In DY3, JPS will complete the Plan Do Study Act cycles to improve data collection and intervention activities. This is an important part in the data tracking and program implementation. During DY3, JPS will develop a plan of disseminating the findings and best practices to stakeholders. Disseminating this information will demonstrate ongoing improvement opportunities for the program across the clinics. Ongoing engagement and support of community stakeholders is essential to the successful recruitment of women into the program and providing a continuum of care through integrated referrals. JPS will bring together an oversight board consisting of the members of JPS and other pertinent agencies or individuals quarterly. The oversight committee will have several purposes: 1) continue to engage stakeholders in project, 2) share information, 3) identify barriers and develop strategies, 4) provide access to expertise, and 5) help foster wider public support for Journey to Life as an innovative strategy to provide obstetric care as a means to improve birth outcomes.

By DY4, JPS will measure the timeliness of prenatal and postnatal visits. The goal will be to increase prenatal care (defined as those whose began prenatal care during the first 13 weeks of pregnancy or within 42 days of enrollment) and postnatal visits between 21 and 56 days following delivery to meet 50% HEDIS national benchmark by the end DY4 and by 75% HEDIS national benchmark by DY5. JPS plans to continue this model after the completion of DY5 due to the confidence in these innovative programs.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $4,115,957
Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization

Unique RHP outcome identification number(s): 126675104.3.46 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

Process Milestones:

DY2:
Process Milestone 1-(P-1) – Partner with identified agencies for project planning to develop protocols/strategies for educating women on the appropriate utilization of the emergency department.
Process Milestone 2-(P-2) – Partner with identified agencies serving the prenatal community to determine baseline rates of the inappropriate utilization of the emergency department.
Process Milestone 3-(P-3) – Develop and test data systems to ensure validity of information regarding the utilization of the emergency department by prenatal patients.

DY-3:
Process Milestone 4-(P-4) – Conduct Plan, Do, Study, Act Cycles (rapid cycle improvement) to identify strategies with partnering agencies for providing educational opportunities at JPS and in the community to educate prenatal patients on the utilization of the emergency department.
Process Milestone 5-(P-5) – Develop a system to disseminate findings and best practices to stakeholders to help decrease the number of prenatal patients that inappropriately utilize the emergency department, including identifying project impacts, “lessons learned”, and key challenges associated with expansion of the project. This will include special consideration for safety-net populations.

Outcome Improvement Targets:
DY-4
Outcome Improvement Milestone 1-(IT-9.2) – Decrease the number of prenatal patients utilizing the emergency department by 5% from established baseline.

DY-5
Outcome Improvement Milestone 2-(IT-9.2) – Decrease the number of prenatal patients utilizing the emergency department by 10% from established baseline.

Rationale:
In collaboration with the University of North Texas Health Science Center’s health provider group, UNT Health, and the JPS Health Provider Group (JPSPG), and support from local community groups, we propose to bring innovative prenatal care to 5,166 (92% of deliveries at JPS are receiving prenatal care at JPS clinics based on FY11 data) women over the life of the project. We are particularly interested in the CenteringPregnancy and Maternal Medical Home
models of group care because we believe it will address the social risk factors our patients often face, increase access to care in the outpatient setting, and reduce racial disparities in birth outcomes, a problem that Tarrant County has yet to resolve. The CenteringPregnancy model of care has already been implemented and accepted by Tarrant County women as seen at the University of North Texas Health Science Center and JPS Health Center for Women-Main.

Since several JPS Community Clinics have only one obstetric nurse practitioner who provides women’s services, the CenteringPregnancy model is not the best practice. The number of patients in these clinics would not be large enough to create groups for CenteringPregnancy. Therefore, JPS proposes to use the Maternal Medical Home model. The Maternal Medical Home will enhance prenatal care through the addition of supportive services that Texas Medicaid does not cover by enhancing coordination with existing JPS and community services. Patients will complete a medical and psychosocial assessment at their first visit, and be linked to services as warranted by assessment findings. Services may include doula services, dental services, dietitian and nutritional services, and case management. Each patient will have a health care coach and patient navigator who will assist her in scheduling appointments and who will educate her on the appropriate utilization of the emergency department.

Both of these innovative programs help to coordinate prenatal care and decrease barriers to care, which in turn will decrease the inappropriate utilization of the emergency department. In CenteringPregnancy, patients are educated in a group setting, which promotes open discussion and helps to foster questions that might otherwise not be addressed. Through the Maternal Medical Home, patients are given a patient navigator and health care coordinator to help follow up with visits, overcome health care system barriers and provide internal and external community resources.

JPS chose the overall outcome of decreasing the inappropriate utilization of the emergency department by prenatal patients because over 3,000 visits were made to the emergency department by prenatal patients in fiscal year 2011. Health care access refers to an individual’s ability to obtain recommended and needed primary and specialty care when needed in the best setting possible. Lack of access and fragmented coordination for the low-income, uninsured population impacts the increased utilization of the ED for health conditions controllable through the outpatient setting. Texans spent over $24 billion on hospitalizations among people ages 18 years and older that could have been prevented if those individuals possessed adequate access to outpatient care.

JPS will identify reasons for inappropriate utilization of the emergency department and track these through the life of the project. JPS will establish baseline using data gathered in DY2, and will validate this data to compare over the life of the Waiver. Also in DY2, JPS will partner with identified agencies for project planning to develop protocols/strategies for educating women at JPS and in the community.
In DY3, JPS will complete the Plan Do Study Act cycles to improve data collection and intervention activities. This is an important part in the data tracking and program implementation. During DY3, JPS will develop a plan to disseminate findings and best practices to internal and external stakeholders. Disseminating this information will demonstrate ongoing improvement opportunities for the program across the clinics. Ongoing engagement and support of community stakeholders is essential to the successful recruitment of women into the program and providing a continuum of care through integrated referrals. JPS will bring together an oversight board consisting of the members of JPS and other pertinent agencies or individuals quarterly. The oversight committee will have several purposes: 1) continue to engage stakeholders in project, 2) share information, 3) identify barriers and develop strategies, 4) provide access to expertise, and 5) help foster wider public support for Journey to Life as an innovative strategy to provide obstetric care as a means to improve birth outcomes and decrease emergency department utilization.

By DY4, JPS will measure the utilization of the emergency department by prenatal patients. The goal will be to decrease the frequency of inappropriate emergency department visits by prenatal patients by 5% of the baseline. By DY5, the goal will be to decrease the frequency of inappropriate emergency department visits by prenatal patients by 10% of the baseline. JPS plans to continue this model after completion of DY5 due to the confidence in these innovative programs.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**Starting Point/Baseline:**

- **Target Population:**
  - Specific Number: 3,084 prenatal women in DY4 and 3,875 prenatal women in DY5 who are defined as the intervention population. These women will have been enrolled and received prenatal care through either of the two evidence-based models, Centering Pregnancy or the Maternity Medical Home.
  - Description of Population: JPS Obstetric Patients
  - Baseline data:
    - 3,230 ED visits were provided in FY11 for patients who were identified as pregnant. Baseline data will be established in DY2 to determine which of these ED visits were potentially preventable.

**Process Milestone 1 [P-1]:**

- Project Planning to engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
  - Goals:
    - a. Partner with identified agencies for project planning to develop protocols/strategies for educating prenatal patients at JPS and in the community.
    - b. Implement a patient tracking system that captures the utilization of the emergency department and develop systems to proactively educate prenatal women on the appropriate utilization of the emergency department.
    - c. Identify key challenges associated with the expansion of the project.
  - Data Source: EHR/EPIC and Written protocols and completion

**Process Milestone 4 [P-4]:**

- Conduct Plan Do Study Act cycles (rapid cycle improvement) to identify strategies with partnering agencies for effective community education regarding appropriate use of the emergency department.
  - Goal:
    - f. Predict what the change in outcomes will be
    - g. Plan how the change will be implemented
    - h. Collect the data
    - i. Analyze the data
    - j. Establish baseline benchmarks
  - Data Source: EHR/EPIC

**Outcome Improvement Target 1 [IT-9.2]:**

- Rate 1: Decrease the number of prenatal patients utilizing the emergency department by 5% which equates to 162 fewer visits.
- Improvement Target: 5% fewer visits which equates to 162 fewer visits.
- Data Source: EHR/HEDIS

**Outcome Improvement Target 1 Estimated Incentive Payment:**

- $104,566

**Process Milestone 4 Estimated Incentive Payment:**

- $97,586

**Outcome Improvement Target 2 [IT 9.2]:**

- Rate 1: Decrease the number of prenatal patients utilizing the emergency department by 10% which equates to 323 fewer visits.
- Improvement Target: 10% fewer visits which equates to 323 fewer visits.
- Data Source: EHR/HEDIS

**Outcome Improvement Target 2 Estimated Incentive Payment:**

- $250,050

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $508,321*
Title of Outcome Measure (Improvement Target): IT-9.3 Pediatric/Young Adult Asthma Emergency Department Visits

Unique Project ID: 126675104.3.47 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

DY2: Process milestone 1 (P-2) – Establish baseline rates – Partner with identified agencies serving the underserved pediatric and young adult population to determine baseline data specific to pediatric/young adult asthma emergency department visits.
DY3: Process milestone 2 (P-4) – Plan-Do-Study-Act cycle will be utilized to identify appropriate communication flow between partnering agencies for seamless coordination of care and prevention of potentially preventable ED admissions.
DYs 4 and 5: Outcome improvement – Reduce the percentage of pediatric and young adult patients with asthma who have greater than or equal to one visit to the emergency room by 10% (DY4) and 15% (DY5) from established baseline.

Rationale:
Tarrant County is home to 401,322 children ages 0-14. According to CCHAPS, a Community-wide Children’s Health Assessment and Planning Survey, 18.6% of those children have asthma. Asthma is the most common chronic disease in childhood and children in low-income families are more than twice as likely to have been diagnosed with asthma than children in families that are not low-income. Asthma is the leading cause of emergency department visits and hospitalizations for children in the United States and is one of the leading causes of school absenteeism. Asthma-related illnesses lead to almost 13 million school days missed per year.

Treating children with asthma in emergency departments (ED) is not only costly, but in many cases, unnecessary. Research shows that ED visits typically cost five times as much as primary care visits, and 17 percent of all pediatric ED visits could be eliminated by proper therapy. The estimated annual cost of treating asthma in children is $8 billion. Among Medicaid-enrolled children with persistent asthma, the underuse of controller medications is widespread, reaching as high as 73%. As a result, there are more episodes, greater use of emergency departments and hospitals, and increased treatment costs.

Children with asthma continue to suffer as adults affecting not only their quality of life, but also their lifetime productivity. It has been calculated that the economic costs of asthma for all people born in the year 2000 who develop this diagnosis (approximately 380,000 people) will be: $7.2 billion, including 3.2 billion in medical costs and $4 billion in work/productivity loss.
When children receive tailored asthma education and ongoing treatment, they are less likely to require costly hospitalizations and avoidable emergency room visits. A focus on chronic, complex care will require workflow redesign and increased emphasis on connected and coordinated disease-based care teams. With the implementation of this DSRIP project, we believe that aggressive, proactive, and coordinated multidisciplinary care will significantly reduce emergency department visits in our target population.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

*(add outcome amounts over DYs 2-5): $15,074*
Title of Outcome Measure (Improvement Target): IT-3.11 Pediatric Asthma 30-Day Readmission Rate

Unique Project ID: 126675104.3.48 (Pass 2)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:

DY2: Process milestone 1 (P-1) – Project Planning – Establish community linkages to develop a project plan focused on chronic care management for asthma in the pediatric and young adult population.

DY2: Process milestone 2 (P-2) – Establish baseline rates – Partner with identified agencies serving the underserved pediatric and young adult population to determine baseline data specific to pediatric asthma 30-day readmission rates specific to our population.

DY3: Process milestone 3 (P-3) – Develop and test data systems to ensure validity of information gathered specific to pediatric asthma 30-day readmission rates.

DYs 4-5: Outcome improvement (IT 3.11) – Reduce the percentage of pediatric and young adult patients with asthma who are readmitted to the hospital for any cause within 30 days of discharge from initial admission by 10% (DY4) and 15% (DY5) from established baseline.

Rationale:
Tarrant County is home to 401,322 children ages 0-14. According to CCHAPS, a Community-wide Children’s Health Assessment and Planning Survey, 18.6% of those children have asthma. Asthma is the most common chronic disease in childhood and children in low-income families are more than twice as likely to have been diagnosed with asthma than children in families that are not low-income. Asthma is the leading cause of emergency department visits and hospitalizations for children in the United States and is one of the leading causes of school absenteeism. Asthma-related illnesses lead to almost 13 million school days missed per year.

Hospitalizations and emergency department visits for children with asthma is not only costly, but in many cases, unnecessary. The estimated annual cost of treating asthma in children is $8 billion and inpatient hospitalizations represent the largest single direct medical expense for this chronic condition. Among Medicaid-enrolled children with persistent asthma, the underuse of controller medications is widespread, reaching as high as 73%. As a result, there are more episodes, greater use of emergency departments and hospitals, and increased treatment costs.
Children with asthma continue to suffer as adults affecting not only their quality of life but their lifetime productivity as well. It has been calculated that the economic costs of asthma for all people born in the year 2000 who develop this diagnosis (approximately 380,000 people) will be: $7.2 billion, including 3.2 billion in medical costs and $4 billion in work/productivity loss.\(^7\)

When children receive tailored asthma education and ongoing treatment, they are less likely to require costly hospitalizations and avoidable emergency room visits.\(^8\) Research indicates that having a written asthma management plan is associated with reduced rates of hospitalizations.\(^9\) A focus on chronic, complex care will require workflow redesign and increased emphasis on connected and coordinated disease-based care teams. With the implementation of this DSRIP project, we believe that aggressive, proactive, and coordinated multidisciplinary care will significantly reduce 30-day readmission rates in our target population.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):*$199,775
**Title of Outcome Measure (Improvement Target):** IT-4.9 Average Length of Stay

**Unique Project ID:** 126675104.3.49 (Pass 3)

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**
Rehab Provider will reduce the average inpatient length of stay for JPS Connections patients eligible for inpatient rehab. Rehab Provider will provide a high-quality appropriate care delivery setting for earlier rehabilitation for JPS Health Network to refer patients with a specific set of serious, acute conditions. The outcome will quantify how much the care coordination and transition agreement, shared data, and coordinated protocols between the two provider systems shortens the average time that these patients sit in an acute care bed prior to being able to begin rehabilitative therapy.

**Process Milestones:**
In DY2, JPS Health Network and Rehab Provider will establish electronic data systems and tracking mechanisms for patients referred from the ED. In DY3, JPS Health Network and Rehab Provider will establish a baseline average length of stay for JPS Connections with applicable diagnoses.

**Outcome Improvement Targets for each year:**
In DY4, average length of stay at JPS Health Network will decrease by 10% over baseline. By DY5, average length of stay at JPS Health Network will decrease by 15% over baseline.

**Rationale:**
The process milestones chosen (testing data systems, establishing a baseline) will prepare the two providers to track patients and understand the improvements that will result from the Category 2 care transitions intervention. The improvement targets were chosen based on reasonable reductions in ALOS resulting from a carefully coordinated referral program.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc) to achieve a particular targeted outcome. We then allocated more funding to these
metrics. For example, we gave a greater weight to a hypertension or diabetes related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Specifically to the value placed on the outcome of reduced length of stay, we identified the average cost of stay for the inpatient rehabilitation patient, reduced in accordance with our model for less than maximum individual and community impact, and multiplied by the number of patients impacted and number of days length of stay is to be reduced.

Title of Outcome Measure (Improvement Target): IT-6.1(5) – Percent Improvement Over Baseline of Patient Satisfaction Scores – overall health status/functional status of JPS Connections Patients presenting with 3 specific CMGs

Unique Project ID: 126675104.3.50 (Pass 3)
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
JPS Connections patients exhibiting the 3 selected CMGs for stroke, hip replacement and hip fracture and that match Rehab Provider’s admission requirements will be transferred from JPS Health Network inpatient after stabilization to Rehab Provider for their rehabilitation care. The patient satisfaction measure will be used to assess the impact of the care transition protocols and systems established and implemented collaboratively by JPS Health Network and Rehab Provider.

Process Milestones:
In DY2, JPS Health Network will develop a CG-CAHPS-based survey specifically designed to capture patient satisfaction with inpatient rehab care for stroke, hip replacement or hip fracture patients. In DY3, JPS will test this survey in order to establish a baseline and confirm the validity of this survey.

Outcome Improvement Targets for each year:
In DY4 and 5, the survey will be utilized to track improvement of patient satisfaction that results from the Category 2 inpatient rehab referral intervention.

Rationale:
The process milestones chosen (developing and piloting the survey instrument and methodology and establishing a baseline) will prepare us for fielding the instrument to each patient both pre- and post-intervention (care transition). The improvement targets will be determined once pre-intervention baseline is established.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension or diabetes related outcome.
over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Specifically to the value placed on the outcome of increase patient satisfaction, we identified the revenue associated with inpatient rehabilitation patients and conservatively assumed a hospital could expect to realize a maximum of two percent (2%) of that revenue from a future referral from just one patient. Then, that maximum amount was discounted based on the individual and community impact; which for this population was presumed less than the maximum amount. In other words, of the $4.7 million dollars per year of charges associated with our inpatient rehabilitation patients, we assumed the ability to capture less than two percent of that revenue from future referrals as a result of improved patient satisfaction.

**Title of Outcome Measure (Improvement Target):** IT-1.1 Reduce Third Next Available Appointment

**Unique RHP outcome identification number(s):** 126675104.3.51  
**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**  
By the end of the Waiver, our goal is to reduce the 3rd next available appointment for routine eye exam to 30 days or less.

**Process Milestones:**
- In DY2, the baseline data will be verified and validated. Data reported for in a new EMR for end of 2012 is over 100 days to next available appointment for routine eye exam. There are approximately 17,000 diabetic patients in the network that will require a routine eye exam each year.

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to reduce the third next available appointment for routine eye exam to 75 days or less.
- In DY4, our goal is to reduce the third next available appointment for routine eye exam to 50 days or less.

**Rationale:**
The 3rd next available appointment is the industry standard to measure practice health and is directly related to patient satisfaction scores. Wait times are currently over 100 days for the ophthalmology service. Compliance with annual eye exams for patients with diabetes is both a HEDIS and AHRQ quality measure. The addition of optometrists to the ophthalmology service will enhance both access to service and compliance with preventive eye exams for the JPS medical home population.

**Outcome Measure Valuation:**
This outcome was not included in the original submission and will have no value; other outcomes for this project will remain at original dollar value.

**Title of Outcome Measure (Improvement Target):** IT-2.11 Ambulatory Care Sensitive Conditions Admission Rate

**Unique RHP outcome identification number(s):** 126675104.3.52

**Performing Provider Name/TPI:** JPS Health Network/126675104

**Outcome Measure Description:**

DY2

Process Milestone 1:
P-1: Project planning—engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans. Partner with MedStar Medical Control Authority, JPS emergency department and JPS case management staff for project planning to develop protocols for identification of patients in the ED who might normally be held for overnight observational admission who can be safely managed in their home with medical monitoring and effective transition to their PCP.

Process Milestone 2-
Partner with MedStar Medical Control Authority, JPS emergency department and JPS case management staff to determine baseline rates specific to Ambulatory Care Sensitive Condition Admission rates for the Observation Avoidance Program.

Process Milestone 3:
P-3: Develop and test data systems
Develop eligible patient identification and referral system. Establish network for patient referrals and test appointment scheduling and referral system specific to the Observation Avoidance Program to ensure data reliability.

DY3

Process Milestone 4:
Plan-Do-Study-Act Cycle will be utilized to identify the resources available for patients who are identified as having an ACSC that can be managed at home versus an overnight observational admission.
Regional Health care Partnership

Improvement Target 1: (IT-2.11) - Initiate care observational admission avoidance services to targeted patients. Targeted patients include all ASCS and Diabetes, End Stage Renal Disease, Cardiovascular Disease/Hypertension, Behavioral Health/Substance Abuse, Chronic Obstructive Pulmonary Disease, and Asthma using the Observation Admission Avoidance Program. by 5% from established baseline. Anticipated impact 5 patients.

DY 4 Improvement Target 2 (IT-2.11): This program will reduce the number of PPA for those with ambulatory sensitive conditions by 10% from established baseline. Anticipated impact 15 patients.

DY 5: Improvement Target 3 (IT-2.11): This program will reduce the number of PPA for those with ambulatory sensitive conditions by 15% from established baseline. Anticipated impact 30 patients.

Rationale
Data from July 2011 through June 2012 revealed a subset of individuals in the JPS Connection program having 452 out of 10,239 cases of Avoidance Admissions for ASCS. JPS Connection provides eligible Tarrant County residents with low cost medical care at JPS locations. Eligibility is based on household size and gross monthly income according to the current Federal Poverty Income levels.

In our community, one hospital and payer group has identified 3,000 patients that were admitted to 23 hour “Observation” at a cost of $5,000 per admission. In some cases, these observational admissions are simply because the ED physician is uncomfortable sending the patient home to an unknown and medically unsupervised setting. Under this program, MedStar will receive these patients into their community health program and conduct any necessary follow-up visits until the patient can be scheduled for follow-up with their primary care provider.

Valuation
During DY 2, we will determine the use data for Observational Admissions and the costs associated with this use. We will then determine the processes necessary to achieve the Improvement Milestones implement the program and measure the change in use patterns of the target population. The baseline costs of prior use will then be compared to the actual costs of the target population’s use of healthcare services, along with a tool to measure the patient’s perception of their health status.

Once established, we will apply currently measured data metric to the expanded population each year as described above.
Rationale/Justification: Please describe your rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), including, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, estimated local funding, etc.

Using the emergency care system and overnight observation for low-acuity and preventable admissions and readmissions results in lack of care coordination, uses high cost resources for low-acuity activities and deprives patients needing those resources when they are consumed by low acuity patients. The economic costs of these services can be easily tracked and benchmarked over time. The clinical results can best be measured by the patient’s own perception of their health status and their ability to manage their own healthcare needs.

The milestones and metrics for this program has been based on actual experiences of JPS and MedStar conducting limited enrollment pilot projects in each of these areas, tracking the actual data as described and measuring results.

This navigation program significantly expands already operating, proven programs the impact larger number of patients. This increase in patient populations will allow for a more robust analysis of the impact to the patient and the costs of care for possible replication in other areas.

### Related Category 1 or 2 Projects: 2.9 JPS-MedStar Patient Navigation Program

**Target Population:**
Specific Number: 450

**Description of Population:** This program will be focused on reducing potentially avoidable observation admissions for patients that can be effectively managed at home, with medical support, while awaiting their follow-up PCP appointment. In many cases, the ED physician may be uncomfortable sending the patient home due to lack of available resources or the concern the patient does not have an option for care if needed at home. Under this program, these patients would be referred to the MedStar Community Health Program (CHP) for in-home follow up care during the brief transition from ED to PCP. The patient will receive scheduled home visits and a 10-digit non-emergency phone number to contact the MedStar personnel assigned to assist them. ACSC most typically enrolled in this program will be seizures, falls, COPD, CHF, hypertension, diabetes and angina.

**Baseline data:**
If no baseline data, please indicate your plan to collect baseline data as a process measure in DY2 or DY3 in lieu of setting an outcome improvement target.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $664,925
Title of Outcome Measure (Improvement Target): IT-4.8 Sepsis Resuscitation and Management: Reduce Mortality
Unique RHP outcome identification number(s): 126675104.3.53
Performing Provider Name/TPI: JPS Health Network/126675104

Outcome Measure Description:
A reduction in mortality rate will be driven by the early identification, intervention and evidence based management while in ED and ICU of patients septic patients admitted through ED. Early intervention will circumvent the development of organ failure and other complications which are the result of poorly managed sepsis. By avoiding these complications, treatment intensity, resources, and LOS in the ICU are reduced.

Process Milestones:
Year 2 Process Milestones: Reactivating the Sepsis Response team for the purpose of project planning; establishing baseline rates; developing data systems; re-designing processes and communicating results(Rapid cycle PI). Other Y2 Milestones are, hiring the sepsis coordinator, clinical analyst and 2.5 FTEs which will expand the existing Medical Emergency Team and provide 24/7 Sepsis Response Team coverage. Mortality Improvement Milestones for year 2 are not defined, because process standardization will be in evolution.
Year 3 Process Milestones: The team’s utilization of the tools for the rapid response to and the management of sepsis will improve compliance with diagnosis to 65% (224 patients) and sepsis management to 75%(259 patients). Rapid cycle improvement, lean, six sigma and other PI methods will drive continued improvement in the management of these patients. Better management of sepsis and the avoidance of complications are expected to reduce mortality to 15% in Y3 (17 saved lives/345 target)).

Outcome Improvement Targets for each year:
Year 4 Milestones: Improved compliance with diagnosis to 75% (249 patients/576 target) and sepsis management to 85% (293 patients/576 target); ICU LOS reduction to 5%(4.2 ICU ALOS). Mortality rate of 15%.

Year 5 Milestones: Improved compliance with diagnosis to 85% (293 patients/576 target); sepsis management to 95% % (327 patients/576 target); ICU LOS reduction to 10% % (3.7 ICU ALOS). Mortality rate of 12%, representing 28 saved lives over the waiver period.

JPS Health Network is proposing the erection of an Innovation and Transformation Center (Category 2) which will increase competencies in performance improvement and also support the Network’s Measurement System. Secondly we also reactivating our Harm Avoidance teams for reducing Health Acquired Infections (CAUTI, CLABSI, SSI) which could result in reducing Sepsis acquired after admission.

Rationale:
By identifying the presence of sepsis early on in the course of care, we have the opportunity to initiate early and appropriate treatment which reduce complications and associated mortality. The refinement of the data bases, dashboards and methods of disseminating, participation in learning and PI meetings will provide feedback and further engage clinicians.

**Outcome Measure Valuation:**

A value was not placed on reducing mortality; this project was valued based on reduction in ICU length of stay. As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-1.7- Controlling High Blood Pressure (NCQA-HEDIS, 2012, NQF 0018) (Stand-alone)

Unique RHP outcome identification number(s): 135036506.3.1
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-1.7: Controlling high blood pressure (Standalone measure)

- Numerator: The number of patients in the denominator whose most recent blood pressure (BP) is adequately controlled (BP less than 140/90 mm Hg) during the measurement year
- Denominator: Patients 18 to 85 years of age as of December 31 of the measurement year with a diagnosis of hypertension

As one of our primary care metrics we chose blood pressure control. As high blood pressure is a prerequisite to many other chronic illnesses and serious medical conditions, getting BP under control with proper PCP supervision, medications and regular visits can help patients’ quality of life and overall health.

By the end of the Waiver, our goal is to have > 63.3% of patients who are Baylor Clinic patients at Baylor All Saints Medical Center have good blood pressure control (< 140/80 mmHg). This is a projected 6.1% improvement over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2. Improvement will be measured primarily on new patients to the Baylor Clinic.

Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.
- In DY2, we will confirm and establish our baseline. Baylor currently tracks BP control and uses a threshold of <130/80 mmHg for patients who have hypertension. Based on our current data, 57.5% of patients with hypertension have controlled BP (130/80 mmHg). We will reestablish our DY2 baseline based on new patients to the Baylor Clinic.
- In DY3, our goal is increase the % of patients who have BP control (< 140/80 mmHg) to 59.6% (or 2.1% improvement over baseline established in DY2)
- In DY4, our goal is increase the % of patients who have BP control (< 140/80 mmHg) to 61.6% (or 4.1% improvement over baseline established in DY2)
- In DY5, our goal is increase the % of patients who have BP control (< 140/80 mmHg) to 63.6% (or 6.1% improvement over baseline established in DY2)

Rationale:
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data...
that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Controlling high blood pressure is essential in avoiding heart attacks, stroke, heart failure and a multitude of other diseases and complications. Through medication management, proper primary care attention and education, patients can achieve better blood pressure control in the outpatient setting. In Region 10, Hypertension was identified as one of the top 5 most prevalent diseases in the area, with over 1,000 preventable admissions in 2010. A recent article in the New York Times suggested that hypertensive complications can be especially deadly in the African-American population, who make up 12% of the RHP 10 population. Blood pressure is a standard metric that all Baylor Clinics monitor and regulate. Patients who are uncontrolled will receive the attention they need to get their hypertension under control. Patients will receive medication management, lifestyle management techniques and education about their illness in this clinic PCMH setting. Our metrics and milestones are designed to increase improvement in BP control for the target population.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension or diabetes control would have greater impact than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-6.1 - Percent improvement over baseline of patient satisfaction scores (Stand-alone measure)

1) Patients are getting timely care, appointments and information (Stand-alone measure):
Measurement of Satisfaction Related to Clinic Wait Times

Unique RHP outcome identification number(s): 135036506.3.2
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:
(1) are getting timely care, appointments, and information; (Standalone measure)
(2) how well their doctors communicate; (Standalone measure)
(3) patient’s rating of doctor access to specialist; (Standalone measure)
(4) patient’s involvement in shared decision making, and (Standalone measure)
(5) patient’s overall health status/functional status. (Standalone measure)

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients’ in their own care. For this metric we will be measuring is to improve the satisfaction scores in regards to clinic wait times. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2. Improvement will be measured primarily on new patients to the Baylor Clinic.

By the end of the Waiver, our goal is to have the Baylor Clinic at Baylor All Saints Medical Center obtain a patient satisfaction score of 84.9% on the survey question related to wait time to appointment satisfaction. This falls under metric (1)- patients are getting timely care, appointments and information of 3.6.1.

Although the Baylor Clinic at Baylor All Saints Medical Center is at a 84th percentile score of patients satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. The baseline percentile score of 84.9% is equivalent to a 60th percentile score nationally, which also presents an opportunity to improve for this Baylor Clinic. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.
Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. Currently, the Baylor Clinic at Baylor All Saints Medical Center is at 82.4% satisfaction with clinic wait times. We will reestablish our DY2 baseline based on new patients to the Baylor Clinic.
- In DY3, our goal is increase the % of patient satisfaction related to wait times to 83.3% (or 0.9% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patient satisfaction related to wait times to 84.1% (or 1.7% improvement over DY2 baseline)
- In DY5, our goal is increase the % of patient satisfaction related to wait times to 84.9% (or 2.5% improvement over DY2 baseline)

Rationale:

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients’ ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease. Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction, however there is opportunity for improvement. This outcome has an impact on the Region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

1) Patients are getting timely care, appointments and information (Stand-alone measure): We will measure this particular metric through monitoring and improving the survey question around improving wait times for patients

---

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

Region 10 RHP Plan  
Page 1723
Title of Outcome Measure (Improvement Target): IT-6.1 - Percent improvement over baseline of patient satisfaction scores (Stand-alone measure)

1) Patients are getting timely care, appointments and information (Stand-alone measure):
Measurement of Satisfaction Related to Response Time to Patient Phone Calls

Unique RHP outcome identification number(s): 135036506.3.3
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-6.1: Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for improvement in a specific tool. Certain supplemental modules for the adult CG-CAHPS survey may be used to establish if patients:

(1) are getting timely care, appointments, and information; (Standalone measure)
(2) how well their doctors communicate; (Standalone measure)
(3) patient’s rating of doctor access to specialist; (Standalone measure)
(4) patient’s involvement in shared decision making, and (Standalone measure)
(5) patient’s overall health status/functional status. (Standalone measure)

Patient satisfaction is an important part of overall treatment and encourages participation and compliance of patients’ in their own care. For this metric we will be measuring improvement in the responsiveness to patient phone calls in a timely manner.

By the end of the Waiver, our goal is to have the Baylor Clinic at Baylor All Saints Medical Center obtain a patient satisfaction score of 95.0% on the survey question related to patient phone calls being returned in a timely fashion. This falls under metric (1) Patients are getting timely care, appointments and information of 3.6.1. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2. Improvement will be measured primarily on new patients to the Baylor Clinic.

Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. Currently, the Baylor Clinic at Baylor All Saints Medical Center is at 94.2% satisfaction with patients receiving a response to their phone calls in a timely manner. We will reestablish our DY2 baseline based on new patients to the Baylor Clinic.
- In DY3, our goal is increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 94.5% (or 0.3% improvement over DY2 baseline)
In DY4, our goal is to increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 94.8% (or 0.6% improvement over DY2 baseline)

In DY4, our goal is to increase the % of patient satisfaction related to receiving a timely response to a patient phone call to 95.0% (or 0.8% improvement over DY2 baseline)

Although the Baylor Clinic at Baylor All Saints Medical Center is at a 94th percentile score of patient satisfaction related to this particular metric, we believe there is still opportunity to improve and that with any incremental gain in patient satisfaction equates to better compliance and outcomes for our patients. By maintaining high standards and enforcing metrics around satisfaction for our staff, we will continue to pursue high patient satisfaction scores in our Baylor Clinics.

**Rationale:**

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

Patients’ ability and perception of receiving timely care, appointments and information can greatly impact the level of compliance and trust the patient has with their clinic and provider. Data from Press Ganey Associates in 2007 has demonstrated that patients judge a medical practice by the way they are treated as people, not the way they are treated for their disease\(^{401}\). Additionally, they found that satisfied patients are more likely to comply with treatment plans, ultimately having better outcomes which lowers costs; are more rewarding to care for and take up less physician/staff time, reducing length of visits and wait times for the overall practice. Baylor Clinics have historically had high performance in all measures related to patient satisfaction, however there is opportunity for improvement. This outcome has an impact on the Region through increasing utilization of outpatient based primary care. If patients are satisfied, they will continue to come to their appointments, stay healthier and stay out of the ED. We anticipate that we will be able to raise patient satisfaction in the domains mentioned below through the Baylor Clinic PCMH model.

1) Patients are getting timely care, appointments and information (Stand-alone measure): We will measure this particular metric through monitoring and improving the survey question around improving wait times for patients

---

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

<td>• Numerator: Number of women aged 40 to 69 that have received an annual mammogram during the reporting period.</td>
</tr>
<tr>
<td>• Denominator: Number of women aged 40 to 69 in the patient or target population. Women who have had a bilateral mastectomy are excluded</td>
</tr>
</tbody>
</table>

By the end of the Waiver, our goal is to have > 50.4% of women ages 40-69 who are patients of the Baylor Clinic at Baylor All Saints Medical Center to have a breast cancer screening. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2. Improvement will be measured primarily on new patients to the Baylor Clinic.

**Process Milestones and Outcome Improvement Targets for each year:** Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. The Baylor Clinic at Baylor All Saints Medical Center is at a 42.1% screening rate for women between 40-69. We will reestablish our DY2 baseline based on new patients to the Baylor Clinic.
- In DY3, our goal is increase the % of patients have had a breast cancer screen to at least 45.0% (or 2.9% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patients have had a breast cancer screen to at least 47.7% (or 5.6% improvement over DY2 baseline)
- In DY5, our goal is increase the % of patients have had a breast cancer screen to at least 50.4% (or 8.3% improvement over DY2 baseline)

**Rationale:**

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.
In Tarrant County, only 58% of women over 40 receive breast cancer screenings. There is room for improvement with this metric to screen more women and utilize early detection methods for breast cancer\textsuperscript{402}.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. **Title of Outcome Measure (Improvement Target):** IT-12.5- Other USPSTF-endorsed screening outcome measures (Non-Stand-alone): Influenza Vaccination Rate

**Unique RHP outcome identification number(s):** 135036506.3.5

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Outcome Measure Description:**

Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

As part of primary care, the influenza vaccine is a simple, cost effective way for patients to protect themselves from the flu and other potential clinical exacerbations.

By the end of the Waiver, our goal is to have > 67.8% of Baylor Clinic patients over the age of 18 receive an influenza vaccination. This is an improvement of 5.3% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2. Improvement will be measured primarily on new patients to the Baylor Clinic.

**Process Milestones and Outcome Improvement Targets for each year:** Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. The Baylor Clinic at Baylor All Saints Medical Center is at a 62.5% rate for patients over 18 that have received an influenza vaccine in the past 12 months. We will reestablish our DY2 baseline based on new patients to the Baylor Clinic.
- In DY3, our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 64.4% (or 1.9% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 66.2% (or 3.7% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patients >18 years old that have had an influenza vaccination in the past 12 months to 67.8% (or 5.4% improvement over DY2 baseline)

**Rationale:**

In Tarrant County, only 40% of individuals over 18 received an influenza vaccination in the past 12 months. Less than one out of every three African-American or Hispanic individuals in Tarrant County received an influenza vaccination. There were 290 influenza-related deaths in RHP 10 in...
The rate of influenza vaccinations in the Region is quite low and there is an opportunity to increase the number in the target population that receive this basic vaccination in order to prevent exacerbations of health issues, reduce the prevalence of influenza and prevent ED visits related to influenza that can otherwise be handled in an outpatient setting.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

**Title of Outcome Measure (Improvement Target):** IT-11.1- Improvement in Clinical Indicator in identified disparity group. Improvement in Asthma Percent of Opportunities Achieved

**Unique RHP outcome identification number(s):** 135036506.3.6

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Outcome Measure Description:**

The disparity group for this metric is the underserved/uninsured population in Tarrant County that has uncontrolled Asthma.

IT 11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider *(Standalone measure)*

- Numerator: Number of asthma opportunities completed/fulfilled
- Denominator: Asthma appropriate opportunities x number of asthma patients

By the end of the Waiver, our goal is to have achieved a 68.6% percent of opportunities achieved for the Baylor Health Care System Asthma Percent of Opportunity Achieved (POA). Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

At Baylor Health Care System, we have a standard Asthma POA which consists of: documentation of action/management plan, severity assessment, controller therapy for those who are eligible, and spirometry within last two years. We measure this yearly for our asthma patients and calculate POA by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from bundle performance which is usually an all-or-none metric calculating the percentage of patients who’ve achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in asthma management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their asthma patients than in the prior reporting period. For example: For asthma- there are four opportunities (i.e. metrics) per patient (1) documentation of action/management plan, 2) severity assessment, 3) controller therapy for those who are eligible, and 4) spirometry within last two years). The denominator would be number of patients times 4. So, for example, if there are 10 patients times 4 opportunities each = 40 opportunities to be achieved. If, in the course of the year, only 30 of those opportunities were completed; this means that our POA (Percent of Opportunities Achieved) = 30/40=75%. To achieve a 10% improvement in POA, we would have to have completed at least 34/40 opportunities to get at 85% achievement.

**Process Milestones and Outcome Improvement Targets for each year:** Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.
• In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 63.4% POA was achieved for Asthma patients
• In DY3, our goal is to increase the POA % for Asthma patients to 65.2% (or 1.8% improvement over DY2 baseline)
• In DY4, our goal is to increase the POA % for Asthma patients to 67.0% (or 3.6% improvement over DY2 baseline)
• In DY5, our goal is to increase the POA % for Asthma patients to 68.6% (or 5.2% improvement over DY2 baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Pulmonologists should handle more complex cases but also use this opportunity to help educate the underserved population (especially Hispanics and African-Americans) about the importance of screenings and prevention.

**Rationale:**
We plan on measuring the improvement in Asthma for Baylor Clinic patients who receive care from a specialist. At Baylor Health Care System, we have a standard Asthma Percent of Opportunities Achieved which consists of: documentation of action/management plan, severity assessment, controller therapy for those who are eligible, and spirometry within last two years. We feel that this measure is a comprehensive way to measure the patients with asthma in the Baylor Clinic and manage their condition holistically.

Asthma affects about 9% of the Tarrant County population and had approximately 1158 cases of hospitalization in 2010. According to the Office of Minority Health, African-Americans were 30% more likely to have Asthma than non-Hispanic whites and were three times more likely to die from an asthma-related issue than non-Hispanic whites. Hispanics are 30% more likely to visit the hospital for Asthma than non-Hispanic whites.

A study by Meng, Leung, et al. found that patients with Asthma that saw a specialist had higher rates of compliance because specialists were more likely to identify the disease and follow national guidelines and protocols to treat these patients leading to better quality outcomes and long(er) term control. Making the pulmonologist a part of our Asthma patients’ care team will help to avoid exacerbations, prevent complications and reduce hospitalizations.

Many of the underserved patients in the Region require specialty care related to chronic diseases. Lack of timely access to this needed care, often results in clinical exacerbations and worsening of their health conditions that can be avoided or lessened through improved access. A study

---

404 RHP 10 Community Health Needs Assessment
405 Office of Minority Health: http://www.minorityhealth.hhs.gov
conducted in 2010 by Bellinger, et al. confirmed that minority and underserved populations not only receive less care but access to care is mitigated by physician referral, geographic location and insurance type.\textsuperscript{407}

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

Title of Outcome Measure (Improvement Target): IT-12.2- Cervical Cancer Screening (HEDIS 2012) (Non-Stand-alone Measure)  

Unique RHP outcome identification number(s): 135036506.3.7  
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:  
IT-12.2: Cervical Cancer Screening (HEDIS 2012) *(Non-standalone measure)*  
- Numerator: Number of women aged 21 to 64 that have received a PAP in the measurement year or two prior years.  
- Denominator: Women aged 21 to 64 in the patient or target population. Women who have had a complete hysterectomy with no residual cervix are excluded.

