive behavioral health services with MHMR while bringing a primary care team into the MHMR clinic for a comprehensive model of care. The JPS Health Network project will serve clients registered to receive primary care or behavioral health services with JPS. Each entity offers a distinct array of mutually exclusive services for this project.

This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

JPS Health Network defined the population that will be directly impacted by the project as primary care patients needing embedded behavioral health services and all behavioral health outpatients in the JPS Health Network. The percentage of the population expected to be positively impacted by the project is 26%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to
determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her quality of life is significantly improved through the proper management of depression, diabetes control, and diabetics with blood pressure.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 4. We believe this to be the correct number because when a person is positively impacted, his or her potential dependence on the community is significantly decreased.

Specifically, 5567 patients (DY2 = 557, DY3 = 1670, DY4 = 1670, and DY5 = 1670) receiving both primary and behavioral health care in an integrated fashion will be positively impacted in the following quantifiable ways:

- Increase percentage of primary care patients screened for depression in primary care clinics where behavioral health services are co-located by 5500 patients over life of project
- Increase percentage of individuals receiving both physical and behavioral health care at the established locations by 3% over life of project
- Increase percentage of individuals with a treatment plan developed and implemented with primary care and behavioral health expertise by 1% over life of project
- Improve baseline percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg by a percentage to be determined in DY3.
- Improve baseline percent of behavioral health patients 18-75 years of age with diabetes (type 1 or type 2) who had BP less than 140/90 mm Hg by a percentage to be determined in DY3.
- Increase in patients screened for clinical depression using a standardized tool AND follow-up plan is documented by a percentage to be determined in DY3.

### Integrate Primary and Behavioral Health Care Services

#### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1 [P-3]:** Develop and implement a set of standards to be used for integrated services to ensure effective information sharing, proper handling of referrals of behavioral health clients to physical health providers and vice versa.

**Metric 1 [P-3.1]:** Number and types of referrals that are made between providers at the location
- **Baseline/Goal:** Establish number of behavioral health referrals are made using the set of standards between providers at location
- **Data Source:** Review of referral data and survey result

**Metric 2 [P-3.2]:** Number of referrals that are made outside of the location
- **Baseline/Goal:** Report indicating number of referrals made outside of the location
- **Data Source:** Surveys of providers to determine the degree and quality of information sharing; Review of referral data and survey results

#### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 2 [P-3]:** Develop and implement data collection and reporting mechanisms and standards to track the utilization of integrated services as well as the health care outcomes of individual treated in these integrated service settings.

**Metric 1 [P-X.1]:** Utilize a Integrated Care Utilization Tracking Report to inform practice
- **Baseline/Goal:** Create Integrated Care Utilization Tracking Report
- **Data Source:** EMR

**Milestone 3 Estimated Incentive Payment:** $1,310,166

#### Year 4 (10/1/2014 – 9/30/2015)

**Milestone 3 [P-X]:** Develop and implement a set of standards to be used for integrated services to ensure effective information sharing, proper handling of referrals of behavioral health clients to physical health providers and vice versa.

**Metric 1 [P-3.1]:** Depression management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134)

- **Diabetes care:** HbA1c poor control (>9.0%) - NQF 0059
- **Diabetes care:** BP control <140/80mm Hg18 – NQF 0061

#### Year 5 (10/1/2015 – 9/30/2016)

**Milestone 4 [P-6]:** Develop integrated behavioral health and primary care services within co-located sites.

**Metric 1 [P-6.1]:** Number of providers achieving Level 4 of interaction (close collaboration in a partially integrated system).

**Milestone 6 [P-X3]:** Depression Screening in primary care clinics where behavioral health services are co-located.

**Metric 1 [P-X3.1]:** Increase in percentage of primary care patients screened for depression in primary care clinics where behavioral health services are co-located.

- **Baseline/goals:** 2500 patients will be screened for depression
- **Data Source:** EMR, Project Documentation

**Milestone 6 Estimated Incentive Payment:** $1,401,573

**Milestone 7 [I-8]:** Integrated Services

**Metric 1 [I-8.1]:** 3% of Individuals receiving both physical and behavioral health care at the established locations.

- **Goal:** 3% of individuals receiving both physical and behavioral health care in

**Milestone 9 [P-X4]:** Depression Screening in primary care clinics where behavioral health services are co-located.

**Metric 1 [P-X4.1]:** Increase in percentage of primary care patients screened for depression in primary care clinics where behavioral health services are co-located.

- **Baseline/goals:** 3000 patients will be screened for depression
- **Data Source:** EMR, Project Documentation

**Milestone 9 Estimated Incentive Payment:** $1,157,821

**Milestone 10 [I-8]:** Integrated Services

**Metric 1 [I-8.1]:** 3.5% of Individuals receiving both physical and behavioral health care at the established locations.

- **Goal:** 3.5% of individuals receiving both physical and behavioral health care in

**Milestone 10 Estimated Incentive Payment:** $1,157,821

Project Summary Template to be completed for each Category 1 and 2 project
Project Option 2.17.1 – Behavioral Health Discharge Management Program

Unique Project ID: 126675104.2.7
Performing Provider Name/TPI: JPS Health Network / 126675104

Provider: JPS Hospital is a 537-bed public hospital with 43 associated ambulatory care and primary care outreach sites in Fort Worth serving all of Tarrant County (897 sq. miles), with a population of approximately 1.8 million residents. As one of Texas’ major urban public hospitals, JPS Health Network serves as the primary safety net provider of acute care for Tarrant County’s Medicaid and uninsured populations. Medicaid, self-pay and uninsured individuals make up 75% of JPS’ patient population. One of only two providers in Tarrant County delivering a full range of behavioral health care services, JPS Health Network is also Fort Worth’s only acute psychiatric care facility.

Intervention: This project will create a comprehensive Behavioral Health Discharge Management Program based on evidence-based models. Psychiatric professionals will be responsible for proactive pre- and post-discharge interaction, intervention, and coordination with patients discharged from Trinity Springs Pavilion (JPS’ 96 bed psychiatric facility) as they return to the community. This project is a new initiative

Need for the project: This project addresses the following community needs: a) CN.4 Lack of access to mental health services, b) CN.5 Insufficient integration of mental health care in primary care medical care system, c) CN.10 Overuse of emergency department (ED) services, and d) CN.11 Need for more care coordination.

Target population: All patients discharging from Trinity Springs Pavilion (96 bed inpatient psychiatric hospital) - 4,923 inpatient discharges annually (14,769 for DY3, DY4, and DY5). This project will provide greater management that will result in improved post-discharge engagement and treatment adherence, the rate of readmission for psychiatric services and the general availability inpatient and intensive services for the significant volume of Medicaid and Uninsured psychiatric patient discharging from TSP.

Category 1 or 2 expected patient benefits: Milestones P-1.1, P-2.1, P-2.2, P-2.3, P-2.4, P-2.5, P-2.6, P-2.7, P-3.1, P-4.1, P-5.1, P-6.1, P-7.1, P-8.2, P-9.1, P-10.1, P-10.2, P-10.3, P-11.1, P-12.1, P-13.1, P-15.1, P-27.1, P-29.1, P-X.1, P-X.2, I-36.1, I-38.1, I-40.1, I-42.1 were selected. All core project components are included in this project. Each was selected due to their natural progression to project implementation. The improvement milestones selected are all considered to be indicative of improved transition management.

Category 3 outcomes: Outcomes IT-3.8, IT-9.1, IT-9.2 were selected. There is an evidence base to suggest that improved transition management will have positive impact on each of these outcome areas.
Project Option 2.17.1 – Behavioral Health Discharge Management Program

**Unique Project ID:** 126675104.2.7  
**Performing Provider Name/TPI:** JPS Health Network / 126675104

**Project Description:**  
This project creates a comprehensive Behavioral Health Discharge Management Program based on evidence-based models. Psychiatric professionals will be responsible for proactive pre- and post-discharge interaction, intervention, and coordination with patients discharged from an inpatient facility as they return to the community. The project uses engagement strategies specific to broad diagnostic categories (i.e., major depressive disorder, schizophrenia, bipolar disorder, etc.) and which involve motivational interviewing techniques to encourage engagement, follow-up participation, medication adherence and identification of red flags necessitating additional assistance. We will utilize patient experience of care councils and peer specialists to inform and improve the discharge and recovery process. This project also will use technology to implement electronic communications to patients with appointment reminders, medication reminders, treatment adherence encouragement, and recovery oriented messages. The program targets patients discharged from Trinity Springs Pavilion (TSP) – 4,923 individuals in 2011. Patients discharging from TSP will experience improved outpatient follow-up within seven and 30 days post-discharge in order to reduce behavioral health readmissions to TSP. JPS Health Network behavioral health services include the Psychiatric Emergency Center (PEC), which provides crisis counseling, triaging and referrals, and TSP, an inpatient 96-bed psychiatric hospital for patients 13 and older in Fort Worth, Texas.