As part of preventive care and screenings, cervical cancer screening is a standard practice that PCP/PCMHs provide for their patients. Education and regular exams can be the difference between early detection and death. By the end of the Waiver, our goal is to have > 75.9% of patients who are Baylor Clinic at Baylor All Saints Medical Center be screened for Cervical Cancer. This is a 5.9% improvement over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows that 72% of patients at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth have had a cervical cancer screening.
- In DY3, our goal is increase the % of patients who have received a cervical cancer screening to at least 73.3% (or 1.3% improvement over DY2 baseline)  
- In DY4, our goal is increase the % of patients who have received a cervical cancer screening to at least 74.6% (or 2.6% improvement over DY2 baseline)  
- In DY5, our goal is increase the % of patients who have received a cervical cancer screening to at least 75.9% (or 3.9% improvement over DY2 baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that OB/GYNs should handle more complex cases but also use this opportunity to help educate underserved women about the importance of screenings and prevention.

Rationale:  
In Tarrant County approximately 77% of women received a Pap smear in the last year, however this percentage was lower for the minority populations in the county\(^{408}\). According to the National Cancer Institute, African-American women are more likely to be diagnosed with

\(^{408}\) RHP 10 Community Health Needs Assessment
cervical cancer and Hispanic women have the highest cervical cancer incidence rate amongst all women\textsuperscript{409}. There is opportunity to increase the screenings in the minority population through engaging OB/GYNs to provide screenings and education for this population. Additionally, these specialists can provide the advanced screenings and education that would not be available in a PCP/PCMH setting.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Year 2 Estimated Outcome Amount: (add incentive payments amounts from each milestone/outcome improvement target): $22,453

Year 3 Estimated Outcome Amount: $19,519

Year 4 Estimated Outcome Amount: $31,322

Year 5 Estimated Outcome Amount: $74,900

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $148,194**
**Title of Outcome Measure (Improvement Target):** IT-12.3- Colorectal Cancer Screening (HEDIS 2012) (Non-Stand-alone Measure)

**Unique RHP outcome identification number(s):** 135036506.3.8

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Outcome Measure Description:**

IT-12.3 Colorectal Cancer Screening (HEDIS 2012) (Non-standalone measure)
- Numerator: Number of adults aged 50 to 75 that have received one of the following screenings. Fecal occult blood test yearly, Flexible sigmoidoscopy every five years, Colonoscopy every 10 years
- Denominator: Number of adults aged 50 to 75 in the patient or target population. Adults with colorectal cancer or total colectomy are excluded.

By the end of the Waiver, our goal is to have > 34.3% of patients who are Baylor Clinic patients at Baylor All Saints Medical Center be screened for Colorectal Cancer. This is an improvement of 10.9% over baseline. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

**Process Milestones and Outcome Improvement Targets for each year:** Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows that only 23.4% of patients at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth have had a Colorectal Cancer Screening
- In DY3, our goal is increase the % of patients who have received a colorectal cancer screening to at least 27.2% (or 3.8% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patients who have received a colorectal cancer screening to at least 30.9% (or 7.5% improvement over DY2 baseline)
- In DY5, our goal is increase the % of patients who have received a colorectal cancer screening to at least 34.3% (or 10.9% improvement over DY2 baseline)

In order to meet these improvements, primary care and specialists in the community will have to work together to meet these goals. We feel that Gastroenterologists should handle more complex cases but also use this opportunity to help educate underserved women about the importance of screenings and prevention. The Baylor Clinic is currently only at a 23% completion rate and will need the help of their specialist partners to meet these goals.

**Rationale:**

In Tarrant County less than 13% of individuals 50 and over obtained a fecal occult blood test within the past 2 years and less than 10% of Tarrant county residents 50 and over met colorectal cancer screening guidelines. There is a definite need for these services in Tarrant County and the
Baylor Clinic plans to provide these screenings to a greater number of people. There is greater need for patients to receive (appropriate) sigmoidoscopies/colonoscopies in the Region as a preventive measure\textsuperscript{410}. According to the Centers for Disease Control and Prevention, Hispanics and African-Americans are less likely to get screened for colorectal cancer and it is often found in the latter stages of the disease as compared to their Caucasian counterparts\textsuperscript{411}. There is an opportunity to increase the colorectal cancer screening rates by engaging specialists in the Tarrant County area to provide these basic and advanced screenings along with education that is focused on this particular topic.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $148,194
**Title of Outcome Measure (Improvement Target):** IT-1.10- Diabetes Care: HbA1c poor control (> 9.0%)- NQF 0059 (Stand-alone measure)

**Unique RHP outcome identification number(s):** 135036506.3.9

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Outcome Measure Description:**
IT-1.10 Diabetes care: HbA1c poor control (> 9.0%) *(Standalone measure)*
- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who had hemoglobin A1c (HbA1c) control > 9.0%.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the Waiver, our goal is to have < 21% of patients 18-75 years old with diabetes (type 1 or type 2) out of glycemic control (HbA1c >9.0%). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. The additional qualifiers for this metric are the following: 1) a patient has been engaged in chronic care management for at least 6 months, 2) Two HbA1c measures will be taken per patient and the most recent HbA1c score will be used for reporting.

One of the outcome measures we have chosen for our chronic care management program is HbA1c performance, as determined by a reduction in poor control, defined as the percent of the population with HbA1c > 9.0%. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

**Process Milestones and Outcome Improvement Targets for each year:** Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.
- In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 25% of patients at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth have an HbA1c > 9.0%
- In DY3, our goal is to reduce this rate to < 23.8% (or reduction of HbA1c >9.0% by 1.2% over DY2 baseline)
- In DY4, our goal is to reduce this rate to < 22.6% (or reduction of HbA1c >9.0% by 2.4% over DY2 baseline)
- In DY5, our end goal is to have this rate be at < 21.4% (or reduction of HbA1c >9.0% by 3.6% over DY2 baseline)

**Rationale:**
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an
ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

In Tarrant County, more than 8% of the population has a diagnosis of diabetes with more than 37% of the population classified as obese and at risk for developing diabetes. In 2010, there were over 2000 cases of avoidable hospitalizations related to diabetes (diabetes short-term complications: 1,136 cases and diabetes long-term complications): 1,986 cases. Traditionally, the underserved population does not have access to the necessary medications and supplies to manage their diabetes thus many patients go undiagnosed or have poor glucose control. Lack of proper education coupled with a lack of primary care attention often leads to more severe. Lack of proper education coupled with a lack of primary care attention often leads to more severe complications and poor health outcomes for those with diabetes. This project would facilitate timely and appropriate care for those with diabetes and ensure that regular labs and point of care testing is completed to monitor results and make appropriate interventions.

Bodenheimer et al., found that patient self-management of chronic disease conditions, such as diabetes, that was co-located in a primary care setting led to significant improvement in HbA1c control in patients. A recent edition of Managed Care found that patients with an HbA1c > 9 had on average almost $5000 worth of hospitalization costs, while those with an HbA1c of < 7 had about $2700 in hospitalization costs. Focusing efforts on improving glycemic control should result in reduced comorbid conditions and improved complication rates for these patients. We expect that at least 5-7% of patients who are seen regularly in a Baylor Clinic will have improved HbA1c levels.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we

Title of Outcome Measure (Improvement Target): IT-1.11- Diabetes Care: BP control (<140/80 mmHg) NQF 0061 (Stand-alone measure)

Unique RHP outcome identification number(s): 135036506.3.10
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-1.11 Diabetes care: BP control (<140/80 mm Hg) - (Standalone measure)

- Numerator: Use automated data to identify the most recent blood pressure (BP) reading during the measurement year. The member is numerator compliant if the BP is less than 140/90 mm Hg.
- Denominator: Members 18 to 75 years of age as of December 31 of the measurement year with diabetes (type 1 and type 2)

By the end of the Waiver, our goal is to have > 57.9% of patients 18-75 years old with diabetes (type 1 or type 2) under BP control (< 140/80 mmHg). This is a 7% improvement over baseline. This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program for at least 6 months. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows that at least 50.9% of patients with diabetes at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth have BP less than 130/80 mmHg.
- In DY3, our goal is increase the % of patients in good BP control (<140/80 mmHg) to 53.4% of patients at the Baylor Clinic who have engaged in the chronic care management program (or 2.5% improvement over DY2 baseline)
- In DY4, our goal is increase the % of patients in good BP control (<140/80 mmHg) to 55.7% (or 4.8% improvement over DY2 baseline) of patients at the Baylor Clinic who have engaged in the chronic care management program
- In DY5, our goal is have at least 57.9% (or 7% improvement over DY2 baseline) of patients in good BP control (<140/80 mmHg)

Rationale:
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data.
that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic. We will have to review our baseline numbers in DY2. Historically, in our E.H.R we have been tracking BP control as <130/80 mmHg. In order to meet the requirements of this project, we will have to re-analyze the numbers and re-establish our new baseline.

As part of the standard of care for diabetes management, optimal blood pressure control is an included component of this protocol. At Baylor Health Care System, blood pressure control and management is a required part of the diabetes care bundle in order to avoid other comorbid conditions such as heart disease and stroke. A 2010 study in the New England Journal of Medicine by Cushman, et al. showed that better and less severe health outcomes related to cardiovascular episodes and stroke were achieved with tight blood pressure control in diabetic patients. Events that would be fatal with higher blood pressure became nonfatal under better blood pressure control in these studies completed. As part of an outpatient, clinic based protocol, blood pressure control can be achieved in patients who will come to the Baylor Clinic as part of the primary care expansion project.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

---

### Diabetes Care: BP control (<140/80 mmHg)

**Related Category 1 or 2 Projects:** 135036506.2.1.- Expand Chronic Care Management Models

**Starting Point/Baseline:**
*Baseline:* The baseline for this project will be confirmed again in DY2 and redefined as <140/80 mmHg. Currently, we have about 50% of our patients that have a BP < 130/80 mmHg at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth.

*Target Population:* Underserved/uninsured diabetic patients with BP >140/80 mmHg in Tarrant County

Title of Outcome Measure (Improvement Target): IT-1.13- Diabetes Care: Diabetes care: Foot exam- NQF 0056

Unique RHP outcome identification number(s): 135036506.3.11
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-1.13 Diabetes care Foot exam- (Non- standalone measure)

- Numerator: Percentage of patients 18-75 years of age with diabetes (type 1 or type 2) who received a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year.
- Denominator: Patients 18-75 years of age as of December 31 of the measurement year who had a diagnosis of diabetes (type 1 or type 2).

One of the outcome measures we have chosen for our chronic care management program is to improve foot screenings for patients with diabetes. By the end of the Waiver, our goal is to have > 97.2% of patients 18-75 years old with diabetes (type 1 or type 2) receive a foot exam (visual inspection, sensory exam with monofilament, or pulse exam) during the measurement year(s). This is for patients who are Baylor Clinic patients and have engaged in the chronic care management program. Our baseline number is an estimate based on historical data and will require further refinement and establishment during DY2.

Process Milestones and Outcome Improvement Targets for each year: Actual percentages based on current baseline were included as were relative percentage improvements in (parentheses) in order to account for the establishment of a new baseline number in DY2.

- In DY2, we will confirm and establish our baseline. A preliminary E.H.R data analysis shows 96% of diabetic patients who are seen by a diabetes educator at the Baylor Clinic at Baylor All Saints Medical Center at Fort Worth receive a foot exam.
- In DY3, our goal is to increase this rate to at least 96.5% (or 0.5% improvement over DY2 baseline) of diabetic patients receiving a foot exam.
- In DY4, our goal is to increase this rate to at least 96.8% (or 0.8% improvement over DY2 baseline) of diabetic patients receiving a foot exam.
- In DY5, our goal is to increase this rate to at least 97.2% (or 1.2% improvement over DY2 baseline) of diabetic patients receiving a foot exam.

Rationale:
Category 3 metrics for proposed projects were identified using several key criteria. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Additionally, metrics selected were based on historical Baylor Clinic data.
that showed material improvement in a 2-3 year time period. Outcomes such as readmissions actually had an increase in the preliminary years after patients obtained a PCMH at a Baylor Clinic.

An innovative part of this project is that the educators (CHWs and RN Care Managers) will be able to conduct diabetic foot exams as part of their education session with their patients. This will increase the rate of screening and allow these providers to identify issues such as ulcers and nerve issues earlier and more often. Foot exams are a low-cost, highly effective way to avoid costly interventions such as wound care and management, amputations, neuropathy and other complex issues. This is better utilization and management of resources through early identification and prevention of serious diabetes foot-related issues. It is recommended by the American Diabetes Association that diabetic patients receive yearly foot exams to determine if there are predisposing factors for ulceration and amputation416.

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

### TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $79,825
**Title of Outcome Measure (Improvement Target):** 11.1- Improvement in Clinical Indicator in Identified Disparity Group. Clinical indicator to be improved and disparity group to be determined by provider.  
Diabetes Percent of Opportunities Achieved Improvement

**Unique RHP outcome identification number(s):** - 135036506.3.16 (Pass 3b)

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth / 135036506

**Outcome Measure Description:**  
IT-11.1 Improvement in Clinical Indicator in identified disparity group. Clinical indicator to be improved and disparity group to be determined by provider (*Standalone measure*)  
- **Numerator:** Number of patients with an improved Diabetes POA (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter  
- **Denominator:** Total number of patients with a Behavioral Health intervention/encounter

One of the outcome measures we have chosen for our behavioral health program is to improve Baylor’s standard diabetes percent of opportunities achieved (POA) (HbA1c, LDL, BP) for patients who have engaged in our behavioral health program. We define the disparate population as the underserved individuals in Tarrant County that have both a diagnosis of diabetes and a behavioral health issue. This amounts to almost 23,000 people in the Tarrant County area (8% of total population has diabetes and 15-30% of those individuals also has a behavioral health issue)

By the end of the Waiver, our goal is to have > 15% of patients who have had a behavioral health intervention/encounter to have improvement in our diabetes POA (HbA1c, LDL, BP) that have uncontrolled values for these measures and have an identified behavioral health issue.

- HbA1c < 8%
- LDL < 100
- BP < 130/80 mmHg

Our Baylor Clinics currently track the Diabetes Percent of Opportunities Achieved (POA) for all patients with diabetes. We measure this yearly for our Diabetic patients and calculate POA. This is calculated by dividing the total number of services or targets achieved over the total number of eligible services or targets within a sample population. POA = number of processes or targets achieved divided by the total number of eligible services or targets within the sample population. This metric differs slightly from “bundle” performance which is usually an all-or-none metric calculating the percentage of patients who’ve achieved ALL the processes or targets within a bundle. Improvement in POA can be translated as follows: An improvement in diabetes management POA from 50% to 60% within a population means the clinic was successful in achieving 10% more processes/targets for their diabetic patients than in the prior reporting period.
For an illustrative example: For diabetes- there are three opportunities (i.e. metrics) per patient (1) LDL < 100 (2) A1c < 8 and (3) BP < 130/80 mmHg. The denominator would be number of patients times 3. So, for example, if there are 10 patients x 3 opportunities each = 30 opportunities to be achieved. If, in the course of the year, only 20 of those opportunities were completed, this means that our POA (Percent of Opportunities Achieved) = 20/30=67%. To achieve a 10% improvement in POA, we would have to have completed at least 23/30 opportunities to get at 76% achievement.

**Process Milestones and Outcome Improvement Targets for each year:**
- In DY2 we will establish a baseline of current status of the Diabetes POA for patients who have a reported behavioral health issue.
- In DY3, we will improve the Diabetes POA for 5% of patients who have had at least one behavioral health intervention/encounter in one year.
- In DY3, we will improve the Diabetes POA for 10% of patients who have had at least one behavioral health intervention/encounter in one year.
- In DY3, we will improve the Diabetes POA for 15% of patients who have had at least one behavioral health intervention/encounter in one year.

**Rationale:**
Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Our main goal by selecting this outcome was to recognize and increase awareness of patients who have co-occurring behavioral health and diabetes health issues. By recognizing this, we believe we can positively impact diabetes outcomes by addressing underlying behavioral health issues that patients may have. In DY2, we will collect our baseline information about the status of the Diabetes POA (HbA1c, LDL, BP) for patients who have a documented behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will report for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.
A recent study conducted in early 2012, by Jeffery Johnson, et al. showed a direct correlation between diabetes and depression. They cited that depression is the most common comorbid condition present in 15-30% of patients with type 2 diabetes and less than 50% are recognized as having depression. Depression is associated with poorer self-care behaviors, decreased quality of life and substantially higher health care costs. Both diabetes and behavioral health issues are prevalent across the Region, warranting measurement of the efficacy of a behavioral health program on chronic diseases.\textsuperscript{417}

**Outcome Measure Valuation:**

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

- Numerator: Number of patients with an improved Diabetes Percent of Opportunities Achieved (POA) improvement (LDL, A1c, BP) score that have had a Behavioral Health intervention/encounter
- Denominator: Total number of patients with a Behavioral Health intervention/encounter

**Baseline:** The baseline for Baylor All Saints will be established in DY2.

**Target Population:** On average, 15-30% of patients with diabetes have a comorbid behavioral health diagnosis (usually Depression), this would amount to 23,000 people in Tarrant county that would have a subset of diabetes + behavioral health issue.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $364,320
Title of Outcome Measure (Improvement Target): IT-11.3- Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Non-stand-alone measure)

Unique RHP outcome identification number(s): 135036506.3.17 (Pass 3b)
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-11.3 Improve utilization rates of clinical preventive services (testing, preventive services and treatment) in target population with identified disparity. *(Non-standalone measure)*

- Numerator: patients who are Baylor clinic patient who engage in a behavioral health treatment/intervention
- Denominator: patients who are Baylor clinic patients who are eligible for behavioral health services

One of the outcome measures we have chosen for our behavioral health program is to increase the number of patients in the underserved population who have improved utilization rates for receiving behavioral health treatments/interventions. The subset of the target population that suffers from mental health issues is prevalent in the Region and affects 25% of the African-American population in Tarrant county. The disparate population that we will be focusing on is the underserved/uninsured patients in Tarrant County.

By the end of the Waiver, our goal is to have > 20% of patients who are eligible to participate in the behavioral health program, engage in the program.

The idea of this metric is that by engaging patients in behavioral health treatment/interventions that their subsequent medical care will also improve. Patients who engage are those who have had at least one behavioral health intervention/encounter in the past 12 months. Patients eligible for behavioral health entail those that have 1) been identified through the PHQ2/9, GAD-7 and Substance Abuse screening tools that are in need of intervention, 2) self-identified need or 3) provider/clinician identification of patient need for behavioral health counseling.

Process Milestones and Outcome Improvement Targets for each year:

- In DY2 we will establish a baseline of how many patients have a behavioral health issue (substance abuse, anxiety, depression, other) based on our E.H.R, self-reported or clinician reported status.
- In DY3, we will improve behavioral health treatment rates by 10%
- In DY4, we will improve behavioral health treatment rates by 15%
- In DY5, we will improve behavioral health treatment rates by 20%
**Rationale:**
Category 3 metrics for this projects were identified using literature only. Baylor has had no previous experience with a behavioral health program of this nature. Because of the strong focus on outpatient services, selected metrics are applicable to care provided in an ambulatory setting. Our main goal by selecting this outcome was to demonstrate increased access and utilization of the behavioral health program we are proposing.

In DY2, we will collect our baseline information about the number of patients who have a behavioral health issue. The problem with this collection is that because this program is new, both patients and clinicians are not actively looking for and documenting behavioral health problems that patients have. As part of our project, we plan to increase screenings using PHQ2/9, GAD-7 and substance abuse tools but until that is implemented, the numbers we will report for baseline will be underreported. Once there is more awareness about the screenings and program, we anticipate that more patients will disclose their behavioral health issue and their providers will also be more aware of these conditions.

We believe if we increase the treatment rates of behavioral health issues, that we will also see an increase in patient compliance rates with other preventive screening/testing and clinical recommendations made by their providers.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $219,371
Title of Outcome Measure (Improvement Target): IT-5.1- Improved Cost Savings: Demonstrate cost savings in care delivery (Non-Stand-alone measure)

Unique RHP outcome identification number(s): - 135036506.3.18
Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-5.1 Improved cost savings: Demonstrate cost savings in care delivery (Standalone measure for Project 2.5 only. For all other projects –Non-standalone measure)
- Type of analysis to be determine by provider from the following list: Cost of Illness Analysis, Cost Minimization Analysis, Cost Effectiveness Analysis (CEA), Cost Consequence Analysis, Cost Utility Analysis, Cost Benefit Analysis

By the end of the Waiver, our goal is to have > 25% cost savings in health care services utilization (through fewer ED visits and less overall utilization) for patients who have engaged in our care navigation program and have a confirmed appointment with a PCP/PCMH.

One of the outcome measures we have chosen for our care navigation program is to improve cost savings in the health care delivery system for those patients who have been served by the care navigation program.

Process Milestones and Outcome Improvement Targets for each year:
- In DY2 we will establish a baseline of average cost savings incurred by patients who have been seen by the care navigation program while in the ED and have a confirmed appointment with a PCP/PCMH. We will compare pre- and post-utilization patterns of enrolled patients to determine the total cost savings incurred (inpatient and outpatient) per patient. For example, if prior to being seen by our care navigation program, a patient’s total cost utilization was $10,000 we anticipate that after being connected to the appropriate resource and being seen for an appointment that over the course of 1 year, total costs would decrease by 20% (DY4) to $8,000.
- In DY3, we aim to improve cost savings for those patients who have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 15% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- In DY4, we aim to improve cost savings for those patients who have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 20% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
- In DY5, we aim to improve cost savings for those patients who have been 1) seen by our care navigation and program and 2) have a confirmed appointment by 25% using a pre/post analysis of utilization patterns for total cost of care over the course of 1 year
Rationale:
In DY2, we plan to do some in depth utilization analysis to determine a baseline of what the cost utilization patterns are for patients seen at Baylor All Saints Medical Center at Fort Worth. This, based on our historical experience with similar programs on other campuses, we anticipate a 15%, 20% and 25% cost savings over the subsequent years in total cost of care savings.

The reason we chose this metric is because financial constraints are a main concern for the Region in being able to provide high-quality care to the underserved population. Cost savings and effectiveness are a key part of the overall Waiver and require providers to be good stewards of their resources. This metric is appropriate because it emphasizes appropriate utilization of resources and reinforces the concept of cost effectiveness. We plan to measure the cost effectiveness and cost utilization of this project. According to the Texas Medical Association, the cost of treating a condition that could be treated in the doctor’s office for $56.21 (including lab and x-ray) costs $193.92 in the emergency department\(^{418}\). This cost differential multiplied by the 443,000 uninsured in Tarrant County creates a significant cost to the county and Region.

Outcome Measure Valuation:
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD**

*(add outcome amounts over DYs 2-5)*: $199,761
Title of Outcome Measure (Improvement Target): IT-9.2- ED appropriate utilization (Standalone measure)

Unique RHP outcome identification number(s): - 135036506.3.19

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth / 135036506

Outcome Measure Description:
IT-9.2 ED appropriate utilization (Standalone measure)
- Reduce all ED visits (including ACSC)
- Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-N/A
- Reduce Emergency Department visits for target conditions
  - Congestive Heart Failure
  - Diabetes
  - End Stage Renal Disease
  - Cardiovascular Disease/Hypertension
  - Behavioral Health/Substance Abuse
  - Chronic Obstructive Pulmonary Disease
  - Asthma

By the end of the Waiver, our goal is to have > 35% reduction in inappropriate ED utilization for all causes and > 20% reduction in inappropriate ED utilization for targeted conditions: CHF, diabetes, ESRD, CVD/hypertension, behavioral health/substance abuse, asthma

One of the outcome measures we have chosen for our care navigation program is to reduce ED utilization. The protocol mentions three parts to this metric:
1) Reduce all ED visits (including ACSC)
2) Reduce pediatric Emergency Department visits (CHIPRA Core Measure)-we will not be measuring this outcome as we do not see pediatric patients at Baylor All Saints Medical Center at Fort Worth
3) Reduce ED visits for target conditions
   a. CHF
   b. Diabetes
   c. ESRD
   d. CVD/Hypertension
   e. Behavioral Health/Substance Abuse
   f. COPD
   g. Asthma
Process Milestones and Outcome Improvement Targets for each year:

- In DY2 we will establish a baseline for the aforementioned components of the improvement metric (less #2- pediatric ED visits) and determine the full opportunity for improvement
- In DY3, we aim to reduce all ED visits by 25% and ED visits for targeted conditions by 10%
- In DY4 we aim to reduce all ED visits by 30% and ED visits for targeted conditions by 15%
- In DY5, we aim to reduce all ED visits by 35% and ED visits for targeted conditions by 20%

**Rationale:**
Baylor All Saints Medical Center at Fort Worth sees very few children, thus metric 2 is not applicable to this project. We do not see enough pediatric patients to make a material impact on the ED utilization rate for this population. Historically, we have not tracked the ED utilization for targeted conditions (i.e. CHF, diabetes, etc.), for this type of project thus we do not have a baseline measurement for these specific diseases. We plan to measure these in DY2 and DY3 and target a modest improvement of ED utilization in the subsequent years.

According to the Community Health Needs Assessment of Region 10, there were 798,904 emergency department visits in 2011, comprising a majority of the 1 million plus visits in the Region. The stakeholder survey conducted amongst performing providers also indicated that there is a significant overuse of emergency department services due to patients’ inability to access primary care. This metric is at the heart of the care navigation project we are proposing and will have a direct impact on patients in Tarrant County utilizing the ED at a decreased rate.

This project uses the popular concept created by Dr. Atul Gawande, referred to as “hot spotting” indicating a focus on finding the high risk/high utilization rates of the ED and determining the root cause for these visits, and then working to remedy those issues. Issues such as transportation, navigation of community and appropriate resources are just two examples that can lead to more effective use of the ED.

**Outcome Measure Valuation:**
As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort to achieve a particular targeted outcome, we then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as

---

419 RHP 10 Community Health Needs Assessment
420 Gawande, A. The hot spotters: can we lower medical costs by giving the neediest patients better care? The New Yorker. (2011).
patient satisfaction because of the quality impact and downstream cost savings/clinical implications hypertension/diabetes control would have than patient satisfaction.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $366,107
**Title of Outcome Measure (Improvement Target):** Right Care, Right Setting – IT-9.2 – ED appropriate utilization

**Unique RHP outcome identification number(s):** 127304703.3.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital Azle / 127304703

**Outcome Measure Description:**

**Process Milestones:**

The process milestones in DY2 are to establish one Walk-In Clinic and hire fulltime staff to operate the clinic (P-1). In DY3 we will conduct a Plan Do Study Act cycles to determine if we are meeting goals, and reaching the target population with information regarding the clinic and the benefits for them (P-4).

**Outcome Improvement Targets for each year:**

- By the end of Waiver, there will be a 50% reduction in unfunded/ Medicaid and Medicare patients in the Emergency Department for non-emergent visits compared to baseline year, which translates to a 5.9% reduction in all ED visits. In DY2, one Walk-In Care Clinic will be established.
- In DY3, 3.3% reduction in all ED visits from baseline
- In DY4, 4.6% reduction in all ED visits from baseline
- In DY5, 5.9% reduction in all ED visits from baseline

**Rationale:**

The reason for selecting P-1 is to ensure that the proposed clinic is developed in a way that meets community needs; P-2 will help us establish the current number of non-emergent patients seen THAZ’s ED; for P-4 we will look at how effective we are at marketing and reaching out to the targeted population to educate them on the benefits of the clinic for them, versus using the emergency department for primary care services. It is anticipated that the clinic could see approximately 7,000 patients per year, with at least 25% of these being patients who would have used the Emergency Department for their non-emergent care.

In DY3, we believe that we will be able to reach 30% of the unfunded, Medicaid and Medicare patients who visit the ED for non-emergent reasons – this translates to a 3.3% reduction in all ED visits. In DY4 with marketing and patient education efforts we aim to reach 40% of the target population, and by DY5 we should be able to effectively reach one out of every two patients in the target population that would have normally used the ED for non-emergent complaints.

**Outcome Measure Valuation:**

---

• **Approach/Methodology:** For every ED visit for the intervention population that is avoided, $150 in cost is saved by the health care system.\(^{422}\) The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

• **Rationale:** ED visit outcome improvement targets are dependent on the target population served (e.g., with either hypertension or diabetes), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already navigate frequent flyers away from the ED. Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

---

\(^{422}\) Based on 2011 historical ED visits data for Texas Health Azle
## Related Category 1 or 2 Projects:

| Related Category 1 or 2 Projects: | 127304703.1.1 Establish more primary care clinics – Walk-in Clinic |

## Starting Point/Baseline:

**Target Population:** Defined as Texas Health Harris Methodist Azle’s emergency department visits, from October 1, 2011 through September 30, 2012. The number of emergency department visits in 2011 was 25,162.

**Baseline/Intervention Population:** As determined by review of the emergency department patients’ records, there were 2,703 unfunded/Medicaid and Medicare patients treated for non-emergent care, as defined by level four or five on the ESI classification scale.

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1 [P-1]:** Project Planning-
evaluate stakeholders, identify current utilization, determine timelines and document implementation plans

**Baseline/Target: Establish one walk-in clinic.**

**Data Source:** Human Resources Records

**Milestone 1 Estimated Incentive Payment $6,301**

**Milestone 2 [P-2]:** Establish baseline rates for non-emergent ED visits by unfunded or Medicare/Medicaid patients over intervention population which is currently 2700-2900 visits per year.

**Data Source:** EHR, Registration data, claims.

**Milestone 1 Estimated Incentive Payment $6,300**

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3 [P-4]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.

**Data Source:** EHR, Registration data, claims.

**Milestone 2 Estimated Incentive Payment $9,959**

**Outcome Improvement Target 1 [IT-9.2]:** ED appropriate utilization

**Goal:** Reduction in target population ED visits 30%, which is approximately 840 visits.

**Data Source:** EHR, Registration data, claims.

**Outcome Improvement Target 1 Estimated Incentive Payment $9,958**

### Year 4 (10/1/2014 – 9/30/2015)

**Outcome Improvement Target 2 [IT-9.2]:** ED appropriate utilization

**Goal:** Reduction in target population ED visits 40%, which is approximately 1150 visits.

**Data Source:** EHR, Registration data, claims.

**Outcome Improvement Target 2 Estimated Incentive Payment $21,307**

### Year 5 (10/1/2015 – 9/30/2016)

**Outcome Improvement Target 3 [IT-9.2]:** ED appropriate utilization

**Goal:** Reduction in target population ED visits 50%, which is approximately 1490 visits.

**Data Source:** EHR, Registration data, claims.

**Outcome Improvement Target 3 Estimated Incentive Payment $50,951**
### Year 2

**Starting Point/Baseline:**

**Target Population:** Defined as Texas Health Harris Methodist Azle’s emergency department visits, from October 1, 2011 through September 30, 2012. The number of emergency department visits in 2011 was 25,162.

**Baseline/Intervention Population:** As determined by review of the emergency department patients records, there were 2,703 unfunded/Medicaid and Medicare patients treated for non-emergent care, as defined by level four or five on the ESI classification scale.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): **$104,775**
Title of Outcome Measure (Improvement Target): Right Care, Right Setting: ED Appropriate Utilization – IT – 9.2 for HELP Chronic Disease Management Program

Unique RHP outcome identification number(s): 127304703.3.2
Performing Provider Name/TPI: Texas Health Harris Methodist Hospital Azle / 127304703

Outcome Measure Description:
By the end of the Waiver, our goal is to reduce by 50% the number of unfunded/Medicaid patients who are treated in the emergency department for a chronic disease.
In 2011 the emergency department at Texas Health Azle, 56% of the patients were either unfunded or Medicaid. This translates into approximately 13,154 patients. A review of the patient records indicates there were 1,902 of these patients were treated for an uncontrolled chronic disease.

Process Milestones:
- In DY2, the goal is to formalize the project planning by establishing a multidisciplinary team of 4.0 full-time employees to help patients with chronic disease better manage their condition.

Outcome Improvement Targets for each year:
- In DY3, the goal is to reduce by 10% the number of unfunded/Medicaid patients who are treated in the emergency department for an uncontrolled chronic disease.
- In DY4, the goal is to reduce by 25% the number of unfunded/Medicaid patients who are treated in the emergency department for an uncontrolled chronic disease.
- In DY5, the goal is to reduce by 50% the number of unfunded/Medicaid patients who are treated in the emergency department for an uncontrolled chronic disease.

Rationale:
This project was specifically selected because of its relevancy to providing improved cost-effective, competent care to help manage hypertension, high cholesterol and diabetes in the uninsured population. We know this program is needed because, in August 2011, we conducted focus groups for uninsured patients living in our community with chronic disease. Findings from those focus groups indicated that while chronic disease patients recognized their need for primary care and assistance with disease management, most felt they didn’t have sufficient support and primary care access to do so. Most focus group participants said they knew what they needed to do in order to be compliant – exercise, take proper medication, and improve their nutrition. Unfortunately, the same participants pinpointed their inability to pay as a critical barrier to following through with these needed management techniques and supports. Most

---

423 Our focus group findings were compiled in a June 2011 report, “What the Disadvantaged of Tarrant and Parker County Need to Improve Their Chronic Disease Self-Management Efforts.”
respondents admitted to taking their medicine every other day to stretch out the medicine. Respondents also said they didn’t want to use hospital ERs as their only source of care when their disease flared, but lacked any alternative.

Based on patient records, there were 1,902 unfunded or Medicaid patients seen in the emergency department for uncontrolled chronic disease. According to the results of three focus groups conducted with these patients, the prevalent reason for going to the emergency department for treatment is limited or no access to primary care. The patients wait until the condition is at an emergent level, then they come to the emergency department. When the prescription runs out, the cycle starts again. This is a costly and dangerous way to manage a chronic disease.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $1,322 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., with either hypertension or diabetes), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**Year 2 Estimated Outcome Amount:**

(add incentive payments amounts from each milestone/outcome improvement target): $35,974

### Year 3 (10/1/2013 – 9/30/2014)

**Improvement Target 1 [IT-9.2]:** ED appropriate utilization

**Goal:** 10% decrease in the number of unfunded/Medicaid visits, who are treated in the emergency department for an uncontrolled chronic disease compared to baseline, estimated 190 visits.

**Data Source:** Patient Records

Milestone 2 Estimated Incentive Payment $56,861

### Year 3 Estimated Outcome Amount: $56,861

### Year 4 (10/1/2014 – 9/30/2015)

**Improvement Target 2 [IT-9.2]:** ED appropriate utilization

**Goal:** 25% decrease in the number of unfunded/Medicaid visits, who are treated in the emergency department for an uncontrolled chronic disease compared to baseline, estimated 475 visits.

**Data Source:** Patient Records

Milestone 3 Estimated Incentive Payment $60,828

### Year 4 Estimated Outcome Amount: $60,828

### Year 5 (10/1/2015 – 9/30/2016)

**Improvement Target 3 [IT-9.2]:** ED appropriate utilization

**Goal:** 50% decrease in the number of unfunded/Medicaid visits, who are treated in the emergency department for an uncontrolled chronic disease compared to baseline, estimated 951 visits.

**Data Source:** Patient Records

Milestone 4 Estimated Incentive Payment $145,459

### Year 5 Estimated Outcome Amount: $145,459

### TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $299,123
Title of Outcome Measure (Improvement Target): IT-10.1- Quality of Life (Substance Abuse Expansion)

Unique RHP outcome identification number(s): 127373205.3.1
Performing Provider Name/TPI: Helen Farabee Centers / 127373205

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
The outcome measure is designed to track improvement in quality of life scores as measured by the Substance Abuse Adult/Child Treatment Assessment. This is the assessment mandated by the Department of State Health Services and maintained in the Clinical Management for Behavioral Health Services (CMBHS) database. The assessment is a multipurpose tool developed for adult and child substance abuse services to support decision making, including level of care and service planning, to facilitate quality improvement initiatives, and to allow for the monitoring of outcomes of services. The process milestones are designed to track reporting of findings, lessons learned, and best practices to local stakeholders. This reporting summarizes the status of the referenced category 1 project implementation. The expected improvement milestone for DY4 is to see improvement in quality of life, comparing assessments at first contact with assessments at three months, as measured by the Substance Abuse Adult/Child Treatment Assessment, for 5% of patients in Wise County. The milestone increases to 10% for year 5.

Rationale:
The process milestones were selected in order to provide stakeholders with status reports regarding the new interventions in Wise County. The outcome improvement target was selected in order to quantify any change in quality of life as the result of the new services.

Outcome Measure Valuation:
Substance abuse imposes a heavy burden on emergency department and primary care settings. When individuals are screened for substance abuse and receive appropriate treatment, the related utilization and abuse of health care settings will go down 50% with a savings of $3.81 to $4.30 for every dollar spent on treatment services. We used the average of $4.05 saved for every dollar spent on treatment services.

The savings of $4.05 was determined by the Texas Drug Demand Reduction Advisory Committee Report to state leadership. That savings amount was determined based on costs saved from incarceration, hospitalization, emergency department usage, and homelessness.

---

**Unique RHP outcome identification number(s):** 127373205.3.2

**Performing Provider Name/TPI:** Helen Farabee Centers / 127373205

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**
The outcome measure is designed to track improvement in quality of life scores as measured by the Adult Needs and Strengths Assessment (ANSA) and the Child and Adolescent Needs and Strengths assessment (CANS). The ANSA and CANS are multipurpose tools developed for adult and child behavioral health services to support decision making, including level of care and service planning, to facilitate quality improvement initiatives, and to allow for the monitoring of outcomes of services. These tools are mandated for use by the Department of State Health Services within the Texas Recovery and Resiliency model of care. The process milestones are designed to track reporting of findings, lessons learned, and best practices to local stakeholders. This reporting summarizes the status of the referenced category 1 project implementation. The measurement time frame is one assessment at Intake compared to the subsequent assessment 3 months post intake. This measurement time frame is chosen to avoid measuring any effects produced by the Peer Support project (127373205.2.1). The expected improvement milestone for DY4 is to see improvement in quality of life, comparing assessments at first contact with assessments at 3 months, as measured by the ANSA, for 5% of patients in Wise County. The milestone increases to 10% for year 5.

**Rationale:**
The process milestones were selected in order to provide stakeholders with status reports regarding the new interventions in Wise County. The outcome improvement target was selected in order to quantify any change in quality of life as the result of the new services.

**Outcome Measure Valuation:**
The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years. Based on the literature, an estimated Quality of Life Year gained by this intervention is 0.0245 years. The result is a $1,225 quality of life improvement per patient impacted.

The valuation is aligned with the Medicaid Waiver goals to develop programs that enhance access to health care, increase the quality of care, the cost-effectiveness of care provided and the health of the patients and families served. The primary valuation method uses cost-utility analysis (a type of cost-effectiveness research). Cost-utility analysis (CUA) measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses
a quality-adjusted life-years (QALYs) analysis that combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known (e.g., emergency department visits that are avoided). In order to make the valuations fair across potentially different types of interventions the common health goal, or outcome, is the number of life-years added. The number of life-years added is based on a review of the scientific literature. A search of the scientific literature identified the following two studies. The first study looked at telemedicine and mental health and was conducted by Pyne (2010)\textsuperscript{425} which showed a 0.015 incremental QALY for patients with depression in rural New Mexico who received depression treatment by telemedicine. Another study by Hollinghurst et al. (2010)\textsuperscript{426} examining online cognitive behavioral treatment (CBT) of depression found the QALY gain for the waitlist control group of 0.494 (sd=0.099) while the QALY gain for the intervention group was 0.528 (sd=0.081). The additional QALY gain for intervention was 0.034. The average of the two estimated QALYs is 0.0245.

| Year 2 Estimated Outcome Amount: (add incentive payments amounts from each milestone/outcome improvement target): $8,034 | Year 3 Estimated Outcome Amount: $18,205 | Year 4 Estimated Outcome Amount: $19,472 | Year 5 Estimated Outcome Amount: $42,323 |

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):*$88,034
Title of Outcome Measure (Improvement Target): IT-9.4 Other Outcome Improvement Target (Number of Telephonic Psychiatric Consultations)

Unique RHP outcome identification number(s): 127373205.3.4 (Pass 2)

Performing Provider Name: Helen Farabee Centers/127373205

Outcome Measure Description:

The outcome measure is designed to track the number of telephonic psychiatric consultation events between physicians in enrolled primary care settings and psychiatrists under contract with Helen Farabee Centers.

Rationale:

The process milestones related to project planning and disseminating findings were chosen to match the implementation and design activities associated with the project during DYs 2 and 3. The outcome improvement target was created in order to measure utilization of telephonic psychiatric consultation by enrolled primary care settings. These targets were established so that we would not only have some primary providers enrolled and satisfied with the service (per outcomes in Category 2), but that we would also respond to utilization patterns by refining the service so that it appeals to all enrolled providers.

Outcome Measure Valuation:

The valuation methodology is based on an assumed gain of 0.335 Quality Life Years gained by using the proposed project. One Quality Life Year is commonly estimated at $50,000. Assuming 15 clients were served in the program, the annual valuation is $251,250 ($50,000 x 0.335 = $16,750. $16,750 x 15 = $251,250).

We used Cost-utility Analysis (CUA), which measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses Quality-adjusted life years (QALY) analysis that combines health quality (utility) with the length of time in a particular health state. The benefits of the proposed program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

One study examined collaborative care intervention for multisymptom patients including depression, diabetes, and coronary heart disease (Keaton, 2012). In this study, the effect of the intervention was 0.335 incremental life years gained. This can be considered a conservative gain given that the study focused on depression, which is likely to be the most prevalent and least intense behavioral health condition presented in primary care settings.

Title of Outcome Measure (Improvement Target): IT-2.4  Behavioral Health/Substance Abuse Admission Rate

Unique RHP outcome identification number(s): 130606006.3.1
Performing Provider Name/TPI: Wise Regional Health System/ 130606006

Outcome Measure Description:
In DY3 there will be program development and gathering baseline data from October 1, 2013 to September 30, 2014 through MedeAnalytics data reporting program at Wise Regional Health System on all discharges from acute medical and psychiatric services with the identified diagnostic codes for Behavioral Health/Substance Abuse. Data on these same metrics will be established in DY3 as well at North Texas Community Hospital. We will continue to develop and test data systems in DY3. The outcome is to reduce admission rates for persons with Behavioral Health/Substance Abuse in DY4 with an improvement target of 3% and in DY5 by 7.5% for IT-2.4. When compared to the denominator, the goal is a .55% reduction. We have estimated our reduction in BH/SA admissions with either primary or secondary diagnosis at the end of the Waiver to be 246.

The challenge and opportunity is to develop an Intensive Outpatient Program that addresses both Behavioral Health / Substance Abuse in order to reduce acute care costs associated with the use of higher cost services such as the ED, Inpatient Psychiatric Facility, and acute care.

An Intensive Outpatient Program with evidence-based services has the potential to make a proportional reduction in inpatient admissions for BH/SA target and reduce costs beyond the five-year projected time frame. This program development will also benefit the community at large by providing services to a target population that is underserved, that affects costs of medical health care, and has an impact on the cost of acute care and judicial services in the county.

Process Milestones and Outcome Improvement Targets for each year:
The following parameters are used in determining this outcome measure:

1. One for BH/SA as the principal diagnosis; The ranges/intervals/brackets of BH/SA codes as Principal Secondary Diagnosis is following:
   a. Numerator: All discharges for patients ages 18 years and older with a principal diagnosis of behavioral health or substance abuse (ICD 9 CM categories below).
      i. Behavioral Health codes: 290.X; 293.X-302.X; 306.7-306.9; 307.0-307.1; 307.3-307.7; 307.80, 307.9; 308.X-309.X; 310.0, 310.1, 301.9; 312.X –314.X; 315.0X- 315.2; 315.31-315.34, 315.39; 315.4-315.9; 316-319; 327.X; 388.45; 758.X-758.3X; 759.83; 780.02; 780.50, 780.50, 780.52; 780.54-780.59; 784.6X; 797; 799.2X; 799.51, 799.52, 799.54-799.59; V62.84; V71.0X.

ii. Substance Abuse codes: 291.X; 292.X; 303.X; 304.X; 305.0X-305.9X; 790.03.

b. Denominator: Number of residents age 18 and older living in the RHP counties

2. A second category in which a significant BH/SA secondary diagnosis is present. A list of the ranges/intervals/brackets of BH/SA codes as Secondary Diagnosis is following:
   a. Numerator: All discharges for patients ages 18 years and older with a principle or secondary diagnosis of behavioral health or substance abuse (ICD 9 CM categories below).
         i. Behavioral Health and Substance Abuse diagnosis codes: 290.11; 290.3; 390.41-290.43; 290.8-290.9; 291.X; 292.0X-292.84; 292.89; 293.0X-293.84; 294.11, 294.21, 294.8; 295.X; 296.00-296.04; 296.2X-296.4X; 296.50-296.54; 296.6X-296.8X; 298.X; 299.00, 299.80; 300.01-300.02, 300.11, 300.13, 300.21, 300.3, 300.81; 301.51, 301.83; 303.01-303.02, 303.91-303.92; 304.00-304.02, 304.11-304.12, 304.20-304.22, 304.31, 304.40, 304.42, 304.50, 304.70-304.72, 304.80-304.82, 304.91; 305.01, 305.31, 305.41-305.42, 305.51-305.52, 305.61-305.62, 305.71-305.72, 305.81-305.82, 305.91; 307.1, 307.50-307.51; 308.1; 039.81; 312.00, 312.30, 312.34; 318.1-318.21 348.39; 760.71-760.72; 965.0X, 965.6X; 967.0-967.1; 986.0; 969.1-969.6, 969.8-969.9; 970.1, 970.9; 977.0, 977.3; 995.5X; E950.X; E951.0-E957.1; E952.0-E952.1, E952.9; E953.0-E93.1, E953.9; E955.6, E957.X; V61.21, V62.84.
   b. Denominator: Number of residents age 18 and older living in the RHP counties

Rationale:
The focus in DY2 is to gather baseline data, plan processes and redesign a Behavioral Health/Substance Abuse Intensive Outpatient Program to reduce admission rates in acute care setting that are more costly. It is supported by statistical data from “Mede analytics” program at Wise Regional Health System that reflects 897 discharges for a primary diagnosis and 1904 for a secondary diagnosis of BH/SA-related disorders from acute medical and psychiatric services during October 2011 to September 2012. During this same time period North Texas Community Hospital showed discharges for a related primary diagnosis of 379 and secondary diagnosis of 101.

Outcome Measure Valuation:

- Approach/Methodology: Our valuation approach is consistent with the method within our RHP. We have estimated our reduction of BH/SA admissions with either primary or secondary diagnosis at 7.5%, or 246, from both hospitals by the end of the Waiver period. We take 246 and apply a value of $7,100 per admission to give us an annual value of $1,746,600 in cost savings. We then apply this for five years to get a total outcome value
of $8,733,000. The value is then distributed proportionately across the categories and demonstration years according to the allocation described in the Funding and Mechanics Protocol. This total represents approximately 74% of our total project value and was allocated accordingly.

- **Rationale/Justification:** The value of $7,100 per BH/SA admission was chosen by our RHP using data from AHRQ documented in the Health care Cost and Utilization Project.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP outcome identification number(s): 130606006.3.2
Performing Provider Name/TPI: Wise Regional Health System/ 130606006

Outcome Measure Description:
IT-10-1 Quality of Life is also a stand-alone measure and the SF-36, GAF or other standardized tool will be used to evaluate functional status with an overall goal of increasing functional status by 50% of patients as reported by the chosen evidence-based survey methods at the end of DY5.

Process Milestones and Outcome Improvement Targets for each year:
In DY2 will determine the most appropriate tool to be used with this combined target population of Behavioral Health/Substance Abuse single and dually diagnosed persons that will demonstrate evidence-based quality of life scores. This phase includes the training of staff, purchasing software, group materials, establishing data requirements. This involves establishing the method of evaluating quality of life and the protocols around delivery of the method.

In DY3 will establish baseline data. This will be based on surveys showing improvement in quality of life. Baseline data on improvement will be measured by evidence-based assessment tool. Goal is to establish evidence-based services in an Intensive Outpatient Program that will meet the needs of the population and provide positive outcomes431.

In DY4 and DY5 the improvement targets are implemented, services are maintained and expanded, and data collection will focus on improving quality of life and functions. The improvement target in DY4 will be 33% of patients and 50% in DY5. Completion of substance abuse treatment is strongly associated with improved outcomes, such as long-term abstinence from substance use432.

Rationale:
The focus in DY2 is project planning and gathering quality of life data of persons with Behavioral Health/Substance Abuse diagnosis in an Intensive Outpatient Program. Develop interventions that promote evidence-based outcomes that produce improved quality of life by reducing symptoms, increase functioning, maintain pre-morbid level of functioning, and engaging the patients in their own care and treatment.433 In DY3 we will develop baseline data. In DY4 improve quality of life for 33% of patients and in DY5 improve to 50% of patients based upon estimates of 6 discharges per month. These estimates project an increase in functional status of 24 patients at the end of DY4 and 36 patients at the end of DY5. The scope of the

431 Evidence-Based Effectiveness of a Private Practice Intensive Outpatient Program With Dual Diagnosis Patients. Edward A. Wise Journal of Dual Diagnosis, 6:25–45, 2010

The project offers alternative community-based intensive services that provide a continuum of care to persons that will impact and improve their level of functioning, reduce symptoms, decrease recidivism in more costly services, and maintain the patient in the community as functioning citizens. This program would cover a wide age range including person’s age 18 years of age up to and including our aging and geriatric population.

**Outcome Measure Valuation:**

- **Approach/Methodology:** This QALY value suggests a quality-adjusted life year for patients with co-occurring mental health and substance abuse to be a factor of 0.335 X $50,000 for each patient. We used this QALY factor and multiplied it by our anticipated DY5 number of patients showing an improvement in quality of life measures, then multiplied times five years. This results in $3,015,000.

This outcome value represents approximately 26% of the total value of the project and was allocated accordingly.

- **Rationale/Justification:** Valuations should be based on economic evaluation principles which identify, measure, and value the relevant costs and consequences of two or more alternatives. Typically, one alternative is a new program while the second is treatment as usual. Cost-utility analysis measures the cost of the program in dollars and the health consequences in utility-weighted units. This valuation uses quality adjusted life-years (QALYs) which combines health quality (utility) with length of time in a particular health state.

Cost-utility analysis is a useful tool for assessing the value of new health service interventions due to the fact that it provides a standard way of valuing multiple types of interventions and programs. The valuation also incorporates costs averted when known. In order to make the valuations fair across potentially different types of interventions, the common health goal, or outcome, is the number of life-years added.

The benefits of the proposed co-location program are valued based on assigning a monetary value of $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $532,078
Title of Outcome Measure (Improvement Target): IT-3.1 All cause 30 day readmission rate-NQF 1789

Performing Provider Name: Wise Regional Health System/130606006
Unique RHP outcome identification number(s): 130606006.3.5 (Pass 3)

Outcome Measure Description:
We propose to establish and verify the baseline in DY2. Based upon 2011 data our total all cause 30 day readmissions were 295 over 5,285 total inpatient admissions, giving us a readmission rate of 5.6%. Our goal is to reduce our readmissions by 3%, or 9 total readmissions, by the end of DY3, 6% or 18 total readmissions over baseline in DY4, and have reduced our total readmissions by 10% or 30 total readmissions by the end of the waiver in DY5.

Rationale:
We chose the process milestone of verifying our readmission rates in DY2 so that we can be sure of our starting point on which to improve. We chose to begin improvement in DY3 because we believe a 3% reduction is attainable. We chose goals that have been proven attainable through similar models of care transitions programs for DY4 and DY5.

Outcome Measure Valuation:
In order to value this project we used the combination of the values provided by our RHP for the two measures, all cause 30-day readmissions and CHF admissions. The value of $7,491 per all cause 30 day readmission was chosen by our RHP using data from the Texas Department of State Health Services. The value of $8,252 per CHF admission was chosen by our RHP using data from the Texas Department of State Health Services. Based upon 2011, data our total all cause 30 day readmissions were 295 over 5,285 total inpatient admissions, giving us a readmission rate of 5.6%. Our goal is to reduce our readmissions by 10% over baseline, or 30 total readmissions by the end of the waiver in DY5.

In addition, we wish to reduce CHF admissions by 10% or 14, with regard to the DY1 CHF admission total of 138. The total value of this project is $3,917,887.

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Regional Health System has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

Wise Regional Health System defined the population that will be directly impacted by the project as All Cause 30 day Readmissions. The percentage of the population expected to be positively impacted by the project is 10%, which was determined based on studies of similar projects.
implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their quality of life is moderately impacted.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their dependence on the community is moderate.

The value of $7,491 per all cause 30 day readmission was chosen by our RHP using data from the Texas Department of State Health Services.

The percentage of the population expected to be positively impacted by the project is 10%, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their quality of life is moderately impacted.
To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 2. We believe this to be the correct number because, when a person is positively impacted, their dependence on the community is moderately.

The value of $8,252 per CHF admission was chosen by our RHP using data from the Texas Department of State Health Services.
## Congestive Heart Failure Admission rate (CHF) - PQI #8 (Standalone measure)

**Related Category 1 or 2 Projects:** Wise Regional Health System

### Year 2 (10/1/2012 – 9/30/2013)

**Starting Point/Baseline:**
- **Process Milestone 1** [P- 2]: Establish (verify) baseline rates
  - Data Source: EMR Reporting System
  - Process Milestone 1 Estimated Incentive Payment *(maximum amount)*: $28,068

**Outcome Improvement Target 1**
- **IT-2.1**: Congestive Heart Failure admission rate- PQI #8 (Standalone measure)
  - Improvement Target: 3% over baseline
  - Data Source: EMR Reporting System
  - Estimated Incentive Payment: $32,534

### Year 3 (10/1/2013 – 9/30/2014)

**Starting Point/Baseline:**
- **DY1 Data shows 138 CHF admissions**

**Outcome Improvement Target 1**
- Improvement Target: 3% over baseline
- Data Source: EMR Reporting System
- Estimated Incentive Payment: $32,534

### Year 4 (10/1/2014 – 9/30/2015)

**Starting Point/Baseline:**
- **Outcome Improvement Target 2**
  - **IT-3.1**: Congestive Heart Failure admission rate- PQI #8 (Standalone measure)
  - Improvement Target: 6% over baseline
  - Data Source: EMR Reporting System
  - Estimated Incentive Payment: $52,206

### Year 5 (10/1/2015 – 9/30/2016)

**Starting Point/Baseline:**
- **Outcome Improvement Target 3**
  - **IT-3.1**: Congestive Heart Failure admission rate- PQI #8 (Standalone measure)
  - Improvement Target: 10% over baseline
  - Data Source: EMR Reporting System
  - Estimated Incentive Payment: $124,841

### Year 2 Estimated Outcome Amount:
- (add incentive payments amounts from each milestone/outcome improvement target): $28,068

### Year 3 Estimated Outcome Amount:
- $32,534

### Year 4 Estimated Outcome Amount:
- $52,206

### Year 5 Estimated Outcome Amount:
- $124,841

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $237,649
Title of Outcome Measure (Improvement Target): IT-9.2 Reduce Pediatric Emergency Department Visits

Unique RHP outcome identification number(s): - 130606006.3.7 (Pass 3b)
Performing Provider Name/TPI: Wise Regional Health System/130606006

Outcome Measure Description:
Decrease inappropriate Emergency Department use by expanding access to pediatric primary care. Specific percentage of reduction will be determined during baseline measurement in DY2 and implemented in DY3. This project estimates a reduction of 13% of ED pediatric visits within Wise County. Data will come from Wise Regional Health System, but other area hospitals will be impacted by this project.

Rationale:
The process milestones selected were chosen to show project planning in DY1 and dissemination of information to help reduce pediatric ED visits for all stakeholders in DY2. The coordination to reduce pediatric ED visits must come from several different sources. Education for providers and patients is required. Education must take place in local primary care clinics as well as the planned pediatric clinic.

Outcome Measure Valuation:
For this category 3 outcome, we took the value of the outcome in relation to the project and applied it evenly across the milestones. The value associated with this outcome was $7,417,271.

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Regional Health System has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B. When calculating the total value, this project is valued at $17,177,531.

Wise Regional Health System defined the population that will be directly impacted by the project as pediatric patients receiving care in two separate settings. One outcome measure is pediatric ED admissions and the other outcome measures clinic setting visits. The percentage of the population expected to be positively impacted by the project is 13% on the hospital side, which was determined based on studies of similar projects implemented elsewhere. The number of patients impacted by this project are as follows: DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.
We also estimated the number of pediatric patient visits and calculated value based upon third day next available appointments.
To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, their whole family is impacted since this project targets pediatric patients. Not only is the health of the child improved but time efficiency for families is improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, their dependence on the community is decreased.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $1,322,988
Title of Outcome Measure (Improvement Target): IT-1.1 Third next available appointments

Unique RHP outcome identification number(s): - 130606006.3.8 (Pass 3b)
Performing Provider Name/TPI: Wise Regional Health System/130606006

Outcome Measure Description:
IT-1.1 Third next available appointment. This is a commonly accepted measure used to determine a patient’s ability to access care. This measure utilizes the third next available appointment to determine the length of time between when initial contact is made to request an appointment and when the patient is seen. The third appointment is featured because the first and second available appointments may reflect openings created by patients cancelling appointments and thus does not accurately measure true accessibility. This measure is easily obtained and recorded, on a daily or weekly basis, by counting the number of days until an opening for the third next appointment is on the schedule. As this project is implemented, we will use this measure to determine improvements in patients’ ability to access pediatric primary care services. The extent of improvement will be determined in during the project planning phase in DY2. It is anticipated that there will be a steady increase in accessibility over DY4 and DY5. It is estimated that the availability of next day appointments will increase by 5% per year over baseline in DYs 4&5, resulting a 10% overall increase.

Rationale:
WRHS has chosen these milestones and metrics based on the goals of the project, to improve access to pediatric primary care, while allowing for the implementation of the project in a logical manner. DY2 will consist of project planning, which involves identifying current capacity and needed resources while establishing timeline for implementation and determining outcome improvement targets. Additionally, stakeholder pediatric patient visits will be measured and accessed. DY3 will be used to determine baseline rates. As the project is implemented, DY4 and DY5 will see improvement in the baseline rate, the extent of this improvement will be determined in DY2, the planning process. It is estimated that the availability of next day appointments will increase by 5% per year over baseline in DYs 4&5, resulting a 10% overall increase.

Outcome Measure Valuation:
For this category 3 outcome, we took the value of the outcome in relation to the project and applied it evenly across the milestones. We estimated 1,645 visits per year. The value associated with this outcome was $9,725,502. This value reflects expanded capacity to 8,225 pediatric patients over 5 years. Using the funding distribution formula, the achievement of this outcome has a 5 year value of $1,734,698.
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Regional Health System has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B. When calculating the total value, this project is valued at $17,177,531.

Wise Regional Health System defined the population that will be directly impacted by the project as pediatric patients receiving care in two separate settings. One outcome measure is pediatric ED admissions and the other outcome measures clinic setting visits. The percentage of the population expected to be positively impacted by the project is 13% on the hospital side, which was determined based on studies of similar projects implemented elsewhere. The number of patients impacted by this project are as follows DY1 5600, DY2 5650, DY3 5700, DY4 5800, and DY 5 5905. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project. We also estimated the number of pediatric patient visits and calculated value based upon third day next available appointments.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, their whole family is impacted since this project targets pediatric patients. Not only is the health of the child improved but time efficiency for families is improved.

To determine the value to the community of each individual positively impacted, we concluded that, on a scale of 1 – 5, the value of this project is a 3. We believe this to be the correct number because, when a person is positively impacted, their dependence on the community is decreased.

#### Year 5 (10/1/2015 – 9/30/2016)

- **Year 5 Estimated Outcome Amount:** $911,265

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $1,734,698
**Title of Outcome Measure (Improvement Target):** Primary Care and Chronic Disease Management IT-1.10 Diabetes care: HbA1c poor control (>9.0%)

**Unique RHP outcome identification number(s):** 130614405.3.1

**Performing Provider Name/TPI:** Texas Health Arlington Memorial / 130614405

**Outcome Measure Description:**
By the end of the Waiver, our goal is to decrease the number of diabetes clinic participants whose HbA1c is > 9.0 by 15%.

**Process Milestones:**
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
- Establish the baseline for this rate.
- In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

**Outcome Improvement Targets for each year:**
- In DY4, the goal is to reduce number of patients with diabetes patients whose HbA1c is > 9.0 by 10% from baseline.
- In DY5 the goal is to reduce number of patients with diabetes patients whose HbA1c is > 9.0 by 15% from baseline.

**Rationale:**
The goal of this project is to develop and implement a more comprehensive diabetes education center/medical home to help reduce the rates of uncontrolled diabetes among project participants. Our goal is to improve the health outcomes and diabetes self-management competency of community residents in Tarrant County by forming a multidisciplinary team, including a nurse practitioner run Chronic Care Clinic based on Wagner’s model, to more effectively assist and monitor patients in the management of their diabetes.

THAM data indicates that Medicaid and uninsured patients make up about 40% of our payer mix of those treated and released from the ED and approximately 30% of inpatient population. In our service area the Hispanic community makes up approximately 31% of the population and is the fastest growing ethnicity in Arlington. Hispanic people are about 1.5 times more likely to develop diabetes than non-Hispanic, white people. In the current THAM Outpatient Diabetes Education Program, approximately 75% of those served are Caucasian, indicating a need for innovation and creativity to reach this population. By developing a comprehensive diabetes clinic available to unfunded or government-funded members in the community, individuals
previously struggling to obtain medical care will have access to the care they need to more effectively manage their diabetes.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run diabetes clinic, expanding on the existing diabetes self-management education service currently provided to our patients. In DY2, we will also develop a mechanism for identifying and tracking high-risk diabetic patients and monitoring effectiveness of interventions (enhanced education, self-management coaching, closer monitoring of medical condition, postdischarge telephonic case management,…) to begin analysis of our information and determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient admission avoided, $8297 in cost is saved by the health care system.\(^435\) Health care costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

\(^435\) Based on 2011 historical inpatient diabetes admissions data for Texas Health Arlington Memorial

Title of Outcome Measure ( Improvement Target): Potentially Preventable Readmissions – 30-Day Readmission Rates (PPRs) - IT.3.3 Diabetes 30-day readmission rate

Unique RHP outcome identification number(s): 130614405.3.2
Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Outcome Measure Description:
By the end of the Waiver, our goal is to decrease 30 day readmission (all-cause) for diabetes patients by 15%.

Process Milestones:
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
- Establish the baseline for this rate.
- In DY3, our goal is to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

Outcome Improvement Targets for each year:
- In DY4, the goal is to reduce diabetes patient readmissions by 10% from baseline
- In DY5 the goal is to reduce diabetes patient readmissions by 15% from baseline.

Rationale:
The goal of this project is to develop and implement a more comprehensive diabetes education center/medical home to help reduce the rates of uncontrolled diabetes among project participants. Our goal is to improve the health outcomes and diabetes self-management competency of community residents in Tarrant County by forming a multidisciplinary team, including a nurse practitioner run Chronic Care Clinic based on Wagner’s model, to more effectively assist and monitor patients in the management of their diabetes.

According to THAM data, diabetes was the fourth highest readmission diagnosis. Data from August 2011 through July 2012 indicate a 30-day readmission rate of over 19%. Additionally, 10% of the THAM service area has been diagnosed with diabetes. Based on THAM outpatient diabetes education data, the program is underutilized in comparison with the service area diabetic population. Our proposed intervention will help individuals who are traditionally underserved and give them access to diabetes education and regular clinical care so they can better manage their diabetes and prevent hospital readmissions.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the
finalization of plans and implementation of an outpatient nurse-practitioner run diabetes clinic, expanding on the existing diabetes self-management education service currently provided to our patients. In DY2, we will also develop a mechanism for identifying and tracking high-risk diabetic patients and monitoring effectiveness of interventions (enhanced education, self-management coaching, closer monitoring of medical condition, postdischarge telephonic case management) to begin analysis of our information and determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient readmission avoided, $8297 in cost is saved by the health care system. Healthcare costs are calculated by multiplying $8297 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g., aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

</tr>
</tbody>
</table>

### Starting Point/Baseline:

- **Baseline Data:** Baseline will be determined in DY2. Preliminary data indicates a 30-day readmission rate at approximately 19%.
- **Target Population:** Low income, disadvantaged community members with a diagnosis of diabetes that do not have access to care.
- **Specific Number:** Numbers will vary but anticipate approximately 1,000 patients with diabetes annually by DY5.
- **Description of Population:** Individuals with diabetes living within Region 10, particularly those in Arlington or southeast Tarrant County

### Year 2 (10/1/2012 – 9/30/2013)

- **Milestone 1 [P-1]:** Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans.
  - **Data Source:** Provider documents describing implementation plan
  - **Process Milestone 1 Estimated Incentive Payment (maximum amount):** $2,617

- **Milestone 2 [P-2]:** Establish baseline rates
  - **Data Source:** Database including patient administrative and coding/billing information such as Premier Quality Advisor identified and baseline rate confirmed
  - **Process Milestone 2 Estimated Incentive Payment (maximum amount):** $2,616

### Year 3 (10/1/2013 – 9/30/2014)

- **Milestone 4 [P-4]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.
  - **Data Source:** Provider documents demonstrating completion of performance improvement project
  - **Process Milestone 4 Estimated Incentive Payment:** $6,205

- **Milestone 5 [P-5]:** Disseminate findings, including lessons learned and best practices, to stakeholders.
  - **Data Source:** Reports or other communication tools produced to disseminate findings
  - **Process Milestone 5 Estimated Incentive Payment:** $6,204

### Year 4 (10/1/2014 – 9/30/2015)

- **Outcome Improvement Target 1 [IT-3.3]:** Diabetes 30-day readmission rate (Stand-alone measure)
  - **Improvement Target:** 10% reduction from baseline.
  - **Data Source:** Identified database determined in DY2
  - **Estimated Incentive Payment:** $13,274

### Year 5 (10/1/2015 – 9/30/2016)

- **Outcome Improvement Target 2 [IT-3.3]:** Diabetes 30-day readmission rate (Stand-alone measure)
  - **Improvement Target:** 15% reduction from baseline.
  - **Data Source:** Identified database determined in DY2
  - **Estimated Incentive Payment:** $31,743
**Potentially Preventable Readmissions – 30-Day Readmission Rates (PPRs) – IT-3.3 Diabetes 30-day readmission rate**

</tbody>
</table>

**Process Milestones:**
In DY2, we will:
- Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes, and obtaining necessary supplies, space and equipment
- Develop and test reporting and monitoring process to evaluate effectiveness
- Establish the baseline for this rate. An initial data pull from our database shows that the baseline rate is close to 315 patients annually with principal diagnosis of heart failure.

**Outcome Improvement Targets for each year:**
- In DY3, our goal is to conduct performance improvement projects, to work towards further reductions and to disseminate information to key stakeholders regarding our progress
- In DY4, to reduce HF patient admissions by 8% from baseline, and in DY5 to reduce HF patient admissions by 10.5% from baseline (from 0.20% to 0.18% of total community members requiring admission with principal diagnosis of heart failure).

**Rationale:**
The target population includes disadvantaged individuals with HF who are at risk for hospital admission due to lack of access to health care resources. The project's goal is to identify at risk patients presenting in the emergency department or within the community, determine resources needed, and facilitate them obtaining the necessary supplies, medications, education and health care in order to effectively monitor and manage their chronic disease.

* Heart failure is among Texas Health Arlington Memorial hospital's top reasons for admission with 316 patients admitted with a primary diagnosis of heart failure and 1,947
patients admitted with primary/secondary diagnosis of heart failure between June 2011 and May 2012. Readmission rates for these patients are near 22%.

*. There were 13,272 hospitalizations of North Texas HF patients who were followed by a readmission in 2011436.

Requests for assistance with health care expenses is now among the top 10 unmet needs within the community, with an increase of 42% from last year.437 The development of a Heart Failure Clinic would provide an option for patients in our community who do not have financial resources to receive care.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run heart failure clinic including hiring and training hospital and clinic staff in Wagner's Chronic Care model and processes being implemented to improve care and education of the at risk HF patient. Time will also be spent communicating information to area health care providers and community members about the availability of the HF Clinic to assist at-risk HF patients in maintaining wellness. In DY2, we will also 1) develop a mechanism for identifying and tracking high-risk HF patients, 2) develop a screening tool to assist in identifying needs that put the HF patient at risk for admission 3) monitor effectiveness of interventions (education, medication reconciliation, ability to meet patient's identified health care need – medication, supplies, primary care provider, transportation to health care appointments – telemonitoring, post-discharge telephonic case management, RN home visits, HF Clinic etc.) and begin analysis of our information to determine potential improvement opportunities 4) collaborate with community health care providers to develop protocols to improve health of HF patients.

In DY3, performance improvement initiatives will be implemented based on opportunities identified from information learned through data collection and analysis. A reporting mechanism will be developed to disseminate information to key partners regarding the project.

In DY 4 and 5, the identified outcomes measures will monitor our effectiveness in achieving the desired outcome of preventing HF patient admissions. We will also continue to evaluate for improvement opportunities and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals

---

affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up healthcare costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable). served, community benefit, cost avoidance, addressing priority community need, estimated local funding, etc.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $107,368**
Title of Outcome Measure (Improvement Target): Potentially Preventable Readmissions – 30 Day Readmission Rates (PPRs) - IT.3.2 Congestive Heart Failure 30-day readmission rate

Unique RHP outcome identification number(s): 130614405.3.4
Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Outcome Measure Description:
By the end of the Waiver, our goal is to decrease 30-day readmission (all-cause) for heart failure (HF) patients by 15%

Process Milestones:
In DY2, we will:
  o Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  o Develop plans/protocols for HF Clinic managed by nurse practitioners. Obtain necessary supplies and equipment
  o Develop and test reporting and monitoring process to evaluate
  o Establish the baseline for this rate. An initial data pull from our database shows that the baseline rate may be as high as 22%

Outcome Improvement Targets for each year:
  • In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects towards further reductions and to disseminate information to key stakeholders regarding our progress
  • In DY4 and DY5: In DY4 our goal is to reduce HF patient readmissions by 10% from baseline and in DY5 to reduce HF patient readmissions by 15% from baseline.

Rationale:
The target population includes disadvantaged individuals HF who are at risk for readmission due to lack of access to health care resources. The project's goal is to identify at risk patients, determine resources needed, and provide them with the necessary supplies, medications, education and health care in order to effectively monitor and manage their chronic disease.

* Heart failure is among Texas Health Arlington Memorial hospital's top reasons for admission with 316 patients admitted with a primary diagnosis of heart failure and 1,947 patients admitted with primary/secondary diagnosis of heart failure between June 2011 and May 2012. Readmission rates for these patients are near 22%.
* According to a report published in 2011 on readmissions in North Texas, patients admitting for congestive heart failure (HF) had the highest number of readmissions (22.6%). HF was also the number one diagnosis resulting in readmission for both the Medicare and uninsured patients. There were 13,272 hospitalizations of North Texas HF patients who were followed by a readmission in 2011.438

---

Requests for assistance with health care expenses has increased by 42% from last year and is now among the top 10 unmet needs within the community. The development of a Heart Failure Clinic would provide an option for patients in our community who do not have financial resources to receive care.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run heart failure clinic including hiring and training hospital and clinic staff in Wagner's Chronic Care model and processes being implemented to improve care and education of the at-risk HF patient. Evaluation of the need for additional Care Transitions coaches and PrimeMedics will also be completed and staff engaged/trained as needed. In DY2, we will also 1) develop a mechanism for identifying and tracking high-risk HF patients, 2) develop a screening tool to assist in identifying needs putting the HF patient at risk for readmission, 3) monitor effectiveness of interventions (education, medication reconciliation, ability to meet patients' identified health care need – medication, supplies, primary care provider, transportation to health care appointments, care transitions coach, telemonitoring, post-discharge telephonic case management, home visits, HF Clinic, etc.) and begin analysis of our information to determine potential improvement opportunities and 4) collaborate with community health care providers to develop protocols to improve health of HF patients post-hospital discharge and along the continuum of care.

In DY3, performance improvement initiatives will be implemented based on opportunities identified from information learned through data collection and analysis. A reporting mechanism will be developed to disseminate information to key partners regarding the project.

In DY4 and 5, the identified outcomes measures will monitor our effectiveness in achieving the desired outcome of preventing HF patient readmissions. We will also continue to evaluate for improvement opportunities and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher

---

incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Title of Outcome Measure (Improvement Target): Perinatal Outcomes – IT-8.2 Percentage of Low Birth-weight births

Unique RHP outcome identification number(s): 130614405.3.5
Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Outcome Measure Description:
IT-8.2 Percentage of Low Birth-weight births
At the conclusion of the 5-year project, we expect a 10% reduction in the number of low birth weight infants delivered at our hospital.

Process Milestones:

• In DY2, we will:
  o Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  o Develop and test reporting and monitoring process to evaluate
  o Establish the baseline for this rate. An initial data pull from our database shows that the baseline rate may be over 10% of total births at the hospital.

• In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

Outcome Improvement Targets for each year:
In DY4, to reduce low birth weight infants by 6% from baseline, and in DY5 to reduce low birth weight infants by 10% from baseline.

Rationale:
There is currently no prenatal clinic available at Texas Health Arlington Memorial to serve these patients. Between January and August 2012, there were 1,382 (2,073 patients annualized) infant deliveries performed. Of these 45.2% (937 annualized) of the women were unfunded or Medicaid funded patients. Estimates indicate approximately 10.2% of the deliveries or over 200 infants at THAM are low birth weight or preterm.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient advanced practice nurse run prenatal clinic, hiring and training staff. In DY2, we will also develop a mechanism for identifying and tracking patients, monitoring the effectiveness of interventions implemented to retain patients in the program and impacting change to healthy behaviors. Analysis of our information will be completed to determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.
In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every low birth-weight birth avoided, $29,000 in cost is saved by the health care system.\(^{440}\) Health care costs are calculated by multiplying $29,000 by the total individuals affected.

- **Rationale/Justification:** Low birth-weight birth outcome improvement targets are dependent on the target population, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place.

  There are no individual and community savings for this outcome.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $402,219
Title of Outcome Measure (Improvement Target): Perinatal Outcomes – IT-8.3 Early Elective Delivery (Medicaid Adult Core Measure/NQF #469)

Unique RHP outcome identification number(s): 130614405.3.6
Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Outcome Measure Description:
IT-8.3 Early Elective Delivery

At the conclusion of the 5-year project, we expect a 95% reduction in the number of early, elective deliveries.

Process Milestones:
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
  - Establish the baseline for this rate.
- In DY3, our goal is to reduce this rate by 50%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

Outcome Improvement Targets for each year:
In DY4, our goal is to reduce low birth weight infants by 75% from baseline and in DY5 to reduce low birth weight infants by 95% from baseline.

Rationale:
There is currently no prenatal clinic available at Texas Health Arlington Memorial to serve these patients. In addition, the clinic run by the county hospital currently serving pregnant women in this area is scheduled to move to a new location outside of the geographic Region easily accessible to our at risk women. This effectively eliminates access to health care for many of these women. Between January and August 2012, there were 1,382 (2,073 patients annualized) infant deliveries performed. Of these 45.2% (937 annualized) of the women were unfunded or Medicaid funded patients. Through effective, ongoing prenatal care and education of the women regarding the risks associated with delivering infants at less than 39 weeks, we hope to decrease the rate of individuals requesting and receiving elective induction of labor for non-medical reasons prior to 39 weeks gestation.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much of the focus in DY2 will be on the finalization of plans and implementation of an outpatient advanced practice nurse run prenatal clinic, hiring and training staff. In DY2, we will also develop a mechanism for 1) identifying and tracking patients, 2) monitoring the effectiveness of interventions
implemented to retain patients in the program and 3) impacting participants to change to healthy behaviors. Analysis of our information will be completed to determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding the project.

In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every early elective delivery avoided, $29,000 in cost is saved by the health care system. Health care costs are calculated by multiplying $29,000 by the total individuals affected.

- **Rationale/Justification:** Early elective delivery outcome improvement targets are dependent on the target population, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $402,219**
Title of Outcome Measure (Improvement Target): Right Care, Right Setting – IT-9.2 – ED appropriate utilization

Unique RHP outcome identification number(s): 130614405.3.7
Performing Provider Name/TPI: Texas Health Arlington Memorial / 130614405

Outcome Measure Description:
IT-9.2 – ED appropriate utilization

By the end of the Waiver, our goal is to improve appropriate ED utilization for the targeted populations by 18%.

Process Milestones:

- In DY2, we will:
  - Complete project planning including identification and hiring/training of necessary staff, development of policies/procedures and processes
  - Develop/test reporting and monitoring process to evaluate effectiveness of program
  - Develop or identify database for capturing information on targeted populations to understand needs in order to develop interventions to effectively meet their needs. This included creating strategies with other community health care providers (skilled nursing facilities, nursing homes, home health agencies, primary care physicians, outpatient clinics and other resources in the community) to facilitate transition of at-risk population to a medical home.
  - Establish the baseline.
- In DY3, we will conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress.

Outcome Improvement Targets for each year:

- In DY4 we will reduce ED utilization for the targeted populations by 10% from baseline
- In DY5 we will reduce ED utilization for the targeted populations by 18% from baseline.

Rationale:

An analysis of the 4,936 June 2012 Texas Health Arlington Memorial ED patient visits indicated that 53% of the patients presenting for care in the ED were unfunded or Medicaid. Of this unfunded or Medicaid population, over half (55%) had diagnoses that did not require emergency care, including conditions such as chronic back pain, prescription refills, follow-up exams or dental disorder. Additional diagnoses, such as limb pain or urinary tract infection might have been managed at a lower level of care making the potential avoidable ED admissions even greater. This program provides patients utilizing the ED for non-emergent care needs with a resource (ED-based case manager) to help navigate them to appropriate resources. The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2
will be on the finalization of plans and implementation of a process for hiring and training staff, identifying individuals who are frequent users of the ED or who are utilizing the ED for services that might be provided at a lower level of care, and developing a process to navigate the individuals to more appropriate health care venues. In DY2, we will also develop a mechanism for 1) tracking patients, 2) monitoring the effectiveness of interventions and 3) monitoring impact on compliance with care plan. Analysis of our information will be completed to determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project. In DY4 and 5, we will continue to monitor our effectiveness to achieve target outcomes and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $540 in cost is saved by the health care system.\(^{441}\) The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- Community benefits were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

---

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $1,413,957*
Title of Outcome Measure (Improvement Target): IT-9.2- ED appropriate utilization

Unique RHP outcome identification number(s): 130724106.3.1
Performing Provider Name/TPI: Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
By the end of the Waiver, our goal is to have 25% reduction in emergency department utilization for behavioral health and substance abuse. Our milestones include the following:

- In DY2, we will meet with stakeholders of emergency departments to establish protocols for data collection and sharing
- In DY3, we will establish a baseline of emergency department utilization for behavioral health and substance abuse
- In DY4, our goal is to reduce ED utilization by 10% so that by the end of the Waiver a significant reduction in ED utilization will occur so that costs will be reduced as a result of expanded access and quicker availability of behavioral services.

Rationale:
Behavioral health conditions, account for increased health care expenditures such as higher rates of potentially preventable inpatient admissions. Texas Medicaid data on potentially preventable inpatient readmissions demonstrates that behavioral health conditions are a significant driver of inpatient costs. Mental health and substance abuse conditions comprise 8% of initial inpatient readmissions to general acute and specialty inpatient hospitals but represent 24% of potentially preventable admissions.442

If access to behavioral health services is expanded and individuals are seen quicker for those services, the use if the emergency department should decrease as people are getting their behavioral health needs met. The process milestones will be targeted towards establishing a data collection and sharing process to evaluate the use of the emergency department as compared to individuals receiving behavioral health services, which will in turn help establish the starting point for baseline. Improvement targets will be determined in DY2 and DY 3 as the baseline is set and data collection is established with local emergency departments.