**Goals and Relationship to Regional Goals:**  
**Project Goals:**  
After implementing an effective Discharge Management Program for behavioral health patients, we will improve care transitions and coordination of care from inpatient to outpatient, postacute care, and home care settings so that patients will experience postdischarge community engagement and stability, reducing the risk of readmission due to their conditions worsening.  
**This project meets the following Regional goals:**  
This project addresses important Regional goals of improving access to behavioral health services and better coordination of behavioral health care services.

**Challenges:**  
Our current system of placing discharge calls to some patients does not provide the level of discharge support needed by psychiatric patients to establish and/or maintain early efforts at recovery. Additionally, there are no targeted interventions based on level of risk. Patients with a psychiatric illness often have difficulty maintaining stability when discharged from inpatient services. This difficulty is reflected in our readmission rate. Additionally, navigating through the mental health system is difficult for patients suffering from mental illness and their families.
Approximately 40% of inpatients are involuntarily admitted to TPS after being brought to JPS Health Network on an Application for Emergency Detention. This results in mandatory treatment for patients who never made the initial decision to seek treatment. All of these factors create significant barriers or challenges to effective transitions to community-based treatment and follow-up levels of care. Our program has high rates of patients who do not keep follow-up appointments or who do not maintain engagement with outpatient treatment providers postdischarge.

5-Year Expected outcome for Provider and Patients:
This project will increase adherence to seven- and 30-day appointment attendance and reduce 30-day behavioral health readmissions by implementing a transition management program focused on psychiatric patients discharging from an inpatient psychiatric facility. Expected outcomes include improvements in the percent of patients discharged who receive clinician follow-up and treatment; percentage of patients /families provided with appropriate education upon discharge; increased percentages of high risk patients\(^{237}\) discharged with customized care plans; and improvement in both the seven-day and 30-day follow up after hospitalization rates. Actual improvement targets will be established in DY3. By reducing readmissions and non-adherence rates we will improve appropriate utilization of the limited behavioral health services available. This project will improve access to mental health services by reducing potentially avoidable utilization, improving integrated care with primary care providers, reducing overuse of psychiatric emergency department services, and enhancing coordination of care.

Starting Point/Baseline:
Currently no formal discharge/transition management program is in place. We conduct multidisciplinary case conferences for high utilizer patients with frequent readmissions, but these activities are retrospective discussions rather than a proactive identification of factors and interventions. In 2011, 4,923 individuals were discharged from TSP, our system’s inpatient psychiatric facility.

Rationale:
This project was selected because of the significant volume of unmanaged psychiatric patient discharges that result in limited postdischarge engagement and treatment adherence, the rate of readmission for psychiatric services, and the general limited availability of inpatient and intensive services. We will adapt evidence-based models that document reduced readmissions, sustained improvement, and cost reduction. We also anticipate this project will reduce no show rates and psychiatric emergency center visits. Technology interventions will be incorporated because of the evidence supporting their efficacy. We have identified a few models that could be adapted and modified to meet the needs of a psychiatric population, including one model that has

---

\(^{237}\) For the purposes of this project, “High Risk Patients” are defined in process milestone 5.
been implemented in over 600 facilities across the U.S. that implements a “transition coach” for patients in the program over four weeks.238

Project Components:
This project includes all core project components. They will be executed sequentially as we move from pre-implementation to go-live. They will form the basis of a project plan built upon carefully selected milestones and metrics. The improvement milestones selected encourage improved family and patient communication, customized care plans, assessment and follow-up as well as follow-up after hospitalization. In DY2, we will complete the Core Component A by developing a cross-continuum team comprised of clinical and administrative representatives from acute care, ambulatory care, behavioral health and community-based non-medical supports as indicated by the process milestone. Core Component B will be completed by conducting an analysis of the key drivers of 30-day hospital readmissions for behavioral health conditions using a chart review tool (e.g. the Institute for Healthcare Improvement’s (IHI) State Action on Avoidable Re-hospitalizations (STAAR) tool and patient and provider interviews. The program will collect information and/or analyze data on factors contributing to preventable readmissions within 30 days. Staff will conduct a minimum of 10 interviews with patient/family members regarding preventable 30-day hospital readmissions. A baseline metric will be determined for all causes of 30-day readmissions. To complete Core Component C we will also identify baseline mental health and substance abuse conditions at high risk for readmissions, (example include schizophrenia, bipolar disorder, major depressive disorder, chemical dependency). The team will identify key factors that increase the likelihood of preventable 30-day readmissions for individuals with mental health and substance use disorders. We will ensure Core Component D is met by reviewing best practices for improving care transitions from a range of evidence-based or evidence-informed models. Evidence-based frameworks that support seamless care transitions and impact preventable 30-day readmissions will be identified. A written operations manual will be developed for care transitions intervention with administrative protocols and clinical guidelines. The manual will identify and prioritize evidence-based strategies and clinical protocols that support seamless care transitions and reduce preventable 30-day readmissions as required by Core Component E. We will develop a plan for a hospital care transition process. We will conduct a study to determine feasibility of providing a wellness,