Outcome Measure Valuation:
Improved access to services will engage individuals in treatment sooner and potentially prevent visits to the emergency department and other higher cost services. Based on a review by the

Indigent Care Collaborative in Central Texas, the average use of the emergency department by people with a behavioral health diagnosis is 7.085 visits per year, with the national average of an emergency department visit by a person with a behavioral health diagnosis is $1,500 per visit. On average, a person with a behavioral health diagnosis will have an annual cost of $10,628 in emergency department visits. On average, it costs $12 per day to provide community mental health services to adults at an annual average cost of $4,380 per year, providing a cost savings of $6,248 per patient year. Utilizing the Region 10 Category 3 pricing Model, Pecan Valley values the reduction in emergency department use by clients with behavioral health at $13,706,550, as related to the priority population for community centers as defined by the Texas Department of State Health services. In addition to health care cost savings, there is an added value to the person suffering with behavioral health issues. According to a study performed for the Center for Health Care Service, access to telemedicine services increases the quality-adjusted life years by 2.45%. Utilizing the cost-utility analysis at a rate of $50,000 per life year, the adjusted value per person is equivalent to $1,225 per year. Based on the Region 10 Category 3 pricing model, Pecan Valley values the impact to the individuals to be served at $2,149,875 over the course of the grant, for a total grant valuation of $15,856,425. This amount does not include a value for the community impact, which would reach across multiple areas and which is not limited to, but would include reducing lost wages and lost productivity in the community, increasing the access to emergency departments due to a reduction in improper utilization, and a reduction in incarceration the behavioral health-affected population. Considering the impact of the improved access, improved quality of life, and potential cost reduction from ED use and other high cost services, Pecan Valley values this project to exceed the $1,460,649 incentive payment for the waiver period.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $1,460,649
Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores

Unique RHP outcome identification number(s): 130724106.3.2

Performing Provider Name/TPI: Pecan Valley Centers for Behavioral and Developmental Healthcare / 130724106

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
By the end of the Waiver project, our goal is to show:

- In DY2- protocols, mechanisms of collection, timeframes and sampling for data collection of the survey will be identified and determined.
- In DY3- we will establish the baseline for patient satisfaction by utilizing the CG-CAHPS survey
- In DY4- patient satisfaction will show 40% of individuals receiving integrated care report satisfaction with overall health and functioning status
- In DY 5-70% of individuals reporting satisfaction with their overall health and functioning status

Rationale:
According to a recent study released by the Robert Wood Johnson Foundation, only 33% of patients with BH conditions (24% of the adult population) receive adequate treatment. Patients with BH issues experience higher risk of mortality and poor health outcomes, largely due to a lack of preventive health services and poorly controlled co-morbid medical disease. Risk increases with the severity of the behavioral health diagnoses.\(^{447}\) Health care systems which successfully integrate behavioral health and primary care services demonstrate improved care, cost savings, increased provider and consumer satisfaction.\(^{448}\) More importantly for medically indigent populations, which have co-occurring chronic health and mental health conditions, integrated health is even more valuable.

Since behavioral health problems are often cyclical in nature meaning that over a course of months or years a person may experience periods of time when symptoms are well controlled (or in remission) while at other times symptoms can range from moderate to severe, collaborative care is important. In addition to health conditions, psychiatric medications also complicate the problem because they are associated with obesity and high triglyceride levels, known risk factors

\(^{448}\) Integrating Publicly Funded Physical and Behavioral Health Services: A Description of Selected Initiatives, Health Management Associates (2007).
for cardiovascular disease. Adults with serious mental illnesses are known to have poor nutrition, high rates of smoking and a sedentary lifestyle—all factors that place them at greater risk for serious physical disorders, including diabetes, cardiovascular disease, stroke, arthritis and certain types of cancers. Despite such extensive medical needs, adults with serious mental illnesses often do not receive treatment. Among people with schizophrenia, fewer than 70% of those with co-occurring physical problems were currently receiving treatment for 10 of 12 physical health conditions studied.449

**Outcome Measure Valuation:**
The benefit of integrated healthcare will result in a wider continuum of care. Integrating care can impact patient satisfaction because individuals will be able to receive both their primary care and behavioral care in one location resulting in improved satisfaction. The integrated model will result in the “right” treatment being provided at the “right time”. By removing barriers to primary care, for individuals with behavioral health issues, an expected overall improvement in health care status and functioning can be expected. The valuation of this project is aimed at assessing patient satisfaction as it relates to patient experiences with integrated health care. In order to retain patients with both physical and behavior health needs, patient satisfaction must be maintained. Utilizing the Region 10 Pricing Model, Pecan Valley Centers’ places a value of customer satisfaction to equal $87,427. This calculation is based on a 70% favorable rating of the population at a value of 2% of billing over the five-year period of the Waiver. In addition, Pecan Valley Center’s recognizes that integrated health will lead to lower level intervention needed to address the patients’ on-going physical needs. Taking into consideration the impact of the improved access to both primary and behavioral healthcare, improved health outcomes, improved satisfaction and potential cost reduction, Pecan Valley values this project to exceed the $455,126 incentive payment for the waiver period.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores

Performing Provider Name: Pecan Valley Centers for Behavioral and Developmental Healthcare/130724106

Unique RHP outcome identification number(s): 130724106.3.3 (Pass 2)

Outcome Measure Description:
By the end of the Waiver project, our goal is:
   DY2: Identify technology needs for survey completion, timelines and protocols to collect sampling.
   DY3: Establish the baseline.
   DY4: Show 40% improvement in patient satisfaction of individuals with improved access.
   DY 5: to show 60% of individuals reporting increased satisfaction with getting timely care, appointments, and information during the extended clinic hours.

Rationale:
Many individuals have difficulty accessing behavioral health services due to multiple barriers. Two of these barriers are the inability to access routine services during normal business hours due to work schedules for family commitments. Another barrier is transportation to these appointments. By addressing these two barriers, the intent is to provide services in a more convenient manner and as a result, individuals will receive quality care and be more satisfied with their treatment. If access to behavioral health services is expanded and individuals have improved access for those services, the potential use of the emergency department should decrease as people get their behavioral health needs met. As individuals receive more accessible treatment, their lives will be impacted in a positive manner and improve patient satisfaction. The process milestones will be to develop technology units and timelines to distribute and collect information from the patient survey hours. The distribution of this survey will help establish the starting point for baseline. Improvement targets will be determined in DYs 4 and 5 as the baseline is set and data collection of survey results are analyzed.

Outcome Measure Valuation:
The project will aim to improve patient satisfaction and the value of this measure. The American Medical Association affiliate Press Ganey reports that positive patient surveys assist in retaining patients for continued care. In addition to serving patients in a lower cost and in the least restrictive environment, the extended hours will be targeted to accommodate employed patients or individuals with other family commitments. The project will also add a transportation component for individuals receiving services after 5 pm. A potential barrier to treatment will be addressed as individuals are able to maintain their employment without interruption, not having the need to make arrangements for dependent care and allowing children to complete the entire
school day without interruption. By providing transportation, access to behavioral health providers will be more readily available and fewer individuals will not have to rely on other’s to provide transportation. For those employed, the Federal Minimum Wage of $7.25 (U.S. Department of Labor) Pecan Valley Centers estimates that wages retained by patients attending after-hours behavioral health appointments are calculated at a minimum $35,287 over the life of the grant. In addition to providing services in a lower cost environment and allowing patients to maximize their earning potential, telemedicine services will be offered in at least one location. According to Brown et al., access to telemedicine improves the quality-adjusted life-years (QALYs) at a value of $1,225 per person who utilizes this service. Pecan Valley Centers expects that this will provide a minimum value of $397,488 over the life of the grant. Taking into consideration the impact of the improved access, improved quality of life, improved satisfaction and potential cost reduction, Pecan Valley values this project to exceed the $642,489 incentive payment for the waiver period.

450 Brown HS, Hasanat AP & Bohman TP. Valuing the program to provide integrated care through telemedicine. 2012.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $642,489
Title of Outcome Measure (Improvement Target): Right Care Right Setting – 9.2 – ED appropriate utilization

Unique RHP outcome identification number(s): 131036903.3.1
Performing Provider Name/TPI: Texas Health Harris Methodist Cleburne / 131036903

Outcome Measure Description:
Process Milestones:
The DY2 process milestone will be (P-1) Project Planning – engage stakeholders, identify current utilization, determine timelines and document implementation plans. In DY3, we will use milestone (P-2) establish baseline rates and conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities.

Outcome Improvement Targets for each year:
By the end of DY4, there will be a 30% reduction in Medicare, Medicaid and unfunded patients who visit the Emergency Department (ED) for the following target conditions: chronic obstructive pulmonary disease, asthma, hypertension, congestive heart failure and diabetes. This is defined as our intervention population.
In DY5, the goal will be to reduce the ED visits from patients with these target conditions by 40%.

Rationale:
The reason for selecting P-1 is to ensure that the proposed clinic is developed in a way that meets community needs; P-2 will help us establish the current number of target visits diverted from the ED.
For P-4, we will look at how effective we are at reaching out to the intervention population to educate them on the benefits of the clinic versus using the emergency department for primary care services. Another goal for PDSA is to communicate clinic efficacy with the ED physicians and current primary care providers.
Increasing community awareness in terms of the availability of an APRN clinic will also attract patients who have been utilizing other facilities to meet their health care needs. Because of this, we believe that we will realistically be able to decrease 30% of the intervention population coming in through the ED in DY4.
By increasing staffing, we project a decrease of 40% of the intervention population in DY5.

Outcome Measure Valuation:
- Approach/Methodology: For every ED visit avoided, $665 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of decreased encounters to determine the total days saved by the individuals affected. Next,

451 Based on 2011 historical ED visits data for the intervention population for Texas Health Cleburne
we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale:** The value for each outcome is largely dependent on what outcome improvements are expected as a result of the proposed program. Outcome improvement targets are set, taking into consideration the following factors:
  - Volume capacity of the proposed program, which defines the baseline/intervention population
  - Clinical literature or historical performance that provide a comparison for expected improvement as a result of the program

The valuation model computes separate values for program impacts on the health care system, the individual and the community. Community benefits took into account lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits considered these factors: lost wages, caretaker expense and extension of life (if applicable).

**Title of Outcome Measure (Improvement Target):** Diabetes care: HbA1c poor control (>9.0%) – NQF 0059 (Stand-alone measure)

**Unique RHP outcome identification number(s):** 136326908.3.1

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hospital HEB / 136326908

**Outcome Measure Description:**
By the end of the Waiver, our goal is to decrease the number of diabetes clinic participants whose HbA1c is > 9.0 by 15%. Our milestones include the following:

**Process Milestones:**
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
- Establish the baseline for this rate.
- In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

**Outcome Improvement Targets for each year:**
- In DY4, to reduce number of patients with diabetes patients whose HbA1c is > 9.0 by 10% from baseline
- In DY5 to reduce number of patients with diabetes patients whose HbA1c is > 9.0 by 15% from baseline.

**Rationale:**
The goal of this project is to develop and implement a more comprehensive diabetes education center/medical home to help reduce the rates of uncontrolled diabetes among project participants. Our goal is to improve the health outcomes and diabetes self-management competency of community residents in Tarrant County. THAM data indicates that Medicaid and uninsured patients make up about 40% of our payer mix of those treated and released from the ED and approximately 30% of inpatient population. In our service area the Hispanic community makes up approximately 31% of the population and is the fastest growing ethnicity in Arlington. Hispanic people are about 1.5 times more likely to develop diabetes than non-Hispanic white people. In the current THAM Outpatient Diabetes Education Program, approximately 75% of those served are Caucasian, thus indicating a need for innovation and creativity to reach this population. By developing a comprehensive diabetes clinic available to unfunded or government-
fund members in the community, individuals previously struggling to obtain medical care will have access to the care they need to more effectively manage their diabetes.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run diabetes clinic, expanding on the existing diabetes self-management education service currently provided to our patients. In DY2, we will also develop a mechanism for identifying and tracking high-risk diabetic patients and monitoring effectiveness of interventions (enhanced education, self-management coaching, closer monitoring of medical condition, post-discharge telephonic case management to begin analysis of our information and determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project.

In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient admission avoided, $11,538 in cost is saved by the health care system. Health care costs are calculated by multiplying $11,538 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient admissions outcome improvement targets are dependent on the target population being enrolled by the respective hospital, size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable inpatient admissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

**136326908.2.1 Expand Chronic Care Management Models: Redesign the Outpatient Delivery System to Coordinate Care for Patients with Chronic Diseases (Diabetes)**

**Starting Point/Baseline:**

**Baseline Data:** Baseline will be determined in DY2, assumed 15% of target population enrolled.

**Target Population:** Low income, disadvantaged community members with a diagnosis of diabetes that come in through the emergency department more than twice per year and do not have access to care.

**Specific Number:** Numbers will vary but anticipate approximately 800 patients with diabetes annually in 2011.

**Description of Population:** Individuals with diabetes living within Region 10, particularly those in Hurst, Euless, and/or Bedford.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $32,687*
Title of Outcome Measure (Improvement Target): Potentially Preventable Readmissions – 30-Day Readmission Rates (PPRs)-IT.3.3 Diabetes 30-day readmission rate

Unique RHP outcome identification number(s): 136326908.3.2

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital HEB / 136326908

Outcome Measure Description:
By the end of the Waiver, our goal is to decrease 30 day readmission (all-cause) for diabetes patients by 15%. Our milestones include the following:

Process Milestones:
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop and test reporting and monitoring process to evaluate
- Establish the baseline for this rate.

Outcome Improvement Targets for each year:
- In DY3, our goal is to reduce this rate by 4%; to conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress.
- In DY4, to reduce diabetes patient readmissions by 10% from baseline.
- In DY5 to reduce diabetes patient readmissions by 15% from baseline.

Rationale:
The goal of this project is to develop and implement a more comprehensive diabetes education center/medical home to help reduce the rates of uncontrolled diabetes among project participants. Our goal is to improve the health outcomes and diabetes self-management competency of community residents in Tarrant County.

According to THHEB data, diabetes was the fourth highest readmission diagnosis Data from August 2011 – July 2012 indicate a 30 readmission rate of over 19%. Additionally, 10% of the THHEB service area has been diagnosed with diabetes. Based on THHEB outpatient diabetes education data, the program is underutilized in comparison with the service area diabetic population. Our proposed intervention will help individuals who are traditionally underserved and give them access to diabetes education and regular clinical care so they can better manage their diabetes and prevent hospital readmissions.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as
the completion of planning for the project key components. Much focus in DY2 will be on the finalization of plans and implementation of an outpatient nurse-practitioner run diabetes clinic, expanding on the existing diabetes self-management education service currently provided to our patients. In DY2, we will also develop a mechanism for identifying and tracking high-risk diabetic patients and monitoring effectiveness of interventions (enhanced education, self-management coaching, closer monitoring of medical condition, postdischarge telephonic case management, …) to begin analysis of our information and determine potential improvement opportunities.

In DY3, performance improvement initiatives will be implemented based on opportunities identified and a reporting mechanism developed to disseminate information regarding project. In DY4 and 5, we will continue to monitor our effectiveness and take action to improve performance as needs are identified.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every inpatient readmission avoided, $9,253 in cost is saved by the health care system. Health care costs are calculated by multiplying $9,253 by the total individuals affected. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** Inpatient readmissions outcome improvement targets are dependent on the target population served (e.g., aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease), and current processes in place that already prevent avoidable readmissions (e.g., keeping lower acuity patients under observation instead of admitting them).

- **Community benefits** were calculated using lost productivity (net of lost wages), work presenteeism, lost in payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).

Title of Outcome Measure (Improvement Target): Potentially Preventable Readmissions – 30-Day Readmission Rates (PPRs) – IT.3.2 Congestive Heart Failure 30-day readmission rate

Unique RHP outcome identification number(s): 136326908.3.3

Performing Provider Name/TPI: Texas Health Harris Methodist HEB / 136326908

Outcome Measure Description:
The outcomes measure is to decrease the number of readmissions of the patients with heart failure over the course of the project using a variety of multidisciplinary approaches along the entire continuum of care. The process measures are as follows:

Process Milestones:
- **P-1**: Project planning-in Year 2 needs to identify current capacity and needed resources, determine timelines, obtain needed resources, develop and approve protocols, and document implementation plan. The goal is to complete P-1 prior to the end of Year 2.
- **P-3**: Develop and test system – In DY2, we will implement a PharmD-driven HF clinic; enroll identified patients at high risk for HF readmission; and test physician-approved protocols using a PDSA model. We will also develop a program to assist patients to better self-manage their chronic conditions by leveraging an innovative intensive outpatient multidisciplinary psychiatric chronic disease clinic of an associated behavioral health hospital.
- **P-5**: Disseminate findings, including lessons learned and best practices, to stakeholders in DY3– Based on patients enrolled in the chronic illness program and HF clinic and how well they respond to the program (in terms of readmission rates, etc.), we can make appropriate recommendations for program improvement e.g., how to increase enrollment, improve adherence

Outcome Improvement Targets for each year:
Our baseline CHF readmission rate is 20%. Utilizing the process milestones of planning, implementing, and measuring the targeted interventions and using a PDSA model, our goal is to decrease the readmission rate from:
- 20% to 19% in DY3
- 19% to 18% in DY4
- 18% to 16% in DY5

Rationale:
These process milestones were chosen for measurement because they are the innovative approaches within the entire program that we envision. This program will also include the more conventional transition coaches, dedicated disease management case managers, and ensuring that patients with limited to no financial resources have the tools they need to self-manage their disease.
The concentration of CHF programs focused on the care of the patient postdischarge will impact the readmission rate, thereby helping us reach the goal of Premier’s 75-percentile (~16%).

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every CHF admission avoided, $8,252 in cost is saved by the health care system. The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** CHF outcome improvement targets are dependent on the target population served (aging populations will have increased admissions due to higher incidence rates), size (e.g., if a hospital is at maximum capacity, admission rates can only decrease) and also current processes in place that already prevent avoidable hospitalizations (e.g., keeping lower acuity patients under observation instead of admitting them).

- Community benefits were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using wages, caretaker expense and extension of life (if applicable).

Title of Outcome Measure (Improvement Target): IT-3.8 Behavioral Health Substance Abuse 30-day readmission rate (Stand-alone measure)  
Unique RHP outcome identification number(s): 136326908.3.4

Performing Provider Name/TPI: Texas Health Harris Methodist Hospital HEB/Springwood / 136326908

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:

For this project milestone P-2 will establish a baseline rate for behavioral health readmissions and P-3 develop and test data systems for effectiveness of behavioral health follow up. After the baseline rate is set and systems have been tested we will utilize milestone P-1 to plan the target readmission rates, engage stakeholders, identify current capacity and determine the timeline and implementation plan. Outcome Improvement target IT-3.8 will show the decreases in readmissions by 20% in DY3, 35% in DY4 and 50% in DY5.

Rationale:

Utilizing milestone P-2 establish baseline rate for behavioral health readmissions will allow us to have a starting point of current readmissions. Milestone P-3 develop and test data systems for effectiveness of behavioral health follow ups will allow us to track patients seen in acute care that follow up with the integrated clinic and exchange information that will allow the continuing care provider to address all the issues established by the acute care provider so readmissions are decreased. Milestone P-1 will allow us to set our plan, engage our stakeholders and create our timeline and implementation plan of how to decrease our readmissions. We chose our outcome Improvement target of decreasing readmissions by 25% in DY3, 35% in DY4 and 50% in DY5 based on a current study of readmission targets if chronic medical issues and behavioral issues are captured by behavioral health and medical providers that are integrated.

Outcome Measure Valuation:

- **Approach/Methodology:** For every behavioral health readmission avoided, $7,491 in cost is saved by the health care system.\(^{454}\) The average length of stay per admission is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale:** Behavioral health outcome improvement targets are dependent on the target population served (aging populations will have increased readmissions due to higher

\(^{454}\) HCUP
incidence rates), size (e.g., if a hospital is at maximum capacity, readmission rates can only decrease) and also current processes in place that already prevent avoidable readmissions.

- **Community benefits** were calculated using lost productivity (net of lost wages), worker presenteeism, lost payroll taxes and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
### Related Category 1 or 2 Projects:

136326908.2.3 Design, implement, and evaluate projects that provide integrated primary and behavioral health care services.

### Starting Point/Baseline:

**Readmission Rate of 10.8%**

### Year 2 (10/1/2012 – 9/30/2013)

**Milestone 1 [P-2]:** Establish baseline rate for behavioral health readmissions

Data Source: Data from mental health coalition readmission rates

Milestone 1 Estimated Incentive Payment (maximum amount): **$38,548**

**Milestone 2 [P-3]:** Develop and test data systems for effectiveness of behavioral health follow-up

Data Source: Electronic Health Record and claims

Milestone 2 Estimated Incentive Payment: **$38,549**

### Year 3 (10/1/2013 – 9/30/2014)

**Milestone 3 [P-1]:** Project planning-engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

Data Source: Minutes from stakeholder meetings, capacity from the EHR, timeline and implementation plan

Milestone 3 Estimated Incentive Payment: **$60,931**

### Year 4 (10/1/2014 – 9/30/2015)

**Outcome Improvement Target 1 [IT-3.8]:**

Goal: Readmissions decrease by 20%

Data Source: EHR and claims

Outcome Improvement Target 1 Estimated Incentive Payment: **$60,931**

### Year 5 (10/1/2015 – 9/30/2016)

**Outcome Improvement Target 2 [IT-3.8]:**

Goal: Readmissions decrease by 35%

Data Source: EHR and claims

Outcome Improvement Target 2 Estimated Incentive Payment: **$130,364**

**Outcome Improvement Target 3 [IT-3.8]:**

Goal: Readmissions decreased by 50%

Data Source: EHR and claims

Outcome Improvement Target 3 Estimated Incentive Payment: **$311,739**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $641,061
Title of Outcome Measure (Improvement Target): Right Care, Right Setting – IT-9.2 – ED appropriate utilization

Unique RHP outcome identification number(s): 136326908.3.5

Performing Provider Name/TPI: Texas Health Harris Methodist Hurst Euless Bedford / 136326908

Outcome Measure Description:
By the end of the Waiver, our goal is to decrease all ED visits for targeted populations 18%. Our milestones include the following

Process Milestones:
- In DY2, we will:
  - Complete project planning including identification and hiring of necessary staff, development of policies/procedures and processes
  - Develop/test reporting and monitoring process to evaluate effectiveness of program
  - Develop or identify database for capturing information on targeted populations to understand needs in order to develop interventions to effectively meet their needs. This included creating strategies with other community health care providers (skilled nursing facilities, nursing homes, home health agencies, primary care physicians, outpatient clinics and other resources in the community) to facilitate transition of at-risk population to a medical home.
- In DY3, we will conduct performance improvement projects to work towards further reductions and disseminate information to key stakeholders regarding our progress

Outcome Improvement Targets for each year:
- In DY4 we will reduce ED utilization for the targeted populations by 7% from baseline
- In DY5 we will reduce ED utilization for the targeted populations by 11% from baseline

Rationale:
There is a shortage of outpatient clinics and services for the poor. Because of our area in the mid-cities we have no public transportation. People simply cannot make it to Ft Worth to the community hospital. We are the local clinic for the poor, undocumented, old and chronically ill with no resources. Internal numbers tell us with the 18% improvement based on 7,534.2 visits 1,356.2 days could be saved. The same research shows avoided inpatient admissions are projected to be 7.98%.

The identified process milestones will assist the organization in developing and implementing the structure needed to complete the project. Process milestones identified in DY2 include the establishment of a baseline rate for measuring our effectiveness in future project years as well as the completion of planning for the project key components. The focus in DY2 will be on the finalization of plans and implementation of the program utilizing case managers,
navigatorsm, support staff and other professionals available in the hospital. Utilizing other services being planned in our community such as the Coumadin clinic here at the hospital and the heart failure clinic in the planning stage will be of great value and will be expanded as needed.

DY3, outcomes will identify issues not working well then plans will be made changes and processes adjusted.

DY4 and 5 we will continue to monitor our effectiveness and take action to improve performance as needs are identified. The two goals identified that will be of the most help to the community and the patients are ED visits pre and post navigation services by individuals identified as ED frequent fliers and then measuring the appropriate utilization by this group. The identified patient conditions are going to be one of the guides utilized for effective measurement.

**Outcome Measure Valuation:**

- **Approach/Methodology:** For every ED visit avoided, $535 in cost is saved by the health care system. The average length of stay per ED visit is multiplied by the number of avoidable admissions to determine the total days saved by the individuals affected. Next, we use the total days saved to calculate individual and community costs. The total valuation is calculated by summing up health care costs, individual costs, and community costs.

- **Rationale/Justification:** ED visit outcome improvement targets are dependent on the target population served (e.g., the number of frequent flyers, patients with greater than three visits in a year), size (e.g., if a hospital is at maximum capacity, rates can only decrease), and current processes in place that already prevent navigate frequent flyers away from the ED.

- **Community benefits** were calculated using lost productivity (net of lost wages), lost payroll taxes, and lost sales tax. Individual benefits were calculated using lost wages, caretaker expense and extension of life (if applicable).
### Texas Health Harris Methodist Hurst Euless Bedford

**136326908.2.4 Establish/Expand a Patient Care Navigation Program** – Provide navigation services to targeted patients who are at high risk of disconnect from institutionalized health care

### Baseline Data

- **Starting Point/Baseline:**
  - Baseline Data: The actual baseline data is not known and will be obtained in DY2 year.
  - **Target Population:** Low income, frequent users of the emergency department with target conditions that do not have access to a primary care physician or medical home
  - **Specific Number:** Numbers will vary but anticipate 11,000 - 12,500 annually (10%-15% of annual ED volume)
  - **Description of Population:** Community members with target conditions within Region 10, particularly those living in Arlington or southeast Tarrant County.

### Year 2 (10/1/2012 – 9/30/2013)

#### Milestone 1 [P-1]: Project planning

- Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans

- **Data Source:** Provider documents describing implementation plan

- **Baseline/Goal:**
  - Milestone 1 Estimated Incentive Payment (maximum amount): **$18,014**

#### Milestone 2 [P-2]:

- Establish baseline rates (Emergency Department (ED) visits rate for target population: Congestive Heart Failure, Diabetes, End-stage Renal Disease, Cardiovascular Disease/Hypertension, Behavioral Health/Substance Abuse,

- **Data Source:** Reports or other communication tools produced to disseminate findings

- **Baseline/Goal:** 1 report

### Year 3 (10/1/2013 – 9/30/2014)

#### Milestone 4 [P-4]: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities

- **Data Source:** Provider documents demonstrating completion of performance improvement project

- **Milestone 4 Estimated Incentive Payment:** **$28,474**

#### Milestone 5 [P-5]: Disseminate findings, including lessons learned and best practices, to stakeholders

- **Data Source:** Reports or other communication tools produced to disseminate findings

### Year 4 (10/1/2014 – 9/30/2015)

#### Outcome Improvement Target 2 [IT-9.2]: ED Appropriate Utilization

- **Improvement Target:** 9% improvement from baseline.

- **Data Source:** Hospital discharge records

- **Outcome Improvement Target 2 Estimated Incentive Payment:** **$91,381**

### Year 5 (10/1/2015 – 9/30/2016)

#### Outcome Improvement Target 3 [IT-9.2]: ED Appropriate Utilization

- **Improvement Target:** 131% improvement from baseline.

- **Data Source:** Hospital discharge records

- **Outcome Improvement Target 3 Estimated Incentive Payment:** **$218,519**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $449,362
Title of Outcome Measure (Improvement Target): IT 9.2 – ED Appropriate Utilization

Unique RHP outcome identification number: 138910807.3.1 (Pass 2)
Performing Provider Name/TPI: Children’s Medical Center of Dallas/13890807

Outcome Measure Description:
Category 3 – OD-9 Preventive and Primary Care: IT.9.2 Reduce pediatric emergency department visits
Decrease inappropriate emergency department use by expanding access to pediatric primary care by establishing a 24/7 nurse triage line and expanding primary care hours. Specific percentage of reduction will be determined during baseline measurement in DY2.

Process Milestones:
DY2:
Milestone 1: P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans
Milestone 2: P-2: Establish baseline rates
Milestone 3: P-3: Develop and test data systems

DY3:
Milestone 4: P-4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
Milestone 5: P-5: Disseminate findings, including lessons learned and best practices to stakeholders.

Outcome Improvement Targets:
DY4:
Milestone 6: I-1: Achieve X% reduction in emergency department use, where X will be determined in DY2 based on baseline data. Note: Provider would like to understand the numerator and denominator definitions prior to establishing percentage change goal.

DY5:
Milestone 7: I-1: Achieve Y% reduction in emergency department use, where Y will be determined in DY2 based on baseline data. Note: Provider would like to understand the numerator and denominator definitions prior to establishing percentage change goal.

Rationale:
Improving access to primary care by opening new pediatric primary care offices, offering expanded office hours, using telecommunication to link primary care providers with specialists, providing a medical home for children with complex and chronic medical conditions, expanding hours for urgent care, providing a 24/7 nurse triage telephone service, enhancing/expanding the
medical home, developing patient/family navigation, implementing evidence-based health promotion programs and implementing/expanding care transitions program should reduce inappropriate use as well as overall use of emergency department services.

**Outcome Measure Valuation:**
This project was valued using the score for Project 1.1 which was valued using the Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals 4
- Addresses Community Needs 2
- Project Investment 1
- Project Scope 1
- Value Weight of the Project 8

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

Title of Outcome Measure (Improvement Target): IT 9.3 – Reduce Pediatric and Young Adult Asthma Emergency Visits

Unique RHP outcome identification number: 138910807.3.2 (Pass 2)
Performing Provider Name/TPI: Children’s Medical Center of Dallas/13890807

Outcome Measure Description:
Category 3 – OD-9 Preventive and Primary Care: 3.9.3 Reduce Pediatric/Young Adult Asthma Emergency Department visits

Decrease pediatric and young adult asthma emergency department use by expanding access to and enrollment in a disease management program in the medical home settings of MyChildren’s in RHP 10. Specific percentage of reduction will be determined during baseline measurement in DY2.

Process Milestones:
Milestone 1: P1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans
Milestone 2: P2: Establish baseline rates
Milestone 3: P3: Develop and test data systems

DY3:
Milestone 4: P4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
Milestone 5: P5: Disseminate findings, including lessons learned

Outcome Improvement Targets:
DY4:
Improvement Target 1: Achieve X% reduction in pediatric/young adult asthma emergency department use, where X will be determined in DY2 based on baseline data. Further understanding on the numerator and denominator are needed before projecting a percentage reduction.

DY5:
Improvement Target 2: Achieve Y% reduction in pediatric/young adult asthma emergency department use, where Y will be determined in DY2 based on baseline data. Further understanding on the numerator and denominator are needed before projecting a percentage reduction.

Rationale:
Implementing a disease management program targeting patients with asthma in the medical home setting of MyChildren’s should reduce pediatric and young adult emergency use as well as overall use of emergency department services.
**Outcome Measure Valuation:**
This project was valued using the score for Project 1.2, which was based on Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals
- Addresses Community Needs
- Project Scope
- Project Investment
- Value Weight of the Project

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

---

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD:** $ 510,000
Title of Outcome Measure ( Improvement Target): IT-1.18 – Follow-up After Hospitalization for Mental Illness

Unique RHP outcome identification number: 138910807.3.3 (Pass 2)
Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807

Outcome Measure Description:
Category 3 – OD-1 Primary and Chronic Disease Management: 3.1.18 Follow-up After Hospitalization for Mental Illness

Increase follow-up within 30 days after hospitalization for mental illness in patients enrolled in the MyChildren’s medical home through the expansion of behavioral health services in MyChildren’s in RHP 10. Specific percentage of increase will be determined during baseline measurement in DY2.

Process Milestones:
- DY2:
  - P-1: Project Planning – Engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans
  - P-2: Establish baseline rates
  - P-3: Develop and test data systems
- DY3:
  - P-4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  - P-5: Disseminate findings, including lessons learned and best practices to stakeholders

Outcome Improvement Targets:
- DY4:
  IT-1.18: Achieve X% increase in follow-up after a hospitalization for mental illness, where X will be determined in DY2 based on baseline data. Need additional information on numerator and denominator prior to establishing percentage increase.
- DY5:
  IT-1.18: Achieve Y% increase in follow-up after a hospitalization for mental illness, where Y will be determined in DY2 based on baseline data. Need additional information on numerator and denominator prior to establishing percentage increase.

Rationale:
Expand pediatric behavioral health capacity in CMC primary care settings to align and coordinate care for behavioral and medical illnesses in an attempt to improve patient/family self-management and reduce unnecessary exacerbation of chronic illnesses. Collaborate with
Timberlawn Services and other behavioral health care providers for coordination of care between medical services and behavioral health services.

Implementing a follow-up process for patients postdischarge for a mental illness and enrolled in MyChildren’s medical home should reduce readmissions, exacerbation and complications of mental illnesses. By specifically targeting timely outpatient follow-up after an inpatient stay for mental illness, additional processes and resources will be dedicated to provide timely outpatient follow-up.

**Outcome Measure Valuation:**
This project was valued using the value of Project 1.3, which was developed using the Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:

- Meets Waiver Goals
- Addresses Community Needs
- Project Scope
- Project Investment
- Value Weight of the Project

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

### Year 2 (10/1/2012 – 9/30/2013)

**Process Milestone 1 [P-1]:** Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans.  
- Goal: Completed by 9/30/2013  
- Data source: Administrative data  
- Process Milestone 1 Estimated Incentive Payment (maximum amount): $12,500

**Process Milestone 2 [P-2]:** Establish baseline rates  
- Goal: Completed by 9/30/2013  
- Data source: Electronic health record  
- Process Milestone 2 Estimated Incentive Payment (maximum amount): $12,500

**Process Milestone 3 [P-3]:** Develop and test data systems  
- Goal: Completed by 9/30/2013  
- Data source: Electronic health record reports  
- Process Milestone 3 Estimated Incentive Payment (maximum amount): $12,500

### Year 3 (10/1/2013 – 9/30/2014)

**Process Milestone 4 [P-4]:** Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities  
- Goal: Completed by 9/30/2014  
- Data Source: Administrative data  
- Process Milestone 4 Estimated Incentive Payment (maximum amount): $18,750

**Process Milestone 5 [P-5]:** Disseminate findings, including lessons learned and best practices to stakeholders.  
- Goal: Completed by 9/30/2014  
- Data Source: Administrative data  
- Process Milestone 5 Estimated Incentive Payment (maximum amount): $18,750

### Year 4 (10/1/2014 – 9/30/2015)

**Outcome Improvement Target 1 [IT-1.18]:** Achieve X% increase in follow-up after hospitalization for mental, where X will be determined in DY2 based on baseline data.  
- a. Numerator:  
  - Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.  
  - Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.  
- b. Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year.  
  The denominator for this measure is

### Year 5 (10/1/2015 – 9/30/2016)

**Outcome Improvement Target 2 [IT-1.18]:** Achieve Y% increase in follow-up after hospitalization for mental, where Y will be determined in DY2 based on baseline data.  
- a. Numerator:  
  - Rate 1: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 30 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.  
  - Rate 2: An outpatient visit, intensive outpatient encounter or partial hospitalization with a mental health practitioner within 7 days after discharge. Include outpatient visits, intensive outpatient encounters or partial hospitalizations that occur on the date of discharge.  
- b. Denominator: Members 6 years and older as of the date of discharge who were discharged alive from an acute inpatient setting (including acute care psychiatric facilities) with a principal mental health diagnosis on or between January 1 and December 1 of the measurement year.  
  The denominator for this measure is

Title of Outcome Measure (Improvement Target): IT 9.2 – ED Appropriate Utilization

Unique RHP outcome identification number: 138910807.3.4 (Pass 2)
Performing Provider Name/TPI: Children’s Medical Center of Dallas/13890807

Outcome Measure Description:
Category 3 – OD-9 Preventive and Primary Care: IT.9.2 Reduce pediatric emergency department visits
Decrease inappropriate emergency Department use by expanding access to medical homes. Specific percentage of reduction will be determined during baseline measurement in DY2. All milestones and metrics are based on the relevancy to RPH 10’s population, community needs, RHP priorities and the starting point for the project.

Process Milestones:
- **DY2:**
  - P-1: Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementations plans
  - P-2: Establish baseline rates
  - P-3: Develop and test data systems
- **DY3:**
  - P-4: Conduct Plan Do Study Act (PDSA) cycles to improve data collection and intervention activities
  - P-5: Disseminate findings, including lessons learned and best practices to stakeholders

Outcome Improvement Targets:
- **DY4:**
  - IT-9.2: Achieve X% reduction in emergency department use, where X will be determined in DY2 based on baseline data. Note: Provider would like to understand the numerator and denominator definitions prior to establishing percentage change goal.
- **DY5:**
  - IT-9.2: Achieve Y% reduction in emergency department use, where Y will be determined in DY2 based on baseline data. Note: Provider would like to understand the numerator and denominator definitions prior to establishing percentage change goal.

Rationale:
Improving access to primary care by enhancing/expanding the medical homes should reduce inappropriate use as well as overall use of emergency department services. Studies have shown a decrease of 25% or more in inappropriate use of the ED by patients enrolled in a medical home as well as a decrease in overall use of the ED patient receiving care in a medical home environment.
Outcome Measure Valuation:

Project Valuation:
This project was valued using the score for Project 2.1, which was valued using the Scoring Criteria Guidance with a 1 to 5 scoring range and the following criteria:
- Meets Waiver Goals
- Addresses Community Needs
- Project Scope
- Project Investment
- Value Weight of the Project

Each point of the scale was given a value of $187,500 based on expected savings, improved outcomes and improved satisfaction with the health care system over the life of the project and beyond the life of the project as all patients are pediatric with expected savings to continue into adulthood. The overall project value was then divided between Category 1 and 3 based on HHSC-provided guidelines with Category 4 being allotted the maximum 15% in later years by reporting on Optional Domain 6.

Title of Outcome Measure (Improvement Target): IT-1.1 Third next available appointment

Unique RHP outcome identification number(s): 138980111.3.1

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/ 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving time to third next available appointment for the target population. The expected outcome by the end of the Waiver is to improve time to third next available appointment by 10% from baseline.

Process Milestones and Outcome Improvement Targets for each year:
The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include the identification, recruitment of staff, equipment acquisition, and collection of baseline data using a Registered Nurse as the Project Lead. Use of Region stakeholders (community and medical composition) will indicate needs and additional scope of the project.

- Establish baseline rates [P-2]. The baseline will be established using quantitative measures of pre and post appointment schedules counting the third next appointment time for New and Established patients appointments.

- Third next available appointment [IT-1.1]. Time to third next available appointment will be measured by Appointment Schedules and comparing DY4 and DY5 to baseline data.

Rationale:
Primary Care and Chronic Disease Management – Third next available appointment was selected as an outcome measure to assess the effectiveness of the project in meeting the needs of the target population, allowing the patients to be seen closer to home and with less time between appointments. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage children with severe burns in RHP 10 who have received services from Shriners Hospital in Galveston and their families, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.
Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients living in RHP 10 in the target population. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

1. Primary Care and Chronic Disease Management – Third next available appointment [IT-1.1]. This outcome improvement target measures the average length of days between the day a patient makes a request for an appointment and the third available appointment. Patients receiving telemedicine services from this intervention will see a reduction in days to the third next available appointment due to the use of telemedicine services at UNT Health Science Center and the reduced amount of travel time required for an appointment.

Outcome Measure Valuation:

2. Approach/Methodology: Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

3. Rationale/Justification: For third next available appointment, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. We are anticipating that all of the population is expected to be positively impacted by a 10% decrease in time to third next available appointment.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,183 (Baylor Health Care System data).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which was valued at $237 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $35,720*
Title of Outcome Measure (Improvement Target): IT-6.1(Domain 1) Patient Satisfaction:
Percent improvement over baseline of patient satisfaction scores for one or more of the patient satisfaction domains that the provider targets for a specific tool.

Unique RHP outcome identification number(s): 138980111.3.2

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/ 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient satisfaction in getting timely care, appointments, and information for the target population. The expected outcome by the end of the Waiver is to improve time to patient satisfaction in getting timely care, appointments and information for the target population by 10% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include the identification, recruitment of staff, equipment acquisition, and collection of baseline data using a Registered Nurse as the Project Lead. Use of Region stakeholders (community and medical composition) will indicate needs and additional scope of the project.
- Establish baseline rates [P-2]. The baseline will be established using quantitative measures of pre- and pos patient and parent satisfaction ratings of project services.
- Patient Satisfaction [IT-6.1] Domain 1. Patient satisfaction will be measured by Program Records and CGCAHPS survey on patient’s overall health status/functional status and comparing DY4 and DY5 to baseline.

Rationale:
Patient Satisfaction – percent improvement of patient satisfaction scores in getting timely care, appointments and information was selected to assess the effectiveness of this project in meeting the needs of the target population. Children’s burns account for many hours of care and follow-up visits lasting months to years (children under five years of age account for almost 20% of all burn cases in the U.S.). If patients and parents participate in a coordinated multidisciplinary burn care program the patient has the greatest chance of a satisfying long-term outcome. Successful treatment outcomes and patient satisfaction are correlated. When the patient and parent are satisfied with the medical care and service they receive they are more likely to follow treatment plans, complete treatments and not drop out of care. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage children with severe
burns in RHP 10 who have received services from Shriners Hospital in Galveston and their families, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients living in RHP 10 in the target population. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Patient Satisfaction – percent improvement of patient satisfaction scores in getting timely care, appointments and information [IT-6.1] Domain 1. This outcome improvement target measures patient satisfaction for patients. Patients receiving telemedicine services from this intervention should see an improvement in patient satisfaction. If patients and parents participate in a coordinated multidisciplinary burn care program the patient has the greatest chance of a satisfying long-term outcome. Successful treatment outcomes and patient satisfaction are correlated. When the patient and parent are satisfied with the medical care and service they receive they are more likely to follow treatment plans, complete treatments and not drop out of care.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For patient satisfaction percent improvement over baseline of patient satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. We are anticipating that we will test the entire population, and are expecting to increase the patient satisfaction scores for the project by 10%.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $13 (per General Services Administration’s federal per diem rates, as well as information provided by UNT Health Science Center’s Department of Pediatrics), which was based on two percent of the expected reduced cost of each
estimated travel occurrence, in addition to the reduced cost of lost productivity for both school and work.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which was valued at $11 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization

Unique RHP outcome identification number(s): 138980111.3.3

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/ 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing pediatric ED visits for the target population. The expected outcome by the end of the Waiver is to reduce inappropriate ED utilization related to burns in target population receiving intervention by 10% over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include the identification, recruitment of staff, equipment acquisition, and collection of baseline data using a Registered Nurse as the Project Lead. Use of Region stakeholders (community and medical composition) will indicate needs and additional scope of the project.
- Establish baseline rates [P-2]. The baseline will be established by determining number of non-urgent ED visits at pre-project implementation and comparing to post project non-urgent ED visits using patient medical records.
- Right Care, Right Setting – ED Appropriate Utilization [IT-9.2]. Reduction in ED use will be measured by using patient medical records and comparing DY4 and DY5 to baseline.

Rationale:
Right Care, Right Setting – ED Appropriate Utilization was selected as an outcome measure to assess the effectiveness of the project in meeting the needs of the target population, allowing the patients to receive specialized care closer to home, with less time between appointments and in providing a resource in the Region for treatment other than the pediatric ED. Additionally, total payor non-urgent ED visits are estimated to be at the 10-40% of all ED visits. Medicaid non-urgent ED visits are at the 25% level based on a national sample of all medical insurance payor types. Shifting ED visits for non-urgent health problems to primary care providers in the community is a necessary step for broader efforts in the health care system to create —patient-centered medical homes. This would not only improve the quality of care by ensuring that patients have a primary care physician to see for their non-urgent health problems and coordinating care with specialists and other providers, but it is also likely to generate additional cost savings by reducing unnecessary or redundant utilization. To support the achievement of this outcome, specific process milestones and metrics were selected.
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage children with severe burns in RHP 10 who have received services from Shriners Hospital in Galveston and their families, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients living in RHP 10 in the target population. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

4. ED Appropriate Utilization [IT-9.2]. This outcome improvement target measures appropriate utilization of the pediatric ED for patients receiving the intervention. Patients receiving telemedicine services from this intervention will see a reduction in use of the ED due to having an additional resource for care related to severe burns and due to receiving specialized care through the use of telemedicine services at UNT Health Science Center.

Outcome Measure Valuation:

5. **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

6. **Rationale/Justification:** For ED appropriate utilization, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100 patients. The percentage of improvement expected by the project is 10%, equating to 10 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,500 due to the patient population mix.
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $1,200 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved with the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP outcome identification number(s): 138980111.3.4

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/ 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving quality of life scores for the target population. The expected outcome by the end of the Waiver is to improve quality of life scores for the target population by 5% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include the identification, recruitment of staff, survey instrument review, and collection of baseline data using a Registered Nurse as the Project Lead. Use of Region stakeholders (community and medical composition) will indicate needs and additional scope of the project.

7. Establish baseline rates [P-2]. The baseline will be established by the identification, recruitment of staff, survey instrument review, and collection of baseline data using a Registered Nurse as the Project Lead. Use of Region stakeholders (community and medical composition) will indicate needs and additional scope of the project.

8. Quality of Life/Functional Status – [IT-10.1] Quality of Life will be measured by the Child Health Questionnaire (CHQ) by Landgraf, Abgetz and Ware (1996): CHQ-PF 28 and CHQ-CF 87. The project will use the Child Health Questionnaire’s (CHQ) to measure health-related quality of life concepts from the patient's and parent's perspective (specific forms used are based on the specific age of the patient). CHQ measures will be collected for children with severe burns and chronic conditions. Most CHQ information is collected on healthy children and the project allows information to be collected on a different patient population. Measurements will include: physical functioning, performance in physical role, performance in emotional role, vitality, social functioning, bodily pain, general health perceptions, and mental health scores to be collected and used to improve medical care. DY4 and DY5 results will be compared to baseline to measure improvement.

Rationale:
Quality of Life/Functional Status – Quality of Life was selected to assess the effectiveness of this project in meeting the needs of the target population. The ability to measure the project’s patient experience is critical to understanding how to improve the quality of health care for severely burned children receive. The project will use the Child Health Questionnaire’s (CHQ) to measure health-related quality of life concepts from the patient's and parent's perspective.
(specific forms used are based on the specific age of the patient). To support the achievement of this outcome, specific process milestones and metrics were selected:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage children with severe burns in RHP 10 who have received services from Shriners Hospital in Galveston and their families, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- **Establish baseline rates** [P-2]. This process milestone is necessary as baseline rates have not been established for the patients living in RHP 10 in the target population. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- **Quality of Life/Functional Status** – [IT-10.1] Quality of Life. This outcome improvement target measures quality of life for patients. Patients receiving telemedicine services from this intervention should see an improvement in quality of life scores because if patients and parents participate in a coordinated multidisciplinary burn care program the patient has the greatest chance of a satisfying long-term outcome. Successful treatment outcomes, improved quality of life and patient satisfaction are correlated. This outcome improvement target measures quality of life for patients. Integrating back into a social and school environment is very difficult after a severe burn injury. The severely burned child will face many changes as they begin their long journey at increasing functionality and aesthetics. Quality of life scores allow burn survivors and their caregivers to become integrated back into their community and assures a high quality of life and life success.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For quality of life, UNT Health Science Center defined the population that will be directly impacted by the project as severely burned patients in North Texas requiring burn follow-up care services, which would be approximately 100
patients. We anticipate that we will test the entire population and are expecting to increase the quality of life scores by 5%.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,510 (as cited in the articles, "Relationships between Quality of Life Questionnaire (QLQ) and the SF-36 among young adults burned as children" in the journal, ScienceDirect and “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

138980111.1.1 Implement telemedicine program to provide or expand specialist referral services in an area identified as needed to the Region – 1.7.1: Telemedicine for Children Recovering From Severe Burns

**Starting Point/Baseline:**

**Baseline data:** There is currently no baseline data available for the project. Severely Burned Children have follow-up visits at 3, 6, 9, and 12 months. Approximately 3-4 patient visits per patient per year per age of child and medical condition.

**Target Population:**

**Specific Number:** Initial estimate is 100 severely burned patients in North Texas in various phases on follow-up burn care in conjunction with Shriners Hospital for Burns, Galveston Texas. Additional children populations and site locations will be identified

**Description of Population:** The initial phase of the project will focus on severely burned patients in North Texas requiring burn follow-up care services.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $88,320
Title of Outcome Measure (Improvement Target): IT-3.1: All-cause 30-day readmission rate – NQF 1789

Unique RHP outcome identification number(s): 138980111.3.6
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing all-cause 30-day readmission rates for Medicaid patients receiving services from the project Community-Based Primary Care for the Elderly. The expected outcome by the end of the Waiver is to reduce all-cause 30-day readmission rates for the target population by 10% over baseline (10 readmissions prevented). The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and hospital administration regarding targeted conditions most strongly related to readmissions. A review of the literature on this topic has already been conducted. The intervention will be planned targeting these risk factors.
- Establish baseline rates [P-2]. Prior work suggests that approximately 20% of Medicaid elders experience readmission within 30 days of hospital discharge. Additional baseline data from our target population will be collected by survey at initial patient encounters.
- Develop and test data systems [P-3]. This will involve setting up methods to track and collect readmission data from our target population and from area hospitals
- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – [IT-3.1]: All-cause 30-day readmission rate – NQF 1789 will be measured by tracking patients provided services through the community-based medical clinics (mobile teams and community-based clinics).

Rationale:
Approximately 20% of Medicaid-eligible elders are readmitted to hospitals within 30 days of discharge, which is a significant financial drain that also reduces overall quality of life. Through implementation of our mobile clinics, we propose to reduce Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – All-cause 30-day readmissions by 10% over baseline thereby providing a substantial cost savings. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1].
milestone is important as it provides the opportunity to engage primary care physicians and other primary care providers in evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for this particular population, which is at higher risk for hospital readmissions. Establishing baseline rates for our target population will provide the ability to assess the effectiveness of the project.

- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect 30-day readmission data from program records and area hospitals.

- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – [IT-3.1] – All-cause 30-day readmission rate – NQF 1789. This outcome improvement target measures the number of 30-day readmissions among Medicaid elders and near elders receiving care from the project titled Community-Based Primary Care for the Elderly. Participants in this intervention will demonstrate a reduced risk of 30-day readmission by receiving care from the mobile teams and community clinics, particularly though provision of urgent care services.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For All Cause 30 day Readmission Rate, UNT Health Science Center defined the population that will be directly impacted as Patients receiving services from the project titled Community-Based Primary Care for the Elderly who have been admitted to a hospital. It is anticipated that approximately 500 patients will be hospitalized annually. Based on various literature, it is estimated that 20% (or 100) of the target population will be readmitted within 30 days. The percentage of improvement expected by the project - is 10%, equating to 10 lives positively impacted by this outcome.
Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data). The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $15,217
Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores – of patient’s involvement in shared decision making.

Unique RHP outcome identification number(s): 138980111.3.7
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient satisfaction scores of patient’s involvement in shared decision making for those receiving services from the project “Community-Based Primary Care for the Elderly.” The expected outcome by the end of the Waiver is to improve patient satisfaction scores in decision making by 15% (among all 3,071 patients) over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local primary care providers as well as patients to identify key components required for effective patient participation in medical decision making.
- Establish baseline rates [P-2]. The baseline will be established by providing the survey prior to and after patient encounters with the mobile teams and clinics.
- Develop and test data systems [P-3]. The Consumer Assessment of Health Plans Survey (CAHPS) module on Patient/Caregiver Experience – Shared Decision Making will be incorporated into the computerized patient interview. Beta testing will be conducted to ensure accuracy of data as well as test data analytic systems.
- Patient Satisfaction – [IT-6.1] Percent improvement over baseline of patient satisfaction scores of patient’s involvement in decision making will be measured by comparing pre- and post-interviews from patient encounters with the mobile teams and community clinics.

Rationale:
Prior work has shown that patient perception of involvement in medical decision making and medical care is directly related to outcomes (Brody et al 1989). Therefore, we seek improve patient satisfaction scores of patient’s involvement in decision making by 15% over baseline (among all 3,071 patients). To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This
milestone is important as it provides the opportunity to engage primary care providers and patients to identify key barriers for patient involvement in medical decision making (e.g., health literacy). Medical team encounters will be designed to specifically address barriers identified.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for this milestone. Baseline rates will be based on patient experience with prior medical providers. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect patient satisfaction measures.
- Patient Satisfaction – [IT-6.1] Percent improvement over baseline of patient satisfaction scores of patient’s involvement in decision making. This outcome improvement target measures improvement in patient perception of involvement in medical decision making by participation in the community-based medical model. Participants in this intervention will be actively engaged in medical decision making by the health care teams thereby affording the patients the opportunity to have direct input into his/her health care.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For Patient Satisfaction Percent Improvement Over Baseline of Patient Satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as 3,071 individuals who will receive services through this project. We are anticipating that we will - test the entire population and are expecting to increase the patient satisfaction scores of patient’s involvement in shared decision making by 15%.

Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16 per article “BMC Medicine Research” in the journal BioMed Central), which is based on two percent of the expected reduced cost of mobile healthcare.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
**Patient Satisfaction – IT-6.1** Percent improvement over baseline of patient satisfaction scores – of patient’s involvement in shared decision making.

Title of Outcome Measure (Improvement Target): IT-10.1- Quality of Life

Unique RHP outcome identification number(s): 138980111.3.8
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient quality of life scores as measured by the SF-36 for those receiving services from the project “Community-Based Primary Care for the Elderly.”. The expected outcome by the end of the Waiver is to improve quality of life scores by 10% over baseline (among all 3,071 patients). The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local health care providers as well as patients to discuss health care barriers to quality of life. The SF-36 will be incorporated into the patient interviews to be developed in DY2-3 with beta testing completed in DY3.
- Establish baseline rates [P-2]. The baseline will be established by pre-medical encounters for each patient receiving services within the target population.
- Develop and test data systems [P-3]. The interview and data collection and analysis system will be developed over DY2-3 and beta tested in DY3. Full implementation of the system will be in DY4.
- Quality of Life/Functional Status- Quality of Life [IT-10.1]. Percent improvement over baseline of patient quality of life scores will be measured by comparing SF-36 scores prior to and after patient encounters by the mobile teams and community clinics.

Rationale:
Prior work shows how quality of life and health status have reciprocal relationships. In fact, the Oregon Health Insurance Experiment (Finkelstein 2011) demonstrated that enrollment in Medicaid had a significant beneficial impact on quality of life, health care utilization (including preventive care measures and hospitalizations), and overall medical expenditures and debt when compared to the control group with no insurance. By implementing this community-based medical model, we propose to improve quality of life by 10% over baseline (among all 3,071 patients). To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians as well as patients in evidence-based process models related to improvement in QOL, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

• Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patient quality of life. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

• Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect QOL measures.

• Quality of Life/Functional Status- Quality of Life [IT-10.1]. Percent improvement over baseline of patient quality of life. This outcome improvement target measures improvement in QOL experienced by participation in the community-based medical model. Participants in this intervention will demonstrate improved QOL owing to the fact that they will receive medical care “where they live” thereby overcoming the significant barrier of “access” to care pointed out by a recent survey of Tarrant County elders.

Outcome Measure Valuation:

• **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

• **Rationale/Justification:** For Quality of Life, UNT Health Science Center defined the population as the 3,071 individuals who will receive services through the project titled Community-Based Primary Care for the Elderly. We anticipate that we will survey the entire population and expect to increase quality of life scores by 10% for patients receiving services through this project.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755(as cited in the article “Cost –effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial”, in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a
cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-3.1: All-cause 30-day readmission rate – NQF 1789

Unique RHP outcome identification number(s): 138980111.3.10

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing all-cause 30-day readmission rates for Medicaid-eligible elders 65 receiving the intervention. The expected outcome by the end of the Waiver is to reduce all-cause 30-day readmission rates for Medicaid-eligible elders 65 and above receiving the intervention by 10% over baseline (3 readmissions prevented). The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and hospital partners regarding targeted conditions most strongly related to readmissions, which will be targeted in the intervention.

- Establish baseline rates [P-2]. Prior work suggests that 20% of hospitalized Medicaid elders will be readmitted within 30 days of discharge. Additional baseline data from our target population will be collected by survey of patients regarding prior hospital readmission rates.

- Develop and test data systems [P-3]. This will involve setting up methods to track and collect readmission data from program records and partner hospitals.

- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – IT-3.1: All-cause 30-day readmission rate – NQF 1789 will be measured by survey of patients receiving care from this intervention as well as partnering hospital records. We predict that enhanced access to geriatric primary care services through the UNTHSC Division of Geriatrics will reduce 30-day readmission rates within the target population.

Rationale:
Approximately 20% of Medicaid-eligible elders are readmitted to hospitals within 30 days of discharge, which is a significant financial drain that also reduces overall quality of life. By enhancing access to geriatric primary care for Medicaid-eligible elders receiving services within the UNTHSC Department of Internal Medicine, we propose to reduce Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – All-cause 30-day readmissions by 10% over baseline (3 readmissions prevented). This reduction in readmissions will result in a significant cost savings. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project
planning will include discussions with local health care providers and hospital partners regarding targeted conditions most strongly related to readmissions, which will be targeted in the intervention.

- Establish baseline rates [P-2]. Prior work suggests that 20% of discharged Medicaid elders will be readmitted within 30 days. However, this milestone is necessary as baseline rates within our target population and community have not been established. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect 30-day readmission data from area hospitals.

- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – [IT-3.1] – All-cause 30-day readmission rate – NQF 1789. This outcome improvement target measures the number of 30-day readmissions among Medicaid-eligible patients receiving services from the UNTHSC Department of Internal Medicine/Division of Geriatrics. Patients in this intervention will demonstrate improved knowledge regarding appropriate use of medical services and disease self-management, which will result in a reduction in 30-day readmissions.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For all cause 30 day readmission rate, the UNT Health Science Center defined the population that will be directly impacted by the project as the number of hospitalized Medicaid-eligible elders of Tarrant Count ages 65 and above, who receive services from the UNTHSC Department of Internal Medicine, which would - be 33 - individuals. - The percentage of improvement - expected - by the project is 10%, equating to 3 lives positively impacted by this outcome -.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491  (Texas Department of State Health Services data) -.
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,495 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $2,996 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores – of getting timely care, appointments and information

Unique RHP outcome identification number(s): 138980111.3.11
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient satisfaction scores of getting timely care, appointments and information for those receiving services within the UNTHSC Department of Internal Medicine. The expected outcome by the end of the Waiver is to improve patient satisfaction scores in getting timely care, appointments and information by 5% over baseline for all 1,013 patients provided services. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and patients regarding barriers to getting timely care, appointments and information. The intervention will target these barriers.
- Establish baseline rates [P-2]. The baseline will be established by survey of patients prior to and after receiving patient encounters within the UNTHSC Division of Geriatrics.
- Develop and test data systems [P-3]. This will involve setting up methods to collect and analyze survey data.
- Patient Satisfaction – IT-6.1 Percent improvement over baseline of patient satisfaction scores in getting timely care, appointments and information will be measured by survey prior to and after receiving encounters from the UNTHSC Division of Geriatrics.

Rationale:
A sizable literature supports the notion that patient satisfaction with medical care has direct impact on patient outcomes as well as clinical quality and operation performance. The current project targets improvement in patient satisfaction with “getting timely care, appointments and information.” In fact, these are related to commonly implemented quality metrics utilized by clinics throughout the U.S. We seek to improve patient satisfaction with getting timely care, appointments and information by 5% over the Waiver period. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care
providers, clinic staff, and patients regarding barriers to receipt of timely appointments and information. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for patient satisfaction with timeliness to appointments and services. However, prior UNTHealth surveys will provide information for comparison regarding timeliness to appointment. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect patient satisfaction surveys.

- Patient Satisfaction – IT-6.1 Percent improvement over baseline of patient satisfaction scores of getting timely care, appointments and information. This outcome improvement target measures change in patient satisfaction prior to and after receiving services from the UNTHSC Division of Geriatrics. Participants in this intervention will demonstrate improved satisfaction with getting timely care, appointments and information.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For patient satisfaction percent improvement over baseline of patient satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as Medicaid-eligible elders of Tarrant County ages 65 and above, who receive services from the UNTHSC Department of Internal Medicine, which would be approximately 1,013 individuals. We are anticipating that we will test the entire population, and are expecting to increase - the patient satisfaction scores for the project by 5%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $15 (per information provided by the UNT Health Science Center’s Division of Geriatrics).
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $9 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $6 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Unique RHP outcome identification number(s): 138980111.3.12
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
Improving the pneumonia vaccination status for Medicaid-eligible adults aged 65 and over receiving services from the UNTHSC Department of Internal Medicine. The expected outcome by the end of the Waiver is to improve the pneumonia vaccination status for adults aged 65 and over by 15% over baseline (51 new vaccinations). The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and patients regarding barriers to receiving pneumonia vaccinations. The appropriate evidence-based plan will be developed with timelines generated.
- Establish baseline rates [P-2]. The baseline will be established by survey of patients receiving services from the intervention regarding prior vaccination history.
- Develop and test data systems [P-3]. This involves generation of a method for collecting and analyzing survey data.
- Primary Care and Primary Prevention- Pneumonia vaccination status for older adults (HEDIS 2012) [IT-12.4] will be measured by survey of patients receiving services from the UNTHSC Department of Internal Medicine, Division of Geriatrics.

Rationale:
The risk for developing pneumonia is higher among the elderly owning to chronic (often comorbid) illnesses. Pneumonia is oftentimes cited as the fifth leading cause of death among the elderly. Given the increase medical illnesses and comorbidities among our target population, they are at increased risk for pneumonia. The current project seeks to increase the percentage of elders ever receiving a pneumonia vaccine by 15% over baseline (51 new vaccinations) during the Waiver period. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and hospital partners regarding barriers to receiving appropriate vaccinations among the target population. The intervention will be designed to address these key barriers.
Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for patients from the target population and community. It is anticipated that approximately 33% (334) will never have received the target vaccination.

Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect and analyze survey data regarding patient vaccination history.

Primary Care and Primary Prevention- Pneumonia vaccination status for older adults (HEDIS 2012) [IT-12.4]. This outcome improvement target measures the percentage of patients receiving pneumonia vaccinations prior to and after intervention. Patients in the intervention will gain understanding of the importance of receiving appropriate vaccinations and the dangers of not doing so, with particular emphasis on pneumonia vaccinations. It is anticipated that this education, as well as targeted interventions regarding key barriers to access, will significantly improve vaccination rates among the target population.

Outcome Measure Valuation:

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

- **Rationale/Justification:** For pneumonia vaccination status for older adults, UNT Health Science Center defined the population that will be directly impacted by the project as Medicaid-eligible elders of Tarrant County ages 65 and above, who receive services from the UNTHSC Department of Internal Medicine is estimated to be 1013 individuals, of which 674 have received the vaccination. It is anticipated that approximately 15% or 51 additional patients will receive the vaccination.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $15,682 (as cited in the article “Incidence and Cost of Pneumonia in Medicare Beneficiaries” in Chest Journal).-.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $6,273 for each positive outcome realized. Also, additional multiplier was applied to determine the
benefit it provided to the community, the resulting additional valuation amount is $6,273 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
### Primary Care and Primary Prevention - IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $718,086*
Title of Outcome Measure (Improvement Target): IT-9.2 ED Appropriate Utilization

Unique RHP outcome identification number(s): 138980111.3.13
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing inappropriate ED use among the target population. The expected outcome by the end of the Waiver is to reduce all ED visits in patients of PCPs receiving the training/intervention by 2% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
• Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart.
• ED Appropriate Utilization Rate [IT-9.2]. ED visits for target conditions:
  o Congestive Heart Failure
  o Diabetes
  o End-stage Renal Disease
  o Cardiovascular Disease/Hypertension
  o Chronic Obstructive Pulmonary Disease
  o Asthma
  will be measured by analysis of ED utilization data collected by the DFW Hospital Council.

Rationale:
Right Care, Right Setting – ED Appropriate Utilization was selected as an outcome measure to assess the effectiveness of the project training materials which include training on medical home and chronic care models, disease registry use for population health management. As a result of the training, PCPs should improve the percentage of high-risk populations receiving preventive measures, increase patient self-management, and reduce inappropriate ED utilization. To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care
physicians in updated training in emerging and evolving health care delivery models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been confirmed for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Right Care, Right Setting – ED Appropriate Utilization [IT-9.2]. This outcome improvement target measures the number of ED visits for targeted conditions (congestive heart failure, diabetes, end-stage renal disease, cardiovascular disease/hypertension, chronic obstructive pulmonary disease and asthma). Primary care participants receiving education will demonstrate improvement in appropriate management and self-management for targeted conditions, resulting in fewer ED visits. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For ED appropriate utilization, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who visit the ED and receive services from PCPs receiving intervention, which would be approximately 23,612 patients. The percentage of improvement by the project is 2%, equating to 472 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,200 due to the patient population mix. -For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $480 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $480 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
**Right Care, Right Setting — ED appropriate utilization**

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $256,666
Title of Outcome Measure (Improvement Target): IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012)

Unique RHP outcome identification number(s): 138980111.3.15
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving the pneumonia vaccination status for adults ages 65 and over. The expected outcome by the end of the Waiver is to improve the pneumonia vaccination status for adults aged 65 and over by 3% over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
- Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart.
- Primary Care and Primary Prevention- Pneumonia vaccination status for older adults (HEDIS 2012) [IT-12.4] will be measured by data aggregated by the North Texas Regional Extension Center and North Texas Accountable Healthcare Partnership and DY4 and DY5 will be compared to baseline.

Rationale:
Primary Care and Primary Prevention- IT-12.4 Pneumonia vaccination status for older adults (HEDIS 2012) was selected as an outcome measure because training will specifically addresses gaps in care in primary care, where sub-optimal rates of pneumonia immunizations are administered to older patients. This measure will assess the effectiveness of the project training materials which include modules in pneumonia prevention, including immunization in older adults. Medical home and chronic care models are also included in the training and have been shown to improve immunization status. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians in updated training in emerging and evolving health care delivery models, to identify capacity, to plan and document needed resources, and to implement plans
necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been confirmed for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Primary Care and Primary Prevention- Pneumonia vaccination status for older adults (HEDIS 2012) [IT-12.4]. Primary care participants receiving education will demonstrate improvement in pneumonia vaccination status in adults 65 and older. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For Pneumonia vaccination status for older adults, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who are 65 and older and receive services from PCPs receiving intervention, which would be approximately 14,167. The percentage of improvement in pneumonia vaccinations for this population is expected to be 3%, equating to 425 lives positively impacted.

Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $417 (as cited in the article, “Pneumococcal Vaccination Reduces Mortality and Costs in Elderly” in the internet journal at www.respiratoryreviews.com), -which was based on the average savings per person vaccinated.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $167 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $167 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**1.3.15 Increase Training of Primary Care Workforce – “Other” project option: Update primary care training programs to include training on the medical home and chronic care models, disease registry use for population health management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement (1.2.1: Training Primary Care Workforce in Evolving Health Care Delivery Models)**

### Starting Point/Baseline:

**Baseline data:** Based on 2010 Census Data, 141,667 ages 65 and older have never received the pneumococcal vaccine. Actual baseline data for providers and corresponding patients will be identified by performing a provider review and ID of impact metrics and baseline in DY2-3 to set baseline data.

**Target Population:** Total number of people ages 65 and older who have not ever received the pneumococcal vaccine and are seen by the 12,788 PCPs in the Region. According to 2010 Census Data, n= 141,667.

**Specific Number:** Estimated 14,167 based on 10% of PCPs receiving intervention

**Description of Population:** Patients in RHP 10 who are considered high risk for infection and receive services from PCPs receiving intervention

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $254,654
Title of Outcome Measure (Improvement Target): IT 6.1 (1) Percent improvement over baseline of patient satisfaction scores – are getting timely care, appointments, and information

Unique RHP outcome identification number(s): 138980111.3.16
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will track and assess the percent improvement over baseline patient satisfaction scores. The expected outcome by the end of the Waiver period is to improve patient satisfaction by 10% over baseline as measured by CGCAHPS survey on patients getting timely care appointments, and information. To support achievement of this outcome, specific process milestones and metrics were selected:

Process Milestones and Outcome Improvement Targets for each year:

- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Activities will include expanding the primary care training program and rotations for community health workers/promotoras, hiring additional precepting primary care faculty, and developing a mentoring program with primary care faculty and new CHW trainees.
- Establish baseline rates [P-2]. The baseline rates will be established by assessing and collecting patient satisfaction scores from patients prior to CHW exposure.
- Percent improvement over baseline patient satisfaction scores – (1) are getting timely care, appointments, and information [IT-6.1] Patient satisfaction will be measured using the CGCAHPS module (1) that assesses whether patients are getting timely care, appointments, and information.

Rationale:
Patient satisfaction with getting timely care appointments, and information was selected to assess the impact of placing CHWs/promotoras in performing providers’ facilities.

- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important to ensure that capacity for CHW training, placement in rotations, and mentoring is available.
- Establish baseline rates [P-2]. This process milestone is necessary as no patient satisfaction baseline data currently exists. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

Percent improvement over baseline of patient satisfaction scores – (1) are getting timely care, appointments, and information [IT-6.1]. The project will add 40 CHWs and place them in
performing providers’ facilities throughout RHP 10. This improvement target measures the expected outcome of improved patient satisfaction.

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

**Rationale/Justification:**
For Patient Satisfaction Percent Improvement over Baseline of Patient Satisfaction Scores, UNT Health Science Center defined the population that will be directly impacted by the project as patients seen by providers where newly trained CHWs/promotoras are placed, which would be approximately 2,500 individuals. We are anticipating that we will test the entire population, and are expecting to increase the patient satisfaction scores for the project by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $32 (as cited in the article, “Medicaid Savings Resulted When Community Health Workers Matched Thoses With Needs To Home and Community Care” in the journal, *Health Affairs*), which was based on two percent of the expected reduced annual Medicaid spending per participant.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health
Science Center discounted all projects to a reduced price in order to stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $20,130
Title of Outcome Measure (Improvement Target): IT-10.1 Quality of life

Unique RHP outcome identification number(s): 138980111.3.17
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will track and assess the percent improvement over baseline quality of life scores. The expected outcome by the end of the Waiver period is to improve quality of life scores by 10% over baseline as measured by SF-36. To support achievement of this outcome, specific process milestones and metrics were selected:

Process Milestones and Outcome Improvement Targets for each year:
- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Activities will include expanding the primary care training program and rotations for community health workers/promotoras, hiring additional precepting primary care faculty, and developing a mentoring program with primary care faculty and new CHW trainees.
- Establish baseline rates [P-2]. The baseline rates will be established by assessing and collecting patient quality of life scores from patients prior to CHW exposure.
- Percent improvement over baseline in quality of life scores [IT-10.1] Patient quality of life will be measured by using the SF-36.

Rationale:
Demonstrate improvement in quality of life scores, as measured by evidence-based and validated assessment tool (SF-36), for the target population was selected to assess the impact of placing CHWs/promotoras in performing providers’ facilities.
- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important to ensure that capacity for CHW training, placement in rotations, and mentoring is available.
- Establish baseline rates [P-2]. This process milestone is necessary as no patient satisfaction baseline data currently exists. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Quality of Life [IT-10.1]. This outcome improvement target measures quality of life scores of the patients served by community health workers assigned to providers’ facilities. Quality of life is a critical part of a person’s health. Appraisals of quality of life may be an early indicator of changes in health, as they are often more malleable than traditional health indicators such as cholesterol levels or hemoglobin A1c. Further, assessments of quality of life provide great insight into how a patient
perceives the effect of his or her own health and its subsequent effect on overall life. This project proposes to achieve measurable improvements in quality of life scores among patients working with RHP 10 providers employing CHWs to enhance patient care. Part of each trainee’s work will include assessing quality of life at baseline and at the end of working with each patient. It is very likely that patients working with CHWs will enjoy better health outcomes and better health care system encounters when compared with the health and care they received prior to working with CHWs. It is expected that these improvements will be evidenced in improvements in appraisals of quality of life.

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

**Rationale/Justification:**
For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as Patients seen by providers where newly trained CHWs/promotoras are placed, which would be approximately 2,500 individuals. We anticipate that we will test the entire population and are expecting to increase the quality of life scores by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome would be $3,755 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Control Trial” in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s Department of Health management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. - This threshold has been a standard way of valuing life-terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved.
by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-10.1: Quality of Life/Functional Status

Unique RHP outcome identification number(s): 138980111.3.18
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Performing Provider Name: University of North Texas Health Science Center (UNTHSC)
Texas Provider Identifier: 138980111

Outcome Measure Description:
This outcome measure would track and measure quality of life for at-risk, underserved African-American pre-teen girls in Tarrant County. The expected outcome by the end of the Waiver is to improve quality of life, as measured by a 5% increase in the PedsQL score by DY5. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This will include development and implementation of the project plan, execution and documentation of the learning and diffusion strategy, execution and documentation of the evaluation process, tools, and analytics, and identification of 40 African-American pre-teen girls to participate in the program.
- Establish baseline rates [P-2]. The baseline will be established by administering the PedsQL to project participants upon enrollment into the program.
- Quality of Life/Functional Status [IT-10.1]. We will measure quality of life using PedsQL, an evidence-based and validated assessment tool. The PedsQL Measurement Model is a modular approach to measuring health-related quality of life (HRQOL) in healthy children and adolescents and those with acute and chronic health conditions. The PedsQL Measurement Model integrates seamlessly both generic core scales and disease-specific modules into one measurement system. The 23-item PedsQL Generic Core Scales were designed to measure the core dimensions of health as delineated by the World Health Organization, as well as role (school) functioning. The 4 Multidimensional Scales and 3 Summary Scores are:

<table>
<thead>
<tr>
<th>Scales</th>
<th>Summary Scores</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Functioning (8 items)</td>
<td>Total Scale Score (23 items)</td>

</tr>
<tr>
<td>Social Functioning (5 items)</td>
<td>Psychosocial Health Summary (15 items)</td>
</tr>
<tr>
<td>School Functioning (5 items)</td>
<td></td>
</tr>
</tbody>
</table>
Rationale:
Quality of life was selected as an outcome improvement target to assess changes in physical, emotional, social, and school functioning as a result of African-American pre-teen girls having participated in the project. To support achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important to ensure engagement by stakeholder organizations providing evidence-based youth services, and to ensure stakeholder organizations are prepared for data reporting.
- Establish baseline rates [P-2]. This process milestone is necessary as no baseline data currently exists. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Quality of Life [IT-10.1]. This outcome improvement target measures quality of life scores of the at-risk, underserved African-American pre-teen girls, as measured by evidence-based and validated assessment tool (PedsQL) for the target population. The PedsQL is a complex measure that includes indicators of physical functioning, emotional functioning, social functioning, and school functioning. The broad based intervention that is used by youth serving organizations may have different impacts on each factor, although a generally positive impact. Hence, in the absence of baseline data, the projected 5% increase indicates a general positive effect, while effects in each subarea may be greater or less. In addition, there are confounding factors such as age and family SES that may influence the effect.

Outcome Measure Valuation:
- Approach/Methodology: Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

- Rationale/Justification: For quality of life, UNT Health Science Center defined the population that will be directly impacted by the project as Pre-teen African-American girls who are at risk for poor birth outcomes, which would be approximately 40 patients. We are anticipating that we will test the entire population, and are expecting to increase the quality of life scores for the project by 3%.
Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $25,000 (as cited in the article, "Mapping the EQ-5D Index from the SF-12: US General Population Preference in a Nationally Representative Sample" in the journal, Medical Decision Making and “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s School of Public Health), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-2.5 Chronic Obstructive Pulmonary Disease (COPD) Admission Rate – PQI 5

Unique RHP outcome identification number(s): 138980111.3.19
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing potentially preventable admissions for COPD among the target population. The expected outcome by the end of the Waiver is to reduce Chronic Obstructive Pulmonary Disease Admission Rate – PQI 5 by 3% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
- Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart. These data from the process milestones will be analyzed to create the PQI composite score, as defined by the AHRQ. Similar data will be collected over DY3-5.
- Chronic Obstructive Pulmonary Disease (COPD) Admission Rate – PQI 5 [IT-2.5]. COPD Admission Rate will be measured by using the THCIC – Inpatient and Outpatient Data Public Use Data File (PUDF) or comparable current data set from a data mart or other data aggregator.

Rationale:
Potentially Preventable Admissions Chronic Obstructive Pulmonary Disease (COPD) Admission Rate was selected as an outcome measure to assess the effectiveness of the project in training materials which specifically address clinical processes in effective COPD patient management and education on self-management. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians in evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.
Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Chronic Obstructive Pulmonary Disease (COPD) Admission Rate – PQI 5 [IT-2.5]. This outcome improvement target measures the number of non-maternal admissions with a principal diagnosis of COPD among patients in RHP 10 from hospitals in RHP 10. Primary care participants receiving education will demonstrate improved competence and performance related to clinical processes in effective patient management and education on self-management of COPD, resulting in fewer admissions. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

**Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

**Rationale/Justification:** For Chronic Obstructive Pulmonary Disease (COPD) Admission Rate, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for COPD and receive services from PCPs receiving intervention, which would be approximately 330 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for COPD in the target population by 3%, equating to 10 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it is determined that the valuation amount for each positive outcome realized would be $7,931 (TX Dept. of State Health Services data)

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $4,759 for each positive outcome realized. Also, an additional multiplier was applied to determine the
benefit provided to the individual, the resulting additional valuation amount is $3,172 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Title of Outcome Measure (Improvement Target):** IT-2.6 Adult Asthma Admission Rate – PQI 15

**Unique RHP outcome identification number(s):** 138980111.3.20

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in reducing potentially preventable admissions for adult asthma among the target population. The expected outcome by the end of the Waiver is to reduce Adult Asthma Admission Rate – PQI 15 by 3% from baseline. The associated process milestones and improvement targets are:

**Process Milestones and Outcome Improvement Targets for each year:**
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
- Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart. These data from the process milestones will be analyzed to create the PQI composite score, as defined by the AHRQ. Similar data will be collected over DY3-5.
- Adult Asthma Admission Rate – PQI 15 [IT-2.6]. Adult Asthma Admission Rate will be measured by using the THCIC – Inpatient and Outpatient Data Public Use Data File (PUDF) or comparable current data set from a data mart or other data aggregator.

**Rationale:**
Potentially Preventable Admissions Adult Asthma Admission Rate was selected as an outcome measure to assess the effectiveness of the project in training materials which specifically address clinical processes in effective adult asthma patient management and education on self-management. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage primary care physicians in evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.
Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Adult Asthma Admission Rate – PQI 15 [IT-2.6]. This outcome improvement target measures all discharges with a principal diagnosis code of asthma among patients in RHP 10 from hospitals in RHP 10. Primary care participants receiving education will demonstrate improved competence and performance related to clinical processes in effective patient management and education on self-management of asthma, resulting in fewer admissions. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

**Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

**Rationale/Justification:** For Adult Asthma Admission Rate –PQI 15, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for adult asthma and receive services from PCPs receiving intervention, which would be approximately 156 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for adult asthma in the target population by 3%, equating to 5 lives positively impacted by this outcome. -.

Utilizing - the pricing matrix developed by Regional providers to determine the value to the health care system, it was determined that the value amount for each positive outcome realized would be $6,285 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $3,771 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit provided to the individual, the resulting additional valuation amount is $2,514 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-2.10 Flu and Pneumonia Admission Rate

Unique RHP outcome identification number(s): 138980111.3.21
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing potentially preventable admissions for flu and pneumonia among the target population. The expected outcome by the end of the Waiver is to reduce Flu and Asthma Admission Rate by 3% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
- Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart. These data from the process milestones will be analyzed to create the PQI composite score, as defined by the AHRQ. Similar data will be collected over DY3-5.
- Flu and pneumonia Admission Rate [IT-2.10]. Flu and pneumonia Admission Rate will be measured by using the THCIC – Inpatient and Outpatient Data Public Use Data File (PUDF) or comparable current data set from a data mart or other data aggregator.

Rationale:
Potentially Preventable Admissions Flu and pneumonia Admission Rate was selected as an outcome measure to assess the effectiveness of the project in training materials which specifically address clinical processes in effective adult asthma patient management and education on self-management. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage primary care physicians in evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.
Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Flu and Pneumonia Admission Rate – [IT-2.10]. This outcome improvement target measures all discharges with a principal diagnosis code of flu or pneumonia among patients in RHP 10 from hospitals in RHP 10. Primary care participants receiving education will demonstrate improved competence and performance related to clinical processes in effective patient management and education on self-management of asthma, resulting in fewer admissions. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

**Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

**Rationale/Justification:** For Flu and Pneumonia Admission Rate, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who have been discharged with a principal diagnosis code for flu or pneumonia and receive services from PCPs receiving intervention, which would be approximately 463 patients. We are anticipating a reduction of admission rates with a principal diagnosis code for flu or pneumonia in the target population by 3%, equating to 14 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $8,047 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit provided to the community, the resulting additional valuation amount is $4,828 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit provided to the individual, the resulting additional valuation amount is $3,219 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5): $56,249
Title of Outcome Measure (Improvement Target): IT-3.11: Pediatric Asthma 30-Day Readmission Rate

Unique RHP outcome identification number(s): 138980111.3.22
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing potentially preventable readmissions among the target population. The expected outcome by the end of the Waiver is to reduce the pediatric asthma 30-day readmission rate by 5% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. Project planning will include creating partnerships with school districts in RHP 10, identifying and documenting children with asthma, and developing implementation plans for participating school districts.
- Establish baseline rates [P-2]. The baseline will be established by determining pediatric asthma 30-day readmission rates among students participating in the project.
- Develop and test data systems [P-3]. This will involve setting up methods to track and collect readmission data from area hospitals.
- Pediatric Asthma 30-Day Readmission Rate [IT-3.11]. Pediatric asthma 30-day readmission rate will be measured by obtaining pediatric asthma 30-day readmissions data from local hospitals and comparing number of readmissions in DY4 and DY5 to baseline data.