238 A proven method for reducing avoidable readmissions is to improve transitional care, which ensures proper coordination and continuity of care as patients move between various locations or levels of care within one organization. A leading model for this work is The Care Transitions Intervention™, which has been adopted by over 170 leading health care organizations nationwide. Through this approach, Eric Coleman, MD, a nationally-recognized readmissions expert, says that there are four pillars that provide a core set of medical directions that the patient should have: medication self-management, follow-up appointment with the primary care physician or specialist, a knowledge of "red flag" or warning signs of symptoms and how to respond to them, and a personal health record that is a portable core set of medical directions including a medication list and associated allergies, an advance directive, treatment preference, and room for patient questions and concerns. In addition to these four pillars, studies show that care transitions intervention coaching can result in a significant reduction in 30-day hospital readmits, as well as a potential reduction in 90-day and 180-day readmits. Care transitions coaches could help patients by modeling behavior to resolve discrepancies, respond to red flags and obtain a timely follow-up appointment, and also help the patient practice for their next encounter with his/her provider and identify two or three questions to discuss. Enhancing the role of patients and caregivers, measuring the quality and safety of care transitions, and using health information technology to promote safe care transitions also play a role in preventing avoidable readmissions. For more information, please see: http://www.caretransitions.org.
self-management and peer support program for patients with high-risk diagnoses. We will conduct a baseline study and annual reassessments of high risk patients readmitted to the hospital in less than 30 days to determine interval between hospital discharge and visit to PCP/Behavioral Health provider. A study of at least 250 high-risk patients readmitted in less than 30 days to the hospital in a given year will be developed using internal hospital records and documentation as the data source. A Patient Experience of Care Council will be created, (including patient/caregiver representation) to provide advice to JPS Health Network on factors influencing care transition and strategies for improving care transition. In DY3, - pilot programs will be implemented involving inpatient and community behavioral health providers as required in Core Component F-. Peer Specialist Positions will be developed with the focus on providing emotional support and practical guidance regarding the discharge and recovery process in a manner consistent with the feasibility study completed in DY2. Consistent with Core Component G, we will conduct quality improvement for project using methods such as rapid cycle improvement. Activities will include, but will not be limited to, identifying “lessons learned” and identifying key challenges associated with expansion of the project, including special considerations for safety-net populations. Benchmarks and targets for improvement milestones in DY4 and DY5 will also be established. In the fourth and fifth year, the focus will be on assessment and follow-up. There will be an increase in targeting discharged inpatient population members and making clinician follow-up calls to review treatment plans and assess compliance. The plan includes an increase in the number of patients receiving follow-up after hospitalization for mental illness within seven and 30 days. In DY4 and DY5, we will work to increase the percentage of patients/families who are provided appropriate education upon discharge and the percentage receiving customized care plans. We will establish actual improvement percentages in DY3.

- **Unique community need identification numbers the project addresses:**
  - CN.4 – Lack of access to mental health services
  - CN.5 – Insufficient integration of mental health care in the primary care medical care system
  - CN.10 – Overuse of emergency department (ED) services
  - CN.11 – Need for more care coordination

**How the project represents a new initiative or significantly enhances an existing delivery system reform initiative:** This is a new initiative and has not received any other federal funding

**Related Category 3 Outcome Measures:**

**Outcome Measures and Reasons/rationale for selecting the outcome measures:**

IT-3.8 Behavioral Health /Substance Abuse 30-day readmission rate was selected because utilization of transition management will enhance stability in the community and adherence to outpatient visits for patients which reduces 30-day behavioral health readmission rates. Dropping out of treatment after a psychiatric hospitalization increases the likelihood of rehospitalization.
from one in 10 to one in four.\textsuperscript{239} This measure also directly impacts our identified community needs. There is limited access to mental health services (CN.4) and readmissions result in avoidable utilization of the very limited resources available.

**IT-9.1** Decrease in mental health admissions and readmissions to criminal justice settings such as jails or prisons was selected because 98\% of adults and children receiving public community-based mental health services have avoided multiple hospital readmissions.\textsuperscript{240} Admission and readmission to criminal justice settings such as jails and prisons is disruptive and deleterious to recovery from behavioral health disorders. Studies of recidivistic criminal justice patients in Texas and other states have demonstrated poorer physical health status, increased incidence of homelessness, increased propensity to use emergency department, and inpatient services. Interventions that can prevent individuals from cycling through the criminal justice system can help avert poor health and mental health outcomes, reduce long term medical costs and improve functioning.