Rationale:
Potentially preventable readmissions – 30-day readmission rates (PPR) was selected as an outcome measure to assess the effectiveness of the project in helping students develop asthma action plans and avoiding being readmitted to the hospital. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1. This milestone is important as it provides the opportunity to engage participating school districts, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.
Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the participating school districts. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect 30-day readmission data from area hospitals.

Pediatric Asthma 30-Day Readmission Rate [IT-3.11]. This outcome improvement target measures the number of 30-day readmissions among students participating in the project which is a direct measure of the effectiveness of implementing asthma action plans for students with asthma. The outcome improvement target to reduce readmission rates by 5% is determined as a conservative estimate based on a similar proven approach used in the St. Louis metropolitan area. Using data from Cook Children’s Hospital for 2011 it is estimated there are up to 28 readmits annually due to asthma (data for all causes is not known at this time) (CCHAPS 2011), with an estimated 6 of these children from Fort Worth Independent School District (FWISD) alone (FWISD Annual Report 2011-2012).

Outcome Measure Valuation:

Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Rationale/Justification:
For Pediatric Asthma 30-day Readmission Rates, UNT Health Science Center defined the population that will be directly impacted by the project as school age children (K-12) identified by school health services as having asthma in FWISD. We estimate that 20 school age children will be readmitted due to asthma-related illness. The percentage of the population expected to be positively impacted by the project is 5%, equating to 1 life positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data).
For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $2,996 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,495 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-9.3 (Age group defined as those attending grades K-12 and are sent to the ED from school)

Unique RHP outcome identification number(s): 138980111.3.23
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing pediatric/young adult asthma emergency department visits among the target population. The expected outcome by the end of the Waiver is to reduce pediatric/young adult asthma emergency department visits by 20% from baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include creating partnerships with school districts in RHP 10, identifying and documenting children with asthma, and developing implementation plans for participating school districts. As new school districts are added, these processes will be repeated.
- Establish baseline rates [P-2]. The baseline will be established by determining pediatric/young adult asthma emergency department visits among students participating in the project. As new school districts are added, baseline data collection will be ongoing.
- Develop and test data systems [P-3]. This will include setting up methods to track and collect pediatric/young adult emergency department visit data.
- Pediatric//Young Adult Asthma Emergency Department Visits [IT-9.3]. Pediatric/young adult asthma emergency department visits will be measured by tracking the number of 911 calls for students with asthma from participating schools.

Rationale:
Pediatric/young adult asthma emergency department visits was selected as an outcome measure to assess the effectiveness of the project in helping students develop asthma action plans and avoiding having to visit the emergency department. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage participating school districts, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and
documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the participating school districts. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect 30-day readmission data from area hospitals.
- Pediatric/Young Adult Asthma Emergency Department Visits [IT-9.3]. This outcome improvement target measures the number of emergency department visits among students participating in the project. The outcome improvement target of reduction of school-based ED visits due to asthma by 20% is determined as a conservative estimate from reduction rates seen from the implementation in the St. Louis metropolitan area over a similar time period, where the reduction was ~35%.

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

**Rationale/Justification:**
For Pediatric/Young Adult Asthma Emergency Department Visits, UNT Health Science Center defined the population that will be directly impacted by the project as 138 school-age children (K-12) identified by school health services as having asthma in FWISD. The percentage of the population expected to be positively impacted by the project is 20%, equating to 28 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,200. - For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $480 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $720 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-8.2 Percentage of Low Birth-weight Births (CHIPRA/NQF #1382)

Unique RHP outcome identification number(s): 138980111.3.25
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure would track percentage of low birth-weight births among women giving birth in the target population. The expected outcome by the end of the Waiver is to reduce the rate of low birth-weight by 10% over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This will include development and implementation of the project plan, program curriculum, and evaluation tools.
- Establish baseline rates [P-2]. The program baseline will be established during enrollment into the program. Because of targeted recruitment, at least 50 program participants will have delivered a previous low birth weight infant.
- Percentage of low birth-weight births [IT-8.2]. Low birth-weight births will be measured by tracking the percentage of babies weighing <2,500 grams born to women enrolled in the interconception intervention.

Rationale:
- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. For program success there must be significant collaboration between social services and health care providers. This process milestone was selected because of the necessity to mobilize resources and create a feasible implementation plan.
- Establish baseline rates [P-2]. Women with previous low birth weight births will be recruited in the intervention.
- Percentage of low birth-weight births [IT-8.2]. The - interconception interventions proposed in the Tarrant County - Perinatal Health Promotion Initiative will target risk factors that are known to affect low birth weight/prematurity among enrolled women who become pregnant (i.e, chronic diseases, preconception check-up, multivitamin use, smoking cessation, postpartum care, early prenatal care, social and mental wellness, etc.) For program success there must be significant collaboration between social services and health care providers. The improvement target for low birth weight reduction is a decrease by 10% in low birth weight infants born to women enrolled in the intervention compared to pre-intervention births. This is consistent with the success of similar interconception programs.
Outcome Measure Valuation:

Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Rationale/Justification:
For Percentage of Low Birth-weight Births, UNT Health Science Center defined the population that will be directly impacted by the project as women with previous low weight births, which would be approximately 50 patients. The percentage of improvement by the project is 10%, equating to 5 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $44,482. For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $26,689 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $26,689 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-8.9 Other Outcome Improvement
Target: Interpregnancy interval/birth spacing

Unique RHP outcome identification number(s): 138980111.3.26
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure would track pregnancy intervals among women enrolled in the interconception care intervention. The expected outcome by the end of the Waiver is to achieve a pregnancy interval of at least - 9 months of a previous birth among 65% (98) of the women enrolled in the interconception. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This will include development and implementation of the project plan, program curriculum, and evaluation tools.
- Establish baseline rates [P-2]. The program baseline will be established during enrollment into the program.
- Other Outcome Improvement Target: Interpregnancy interval/birth spacing [IT-8.9]. Pregnancy interval will be calculated for each woman by subtracting the reported date of the last live birth from the start date of the last normal self-reported menses among women who become pregnant.

Rationale:
The interconception intervention proposed in the Tarrant County - Perinatal Health Initiative will target risk factors that are known to affect infant mortality among enrolled women who become pregnant (i.e. unintended pregnancy, short pregnancy intervals, chronic diseases, preconception check-up, multivitamin use, smoking cessation, postpartum care, early prenatal care, social and mental wellness, etc.) Women with adverse outcomes, including infant mortality, are intentionally targeted for this intervention.

- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. For program success there must be significant collaboration between social services and health care providers. This process milestone was selected because of the necessity to mobilize resources and create a feasible implementation plan.
- Establish baseline rates [P-2]. In 2009, the percentage of births among the highest risk Tarrant County women that were less than 18 months from previous birth was 34.7%. However, the previous pregnancy interval baseline will be calculated among the target population during enrollment in DY3 for this project because it may vary from this baseline.
- Other Outcome Improvement Target: Interpregnancy interval/birth spacing - [IT-8.9]. The improvement target is for 60% in DY4 and 65% in DY5 to achieve a
pregnancy interval of at least 9 months of a previous birth or avoid pregnancy among the women enrolled in the interconception intervention. This target was chosen because spacing of less than six months is highly predictive of a subsequent poor birth outcome and pregnancy intervals of 12-18 months are associated with high rates of uterine rupture, maternal morbidities, preterm birth, low birth weight, and small for gestational age infants.

Outcome Measure Valuation:

Approach/Methodology:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

Rationale/Justification:
For Other Outcome Improvement Target: Interpregnancy Interval/Birth Spacing, UNT Health Science Center defined the population that will be directly impacted by the project as women with previous adverse birth outcome, including infant mortality, which would be approximately 150 women. The improvement target is to achieve a pregnancy interval of at least 9 months of a previous birth among 65% of the women enrolled in the interconception intervention, equating to 98 lives positively impacted.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $51,589 (as cited in the article, “Preterm Birth: Causes, Consequences, and Prevention, Chapter 12: Societal Costs of Preterm Birth” in the journal National Academies Press) due to the reduction in the cost for care of infants born preterm. For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $30,953 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $30,953 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $2,302,806

Title of Outcome Measure (Improvement Target): IT-3.1: All-cause 30-day readmission rate-NQF 1789

Unique RHP outcome identification number(s): 138980111.3.28
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing all-cause 30-day readmission rates for Medicaid-eligible elders 65 receiving the intervention. The expected outcome by the end of the Waiver is to reduce all-cause 30-day readmission rates for Medicaid-eligible elders 65 and above receiving the intervention by 10% (15 readmissions prevented) over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning - engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with hospital partners regarding best practices to reduce readmissions.
- Establish baseline rates [P-2]. Prior work suggests that approximately 20% of Medicaid elders experience readmission within 30 days of hospital discharge. Additional baseline data from our target population will be collected by survey at initial patient encounters.
- Develop and test data systems [P-3]. This will involve setting up methods to track and collect readmission data from hospital partners.
- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – [IT-3.1] – All-cause 30-day readmission rate- NQF 1789 will be measured by tracking patients provided services and hospital records.

Rationale:
Approximately 20% of Medicaid-eligible elders are readmitted to hospitals within 30 days of discharge, which is a significant financial drain that also reduces overall quality of life. Through implementation of our discharge planning and care coordination model, we propose to reduce Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – All-cause 30-day readmissions by 10% (15 readmissions prevented) over baseline thereby providing a substantial cost savings. To support the achievement of this outcome, specific process milestones and metrics were selected:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This
milestone is important as it provides the opportunity to engage hospital and community partners necessary to design and implement the targeted implementation from best-practice guidelines.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the particular target population though prior data suggest a 20% readmission rate can be expected. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect 30-day readmission data from area hospitals.

- Potentially Preventable Readmissions – 30-day Readmission Rates (PPRs) – [IT-3.1] – All-cause 30-day readmission rate – NQF 1789. This outcome improvement target measures the number of 30-day readmissions among Medicaid-eligible patients discharged from UNT Health Science Center Division of Geriatrics hospital partners. Participants in this intervention will demonstrate improved health management and reduced readmission rates.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B

- **Rationale/Justification:** For 30-Day Readmission Rates, UNT Health Science Center defined the population that will be directly impacted by the project as elderly patients who are eligible for coverage by Medicaid and receive care from UNT Health Science Center Division of Geriatrics physicians – which was 750 patients in FY 2011. It is anticipated that 20% of these patients (150) will be readmitted within 30 days of discharge. Our goal is to reduce hospitalization rates by 10% (15 readmissions prevented).

Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,491 (TX Dept. of State Health Services data).

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $5,993 for each positive outcome realized.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved with the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP outcome identification number(s): 138980111.3.29
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving quality of life scores for Medicaid-eligible elders receiving the intervention. The expected outcome by the end of the Waiver is to improve quality of life scores for patients receiving the intervention by 10% for all 750 patients over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local hospital partners, health care providers, and patients to discuss barriers to quality of life. The SF-36 will be utilized for measurement of QOL.
• Establish baseline rates [P-2]. The baseline will be established during initial encounters by medical teams.
• Develop and test data systems [P-3]. The interview and data collection will be developed over DY2-3 and beta tested in DY3.
• Quality of Life/Functional Status- Quality of Life [IT-10.1]. Percent improvement over baseline of patient quality of life scores will be measured by comparing SF-36 scores prior to and after patient encounters.

Rationale:
If improvement targets are not determined, please indicate that outcome improvement targets will be determined in DY2 for DY3 implementation. QOL is related to a range of diseases as well as health status, which in turn can be utilized to guide interventions (CDC). Higher QOL is related to improved utilization of medical services and reduced overall health costs. Through implementation of this discharge planning and care coordination model, we will significantly improve quality of life, which will be associated with reduced readmissions. To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage local hospital partners, primary care physicians as well as patients in evidence-based process models related
to improvement in QOL, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patient quality of life. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect QOL measures.
- Quality of Life/Functional Status- Quality of Life [IT-10.1]. This outcome improvement target measures improvement in QOL experienced by patients receiving the enhanced discharge planning and care coordination services.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

- **Rationale/Justification:** For Quality of Life- UNT Health Science Center defined the population that will be directly impacted by the project as Elderly patients who are eligible for coverage by Medicaid, which we have estimated to be 750 individuals. We are anticipating that we will test the entire population, and are expecting to increase the quality of life scores for the project by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755 (as cited in the article “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value.
Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique RHP outcome identification number(s): 138980111.3.31
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome will assess the effectiveness of the project in improving the quality of life for program participants. The expected outcome by the end of the Waiver is to improve the mean quality of life scores by 10% over baseline. The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Activities to support project planning will include: conducting a needs assessment of complex behavioral health populations who are frequent users of community public health resources; designing community-based specialized interventions for the target population (a targeted behavioral health population focused on reducing substance abuse, depression symptomatology, and improving quality of life among dually-diagnosed patients residing in the PSH programs); and enrolling and serving individuals with targeted complex needs (a group of dually-diagnosed patients residing in the PSH programs).
- Establish baseline rates [P-2]. The baseline will be established by administering a pre-test of the Quality of Life Enjoyment and Satisfaction Questionnaire (Q-LES-Q). Since this is a new project, the process milestone is necessary to establish baseline rates in order to be able to assess the effectiveness of the project.
- Quality of Life [IT-10.1]. Demonstrate improvement in quality of life (QOL) scores as measured by the Q-LES-Q.

Rationale:
Quality of life was selected as an outcome measure to assess the effectiveness of the project in assisting participants to improve their life enjoyment and functioning.

a. Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to assess the size, characteristics, and needs of the target population, review the literature/experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes, develop a project evaluation plan using qualitative and quantitative metrics to determine outcomes, and design models which include an appropriate range of community-based services and residential supports.
b. Establish baseline rates [P-2]. Since this is a new project, this process milestone is necessary to establish baseline rates in order to be able to assess the effectiveness of the project.

Quality of Life [IT-10.1]. Given the strong connection between substance abuse, mental health and quality of life, the improvement milestone of improving quality of life by at least 10% is justified based on published research with similar community populations (Lundahl & Burke, 2009).

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. - (See Section V.B. for a full explanation of the model.)

For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as 300 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are anticipating that we will test the entire population, and are expecting to increase quality of life scores by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16,750 (as cited in the article, “Cost- effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal Arch Gen Psychiatry, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total...
DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-1.9 Depression Management: Depression Remission at 12 Months (NQF #0710)

Unique RHP outcome identification number(s): 138980111.3.32
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome will assess the effectiveness of the project in managing depression for program participants. The expected outcome by the end of the Waiver is depression remission for at least 10% of patients who report moderate to severe depression, as evidenced by a reduction of PHQ-9 scores greater than 9 (i.e., at least moderate depression) to less than 5 (i.e., minimal or no depression). The total number of people impacted will depend on baseline scores of enrolled participants on the PHQ-9.

The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Activities to support project planning will include: conducting a needs assessment of complex behavioral health populations who are frequent users of community public health resources; designing community-based specialized interventions for the target population (a targeted behavioral health population focused on reducing substance abuse, depression symptomatology, and improving quality of life among dually-diagnosed patients residing in the PSH programs); and enrolling and serving individuals with targeted complex needs (a group of dually-diagnosed patients residing in the PSH programs).

- Establish baseline rates [P-2]. The baseline will be established by administering a pre-test of the PHQ-9.

- Depression management: Depression remission at twelve months [IT-1.9]. Depression remission for at least 10% of patients, as evidenced by a reduction of PHQ-9 scores greater than 9 (i.e., at least moderate depression) to less than 5 (i.e., minimal or no depression).

Rationale:
Reduction in depression symptomatology was selected as an outcome measure to assess the effectiveness of the project in assisting participants to improve their overall functioning.

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to assess the size, characteristics, and needs of the target population, review the literature/experience with populations similar to target population to determine community-based interventions that are effective in averting negative outcomes, develop a project...
evaluation plan using qualitative and quantitative metrics to determine outcomes, and design models which include an appropriate range of community-based services and residential supports.

b. Establish baseline rates [P-2]. The baseline will be established by administering a pre-test of the PHQ-9. Since this is a new project, the process milestone is necessary to establish baseline rates in order to be able to assess the effectiveness of the project.

Depression management: Depression remission at 12 months [IT-1.9]. Given the strong connection between substance abuse and mental health, the improvement milestone of reducing depression symptomatology for at least 10% of patients is justified based on past work with similar community populations (Baker et al., 2012; Westra, et al., 2011).

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

**Rationale/Justification:**
For Depression Management: Depression Remission at Twelve Months, UNT Health Science Center defined the population that will be directly impacted by the project as 300 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are expecting to decrease depression symptomatology for at least 10% of patients, equating to 30 lives positively impacted by this outcome. - . -.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759. The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed,
the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $13,278

Title of Outcome Measure (Improvement Target): IT-10.1-Quality of Life

Unique RHP outcome identification number(s): 138980111.3.33 (Pass 2)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient quality of life scores as measured by the SF-36 for those receiving services from the project Community Based Behavioral Healthcare for Depressed Medicaid Elders and Near Elders. The expected outcome by the end of the waiver is to improve quality of life scores by 10% over baseline. The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local behavioral health care providers as well as patients to discuss health care barriers to quality of life. The SF-36 will be incorporated into the patient interviews to be developed in DYs 2 and 3 with beta testing completed in DY3.
- Establish baseline rates [P-2]. The baseline will be established by pre-mobile behavioral health care team encounters for each patient receiving services within the target population.
- Develop and test data systems [P-3]. The interview and data collection and analysis system will be developed over DY2-3 and beta tested in DY3. Full implementation of the system will be in DY4.
- Quality of Life/Functional Status – Quality of Life [IT-10.1]. Percent improvement over baseline of patient quality of life scores will be measured by comparing SF-36 scores prior to and after patient encounters by the mobile behavioral health care team.

Rationale:
Prior work shows how quality of life and health status have reciprocal relationships. In fact, the Oregon Health Insurance Experiment (Finkelstein 2011) demonstrated that enrollment in Medicaid had a significant beneficial impact on quality of life, health care utilization (including preventive care measures and hospitalizations), and overall medical expenditures and debt when compared to the control group with no insurance. Prior work also demonstrates a positive impact of depression behavioral health services on patient quality of life. By implementing this community-based depression health care program per the IMPACT model, we propose to improve quality of life by 10% over baseline. To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important, as it provides the opportunity to engage behavioral health care physicians as well as patients in evidence-based process models related to improvement in QOL, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

• Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the patient quality of life. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

• Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect QOL measures.

• Quality of Life/Functional Status – Quality of Life [IT-10.1]. Percent improvement over baseline of patient quality of life. This outcome improvement target measures improvement in QOL experienced by participation in the mobile behavioral health care team program for depressed elders. Participants in this intervention will demonstrate improved QOL by owing to the fact that they will receive community-based behavioral health care services for depression.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (*See Section V.B. for a full explanation of the model.*)

For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 dually-diagnosed patients enrolled in the Ft. Worth permanent supportive housing (PSH) program. We are anticipating that we will test the entire population, and are expecting to increase quality of life scores by 10%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16,750 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores – of patients’ involvement in shared decision making.

Unique RHP outcome identification number(s): 138980111.3.34 (Pass 2)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in improving patient satisfaction scores of patients’ involvement in shared decision making for those receiving services from the project “Community Based Behavioral Healthcare for Depressed Elders and Near Elders.” The expected outcome by the end of the Waiver is to improve patient satisfaction scores in decision making by 5% over baseline. The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local behavioral health care providers as well as patients to identify key components required for effective patient participation in medical decision making.
- Establish baseline rates [P-2]. The baseline will be established by providing the survey prior to and after patient encounters with the mobile behavioral health care team.
- Develop and test data systems [P-3]. The Consumer Assessment of Health Plans Survey (CAHPS) module on Patient/Caregiver Experience – Shared Decision Making will be incorporated into the computerized patient interview. Beta testing will be conducted to ensure accuracy of data as well as test data analytic systems.
- Patient Satisfaction – [IT-6.1] Percent improvement over baseline of patient satisfaction scores of patients’ involvement in decision making will be measured by comparing pre- and post-interviews from patient encounters with the mobile behavioral health care team.

Rationale:
Prior work has shown that patient perception of involvement in medical decision making and medical care is directly related to outcomes (Brody et al. 1989). Involvement in decision making is also an essential component of behavioral health care for depression. Therefore, we seek to improve patient satisfaction scores of patients’ involvement in decision making by 5% over baseline. To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage behavioral health care providers and patients to identify key barriers for patient involvement in medical decision making (e.g., health literacy). Mobile behavioral health care team encounters will be designed to specifically address barriers identified.

• Establish baseline rates [P-2]. This process milestone is necessary, as baseline rates have not been established for this milestone. Baseline rates will be based on patient experience with prior mental health providers. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

• Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect patient satisfaction measures.

Patient Satisfaction – [IT-6.1] Percent improvement over baseline of patient satisfaction scores of patients’ involvement in decision making. This outcome improvement target measures improvement in patient perception of involvement in decision making by implementation of the mobile behavioral health care team. Participants in this intervention will be actively engaged in decision making by the behavioral health care teams, thereby affording patients the opportunity to have direct input into their health care.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

For Patient Satisfaction Percent Improvement over Baseline of Patient Satisfaction scores, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are anticipating that we will test the entire population and are expecting to increase the patient satisfaction scores of patient’s involvement in shared decision making by 5%.

Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $16 (per article “BMC Medicine Research” in the journal BioMed Central), which is based on two percent of the expected reduced cost of mobile healthcare.
The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.
### Patient Satisfaction – IT-6.1

Percent improvement over baseline of patient satisfaction scores – of patients’ involvement in shared decision making.

| Year 5 Estimated Outcome Amount: | $994 |

| TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD *(add outcome amounts over DYs 2-5)*: | $1,879 |
Title of Outcome Measure (Improvement Target): IT-14.6: Percent of trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA)

Unique RHP outcome identification number(s): 138980111.3.35 (Pass 2)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in expanding the family medicine residency with trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA). The expected outcome by the end of the Waiver is to increase the percent of trainees from HPSA/MUA’s by 10% over baseline. The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include development of data collection and identification process that will allow us to identify residents from HPSA/MUAs, target trainee applicants from these areas, and identify graduates from residency who practice in HPSA/MUAs after graduation from program. Currently this process does not exist.

- Establish baseline rates [P-2]. Currently the residency does not collect data identifying residents who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA). This data will be collected early in DY3, establishing the baseline for outcome improvement targets.

- Percent of trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA) [IT – 14.6]. The number of residents from HPSA/MUAs will be tracked in DY4 and DY5 with the goal of increasing the percentage of residents from these areas by 10% by the end of DY5.

Rationale:
This outcome measure is a priority for the RHP. RHP community needs as supported by Stakeholder Survey, Texas CHS, County 2010 Health Rankings, Providers Readiness Assessments, and Health Professional Shortage Areas have identified a lack of provider capacity, particularly Medicaid providers who provide primary care services. Five of the Region’s counties are recognized as medically underserved areas and four of the nine counties have a shortage in primary care providers.

In a 2011 Survey of Final-Year Medical Residents performed by Merritt Hawkins, “geographic location” was rated as a “most important” factor by 81% of residents when assessing practice opportunities. The preference may override more practical considerations. Residents often pursue
a location for practice where they trained, grew up, or where their spouse or significant other grew up. Recruitment of trainees from HPSA/MUAs will increase the likelihood that they will return to their communities upon graduation. The expected outcome by the end of the Waiver is to increase the percentage of trainees from HPSA/MUAs by 10% over baseline. To support the achievement of this outcome, specific process milestones and metrics were selected:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Currently, this process does not exist. Engaging stakeholders and needed resources will allow us to expand the residency program in the most efficient manner.
- **Establish baseline rates** [P-2]. Currently the residency does not collect data identifying residents who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA). This data is necessary to show improvement and will be collected early in DY3, establishing the baseline for outcome improvement targets.
- **Percent of trainees who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA)** [IT-14.6]. This improvement target measures the effectiveness of the programs in targeting residents in HPSA/MUAs and should increase primary care providers serving in these areas.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(Section V.B for a full explanation of the model.)*

For percentage of trainees who have spent at least five years living in a HPSA or MUA, UNT Health Science Center expects to increase the number of family medicine residency trainees by six, which will increase the overall number of residency trainees from 12 to 18. It is anticipated that increasing the number of trainees will allow us to increase the number of patient visits by 2,000 for the project period. In addition, it is anticipated this project will increase the percentage of residents who have spent at least five years living in a health professional shortage area (HPSA) or medically underserved area (MUA) by 10%.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,131 (as cited by Agency for Healthcare Research and Quality (AHRQ). Mean Expenses per Person with Care for Selected Conditions by Type of Service: United States, 2010. Medical Expenditure Panel Survey Household Component Data, along with
recommendations provided by UNT Health), as the result- of decreasing per capita cost per patient case by increasing primary care services, prevention, and chronic disease management to patients who currently lack access.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $1,878 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $1,878 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Unique RHP outcome identification number(s):** 138980111.3.36 (Pass 2)

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC)/138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in expanding the family medicine residency with trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey. The expected outcome by the end of the Waiver is to increase the percentage of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey by 10% over baseline. The associated process milestones and improvement targets are:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include development of a survey that will allow residency to identify residents who report that they plan to practice in HPSAs or MUAs upon graduation from the program. Currently this process does not exist.

- **Establish baseline rates** [P-2]. Currently the residency does not collect data identifying residents who plan to practice in HPSAs or MUAs upon graduation from the program. This data will be collected early in DY3, establishing the baseline for outcome improvement targets.

- **Percentage of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey** [P-14.7]. The number of residents who plan to practice in HPSAs or MUAs upon graduation from the program will be tracked in DY4 and DY5, with the goal of increasing the percentage of residents who plan to practice in HPSAs or MUAs upon graduation from the program by 10% by the end of DY5.

**Rationale:**
This outcome measure is a priority for the RHP. RHP community needs as supported by Stakeholder Survey, Texas CHS, County 2010 Health Rankings, Providers Readiness Assessments, and Health Professional Shortage Areas have identified a lack of provider capacity, particularly Medicaid providers who provide primary care services. Five of the Region’s counties are recognized as medically underserved areas and four of the nine counties have a shortage in primary care providers.

In a 2011 Survey of Final-Year Medical Residents performed by Merritt Hawkins, “geographic location” was rated as a “most important” factor by 81% of residents when assessing practice opportunities. The preference may override more practical considerations. Residents often pursue
a location for practice where they trained, grew up, or where their spouse or significant other grew up. Since the residency is located within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02 and serves patients from these areas, residents are more likely to remain in this geographical area serving patients with similar demographics. This project aims to increase the percentage of residents who plan to practice in HPSAs or MUAs upon graduation from the program by 10% by the end of DY5. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Currently, this process does not exist. Engaging stakeholders and needed resources will allow us to expand the residency program in the most efficient manner
- Establish baseline rates [P-2]. Currently the residency does not collect data identifying residents who plan to practice in HPSAs or MUAs upon graduation from the program. This data is necessary to show improvement and will be collected early in DY3, establishing the baseline for outcome improvement targets.
- Percentage of trainees who report that they plan to practice in HPSAs or MUAs based on a systematic survey [IT-14.8]. This improvement target measures the effectiveness of the programs in increasing the percentage of residents who plan to practice in HSPAs and MUAs, thereby increasing primary care access to this population.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

For percentage of trainees who report that they plan to practice in HPSAs or MUAs, UNT Health Science Center expects to increase the number of family medicine residency trainees by six, which will increase the overall number of residency trainees from 12 to 18. It is anticipated that increasing the number of trainees will allow us to increase the number of patient visits by 2,000 for the project period. **Unique RHP outcome identification number(s):** 138980111.3.37 (Pass 2)

**Performing Provider Name/TPI:** University of North Texas Health Science Center/138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in expanding the family medicine residency with trainees who report that they plan to serve Medicaid populations based on a systematic survey. The expected outcome by the end of the waiver is to increase the percentage of trainees who report that they plan to serve Medicaid populations based on a systematic survey by 10% over baseline. The associated process milestones and improvement targets are:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include development of a survey that will allow residency to identify residents who report that they plan to serve Medicaid populations upon graduation from the program. Currently this process does not exist.

- **Establish baseline rates** [P-2]. Currently the residency does not collect data identifying residents who plan to serve Medicaid populations based upon graduation from the program. This data will be collected early in DY3, establishing the baseline for outcome improvement targets.

- **Percentage of trainees who report that they plan to serve Medicaid populations based on a systematic survey** [IT-14.8]. The number of residents who plan to serve Medicaid populations upon graduation from the program will be tracked in DY4 and DY5 with the goal of increasing the percentage of residents who plan to serve Medicaid populations upon graduation from the program by 10% by the end of DY5.

**Rationale:**
This outcome measure is a priority for the RHP. RHP community needs as supported by Stakeholder Survey, Texas CHS, County 2010 Health Rankings, Providers Readiness Assessments, and Health Professional Shortage Areas have identified a lack of provider capacity, particularly Medicaid providers who provide primary care services. Five of the Region’s counties are recognized as medically underserved areas and four of the nine counties have a shortage in primary care providers.

In a 2011 Survey of Final-Year Medical Residents performed by Merritt Hawkins, “geographic location” was rated as a “most important” factor by 81% of residents when assessing practice opportunities. The preference may override more practical considerations. Residents often pursue a location for practice where they trained, grew up, or where their spouse or significant other
grew up. Since the residency is located within a mile of MUC census tracts 1045.03 and 1046.05 and within four miles of HPSA tracts 1046.01, 1046.04, 1062.01 and 1062.02 and serves patients from these areas, residents are more likely to remain in this geographical area serving patients with similar demographics. In addition the current residency clinic has a 36% Medicaid payer mix. This project aims to increase the percentage of residents who plan to serve Medicaid populations upon graduation from the program by 10% by the end of DY5. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Currently, this process does not exist within the program. Engaging stakeholders and needed resources will allow us to expand the residency program in the most efficient manner.
- Establish baseline rates [P-2]. Currently the residency does not collect data identifying residents who plan to serve Medicaid populations upon graduation from the program. This data is necessary to show improvement and will be collected early in DY3 establishing the baseline for outcome improvement targets.
- Percentage of trainees who report that they plan to serve Medicaid populations based on a systematic survey [IT-14.8]. This improvement target measures the effectiveness of the program in increasing the percentage of residents who plan to serve the Medicaid population.

**Outcome Measure Valuation:**

Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

For percentage of trainees who report that they plan to serve Medicaid populations, UNT Health Science Center expects to increase the number of family medicine residency trainees by six, which would increase the overall number of residency trainees from 12 to 18. It is anticipated that increasing the number of trainees will allow us to increase the number of patient visits by 2,000 for the project period. In addition, it is anticipated this project will increase the percentage of trainees who report that they plan to serve Medicaid populations based on systematic survey by 10%.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,131 (as cited by Agency for Healthcare Research and Quality (AHRQ).

Mean Expenses per Person with Care for Selected Conditions by Type of Service: United States,
2010. Medical Expenditure Panel Survey Household Component Data, along with recommendations provided by UNT Health), as the result of decreasing per capita cost per patient case by increasing primary care services, prevention, and chronic disease management to patients who currently lack access.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $1,878 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $1,878 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-10.1 Quality of Life

Unique Project ID: 138980111.3.38 (Pass 3)
Performing Provider Name/TPI: University of North Texas Health Science Center / 138980111

Outcome Measure Description:
The outcome measure selected is quality of life, which will be measured using the widely used and validated SF-12 quality of life instrument. The expected goal is to improve quality of life by 5% over baseline by the end of the waiver. The specific process milestones and the selected improvement targets for each year are:

- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This will include conducting a needs assessment to identify needed specialties that can be provided via telemedicine, identify the types of personnel needed to implement the program, hiring of the respective personnel, and identifying needed services that can be delivered via telehealth. We will implement remote patient monitoring program based on evidence-based models and adapted to fit the needs of the population and local context and document program materials including implementation plan, vendor agreements/contracts, staff training and HR documents.

- Develop and Test Data Systems [P-2]. This will include creating a plan to monitor and enhance technical properties, bandwidth, of telemedicine/telehealth program. We will document bandwidth capacity in relationship to program needs and determine technical properties needed to implement program effectively.

- Percent improvement over baseline in quality of life scores [IT-10.1] Patient quality of life will be measured by using the SF-12. Patients will be in the proposed patient monitoring program for an average of six months and the goal is to improve quality of life scores (SF-12 main summary scores) by 5% from the first baseline measurement to the last measurement collected towards the end of program participation for each Medicaid beneficiary.

Rationale:
Demonstrate improvement in quality of life scores as measured by the SF-12 for the target population was chosen to assess the impact of remote patient monitoring on quality of life.

- Project Planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to conduct the needs assessment and to identify needed specialties and needs that can be met via telemedicine. It allows for the implementation of the remote patient monitoring program.

- Develop and Test Data Systems [P-3]. This process milestone is necessary to ensure that appropriate capacity is available to transmit health information efficiently and effectively.

- Percent improvement over baseline in quality of life scores [IT-10.1]. Remote patient monitoring has been shown to lower the risk of hospitalization for Medicare and Medicare/Medicaid dual eligible patients with chronic health conditions. These reductions in hospitalization rates are a direct consequence of better care coordination and chronic disease stabilization resulting from intensive patient...
monitoring. The SF-12 is a general survey instrument designed to capture different dimensions of health and quality of life. The instrument allows for the measurement of not only general physical and mental health but also other important health domains (physical functioning, role functioning, bodily pain, vitality, and social functioning). These health outcomes are expected to improve for our targeted low-income population as a result of better care coordination and chronic disease management achieved by our interventional telehealth program.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

For Quality of Life, UNT Health Science Center defined the population that will be directly impacted by the project as patients selected for remote patient monitoring, which would be approximately 700 patients. We anticipate that we will remotely monitor the entire population using interventional telehealth and are expecting to increase the quality of life (SF-12) scores by 5%.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $3,755 (as cited in the article, “Cost-effectiveness of a Multicondition Collaborative Care Intervention: A Randomized Controlled Trial” in the journal *Arch Gen Psychiatry*, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which was based on a cost-utility analysis that applied an incremental quality-adjusted life-year to the customary $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $1,444,192*
**Title of Outcome Measure (Improvement Target):** IT-10.2 Activities of Daily Living

**Unique Project ID:** 138980111.3.39 (Pass 2)  
**Performing Provider Name/TPI:** University of North Texas Health Science Center / 138980111

**Outcome Measure Description:**

The outcome measure selected is activities of daily living (functional independence), which will be measured using the widely used and validated Barthel Index of ADLs. The expected goal is to improve functional independence by 5% over baseline by the end of the waiver. The specific process milestones and the selected improvement targets for each year are:

- **Project Planning –** engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This will include conducting a needs assessment to identify needed specialties that can be provided via telemedicine, identify the types of personnel needed to implement the program, hiring of the respective personnel, and identifying needed services that can be delivered via telehealth. We will implement remote patient monitoring program based on evidence-based models and adapted to fit the needs of the population and local context and document program materials including implementation plan, vendor agreements/contracts, staff training and HR documents.

- **Develop and Test Data Systems [P-2].** This will include creating a plan to monitor and enhance technical properties, bandwidth, of telemedicine/telehealth program. We will document bandwidth capacity in relationship to program needs and determine technical properties needed to implement program effectively.

- **Percent improvement over baseline in activities of daily living [IT-10.2].** Patient improvement in activities of daily living will be measured by using the Barthel Index. Patients will be in the proposed patient monitoring program for an average of six months and the goal is to improve the Barthel Index scores by 5% from the first baseline measurement to the last measurement collected towards the end of program participation for each Medicaid beneficiary.

**Rationale:**

Demonstrate improvement in ADL scores, as measured by the Barthel Index for the target population was chosen to assess the impact of remote patient monitoring on activities of daily living.

- **Project Planning –** engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to conduct the needs assessment and to identify needed specialties and needs that can be met via telemedicine. It also allows for the implementation of the remote patient monitoring program.

- **Develop and Test Data Systems [P-3].** This process milestone is necessary to ensure that appropriate capacity is available to transmit health information efficiently and effectively.

- **Percent improvement over baseline in activities of daily living [IT-10.2].** Remote patient monitoring has been shown to lower the risk of hospitalization for Medicare and Medicare/Medicaid dual eligible patients with
chronic health conditions. These reductions in hospitalization rates are a direct consequence of better care coordination and chronic disease stabilization resulting from intensive patient monitoring. The Barthel Index is a general assessment score of functional independence that includes ten items (bathing, grooming, feeding, dressing, bowels, bladder, toilet use, stairs, transfers, and mobility). The overall index score ranges from 0 to 100, with a higher number indicating more independence. Functional independence is expected to improve for our targeted low-income population as a result of better care coordination and chronic disease management achieved by our interventional telehealth program.

**Outcome Measure Valuation:**

**Approach/Methodology:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B.

**Rationale/Justification:**
For Activities in Daily Living (ADLs), UNT Health Science Center defined the population that will be directly impacted by the project as Patients selected for remote patient monitoring, which would be approximately 700 patients. We anticipate that we will remotely monitor the entire population using interventional telehealth and are expecting to increase the Barthel Index of ADLs (functional independence) scores by 5%.

Utilizing the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $2,500 (as cited in the article, “Assessment of post-stroke quality of life in cost-effectiveness studies: The usefulness of the Barthel Index and the EuroQoL-5D” from the journal *Quality of Life Research*, along with recommendations provided by UNT Health Science Center’s Department of Health Management and Policy), which used the Barthel Index to assess the impact of the target population as a means to calculate an incremental quality-adjusted life-year and applied it to the customary $50,000 per life-year gained due to the intervention. This threshold has been a standard way of valuing life-years in terms of whether the cost of the intervention exceeds this standard.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a
reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Title of Outcome Measure (Improvement Target):** IT-2.12- Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions

**Unique RHP outcome identification number(s):** 138980111.3.40

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in reducing all-cause hospital admission rates as measured by the PQI Composite Measure Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions among Medicaid-eligible elders 65 and above receiving services from the project “Community-Based Primary Care for the Elderly.” The expected outcome by the end of the Waiver is to reduce hospital admission rates for Medicaid-eligible elders 65 and above receiving the intervention by 5% over baseline. The associated process milestones and improvement targets are:

**Process Milestones and Outcome Improvement Targets for each year:**
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and hospital administration regarding targeted conditions most strongly related to admissions. A review of the literature on this topic has already been conducted. The intervention will be planned targeting these risk factors.
- Establish baseline rates [P-2]. Prior work suggests that approximately 16% of Medicaid elders are hospitalized annually with the percentages increasing with age. Additional baseline data from our target population will be collected by survey at initial patient encounters regarding hospitalization rates in the prior 12 months.
- Develop and test data systems [P-3]. This will involve setting up methods to track and collect admission data from our target population and from area hospitals.
- Potentially Preventable Admissions – Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions-[IT-2.12-]. All-cause hospital admissions will be measured by the PQI Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions for patients provided services through the community-based medical model (mobile teams and community-based clinics). Additionally, we will establish a tracking system with the local hospitals to track these patients.

**Rationale:**
According to the CDC 2010 estimates, approximately 16% of those 65 and above will experience a hospital stay within a 12-month time frame and the percentage increases to 21% for
those ages 85 and over. Medicaid-eligible elders are more likely to experience hospital admission owing to chronic illnesses and comorbidities. Additionally, it has been proposed that upwards of 40% of hospital admissions are avoidable. Our project aims to reduce Potentially Preventable Admissions – Other Admissions Rate (All-cause hospital admission rates for Medicaid-eligible elders 65 and above receiving services from the project Community-Based Primary Care for the Elderly) by 5% over baseline. To support the achievement of this outcome, specific process milestones and metrics were selected:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians and other primary care providers, as well as local hospital administration, in evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- **Establish baseline rates** [P-2]. While prior work provides an estimate of expected base rates, this process milestone is necessary as baseline rates have not been established for this particular population, which is at higher risk for hospital readmissions. Establishing baseline rates for our target population will provide the ability to assess the effectiveness of the project.

- **Develop and test data systems** [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect all-cause hospital admission data from program records and area hospitals.

- **Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions** [IT-2.12]. This outcome improvement target measures the number of non-maternal hospital admissions among patients of this program in RHP 10. Patients receiving care (including urgent care), care coordination and education from the program will demonstrate improved competence and performance related to clinical processes in effective patient management and education on self-management, resulting in fewer admissions.

**Outcome Measure Valuation:**

- **Approach/Methodology**: Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*
- **Rationale/Justification:** For Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions, UNT Health Science Center defined the population that will be directly impacted as approximately 3,071 patients receiving services from the project titled “Community-Based Primary Care for the Elderly.” Based on various literature, it is anticipated that approximately 500 of those patients will be admitted to a hospital. The percentage of improvement expected by the project - is 5%, equating to 25 lives positively impacted by this outcome.

Utilizing - the pricing matrix developed by Region-10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,100.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Title of Outcome Measure (Improvement Target):** IT-2.12- Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions

**Unique RHP outcome identification number(s):** 138980111.3.41

**Performing Provider Name/TPI:*** University of North Texas Health Science Center (UNTHSC) / 138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in reducing all-cause hospital admission rates for Medicaid-eligible elders 65 and above receiving services from the UNTHSC Department of Internal Medicine. The expected outcome by the end of the Waiver is to reduce all-cause hospital admission rates for Medicaid-eligible elders 65 and above receiving the intervention by 5% over baseline (anticipated 8 hospitalizations prevented). The associated process milestones and improvement targets are:

**Process Milestones and Outcome Improvement Targets for each year:**
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include discussions with local health care providers and hospital partners regarding targeted conditions most strongly related to admissions, which will be targeted in the intervention.
- Establish baseline rates [P-2]. Prior work suggests that approximately 16% of Medicaid elders are hospitalized annually with the percentages increasing with age. Additional baseline data from our target population will be collected at initial patient encounters.
- Develop and test data systems [P-3]. This will involve setting up methods to track and collect admission data from our target population and from partner hospitals
- Potentially Preventable Admissions (PPA) – IT-2.12- Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions:- All-cause hospital admissions will be measured by tracking patients provided services and through partnering hospital records.

**Rationale:**
According to the CDC 2010 estimates, approximately 16% of those 65 and above will experience a hospital stay within a 12-month time frame. Medicaid-eligible elders are more likely to experience hospital admission owing to chronic illnesses and comorbidities. By enhancing access to geriatric primary care to those patients seen by the UNTHSC Department of Internal Medicine, we seek to reduce admission rate 5% over baseline (8 anticipated
hospitalizations prevented) among this population. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians and local hospital providers in discussion of evidence-based process models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for the Medicaid-eligible elders receiving services from the UNTHSC Department of Internal Medicine. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect all-cause hospital admission data from program records and partnering hospitals.

- Potentially Preventable Admissions – IT-2.12 Prevention Quality Indicators (PQI) Composite Measures Potentially Preventable Hospitalizations for Ambulatory Care Sensitive Conditions. This outcome improvement target measures the number of non-maternal all-cause admissions of the target population.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

- **Rationale/Justification:** For Prevention Quality Indicators (PQI) composite measures potentially preventable hospitalizations for Ambulatory Care Sensitive Conditions, the UNT Health Science Center defined the population that will be directly impacted by the project as Medicaid-eligible elders of Tarrant County ages 65 and above who receive services from the UNTHSC Department of Internal Medicine, which would be approximately 162 individuals. The percentage of improvement expected by the project is 5%, equating to 8 lives positively impacted by this outcome.
Utilizing - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $7,100 due to the patient population mix -.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $4,260 for each positive outcome realized. Another additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $2,840 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

<tr>
<td>138980111.1.3</td>
<td>Expand Primary Care Capacity — Expand existing primary care capacity — 1.1.2: Expanding Geriatric Primary Care and Consultative Services to Medicaid Eligible Elders</td>
</tr>
</tbody>
</table>

#### Starting Point/Baseline:
- **Baseline data:** Baseline data will be collected in DY3.
- **Target Population:** Medicaid-eligible elders of Tarrant County age 65 and above who receive services from the UNTHSC Department of Internal Medicine
- **Specific Number:** In FY 11, approx. 750 Medicaid eligible elders received services from UNTHSC Department of Internal Medicine. This project will increase patient pool by 35% — 1,013 patients by DY5. It is anticipated that 16%, or 162, of these patients will be admitted to the hospital. Our goal is reduction in hospitalization from 162 by 5%.
- **Description of Population:** Elderly patients who are eligible for coverage by Medicaid

</tr>
</tbody>
</table>

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $28,942
**Title of Outcome Measure (Improvement Target):** IT-11.3- Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Percentage of people at high risk for infection receiving pneumococcal vaccination)

**Unique RHP outcome identification number(s):** 138980111.3.42

**Performing Provider Name/TPI:** University of North Texas Health Science Center (UNTHSC) / 138980111

**Outcome Measure Description:**
This outcome measure will assess the effectiveness of the project in improving the percentage of people receiving the pneumococcal vaccination in minority populations. The expected outcome by the end of the Waiver is to improve pneumococcal vaccinations in minority populations receiving the intervention by 2% over baseline. The associated process milestones and improvement targets are:

**Process Milestones & Outcome Improvement Targets for each year:**
- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include identification and recruitment of content experts, content development, baseline data analysis and finalization of tracking and analysis methodology, educational plan development and target audience triangulation and assessment strategies.
- Establish baseline rates [P-2]. The baseline will be obtained through the Texas Public Use Data File (Hospital Admissions) or data mart.
- Improvement in Clinical Indicator in identified disparity group [IT-11.3-] Percentage of people at high risk for infection receiving pneumococcal vaccination will be measured by data aggregated by the North Texas Regional Extension Center and North Texas Accountable Healthcare Partnership and DY4 and DY5 will be compared to baseline.

**Rationale:**
Addressing Health Disparities in Minority Populations – IT-11. 3. Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Percentage of people at high risk for infection receiving pneumococcal vaccination) was selected as an outcome measure because minority populations, especially African-Americans and Hispanics, are disproportionately underimmunized for invasive pneumococcal bacteria. This measure will assess the effectiveness of the project training materials which include modules in pneumonia prevention, including immunization, especially in minority populations. Medical home and chronic care models are also included in the training.
and have been shown to improve immunization status. To support the achievement of this outcome, specific process milestones and metrics were selected:

- **Project planning** – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage primary care physicians in updated training in emerging and evolving health care delivery models, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project. Determination of timelines and documentation of implementation are necessary components to assess the process and establish improvement metrics.

- **Establish baseline rates** [P-2]. This process milestone is necessary as baseline rates have not been confirmed for the patients of participating PCPs. Establishing baseline rates will provide the ability to assess the effectiveness of the project.

- **Addressing Health Disparities in Minority Populations** – Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity. (Percentage of people at high risk for infection receiving pneumococcal vaccination) [IT-11.3-]. Primary care participants receiving education will demonstrate improvement resulting in increased pneumococcal immunization status of adults. Educational effectiveness will be measured by improvements in knowledge, competence and performance.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.)

- **Rationale/Justification:** For Improve utilization rates of clinical preventive services (testing, preventive services, treatment) in target population with identified disparity, UNT Health Science Center defined the population that will be directly impacted by the project as patients in RHP 10 who are considered high risk for infection and receive services from PCPs receiving intervention, which would be approximately 38,185. The percentage of improvement in pneumonia vaccinations for this population is expected to be 2%, equating to 764 lives positively impacted by this outcome.

Utilizing, - the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive
outcome realized would be $417 (as cited in the article, “Pneumococcal Vaccination Reduces Mortality and Costs in Elderly” in the internet journal at www.respiratoryreviews.com), which was based on the average savings per person vaccinated.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, the resulting additional valuation amount is $167 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, the resulting additional valuation amount is $167 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**Related Category 1 or 2 Projects::**

138980111.1.4 Increase Training of Primary Care Workforce- “Other” project option: Update primary care training programs to include training on the medical home and chronic care models, disease registry use for population health management, patient panel management, oral health, and other identified training needs and/or quality/performance improvement (1.2.1: Training Primary Care Workforce in Evolving Health Care Delivery Models)

**Starting Point/Baseline:**

**Baseline data:** Based on 2010 Census Data, 240,059 18-64 with chronic conditions have never received the pneumococcal vaccine and 141,667 ages 65 and older have never received the pneumococcal vaccine. Actual baseline data for providers and corresponding patients will be identified by performing a provider review and ID of impact metrics and baseline in DY2-3 to set baseline data.

**Target Population:** Total number of people ages 18 and older who are: 1) considered high risk for infection, 2) have not ever received the pneumococcal vaccine and 3) are seen by the 12,788 PCPs in the Region. According to 2010 Census Data, n= 381,727.

**Specific Number:** Estimated 38,185 are eligible based on 10% of PCPs receiving intervention; 3% improvement would impact 1,146 people

**Description of Population:** Patients in RHP 10 who are considered high risk for infection and receive services from PCPs receiving intervention

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5):* $216,213
Title of Outcome Measure (Improvement Target): IT-1.8 – Depression Management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134).
Unique RHP outcome identification number(s): 138980111.3.43 (Pass 2)
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project at increasing access to care by directly capturing the total number of potential patients screened from the community. Screening will be conducted by the CHWs using the Geriatric Depression Scale (GDS). It is anticipated that 1,500 Medicaid eligible elders and near elders will be screened and receive a treatment plan per the IMPACT model from social workers and psychologists in conjunction with the patients primary care physician through project Community Based Behavioral Healthcare for Depressed Medicaid Elders and Near Elders. The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local behavioral health care providers as well as patients to discuss health care barriers to quality of life. The GDS will be incorporated into the patient interviews to be developed in DYs 2 and 3 with beta testing completed in DY3.
- Establish baseline rates [P-2]. The baseline will be established by pre-mobile behavioral health care team encounters for each patient receiving services within the target population.
- Develop and test data systems [P-3]. The interview and data collection and analysis system will be developed over DY2-3 and beta tested in DY3. Full implementation of the system will be in DY4.
- Depression Management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134) [IT-1.8]. The total number of patients receiving depression screens and treatment plans will be assessed from the program.

Rationale:
Depression is a major, but under-treated, problem among the elderly population, which is disproportionately experienced by poor elderly. Additionally, access to care for depressed Medicaid eligible elderly is a key issue given the limited numbers of health care providers that provide therapeutic treatment for depression. This project will substantially increase access to depression screening and management (1,500 patients) for elderly within community-based settings. To support the achievement of this outcome, specific process milestones and metrics were selected:
• Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important, as it provides the opportunity to engage behavioral health care physicians as well as patients in evidence-based process models related to depression treatment, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

• Establish baseline rates [P-2]. This process milestone is necessary to establish baseline rates of depression within the eligible service population.

• Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect depression measure.

• Depression Management: Screening and Treatment Plan for Clinical Depression (PQR 2011, #134) [IT-1.8]. The total number of patients provided depression screening and treatment plans through this project will be measured. This outcome improvement target measures the community impact of this program by reaching and treating a substantial number of depressed elders of Tarrant County.

**Outcome Measure Valuation:**

For Depression Management: Screening and Treatment Plan for Clinical Depression, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are anticipating that we will provide depression screening and treatment plans for all patients.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $704 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, which resulted in a valuation amount of $1,055 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.

Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may
receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT-1.9 – Depression Management: Depression Remission at Twelve Months (NQF #0710).

Unique RHP outcome identification number(s): 138980111.3.44 (Pass 2)

Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC)/138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project at treating depression by demonstrating 12-month remission among patients receiving services. It is anticipated that a minimum of 10% (150 patients) will be depression-free 12-months after baseline assessment (as measured by the GDS). The associated process milestones and improvement targets are:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local behavioral health care providers as well as patients to discuss health care barriers to quality of life. The GDS will be incorporated into the patient interviews to be developed in DYs 2 and 3 with beta testing completed in DY3.
- Establish baseline rates [P-2]. The baseline will be established by pre-mobile behavioral health care team encounters for each patient receiving services within the target population.
- Develop and test data systems [P-3]. The interview and data collection and analysis system will be developed over DY2-3 and beta tested in DY3. Full implementation of the system will be in DY4.
- Depression Management: Depression Remission at Twelve Months (NQF#0710). The total number of patients receiving depression services who are depression free after 12-months divided by the total number of patients receiving services.

Rationale:
Depression is a major, but under-treated, problem among the elderly population, which is disproportionately experienced by poor elderly. Additionally, access to care for depressed Medicaid eligible elderly is a key issue given the limited numbers of health care providers that provide therapeutic treatment for depression. This Category 3 measure will determine the efficicay of the current project by evaluating 12-month remission rates. It is anticipated that a minimum of 10% (150 patients) will score 10 or below on the GDS after 12 months from initial baseline evaluation. To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important, as it provides the opportunity to engage behavioral health care physicians as well as patients in evidence-based process models related to depression.
treatment, to identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

- Establish baseline rates [P-2]. This process milestone is necessary to establish baseline rates of depression within the eligible service population.
- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to collect depression measure.
- Depression Management: Depression Remission at Twelve Months (NQF#0710). The total number of patients provided depression treatment that are depression-free after 12 months as compared to the total number of patients receiving services. This outcome improvement target measures the community impact of this program by reaching and treating a substantial number of depressed elders of Tarrant County.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

For Depression Management: Depression Remission at Twelve Months, UNT Health Science Center defined the population that will be directly impacted by the project as 1,500 individuals who will receive services through this project. We are expecting to decrease depression remission at twelve months for at least 10% of patients, equating to 150 lives positively impacted by this outcome.

Utilizing the pricing matrix developed by Region 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $1,759.

For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $704 for each positive outcome realized. Also, an additional multiplier was applied to determine the benefit it provided to the individual, which resulted in a valuation amount of $1,055 for each positive outcome realized.

The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order to stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $41,013
Title of Outcome Measure (Improvement Target): IT-4.5 Patient Fall Rate – NQF 0141

Unique RHP outcome identification number(s): 138980111.3.45
Performing Provider Name/TPI: University of North Texas Health Science Center (UNTHSC) / 138980111

Outcome Measure Description:
This outcome measure will assess the effectiveness of the project in reducing the number of falls for Medicaid-eligible elders 65 receiving the intervention. The expected outcome by the end of the Waiver is a reduction in falls of patients receiving the intervention by 10% over baseline (23 falls prevented). The associated process milestones and improvement targets are:

Process Milestones and Outcome Improvement Targets for each year:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. Project planning will include meeting with local hospital partners and health care providers to discuss best practices for fall risk reduction and risk factors for falls among the target population (within hospitals and at home).
- Establish baseline rates [P-2]. The baseline will be established during initial encounters by medical teams and review of hospital records.
- Develop and test data systems [P-3]. The data collection system will be developed over DY2-3 and beta tested in DY3.
- Patient Fall Rate – NQF 0141 [IT-4.5] - will be measured by self-report and informant report by medical teams during home visits and follow-up encounters. Comparison of falls prior to and postintervention will be conducted to test the efficacy of the project.

Rationale:
Falls among the elderly is a significant health care issue among the elderly. Every 18 seconds an older adult is treated in an ED for falls, which is the leading cause of hospital admissions for trauma among the elderly. Approximately one third of older adults fall each year in the U.S. The current discharge planning and care coordination program will have targeted fall prevention education provided to patients. Preventing future falls will have a significant impact in reducing hospital admissions and 30-day readmissions among this targeted population. Through implementation of this discharge planning and care coordination model, we will reduce the number of falls in patients receiving the intervention by 10% over baseline (23 falls prevented). To support the achievement of this outcome, specific process milestones and metrics were selected:

- Project planning – engage stakeholders, identify current capacity and needed resources, determine timelines and document implementation plans [P-1]. This milestone is important as it provides the opportunity to engage local hospital partners, primary care physicians, as well as patients in evidence-based process models, to
identify capacity, to plan and document needed resources, and to implement plans necessary for the project.

- Establish baseline rates [P-2]. This process milestone is necessary as baseline rates have not been established for target population. Establishing baseline rates will provide the ability to assess the effectiveness of the project.
- Develop and test data systems [P-3]. This process milestone is necessary to ensure that appropriate methods are established to appropriate measures.
- Patient Fall Rate – NQF 0141 [IT-4.5]. - This outcome improvement target measures the number of falls experienced by the target population before and after intervention. Participants in this intervention will demonstrate a reduction in number of falls, resulting in a decrease in hospital admission rates as well as improvement in quality of life.

**Outcome Measure Valuation:**

- **Approach/Methodology:** Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. UNT Health Science Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. A full explanation of the model is contained in the RHP plan, Section V.B

- **Rationale/Justification:** For Patient Fall Rate -, UNT Health Science Center defined the population that will be directly impacted by the project as elderly patients who are eligible for coverage by Medicaid, which we have estimated to be approximately 750. It is anticipated 30% of these patients (225) will experience a fall. The percentage of improvement is expected to be 10% (23 falls prevented).

  Utilizing the pricing matrix developed by Region- 10 providers to determine the value to the health care system, it was determined that the valuation amount for each positive outcome realized would be $17,500 (as cited in the article “Cost of Falls Among Older Adults” by the CDC) -.

  For the selected outcome, an additional multiplier was applied to determine the benefit it provided to the community, which resulted in a valuation amount of $14,000 for each positive outcome realized.

  The aggregate annual benefit for the selected outcome was then multiplied by five, which is the number of valuation years, to determine the total direct outcome value. Finally, an additional 30% multiplier was applied, also known as the “halo effect”, due to the positive impact the project would have on the population beyond those directly involved by the project.
Because the Region 10 model assigns prices to each project by computing the total value of the Category 3 outcomes specific to each project, the UNT Health Science Center’s project’s values, in some cases, exceeded the maximum DSRIP payment amount that an individual project may receive. Furthermore, when all UNT Health Science Center’s project’s values were computed, the cumulative valuations for all projects exceeded the UNT Health Science Center’s total DSRIP allocation. As a result, the UNT Health Science Center discounted all projects to a reduced price in order stay within the maximum limit on an individual project’s payment amount and the cumulative DSRIP allocation to the UNT Health Science Center.

Title of Outcome Measure (Improvement Target): IT 2.13 Potentially Preventable Admissions – Other Admissions Rate

Unique RHP outcome identification number(s): 162334001.3.1 (Pass 2)  
Provider name/TPI: JPS Physician Group/162334001

Outcome Measure Description:  
By the end of the Waiver, our goal is to reduce inpatient admissions with a primary diagnosis code of pain.

Process Milestones:  
In DY2 and DY3, we will validate our data on inpatient admits of pain diagnosis while the pain center redesign is being established, which will include the increase in specialist providers, available appointment time and procedure hours and availability. An initial review based on diagnosis indicates that 15% of admits could have been prevented if under the care of a pain specialist. This is from the population of Self Pay and Connections patients which is 59.3% of total inpatient admits with a primary diagnosis of pain. Although our target is Self-Pay and Connections, the depth of which we will be able to touch all those associated with pain in the Tarrant County area is substantial. Currently, Tarrant County does not have a pain center that offers the scope of services, both medical and interventional, that the pain center will be able to execute.

Outcome Improvement Targets:  
DY4: Reduce admissions by 7% over baseline of 3.9 LOS from the population of Self Pay and Connections patients of 89 admits per year on average which would lower to 3.6 LOS.  
DY5: Reduce admission by 15% over baseline of 3.9 LOS from the population of Self Pay and Connections patients of 89 admits per year on average which would lower to 3.3 LOS.

Rationale:  
Specialty care clinics improve access for targeted populations in areas where there are gaps in specialty care. These types of clinics allow for enhanced care coordination for those patients requiring intensive specialty services. Redesigning the pain management clinic will shorten appointment cycle time and maximize provider productivity, allowing the most efficient utilization of pain provider resources and increasing patient access to specialty care in order to prevent avoidable admissions. Category 3 Outcome 2.13 was selected over Outcome 13.1 since the population included all inpatient admits, not directed to hospice or palliative care patients.

Outcome Measure Valuation:  
Our milestones measure an increased population receiving pain management by increasing the number of specialists to meet the demand for in-person visits and procedures, which allow
patients to receive more timely services by specially trained providers. By implementing a single-site pain management facility with medical management and procedural capability, we will significantly increase efficiency. We are projecting to have two board certified pain physicians and two mid-levels dedicated to this center. This will be in concert with four additional highly trained physicians operating in PCMH clinics in strategic locations to service chronic pain patients across Tarrant County. For our inpatient consults, we will have one dedicated board certified pain physician along with one mid-level dedicated to service the inpatient population.

The project will increase access for the pain management population, resulting in decreased wait times by providing pain services for >45 patients per day at a central location and >50 others at satellite PCMH clinics and >30 inpatient consults. This will also expand scope of pain services available to both medical and interventional complex pain patients, including inpatient and ambulatory oncology patients.

This redesign will be the most efficient for the staff providing care, the patients receiving care and enhance procedure cost controls. Most of the procedures currently performed in a JPS Health Network operating room can be done in a procedure room setting if sedation and monitoring are available. This will lead to significant cost savings, and we will be able to provide care to a greater number of patients. The clinic staff will utilize the pain clinic procedure room for most procedures, with the main operating room utilized only when required.

With the implementation of these collective measures, we anticipate decreasing admissions for this population (Self-Pay and Connections) of 15% by the end of the Waiver.

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.
### Other Admissions Rate

#### Year 2
(10/1/2012 – 9/30/2013)

**Process Milestone [P-1]:** Validate baseline data.

Data Source: EHR

**Process Milestone 1:**
Estimated Incentive Payment: $0

**Process Milestone [P-2]:** Review data and determine improvement implementation guidelines and resources needed.

Data Source: Documented redesign plan

The redesign will include:
- Clinic & procedure suite layout and design
- Clinic mgmt & staffing
- Physician/provider staffing
- Referral guidelines and requirements
- Overall protocol guidelines for full pain clinic operations
- Patient termination policy, procedure, and protocol for violators
- Drug testing policy and procedures
- Spine surgical backup and surgery services
- Pharmacy services support
- Clinic security
- Establish 4 primary care PCMH’s specializing in care for chronic pain patients which will increase outpatient visits
- Develop a pain management consult service for complex inpatient pain management

#### Year 3
(10/1/2013 – 9/30/2014)

**Process Milestone [P-3]:** Implement redesign plan

Data Source: Redesign plan

The redesign will include:
- Clinic & procedure suite layout and design
- Clinic mgmt & staffing
- Physician/provider staffing
- Referral guidelines and requirements
- Overall protocol guidelines for full pain clinic operations
- Patient termination policy, procedure, and protocol for violators
- Drug testing policy and procedures
- Spine surgical backup and surgery services
- Pharmacy services support
- Clinic security
- Establish 4 primary care PCMH’s specializing in care for chronic pain patients which will increase outpatient visits
- Develop a pain management consult service for complex inpatient pain management

#### Year 4
(10/1/2014 – 9/30/2015)

**Outcome Improvement Target 1**

[IT-2.13]: Improvement Target: Reduce admits with pain as primary diagnosis 7% improvement over baseline. Baseline is 89 which are the Self Pay and Connections patients, average LOS is currently 3.9 days. In DY4, our plan is to lower that LOS by 7% which would drop to 3.6 days.

Data Source: EHR

Estimated Incentive Payment: $55,216

#### Year 5
(10/1/2015 – 9/30/2016)

**Outcome Improvement Target 2**

[IT-2.13]: Improvement Target: Reduce admits with pain as primary diagnosis 15% improvement over baseline. Baseline is 89 which are the Self Pay and Connections patients, average LOS is currently 3.9 days. In DY5, our plan is to lower that LOS by 15% which would drop to 3.3 days.

Data Source: EHR

Estimated Incentive Payment: $120,034

**Title of Outcome Measure (Improvement Target):** IT- 4.10 Other Outcome Improvement Target – Reduce ALOS for Oncology Inpatient

**Unique RHP outcome identification number(s):** 162334001.3.2 (Pass 2)  
Provider name/TPI: JPS Physician Group/162334001

**Outcome Measure Description:**  
By the end of the Waiver, our goal will be to decrease average length of stay (ALOS) for oncology patients who have been admitted with a primary diagnosis of pain.

**Process Milestones:**  
In DY2 and DY3, we will establish the baseline and validate our data on oncology patients admitted with pain. An initial review indicates that the ALOS is six days; however, with an inpatient pain consult, we could reduce the ALOS by one day.

**Outcome Improvement Targets:**  
DY4: Reduce ALOS by (16.6%) one day over baseline of 6.0 ALOS from the population of Self Pay and Connections patients of 71 admits per year on average amounting to 510 days which would lower to 5.0 ALOS or 425 days (decreased by 85). At an average cost per day of $2,235.10, this would amount to $189,984 in savings in one year alone.  
DY5: Reduce ALOS by (40%) 2.4 days over baseline of 6.0 ALOS from the population of Self Pay and Connections patients of 71 admits per year on average amounting to 510 days which would lower to 3.6 ALOS or 306 days (decreased by 204). At an average cost per day of $2,235.10, this would amount to $455,960 in savings by the end of the waiver. These costs are all estimated and have the ability to be much greater in savings than presented as the access to monitor the oncology patient’s pain by a certified board pain physician will be able to reduce actual admits to inpatient (not just reduce LOS) over time if being cared for by this specialist in an on-going fashion.

**Rationale:**  
Providing an inpatient pain consult to oncology admissions who are admitted for a primary diagnosis of pain can substantially reduce their length of stay if a specialist was available. With the pain clinic redesign, the increased number of specialists available to meet the demand for in-person visits, consults and procedures will allow the patient to be treated and relieved of pain in a timelier manner.

Oncology patients have increased on average year-over-year by 6% since 2006, according to the American College of Surgeons and 5% per year as reported by the Texas Cancer Registry. We
predict an influx of inpatient days linked with oncology patients and their simultaneous pain needs.

Category 3 Outcome 4.10 was selected over Outcome 4.9 since our target was not based on “total number of inpatient days for patients diagnosed with sever sepsis, septic shock, and/or lactate>4mmol/L (36mg/dl)” as referenced in Outcome 4.9. Therefore since there was not a Category 3 specifically referencing oncology admits, we used Outcome 4.10 which is for “other”.

**Outcome Measure Valuation:**
Our milestones measure an increased population receiving pain management in the oncology population. Not just for Self-Pay and Connections patients, which is what our outcomes are based on, but for all oncology patients in Tarrant County. Once the population is aware of the pain treatments that our Oncology services provide, the Commercial/Medicare/Medicaid patients will veer to the JPS Health Network for their Oncology services. The ability to provide inpatient pain consults will decrease the length of stay. In DY4, our goal is to decrease LOS by 16.6% (or one day) and by DY5, decrease by 40% (or 2.5 days) down from the current ALOS of 6 days. At an average cost per day of $2,235.10, this would amount to $455,960 in savings by the end of the waiver. These costs are all estimated and have the ability to be much greater in savings than presented as the access to monitor the oncology patient’s pain by a certified board pain physician will be able to reduce actual admits to inpatient (not just reduce LOS) over time if being cared for by this specialist in an on-going fashion.

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYS 2-5): $740,639*
**Title of Outcome Measure (Improvement Target):** IT 9-2 Right Care, Right Setting – ED Appropriate Utilization

**Unique RHP outcome identification number(s):** 162334001.3.3 (Pass 2)
Provider name/TPI: JPS Physician Group/162334001

**Outcome Measure Description:**
By the end of the Waiver, our goal is to reduce Emergency Department (ED) visits with primary diagnosis of pain.

**Process Milestones:**
In DY2 and DY3, we will establish the baseline and validate our data on ED visits of pain diagnosis while pain center redesign is being established, which will include the increase in specialist providers, available appointment time and procedure hours.

**Outcome Improvement Targets:**
DY4: Reduce ED visits of pain diagnosis by 10% over baseline of 4,386 from the population of Self Pay and Connections patients of which would reduce ED visits by a count of 439. At an average cost per visit of $515.98, this would amount to $226,515 in savings in one year alone.

DY5: Reduce ED visits of pain diagnosis by 20% over baseline of 4,386 from the population of Self Pay and Connections patients of which would reduce ED visits by a count of 877. At an average cost per visit of $515.98, this would amount to $452,515 in savings by the end of the waiver.

**Rationale:**
Specialty care clinics improve access for targeted populations in areas where there are gaps in specialty care. These types of clinics allow for enhanced care coordination for those patients requiring intensive specialty services. Redesigning the pain management clinic will shorten appointment cycle time and maximize provider productivity, allowing the most efficient utilization of pain provider resources, which will provide for appropriate utilization in the ED.

**Outcome Measure Valuation:**
To provide a complete spectrum of pain management services at a single site for the JPS Health Network and pain-focused PCMH clinics in four strategic locations. The goal is to provide care for >45 patients per day at a primary site, >50 at satellite PCMH clinics and >30 inpatient consults. Increased numbers of specialist and extenders to meet procedural demand and referral demand for in-person visits, consults and procedures will allow patients to receive more timely services.
This redesign will be the most efficient for the staff providing care, the patients receiving care and enhance procedure cost controls. Most of the procedures currently performed in a JPS Health Network operating room can be done in a procedure room setting if sedation and monitoring are available. This will be a significant cost savings and we will be able to provide care to a greater number of patients. The clinic staff will utilize the pain clinic procedure room for most procedures, with the main operating room serving the rest. We are projecting to have two board certified pain physicians and two mid-levels dedicated to this center. This will be in concert with four additional highly trained physicians operating in PCMH clinics in strategic locations to service chronic pain patients across Tarrant County. For our inpatient consults, we will have one dedicated board certified pain physician along with one mid-level dedicated to service the inpatient population.

Our milestones measure an increased population receiving pain management by increasing the number of specialists to meet the demand for in-person visits and procedures, which allow patients to receive more timely services. This is from the population of Self Pay and Connections patients which is 70.4% of ED visits with a primary diagnosis of pain. Although our target is Self-Pay and Connections, the depth of which we will be able to touch all those associated with pain in the Tarrant County area is substantial. Currently, Tarrant County does not have a pain center that offers the scope of services, both medical and interventional, that the pain center will be able to execute.

As a Region, providers collaborated on determining specific values for each Category 3 outcome. This was completed by using literature, historical provider-level data or other evidence-based resources to determine specific values for each outcome. Then, based on the number of milestones for both process and improvement, a dollar allocation was made based on the total potential value of each outcome. Improvement milestones were weighted more heavily and thus received more of the funding allocation than process milestones. Additionally, we took into account if an improvement milestone was more complex and involved more effort (resources, time, etc.) to achieve a particular targeted outcome. We then allocated more funding to these metrics. For example, we gave a greater weight to a hypertension- or diabetes-related outcome over a metric such as patient satisfaction because of the quality impact and downstream cost savings/clinical implications. Hypertension or diabetes control will have greater impact than patient satisfaction.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $796,514
**Title of Outcome Measure (Improvement Target):** IT-9.2 ED Appropriate Utilization

**Unique RHP outcome identification number(s):** 186221101.3.1  
**Performing Provider Name/TPI:** Methodist Mansfield Medical Center/ 186221101

**Outcome Measure Description:**  
The outcome measure of ED appropriate utilization will result in a 5% decrease in ED utilization of frequent ED users by DY5.

**Process Milestones and Outcome Improvement Targets for each year:**  
By mid-DY2, a project plan will be conducted to identify the patient populations to be targeted with the Patient Navigation program, determine our current capacities, identify needed resources, determine timelines and document implementation plans. Developing and testing data will be completed in DY2 by beginning to provide navigation services. In DY3, we will conduct a Plan Do Study Act (PDSA) improvement cycle based on the initial process results of providing the navigation service. In DY3 we will establish a baseline of - how many patients who are most at risk of receiving disconnected and fragmented care can be impacted which is expected to be 1,853. In DY4 and DY5 we will achieve a reduction in ED utilization by frequent ED users by 2.5% - in DY4 from DY3 and an additional 2.5% in DY5 from and DY4 all measured against the DY-3 baseline which is expected to be 1,853. Also in DY4 and DY5 we will achieve a reduction in all-cause readmissions with a 2.5% reduction in DY4 from DY3 and an additional 2.5% in DY5 from and DY4 all measured against the DY-3 baseline which is expected to be 252 readmissions.

**Rationale:**  
Our process milestones measure the project planning, plan testing, cycles of improvement and baseline impact rate for which we can - reduce in the number of patients who frequently use the ED or are readmitted due to a lack of care in the appropriate location. As a result of these efforts, there will be a reduction in the number of ED visits by frequent ED users of 5% by DY5. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decreased inappropriate ED utilization.

**Outcome Measure Valuation:**
**Approach/Methodology**
The process milestones during DY2 and DY3 represent the planning and development of the patient navigation program. Each process milestone is required in order to provide the navigation program. The Improvement Targets in DY4 and DY5 represent the effectiveness of the navigation program. The weighting and valuation methodology considers a slightly higher weight and value to the Improvement Targets in DY4 and DY5, which represents the effectiveness of the program and impact to the frequent users of the ED.

**Rationale/Justification:**
The process milestones during DY2 and DY3 will impact over 30,000 of the ED patients as they are screened and analyzed for potential frequent use and possible patient navigation intervention. The DY4 and DY5 improvement targets each represent a significant improvement to the community and lower costs for frequent users of the ED.

Title of Outcome Measure (Improvement Target): IT-3.1 All-cause Readmission Rate

Unique RHP outcome identification number(s): 186221101.3.2
Performing Provider Name/TPI: Methodist Mansfield Medical Center/ 186221101

Outcome Measure Description:
The outcome measure of All-cause readmission rate will result in a 5% decrease in all-cause readmissions from the targeted population by DY5 by providing better care sites for frequent users of ED services.

Process Milestones and Outcome Improvement Targets for each year:
By mid-DY2, a needs assessment to identify the patient populations to be targeted with the Patient Navigation program will be conducted. Establishment of a health care navigation program to provide support to patient populations who are most at risk of receiving disconnected and fragmented care including program to train the navigators, develop procedures and establish continuing navigation education will be completed by the end of DY2. We will begin to provide care management/navigation services to targeted patients by the end of DY2 by providing one new navigator providing service to the first qualified patient. By the end of DY3 we will provide reports on the types of navigation services provided to patients using the ED as high users or for episodic care. Reduction in all-cause readmissions will be achieved with 2.5% reduction in DY4 from DY3 baseline of 252 readmissions and an additional 2.5% in DY5 from DY4 all measured against the DY-3 baseline which is expected to be 252 readmissions.

Rationale:
Our milestones measure the reduction in the number of patients who frequently use the ED; 1) we are increasing the number of patients identified as frequent users of the ED, 2) increasing the number of patient navigators available to provide services to those patients, and 3) increasing the number of patients referred to more appropriate care settings. As a result of these efforts, there will be a reduction in the number of readmissions from the targeted population by 5% by DY5. These milestones will measure whether we have increased the number of frequent ED users that are provided navigation services, increased the number of patient navigation resources, and as a result, decrease inappropriate ED utilization.

Outcome Measure Valuation:

Approach/Methodology:
The process milestones during DY2 and DY3 represent the planning and development of the patient navigation program. Each process milestone is required in order to provide the navigation program. The Improvement Targets in DY4 and DY5 represent the effectiveness of the navigation program. The weighting and valuation methodology considers a slightly higher weight and value to the Improvement Targets in DY4 and DY5, which represents the effectiveness of the program and impact to the frequent users of the ED.

Rationale/Justification:
Please describe your rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), including, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, estimated local funding, etc.

The process milestones during DY2 and DY3 will impact over 30,000 of the ED patients as they are screened and analyzed for potential frequent use and possible patient navigation intervention. The DY4 and DY5 improvement targets each represent a significant improvement to the community and lower costs for frequent users of the ED.

186221101
**Title of Outcome Measure (Improvement Target):** IT-1.11 Diabetes Care: Blood Pressure Poor Control

**Unique RHP outcome identification number(s):** 186221101.3.3

**Performing Provider Name/TPI:** Methodist Mansfield Medical Center / 186221101

**Outcome Measure Description:**

**Process Milestones and Outcome Improvement Targets for each year:**
The outcome measure of Diabetes Care: Blood Pressure Control rate will result in a 3% improvement by DY5 of patients in the program with controlled blood pressure. Out of the 1000 patients expected to be in the program, 25% or 250 are expected to have controlled blood pressure levels. The project seeks to improve this number by 1.5% in DY4 and an additional 1.5% in DY5 of targeted patients in the program with controlled blood pressure. This project will identify patients in the ED who are identified as having poor diabetes control. Based on the project’s efforts to develop clinical care management criteria, standing orders and education services, these patients will be better prepared to self-manage and control their diabetes conditions. The clinical care management criteria, standing orders and availability of education services will be distributed, communicated and shared with the network of primary care providers and charitable clinics in the service area providing consistent methodology for diabetes care in the market ultimately leading to better diabetes control outcomes. By mid-DY2, project planning will be conducted by engaging multidisciplinary stakeholders, identifying current capacity and needed resources. Establishment of baseline rates will provide an opportunity to adjust targets on the number of patients who meet the criteria to receive care under the chronic care model. During DY3, an effort to disseminate findings and summary of the chronic disease care model and project plan will result in stakeholders having a better knowledge base of the program.

**Rationale:**
Diabetes is one of the most costly and highly prevalent chronic diseases in the U.S. Approximately 20.8 million Americans have diabetes and half of these cases are undiagnosed. Complications from the disease cost the country nearly $100 billion annually. In addition, diabetes accounts for nearly 20% of all deaths in people over 25 years of age. Many complications, such as amputation, blindness and kidney failure can be prevented if detected and addressed in the early stages. Although many people live with diabetes years after diagnosis, it is a costly condition that leads to serious and potentially fatal health complications. Diabetes control can improve the quality of life for millions of Americans and save billions of health care dollars.

**Outcome Measure Valuation:**
The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Health care cost/benefit. An Individual impact valuation is determined by applying an “impact” rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Health care value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A “reasonableness” assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

Title of Outcome Measure (Improvement Target): IT-3.3 Diabetes 30-Day Readmission Rate

Unique RHP outcome identification number(s): 186221101.3.5
Performing Provider Name/TPI: Methodist Mansfield Medical Center / 186221101

Outcome Measure Description:

Process Milestones and Outcome Improvement Targets for each year:
The outcome measure of diabetic 30-day readmission rate will result in a 10% reduction of the diabetes 30-day readmission rate from the targeted population in DY4 and an additional 10% reduction in DY5 by providing better care sites for frequent users of ED services. The target population in DY4 for the chronic care program is expected to be 1000 patients. Historically the diabetes readmission rate at the hospital is 6.8%. Therefore, we expect the diabetes 30-day readmission rate among this target population to be 6.8% or 68 patients. In DY4, the goal is to decrease diabetes 30-day readmissions to the hospital from this target population by 10% with an additional 10% reduction over DY4 in DY5. By mid-DY2, project planning will be conducted by engaging multidisciplinary stakeholders, identifying current capacity and needed resources. Establishment of baseline rates will provide an opportunity to adjust targets on the number of patients who meet the criteria to receive care under the chronic care model. During DY3, an effort to disseminate findings and summary of the chronic disease care model and project plan will result in stakeholders having a better knowledge base of the program.

Rationale:
This measure estimates the hospital-level, risk-standardized rate of unplanned, diabetes-related readmissions within 30 days of hospital discharge (RSRR) for patients ages 18 and older. The measure reports a single summary RSRR, derived from the volume-weighted results of five different models, one for each of the following specialty cohorts: surgery, general medicine, cardio-respiratory, cardiovascular and neurology. This measure will indicate the effectiveness of education patients on self-management, providing standing orders, education on chronic disease management and methods for the patient to follow up on the management of their chronic diabetes condition.

Outcome Measure Valuation:
The valuation methodology for this project is based on a standardized RHP approach. We determine the total population expected to be enrolled in the program. We apply the expected improvement/reduction percentage or number of patients to the population enrolled in the program. That results in the number of individuals impacted by this project. The value for each patient with a positive outcome is based on empirical studies and data collected from various research projects and sources. This number is multiplied by the number of impacted individuals to determine a Health care cost/benefit. An Individual impact valuation is determined by
applying an “impact” rating (from 1-5) based on potential impact to an individual with a positive outcome, whether it is related to health status, lifestyle, income ability or impact to length of life. This rating multiplied by the Health care value determines the Individual Impact value. The same method is used for the Community Impact Valuation. The sum of all three indicates an annual impact value. This is multiplied by the five year term of the project and increased due to inflation. This total five year total is then spread based on the number of milestones associated with the project.

Our rationale for valuing each outcome measure (and its associated process milestones and outcome improvement targets), is based on the following, but not limited to, various factors such as size, project scope, population served, community benefit, cost avoidance, addressing priority community need, and estimated local funding. The process and improvement milestones are attributed a value based on the above methodology. A “reasonableness” assessment is conducted to compare value based on community/health/individual impact to the potential program costs projected for the project. Any adjustments are made accordingly.

**Title of Outcome Measure (Improvement Target):** IT-1.10 Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (Standalone measure)

**Unique RHP outcome identification number(s):** 206106101.3.1 (Pass 2)
**Performing Provider Name/TPI:** Wise Clinical Care Associates/206106101

**Outcome Measure Description:**
By the end of the waiver our goal is to reduce the HbA1c >9% to less than 20% of the patient population. We will establish the baseline in DY2. Our data pulled from eClinical Works shows the rate of HbA1c >9% to be 35.94% of the population in DY1. In DY3 we propose to lower the HbA1c >9% to below 30%, below 25% in DY4 and lower than 20% by the end of DY5.