**IT-9.2** ED appropriate utilization was selected because 97\% of adults and children receiving public community-based mental health services have avoided a crisis episode.\textsuperscript{241} JPS Health Network experiences over 24,000 psychiatric emergency visits per year. The transition management program will ensure patients engage in their individualized care plan enhancing stabilization and service utilization outside of the emergency system. This measure also directly impacts our identified community needs. There overuse of the emergency department services (CN.10). Improve transition management will result in reduced utilization of the emergency services because patients will remain more stable in community-based services.

**Relationship to Other Projects:**

**Project 126675104.1.1** – Establish extended operating hours at a select number of local mental health clinics or other community-based settings in areas of the State where access to care is likely to be limited. Extended operating hours allow for greater flexibility with patient engagement and follow-up services. The additional hours and services added to the continuum allow for greater targeted interventions with the Discharge Management Team. This project essentially becomes a tool for the DC Management Team to utilize to help accomplish the Category 3 goals.

**Project 126675104.2.23** – Expand the number of community-based settings where behavioral health services may be delivered in underserved areas (Create PHP and IOP as part of continuum of care). Utilizing expanded community-based settings (PHP and IOP) allows for greater flexibility with patient engagement and follow-up services. The additional hours and services added to the continuum allow for greater targeted interventions with the Discharge Management Team. This project essentially becomes a tool for the DC Management Team to utilize to help accomplish the Category 3 goals.

\textsuperscript{240} Department of State Health Services Behavioral Health Data Book, FY 2010, 4th Quarter, Figures 1.6, 1.7, 1.9, 2.6, 2.7.

\textsuperscript{241} Department of State Health Services Behavioral Health Data Book, FY 2010, 4th Quarter, Figures 1.6, 1.7, 1.9, 2.6, 2.7.
for greater targeted interventions with DC Management Team. This project essentially becomes a tool for the DC Management Team.

**Project 126675104.2.6** – Design, implement, and evaluate projects that provide integrated primary and behavioral health care services. Having embedded care managers in the clinics allows a quick intervention component to the available services. This can be quickly directed toward a patient needing postdischarge assistance and might proactively be engaged as a tool for particularly high-risk patients. Additionally, patients who present with co-occurring medical conditions can be linked to the primary care side of the equation reducing potential readmissions in other sites.

This project will collaborate with MHMR of Tarrant County on interrelated projects such as telemedicine, expanded behavioral health services, RN case management and detox expansion. As this project helps patients transition from inpatient to community-based services each of these community resources will be critical to ensure the patient’s continue to progress across a fully developed continuum.

This project will impact RD-2.3 – Behavioral health and Substance Abuse: 30-Day Readmissions. It is expected this project will improve follow-up rates after hospitalization for mental illness. This is expected to reduce behavioral health 30-day readmissions.

**Relationship to Other Performing Providers’ Projects and Plan for Learning Collaborative:**
This project will participate in the Region’s learning collaborative activities. (See Appendix G for a discussion of the Region’s two proposed learning collaboratives along with a list of participating provider projects for each.)

**Project Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. JPS Health Network has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

JPS Health Network defined the population that will be directly impacted by the project as 4923 patients being discharged from Trinity Springs Pavilion. The percentage of the population expected to be positively impacted by the project is 13%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 5. We believe this to be the correct number because when a person is positively impacted, his or her ability to sustain a normal lifestyle is significantly improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 3. We believe this to be the correct number because when a person is positively impacted, the threat and dependence on the community are significantly reduced.

Specifically, 14,769 patients (4923 annually for DY3, DY4, and DY5) discharging from Trinity Springs Pavilion will receive transition management services will be positively impacted in the following quantifiable ways:

- Increase number of the patients / families who are provided with appropriate education upon discharge by 75% over life of project.
- Increase number of High Risk Patients who are discharged with customized care plans by 60% over life of project.
- Increased patients who have been discharged and have received 3 attempted clinician follow-up calls to review treatment plans and assess compliance by 75% over life of project.
- Increased number of patients receiving follow-up after hospitalization for mental illness within 7 and 30 days by 5% and 7.5% over life of project.
- Reduction in behavioral health/substance abuse 30-day readmission rate to be determined in DY3.
- Decreased mental health admissions and readmissions to criminal justice settings such as jails or prisons to be determined in DY3.
- Reduced emergency department visits for behavioral health conditions to be determined in DY3.