**Rationale:**
According to Texas Department of State Health Services, 9.7% of adults 18 years and older have been diagnosed with diabetes. This disease is not only costly to the health care system, but interventions have also shown promise in decreasing hospitalizations and improving quality of life for diabetics. The importance of glycemic control is particularly well documented, and hemoglobin HbA1c testing is a well-established strategy to monitor glycemic control in patients with diabetes (NCQA, NQF, PQRI, PCPI). Measuring HbA1c values >9.0% among patients aged 18 to 75 years identifies those patients who are in poor control and at highest risk for major health complications. We can measure whether care improvements designed to reduce this rate are working, as well as identify the high-risk patients we should target for focused care improvement. In order to get high-risk patients’ blood sugar levels under control, we will be implementing best practices in our care coordination through Category 2.1.1-Patient Centered Medical Homes. We chose this improvement measurement in DY3 so we can include this area of focus while implementing this care model in our clinics. We will use the disease registry capabilities and increase our registered patients so we can better track our progress. We will also increase diabetic testing and provide proven standards of care for our population of patients.

**Outcome Measure Valuation:**
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Wise Clinical Care Associates has computed the value of this project using the model developed at the Regional level. A full explanation of the model is contained in the RHP plan, Section V.B.

Instead of valuing each outcome for our PCMH individually, we used our RHP method of providing a value per empaneled patient at the end of the waiver and multiplying that times 5 years to reflect the value of the project as a whole. We also chose to use a net savings rate of $2,366 per new patient and $1,186 for each existing patient. This value was calculated by the Baylor Health Care system for our region.
We assumed a 20% attrition rate. We also added 935 patients per year based on historical numbers. Using this valuation model we counted 4606 new empaneled patients in the first year for a savings of $10,897,796. The second year had 3,685 existing patients and 935 new patients for a second year value of $6,582,382. Third year used 3,696 existing patients and 935 new patients for a value of $6,595,476. Fourth year has 3,705 existing patients and 935 new patients for a value of $6,605,951. The fifth year assumes 3,712 existing patients and 935 new patients for a value of $6,614,331. The total value of this project based on this valuation model is $37,295,937.

We took our overall value for project 2.1.1 and applied it proportionately across all categories with weighting per year reflecting the weighting change for each category. We then allocated the amount for Category 1 for each DY equally on attainment of metrics. We weighted outcome, IT-1.10, with 75% of the Category 3 allocation and 25% going to IT-6.1 Percent improvement over baseline of patient satisfaction scores - (2) how well their doctors communicate.
Diabetes care: HbA1c poor control (>9.0%) - NQF 0059 (Standalone measure)

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** (add outcome amounts over DYs 2-5): $1,636,774
Title of Outcome Measure (Improvement Target): IT-6.1 Percent improvement over baseline of patient satisfaction scores (2) how well their doctors communicate

Unique RHP outcome identification number(s): 206106101.3.2 (Pass 2)
Performing Provider Name/TPI: Wise Clinical Care Associates/206106101

Outcome Measure Description:
By the end of the waiver our goal is to improve patient satisfaction 8% over baseline or at least 5% higher than the national average for patient satisfaction scores for the providers, specifically physician communication. Our first year will still include understanding the requirements of a PCMH and specifically NCQA standards.

Rationale:
The same survey will be used to measure this outcome during all reporting periods, so we will spend DY2 making sure we have the appropriate survey in place. In DY3 we will establish baseline using the same survey we plan to use in DY4 and DY5. In looking at our current survey both of our physicians are scoring higher than the national average. We wish to maintain a high score with patients throughout PCMH implementation, so this measure will improve slightly in DY4 and DY5

Outcome Measure Valuation:
Instead of valuing each outcome for our PCMH individually, we used our RHP method of providing a value per empaneled patient at the end of the waiver and multiplying that times 5 years to reflect the value of the project as a whole. Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Wise Clinical Care Associates has computed the value of this project using the model developed at the Regional level. A full explanation of the model is contained in the RHP plan, Section V.B.

Instead of valuing each outcome for our PCMH individually, we used our RHP method of providing a value per empaneled patient at the end of the waiver and multiplying that times 5 years to reflect the value of the project as a whole. We used values determined by Baylor Health System of $2,366 in savings for empaneled patients in their first year and $1,186 per patient in subsequent years. We assumed a 20% attrition rate. We also added 935 patients per year based on historical numbers. Using this valuation model we counted 4606 new empaneled patients in the first year for a savings of $10,897,796. The second year had 3,685 existing patients and 935 new patients for a second year value of $6,582,382. Third year used 3,696 existing patients and 935 new patients for a value of $6,595,476. Fourth year has 3,705 existing patients and 935 new patients for a value of $6,605,951. The fifth year assumes 3,712 existing patients and 935 new
patients for a value of $6,614,331. The total value of this project based on this valuation model is $37,295,937.

We took our overall value for project 2.1.1 and applied it proportionately across all categories with weighting per year reflecting the weighting change each category. We then allocated the amount for Category 1 for each DY equally on attainment of metrics.

We weighted outcome, IT-1.10, with 75% of the Category 3 allocation and 25% going to IT-6.1 Percent improvement over baseline of patient satisfaction scores - (2) how well their doctors communicate.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5)*: $545,591
Title of Outcome Measure (Improvement Target): Potentially Preventable All-cause Readmissions – 30-day Readmission rates

Unique RHP outcome identification number(s): 216719901.3.1
Performing Provider/TPI: Glen Rose Medical Center/216719901

Outcome Measure Description:

By the end of the five-year project we intend to have a total of 10% reduction in GRMC’s overall readmission rate. We will achieve this through Category 1 project of increasing patients access to their primary care physicians, ensuring follow up appointment availability to eliminate delay in care. Oct 11-Aug 2012 we had 934 inpatient and observation patients and of those 216 were readmits.

In DY 2 we will establish our baseline rates and in DY 3 we will conduct Plan Do Study Act cycles to discover the whys of the readmissions and to create a comprehensive plan on how to change the trend of readmissions. We will then disseminate those findings and future plans to our stakeholders and hospital employees so that we can start decreasing the number of readmissions. By DY 4 and 5 we should start to see an improvement and have targeted a 10% improvement over our base for DY 4 and then a total improvement of 15% over DY 5

Rationale:
The national prevention council has created the national prevention strategy which places emphasis on moving us from being a system of the sick to one based on wellness and prevention. When a patient is seen in a clinic setting post discharge earlier intervention can be obtained thus decreasing the number of readmissions as well as the associated costs that go hand in hand with readmissions.

Outcome Measure Valuation:
Performing providers in Region 10 recognize that Category 3 outcomes represent the value that CMS hopes to achieve through the Waiver. Accordingly, Region 10 has priced its projects and outcomes by computing the total value of the Category 3 outcomes connected to each project. Glen Rose Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. (See Section V.B. for a full explanation of the model.) So that the patients in our community have timely access to their primary care providers and with the decrease in readmissions, a reduction in the cost to patients. Our milestones will measure the additional clinic hours and visits provided as well as documenting the correlation in category 3 of decreased readmissions.

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD (add outcome amounts over DYs 2-5):** $94,706
**Title of Outcome Measure (Improvement Target):** IT-6.1 Patient Satisfaction – Percent improvement over baseline of patient satisfaction scores

**Performing Provider Name:** Glen Rose Medical Center/216719901

**Unique RHP outcome identification number(s):** 216719901.3.2 (Pass 2)

**Outcome Measure Description:**

DY2 – Establish baseline rates and begin the education process for all stakeholders.

DY3 – Analyze our baseline and develop our plan of correction to show a 5% increase in HCAHPS.

DY5 – Increase patient satisfaction scores by 25%.

**Rationale:**

“Analyzing patient safety measures can alert hospitals to communication breakdowns that lead to lapses in care. Increasing patient satisfaction can thus significantly impact the quality of care and patient safety.”455 The New England Journal of Medicine article on patients’ perception of hospital care in the United States found that patients’ satisfaction with care was associated with the quality of clinical care in the hospitals. Glen Rose Medical Center has targeted an increase in patient satisfaction scores by 25% by the end of the five-year Waiver period.

**Outcome Measure Valuation:**

Glen Rose Medical Center has computed the value of this project using the model developed at the Regional level. That model computes separate values for impacts on the health care system, the individual and the community. *(See Section V.B. for a full explanation of the model.)*

Glen Rose Medical Center defined the population that will be directly impacted by the project as patients with Medicare who are the target of HCAHPS survey. The percentage of the population expected to be positively impacted by the project is all patients, which was determined based on studies of similar projects implemented elsewhere. We used the pricing matrix developed by Regional providers to determine the value to the health care system for each positive outcome realized as the result of our project.

To determine the value to each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, patient experience improves, which results from improved safety and quality of care that better health outcomes and reduce costs. To determine the value to the

community of each individual positively impacted, we concluded that, on a scale of 1 to 5, the value of this project is a 2. We believe this to be the correct number because when a person is positively impacted, his or her quality of life improve, productivity increases, and the burden on

**TOTAL ESTIMATED INCENTIVE PAYMENTS FOR 4-YEAR PERIOD** *(add outcome amounts over DYs 2-5): $31,760*
Category 4: Population-Focused Improvements
Medical center of Arlington
020940501
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Medical Center of Arlington/020950401  
**Unique RHP identification number:** 020950401.4.2

**Domain Descriptions:**
Medical Center of Arlington will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Medical Center of Arlington healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Medical Center of Arlington currently tracks and reports 2 of the 8 measurements for public reporting. Measurements that have not yet been addressed are:

- Congestive heart Failure Admission Rate
- Diabetes Admission Rates
- Behavioral Health and Substance Abuse Admission Rate
- Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rate
- Hypertension Admission rate
- Pediatric Asthma

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, Medical Center of Arlington will expand existing data collecting system and optimize old system for new reporting processes.

In addition, DSRIP projects will provide interventions to Medical Center of Arlington patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. The proposed project to establish a Care Transition Program is targeted for interventions for patients at high risk for readmission. Preventable admissions will be impacted by interventions deployed for patients to ensure appropriate services are carried out to avoid discontinuity of care. Specifically, this project will track the outcome for reduced readmissions for Congestive Heart Failure patients.

We expect to improve the readmission rate for CHF patients by end of the waiver by 15%.
**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 2: Potentially Preventable Readmissions
Performing Provider Name/TPI: Medical Center of Arlington/020950401
Unique RHP identification number: 020950401.4.3

Domain Descriptions:
Medical Center of Arlington will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Medical Center of Arlington healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Medical Center of Arlington currently tracks and reports 2 of the 7 measurements for public reporting. Measurements that have not yet been addressed are:

- Diabetes: 30-Day Readmissions
- Behavioral Health & Substance Abuse: 30-Day Readmissions
- Chronic Obstructive Pulmonary Disease (COPD): 30-Day Readmissions
- Stroke: 30- Day Readmissions
- Pediatric Asthma: 30-Day Readmissions

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, Medical Center of Arlington will expand existing data collecting system and optimize old system for new reporting processes.

In addition, DSRIP projects will provide interventions to Medical Center of Arlington patients in multiple areas, resulting in improvement of PPRs throughout all measurements in the Reporting Domain.

The proposed project to Redesign Patient Experience is intended to implement process improvements to change the patient satisfaction and experience of hospitalization. Key areas of experience can influence the risk of readmission, including communication, care from nurses and doctors and medication management and discharge process. In particular, how well the staff communicates with patients about medications, and whether key information is provided at discharge can directly impact the risk of readmission for patients.

Another proposed project to establish a Care Transition Program will implement targeted interventions for patients at high risk for readmission to reduce readmissions. Specifically, this project will also track the outcome for reduced readmissions for Congestive Heart Failure patients.
In addition, the proposed project for Sepsis improvement involves the timely identification/diagnosis of sepsis and evidence-based treatment for patients. It is also important for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a part of evidence-based care. To ensure patients know what medications they were on in the hospital and what they must take after discharge, effective medication management is vital for continued care of sepsis and reduced risk for readmissions.

We expect to improve the readmission rate for CHF patients by end of the waiver by 15%. We also expect to see a reduction in readmissions for patients with an initial index admission of Sepsis and those readmitted for Sepsis with initial diagnosis other than Sepsis. Readmissions due to medication management will also be reduced.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 3: Potentially Preventable Complications
Performing Provider Name/TPI: Medical Center of Arlington/020950401
Unique RHP identification number: 020950401.4.4

Domain Descriptions:
Medical Center of Arlington will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Medical Center of Arlington healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 15 of the sixty four measurements are being tracked and reported in a form of public healthcare statistics. All other measures are tracked and reported internally

Currently, HHSC will make potentially preventable event data to providers. In addition, Medical Center of Arlington will expand existing data collecting system and optimize old system for new reporting processes.

In addition, many DSRIP projects will provide interventions to Medical Center of Arlington patients in multiple areas, resulting in improvement of PPCs throughout all measurements in the Reporting Domain.

The proposed project to implement an innovative program for Sepsis improvement aims to identify/diagnosis Sepsis sooner and begin evidence-based treatment to reduce mortality and complications for septic shock and severe sepsis.

Improved sepsis care reduces complications particularly those common in septic patients such as pulmonary embolism, acute myocardial infarction, venous thrombosis, major liver complications, renal failure with and without Dialysis and encephalopathy. Also, the project will focus on reducing the average length of stay for sepsis patients. Reducing the length of stay of patients diagnosed with sepsis will also impact a reduction in complications. Evidence shows with increased length of stay there is increased risk of preventable complications.

The proposed project to Redesign the Patient Experience will focus on patients satisfaction and experience. Improved patient communication and satisfaction with caregivers has been shown to improve quality and safety of care. Studies have linked patient satisfaction with communication with doctor nurses, responsive to patients’ needs and cleanliness to patient perceptions of hospital practices and facility infection rates.
Preventable complications rates are expected to be reduced 5% a year with appropriate Sepsis care for hospitalized patients and improved patient experience.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Medical Center of Arlington/020950401  
**Unique RHP identification number:** 020950401.4.5

**Domain Descriptions:**
Medical Center of Arlington will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Medical Center of Arlington healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 2 of the two measurements are being tracked and reported.

Patient Satisfaction is surveyed by Gallup for HCAHPS requirements. It is reported internally each week for preliminary results. As required, final results are report to CMS and posted publicly. Publicly reported HCAHPS results are based on four consecutive quarters of patient surveys. CMS publishes participating hospitals' HCAHPS results on the Hospital Compare website (www.hospitalcompare.hhs.gov) four times a year, with the oldest quarter of patient surveys rolling off as the most recent quarter rolls on. Additional HCAHPS results can be found on HCAHPS On-Line, (www.hcahpsonline.org).

Medication management is only reported publically as a required element of certain CORE MEASURES reporting. However, it is tracked and reported internally for all inpatients by the quality department as a patient safety and quality of care measurement.

Medical Center of Arlington will expand existing data collecting system and optimize old system for new reporting processes as necessary.

In addition, Medical Center of Arlington has proposed several quality-based projects that will provide improvement of care to all Medical Center of Arlington patients in multiple areas, resulting in improvement patient satisfaction throughout all measurements in the Reporting Domain.

The proposed project to Redesign Patient Experience is aimed at improving the patient satisfaction of the care received (RD-4 1. Patient Satisfaction). The goal to improve patient satisfaction and experience is also important for improved quality and safety of care provided. Studies have linked patient satisfaction with communication with doctor nurses, responsive to patients’ needs and cleanliness to patient perceptions of hospital practices and facility infection rates.
Another focus for Redesign Patient Experience is medication management (RD-4 2. Medication management). How well the staff communicates with patients about medicines, and whether key information is provided at discharge is critical to successful medication management and patient safety.

The proposed project for process improvement for Sepsis care involves the timely identification/diagnosis of sepsis and evidence-based treatment for patients. Improving processes in this program includes effective communication. The communication between the emergency room, doctors, nurses/ care givers and families for these critically ill patients is vital to the plan of care. Teaching patients and families the cause and symptoms of sepsis is also important for care management . Patient satisfaction is improved with effective communication.

It is also important for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a part of evidence-based care. To ensure patients know what medications they were on in the hospital and what they must take after discharge, effective medication management if vital for continued care of sepsis.

Another proposed project to establish a Care Transition Program is targeted for interventions for patients at high risk for readmission. Part of Care transitions is the coordination of care from inpatient to outpatient, post-acute care, and home care settings in order to prevent increased health care costs and hospital readmissions. Medication management is an important part of transition to another care setting including home in order to promote safe and effective care.

Patients enrolled in the Care Transition program will have a greater patient experience and satisfaction when leaving the hospital. It is important in the program that patients are assessed for discharge needs and proper discharge planning and placement is conducted. Specifically, this project will track the outcome for reduced readmissions for Congestive Heart Failure patients.

We expected to improve Patient satisfaction HCAHPS Grand Composite scores to be > 75th percentile by the end of the waiver. Although we are over 95% compliant with Medication Management documentation, we have only earned a 50% on the composite scores on Communication on medications in HCAHPS. We expect effective communication improvement will increase HCAHPS medication scores by 50% by the end of the waiver.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Medical Center of Arlington/020950401

**Unique RHP identification number:** 020950401.4.6

**Domain Descriptions:**
Medical Center of Arlington will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Medical Center of Arlington healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Medical Center of Arlington currently tracks and reports Admit decision time to ED departure for admitted patients for THE JOINT COMMISSION and internal quality requirements. The current tracking system is already in place and will be modified or improved as necessary to satisfy the requirement of new reporting domain.

In addition, the proposed project for Sepsis improvement involves the timely identification and evidence-based treatment of patients. A key component of a Sepsis protocol is the timely identification/diagnosis of septic shock/severe sepsis to admit and begin evidence-based treatment. Process improvements implemented for sepsis protocols in the ED support the goal of less than 1 hour for ED admit/ departure (decision time) for critical patients.

We expect the ED Admit time will be reduced by 25% by the end of the waiver.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Cook Children’s Medical Center/021184901  
**Unique RHP identification number:** 021184901.4.2

**Domain Descriptions:**  
There are no system capability changes required for reporting the two potentially affected measures 1) Bacterial pneumonia immunization and 2) Influenza immunization since these values are already reported to CMS and to Joint Commission. The immunization rates would be measured and reported annually.

Primary care is the customary site for pediatric immunizations so to the extent that more children access a pediatric primary care medical home there should be a concomitant increase in immunization and subsequent reduction in bacterial pneumonia or influenza hospital admissions.

Due to the extremely small number of inpatient admissions for pediatric bacterial pneumonia or influenza, the comparatively small number of patients in a primary care setting and the lack of chronicity between immunization and disease expression it is improbable that a clear population improvement can be demonstrated.

**Domain Valuation:**  
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** North Hills Hospital/094105602

**Unique RHP identification number:** 094105602.4.2

**Domain Descriptions:**
North Hills Hospital will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current North Hills Hospital healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

North Hills Hospital currently tracks and reports 2 of the 8 measurements for public reporting. Measurements that have not yet been addressed are:

- Congestive heart Failure Admission Rate
- Diabetes Admission Rates
- Behavioral Health and Substance Abuse Admission Rate
- Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rate
- Hypertension Admission rate
- Pediatric Asthma

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, North Hills Hospital will expand existing data collecting system and optimize old system for new reporting processes.

North Hills Hospital does not expect any impact in this Reporting Domain from proposed Category 1, and 2 projects and Category 3 outcomes.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: North Hills Hospital/094105602
Unique RHP identification number: 094105602.4.3

Domain Descriptions:
North Hills Hospital will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current North Hills Hospital healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

North Hills Hospital currently tracks and reports 2 of the 7 measurements for public reporting. Measurements that have not yet been addressed are:

- Diabetes: 30-Day Readmissions
- Behavioral Health & Substance Abuse: 30-Day Readmissions
- Chronic Obstructive Pulmonary Disease (COPD): 30-Day Readmissions
- Stroke: 30-Day Readmissions
- Pediatric Asthma: 30-Day Readmissions

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, North Hills Hospital will expand existing data collecting system and optimize old system for new reporting processes.

In addition, a proposed DSRIP project will provide interventions to North Hills Hospital patients, resulting in improvement of Preventable Readmissions.

The proposed project for Sepsis improvement involves the timely identification/diagnosis of sepsis and evidence-based treatment for patients. It is also important for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a part of evidence-based care. To ensure patients know what medications they were on in the hospital and what they must take after discharge, effective medication management is vital for continued care of sepsis and reduced risk for readmissions.

We expect to see a reduction in readmissions for patients with an initial index admission of Sepsis and those readmitted for Sepsis with initial diagnosis other than Sepsis.
**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 3: Potentially Preventable Complications
Performing Provider Name/TPI: North Hills Hospital/094105602
Unique RHP identification number: 094105602.4.4

Domain Descriptions:
North Hills Hospital will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current North Hills Hospital healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 15 of the sixty four measurements are being tracked and reported in a form of public healthcare statistics. All other measures are tracked and reported internally.

Currently, HHSC will make potentially preventable event data to providers. In addition, North Hills Hospital will expand existing data collecting system and optimize old system for new reporting processes.

In addition, a proposed DSRIP project will provide interventions to North Hills Hospital resulting in improvement of PPCs throughout all measurements in the Reporting Domain.

The proposed project to implement an innovative program for Sepsis improvement aims to identify/diagnosis Sepsis sooner and begin evidence-based treatment to reduce mortality and complications for septic shock and severe sepsis.

Improved sepsis care reduces complications particularly those common in septic patients such as pulmonary embolism, acute myocardial infarction, venous thrombosis, major liver complications, renal failure with and without Dialysis and encephalopathy. Also, the project will focus on reducing the average length of stay for sepsis patients. Reducing the length of stay of patients diagnosed with sepsis will also impact a reduction in complications. Evidence shows with increased length of stay there is increased risk of preventable complications.

Preventable complications rates are expected to be reduced 5% year with appropriate Sepsis care for hospitalized patients and improved patient experience.

Domain Valuation:
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** North Hills Hospital/094105602  
**Unique RHP identification number:** 094105602.4.5

**Domain Descriptions:**  
North Hills Hospital will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current North Hills Hospital healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 2 of the two measurements are being tracked and reported.

Patient Satisfaction is surveyed by Gallup for HCAHPS requirements. It is reported internally each week for preliminary results. As required, final results are report to CMS and posted publically. Publicly reported HCAHPS results are based on four consecutive quarters of patient surveys. CMS publishes participating hospitals' HCAHPS results on the Hospital Compare website (www.hospitalcompare.hhs.gov) four times a year, with the oldest quarter of patient surveys rolling off as the most recent quarter rolls on. Additional HCAHPS results can be found on HCAHPS On-Line, (www.hcahpsonline.org).

Medication management is only reported publically as a required element of certain CORE MEASURES reporting. However, it is tracked and reported internally for all inpatients by the quality department as a patient safety and quality of care measurement.

North Hills Hospital will expand existing data collecting system and optimize old system for new reporting processes as necessary.

In addition, North Hills Hospital has proposed a quality-based project that will provide improvement of care to all North Hills Hospital patients resulting in improvement patient satisfaction throughout all measurements in the Reporting Domain.

The proposed project for process improvement for Sepsis care involves the timely identification/diagnosis of sepsis and evidence-based treatment for patients. Improving processes in this program includes effective communication. The communication between the emergency room, doctors, nurses/ care givers and families for these critically ill patients is vital to the plan of care. Teaching patients and families the cause and symptoms of sepsis is also important for care management. Patient satisfaction is improved with effective communication.
It is also important for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a part of evidence-based care. To ensure patients know what medications they were on in the hospital and what they must take after discharge, effective medication management is vital for continued care of sepsis.

Although we are over 95% compliant with Medication Management documentation, we have only earned a 54% on the composite scores on Communication on medications in HCAHPS. We expect effective communication improvement will increase HCAHPS medication scores by 50% by the end of the waiver. In addition, scores for Communication with doctors and nurses as well as discharge process is expected to improve with overall HCAHPS Grand Composite scores to be > 75 percentile of CMS scores.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** North Hills Hospital/094105602  
**Unique RHP identification number:** 094105602.4.6

**Domain Descriptions:**  
North Hills Hospital will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current North Hills Hospital healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

North Hills Hospital currently tracks and reports Admit decision time to ED departure for admitted patients for THE JOINT COMMISSION and internal quality requirements. The current tracking system is already in place and will be modified or improved as necessary to satisfy the requirement of new reporting domain.

In addition, the proposed project for Sepsis improvement involves the timely identification and evidence-based treatment of patients. A key component of a Sepsis protocol is the timely identification/diagnosis of septic shock/severe sepsis to admit and begin evidence-based treatment. Process improvements implemented for sepsis protocols in the ED support the goal of less than 1 hour for ED admit/ departure (decision time) for critical patients.

We expect the ED Admit time will be reduced by 25% by the end of the waiver.

**Domain Valuation:**  
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Grand Total Payments Across Category 4**

| | $21,333 | $49,455 | $52,905 | $57,505 |

Plaza Medical Center
094193202
Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: Plaza Medical Center Fort Worth/094193202
Unique RHP identification number: 094193202.4.2

Domain Descriptions:
Plaza Medical Center Fort Worth will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Plaza Medical Center Fort Worth healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Plaza Medical Center Fort Worth currently tracks and reports 2 of the 8 measurements for public reporting. Measurements that have not yet been addressed are:

- Congestive heart Failure Admission Rate
- Diabetes Admission Rates
- Behavioral Health and Substance Abuse Admission Rate
- Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rate
- Hypertension Admission rate
- Pediatric Asthma

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, Plaza Medical Center Fort Worth will expand existing data collecting system and optimize old system for new reporting processes.

Plaza Medical Center Fort Worth does not expect any impact in this Reporting Domain from proposed Category 1, and 2 projects and Category 3 outcomes.

Domain Valuation:
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined
that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Plaza Medical Center Fort Worth/094193202  
**Unique RHP identification number:** 094193202.4.3

**Domain Descriptions:**
Plaza Medical Center Fort Worth will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Plaza Medical Center Fort Worth healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Plaza Medical Center Fort Worth currently tracks and reports 2 of the 7 measurements for public reporting. Measurements that have not yet been addressed are:

- Diabetes: 30-Day Readmissions
- Behavioral Health & Substance Abuse: 30-Day Readmissions
- Chronic Obstructive Pulmonary Disease (COPD): 30-Day Readmissions
- Stroke: 30-Day Readmissions
- Pediatric Asthma: 30-Day Readmissions

Currently, HHSC will provide potentially preventable event data to providers for reporting. In addition, Plaza Medical Center Fort Worth will expand existing data collecting system and optimize old system for new reporting processes.

In addition, DSRIP projects will provide interventions to Plaza Medical Center Fort Worth patients in multiple areas, resulting in improvement of PPRs throughout all measurements in the Reporting Domain.

The proposed project to Redesign Patient Experience is intended to implement process improvements to change the patient satisfaction and experience of hospitalization. Key areas of experience can influence the risk of readmission, including communication, care from nurses and doctors and medication management and discharge process. In particular, how well the staff
communicates with patients about medications, and whether key information is provided at
discharge can directly impact the risk of readmission for patients.

In addition, the proposed project for Sepsis improvement involves the timely
identification/diagnosis of sepsis and evidence-based treatment for patients. It is also important
for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a
part of evidence-based care. To ensure patients know what medications they were on in the
hospital and what they must take after discharge, effective medication management is vital for
continued care of sepsis and reduced risk for readmissions.

We expect to see a reduction in readmissions for patients with an initial index admission of
Sepsis and those readmitted for Sepsis with initial diagnosis other than Sepsis. Readmissions due
to medication management will also be reduced.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than
the 10% allocation and forgone the optional reporting domain. As a region, it was determined
that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY
were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 3: Potentially Preventable Complications

Performing Provider Name/TPI: Plaza Medical Center Fort Worth/094193202
Unique RHP identification number: 094193202.4.4

Domain Descriptions:
Plaza Medical Center Fort Worth will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Plaza Medical Center Fort Worth healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, 15 of the sixty four measurements are being tracked and reported in a form of public healthcare statistics. All other measures are tracked and reported internally.

Currently, HHSC will make potentially preventable event data to providers. In addition, Plaza Medical Center Fort Worth will expand existing data collecting system and optimize old system for new reporting processes.

In addition, many DSRIP projects will provide interventions to Plaza Medical Center Fort Worth patients in multiple areas, resulting in improvement of PPCs throughout all measurements in the Reporting Domain.

The proposed project to implement an innovative program for Sepsis improvement aims to identify/diagnosis Sepsis sooner and begin evidence-based treatment to reduce mortality and complications for septic shock and severe sepsis.

Improved sepsis care reduces complications particularly those common in septic patients such as pulmonary embolism, acute myocardial infarction, venous thrombosis, major liver complications, renal failure with and without Dialysis and encephalopathy. Also, the project will focus on reducing the average length of stay for sepsis patients. Reducing the length of stay of patients diagnosed with sepsis will also impact a reduction in complications. Evidence shows with increased length of stay there is increased risk of preventable complications.

The proposed project to Redesign the Patient Experience will focus on patients satisfaction and experience. Improved patient communication and satisfaction with caregivers has been shown to improve quality and safety of care. Studies have linked patient satisfaction with communication with doctor nurses, responsive to patients’ needs and cleanliness to patient perceptions of hospital practices and facility infection rates.
Preventable complications rates are expected to be reduced 5% a year with appropriate Sepsis care for hospitalized patients and improved patient experience.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Plaza Medical Center Fort Worth/094193202  
**Unique RHP identification number:** 094193202.4.5

**Domain Descriptions:**
Plaza Medical Center Fort Worth will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Plaza Medical Center Fort Worth healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, 2 of the two measurements are being tracked and reported.

Patient Satisfaction is surveyed by Gallup for HCAHPS requirements. It is reported internally each week for preliminary results. As required, final results are report to CMS and posted publically. Publicly reported HCAHPS results are based on four consecutive quarters of patient surveys. CMS publishes participating hospitals' HCAHPS results on the Hospital Compare website (www.hospitalcompare.hhs.gov) four times a year, with the oldest quarter of patient surveys rolling off as the most recent quarter rolls on. Additional HCAHPS results can be found on HCAHPS On-Line, (www.hcahpsonline.org).

Medication management is only reported publically as a required element of certain CORE MEASURES reporting. However, it is tracked and reported internally for all inpatients by the quality department as a patient safety and quality of care measurement.

Plaza Medical Center Fort Worth will expand existing data collecting system and optimize old system for new reporting processes as necessary.

In addition, Plaza Medical Center Fort Worth has proposed several quality-based projects that will provide improvement of care to all Plaza Medical Center Fort Worth patients in multiple areas, resulting in improvement patient satisfaction throughout all measurements in the Reporting Domain.

The proposed project to Redesign Patient Experience is aimed at improving the patient satisfaction of the care received (RD-4 1. Patient Satisfaction). The goal to improve patient satisfaction and experience is also important for improved quality and safety of care provided. Studies have linked patient satisfaction with communication with doctor nurses, responsive to
patients’ needs and cleanliness to patient perceptions of hospital practices and facility infection rates.

Another focus for Redesign Patient Experience is medication management (RD-4 2. Medication management). How well the staff communicates with patients about medicines, and whether key information is provided at discharge is critical to successful medication management and patient safety.

The proposed project for process improvement for Sepsis care involves the timely identification/diagnosis of sepsis and evidence-based treatment for patients. Improving processes in this program includes effective communication. The communication between the emergency room, doctors, nurses/ care givers and families for these critically ill patients is vital to the plan of care. Teaching patients and families the cause and symptoms of sepsis is also important for care management. Patient satisfaction is improved with effective communication.

It is also important for Sepsis patients to be placed on the right medications (right antibiotics, vasopressors, etc.) as a part of evidence-based care. To ensure patients know what medications they were on in the hospital and what they must take after discharge, effective medication management if vital for continued care of sepsis.

We expected to improve Patient satisfaction HCAHPS Grand Composite scores to be > 75th percentile by the end of the waiver. Although we are over 95% compliant with Medication Management documentation, we have only earned a 57% on the composite scores on Communication on medications in HCAHPS. We expect effective communication improvement will increase HCAHPS medication scores by 50% by the end of the waiver.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Plaza Medical Center Fort Worth/094193202  
**Unique RHP identification number:** 094193202.4.6

**Domain Descriptions:**
Plaza Medical Center Fort Worth will report all the measurements in 5 reporting domains starting on the designated reporting year. Initial analysis of the current Plaza Medical Center Fort Worth healthcare reporting system indicates capability to track and report on some of the required measurements. Some measures are able to be tracked and reported but are not consistently produced or reported. Implementation of new data gathering requirements and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Plaza Medical Center Fort Worth currently tracks and reports Admit decision time to ED departure for admitted patients for THE JOINT COMMISSION and internal quality requirements. The current tracking system is already in place and will be modified or improved as necessary to satisfy the requirement of new reporting domain.

In addition, the proposed project for Sepsis improvement involves the timely identification and evidence-based treatment of patients. A key component of a Sepsis protocol is the timely identification/diagnosis of septic shock/severe sepsis to admit and begin evidence-based treatment. Process improvements implemented for sepsis protocols in the ED support the goal of less than 1 hour for ED admit/ departure (decision time) for critical patients.

We expect the ED Admit time will be reduced by 25% by the end of the waiver.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

Region 10 RHP Plan
Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702
Unique RHP identification number: 109574702.4.2

Domain Descriptions:
Currently, three of the eight measurements are being tracked and one of the eight won’t be due to the volume which we believe is not statistically valid and anticipate that a number of the data fields might be zero (#6 Pediatric Asthma). Measurements that will be address in the near future are Diabetes Admission rate, Behavioral Health and Substance Abuse Admission rate, Hypertension Admission rate. Huguley will establish new protocols for data collecting and reporting, expand existing data collecting system in preparation of the reporting requirements.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 2 projects and Category 3 outcomes.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of the CHF project (109574702.2.1) will facilitate the improvement in the HF readmissions and will positively impact the all-cause admission rate as well as the potentially preventable admissions for patients seeking care at Huguley. Implementation of the sepsis resuscitation bundle (109574702.2.2) will facilitate improvement in both sepsis mortality and length of stay and, in so doing, will positively impact the all-cause admission rate as well as the potentially preventable admissions for patients seeking care at Huguley.

Interventions mentioned above will significantly improve all-cause PPA starting in DY4.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

Huguley will begin to report on all required eight measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
Huguley has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702  
**Unique RHP identification number:** 109574702.4.3

**Domain Descriptions:**
Currently, two of the seven measurements are being tracked, one of the seven won’t be due to the volume which we believe is not statistically valid and anticipate that a number of the data fields might be zero (Pediatric Asthma: 30-day readmissions). Measurements that will be address in the near future are Diabetes: 30-Day Readmissions, Behavioral health & Substance Abuse: 30-day Readmissions, Chronic Obstructive Pulmonary Disease (COPD): 30-Day Readmissions, Stroke: 30-day Readmissions. Huguley will establish new protocols for data collecting and reporting, expand existing data collecting system in preparation for the reporting requirements.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 2 projects, and Category 3 outcomes.

Successful Category 2 interventions will result in various health care improvements during the waiver period. Implementation of the CHF project (109574702.2.1) and the sepsis resuscitation bundle (109574702.2.2) will directly and positively impact the 30-day readmissions. CHF is specifically targeted at doing this and the sepsis resuscitation bundle implementation will decrease the severity of septic patients treated and in so doing, should result in a reduction in 30-day readmissions.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPR rate.

Huguley will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
Huguley has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702  
**Unique RHP identification number:** 109574702.4.4

**Domain Descriptions:**  
Currently, twenty six of the sixty four measurements are being tracked; however, very few of these measures produce statistically valid volumes. The additional 38 measures will be evaluated and if the volume is statistically significant, will be addressed in the near future. Huguley will establish new protocols for data collecting and reporting, expand existing data collecting system in preparation for the reporting requirements.

Some of Huguley’s DSRIP projects target specific practices to reduce PPCs. In addition, multiple quality and performance initiatives have been implemented to improve the quality and safety for the patients we serve. Implementation of the CHF project (109574702.2.1) will specifically and positively impact HF conditions and will result in reductions in PPCs. Implementation of the sepsis resuscitation bundle (109574702.2.2) will directly and positively impact occurrence of hospital acquired septicemia and severe infections in the ED and ICU.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

Huguley will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**  
Huguley has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 4: Patient-Centered Healthcare

Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702
Unique RHP identification number: 109574702.4.5

Domain Descriptions:
Currently, one of the two measurements (Patient Satisfaction) are being tracked and reported by CMS (Patient Satisfaction). The other measure (Medication Management) is also being tracked and reported via Meaningful Use (CMS).

Huguley is involved in a very focused and intentional patient satisfaction/patient experience initiative which will be aided by our DSRIP projects. The implementation and expected outcomes of the CHF project (109574702.2.1) and the sepsis resuscitation bundle (109574702.2.2) over the course of the waiver period will improve and enhance the patient experience.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes.

There is no DSRIP projects focuses on medication management at this time. Therefore no measureable impact is expected on medication management.

Huguley will begin to report the required measures starting in DY4.

Domain Valuation:
Huguley has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Huguley Memorial Medical Center/109574702  
**Unique RHP identification number:** 109574702.4.6

**Domain Descriptions:**  
Initial analysis of the current Huguley healthcare reporting system indicates our time tracking system is in place but will be improved to satisfy the requirement of new reporting domain. There is no DSRIP project associated with this reporting domain and therefore no measureable impact is expected for this domain related to the intervention.

Huguley will begin to report this domain to HHSC starting DY3.

**Domain Valuation:**  
Huguley has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 6: Children and Adult Core Measures

Performing Provider Name/TPI: Huguley Memorial Medical Center/109574702
Unique RHP identification number: 109574702.4.7

Domain Descriptions:
The child core measure is a domain that Huguley doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. Huguley does not meet the minimum volume requirements for publication of these measures by CMS.

Domain Valuation:
Huguley will not report on RD-6 and, as such, no value has been assigned to this domain.

THR Fort Worth
112677302
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth/112677302

**Unique RHP identification number:** 112677302.4.2

**Domain Descriptions:**
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Harris Methodist Fort Worth (THFW) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THFW is not participating in Category 1 interventions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (112677302.2.3) will facilitate patient navigation and positively impact all-cause admission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (112677302.2.1) will reduce diabetes admission rate. Expanding current capacity for the heart failure clinic (112677302.2.2) will provide additional post-acute care for heart failure patients. Implementation of the sepsis bundle (112677302.2.4) will also have a positive impact on readmissions. Interventions mentioned above will significantly improve all-cause PPA starting in DY4.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate. Implementation of the sepsis bundle (112677302.2.4) will also have a positive impact on readmissions.

THFW will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth/112677302
Unique RHP identification number: 112677302.4.3

Domain Descriptions:
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THFW will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THFW is not participating in Category 1 interventions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (112677302.2.3) will facilitate patient navigation and positively impact all-cause readmission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (112677302.2.1) specifically will reduce diabetes readmission rate. Additionally, we expect the heart failure clinic (112677302.2.2) to have a significant impact on CHF readmission rate by providing additional post-acute care for heart failure patients. Implementation of the sepsis bundle (112677302.2.4) will also have a positive impact on readmissions.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPR rate.

THFW will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP
dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth/112677302  
**Unique RHP identification number:** 112677302.4.4

**Domain Descriptions:**  
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THFW will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THFW is not participating in Category 1 interventions.

Category 2 interventions that will target specific THFW healthcare practices to reduce PPC’s include implementation of a patient care navigation program (112677302.2.3) to navigate patients to appropriate health care resources and assist those with chronic health care needs in receiving ongoing care. Implementing and improving compliance with the sepsis resuscitation bundle (112677302.2.4) will directly impact the occurrence of hospital acquired septicemia and severe infections in the ED and ICU.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPC rate.

THFW will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth/112677302  
**Unique RHP identification number:** 112677302.4.5

**Domain Descriptions:**
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THFW will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THFW is not participating in Category 1 interventions.

The only Category 2 intervention that will target this RD specifically is the heart failure clinic (112677302.2.2). A component of this project includes Medication Management as enhanced inpatient screening and discharge processes will verify completion of medication reconciliation and assist patient in understanding and/or obtaining necessary medications prior to discharge.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the heart failure clinic project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Texas Health Harris Methodist Fort Worth/112677302
Unique RHP identification number: 112677302.4.6

Domain Descriptions:
Currently, all RD-5 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THFW will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THFW is not participating in Category 1 interventions.

Since this particular measure reports on the decision time to transfer an emergency patient to another facility and not the actual transport time, (decision to make the first call form arrival in transferring ED until call initiated) it is advisable that THR work closely with our Care Connect reporting to determine if additional data fields need to be build and collected so a report can be created to meet this NQF 0497 measure. During our preliminary review, it appears that we may be able to utilize a MU report that does capture NQF 0497 for all THR entities participating in MU. In addition, a clear time frame in which the reporting period should encompass needs to be stated clearly.

We expect the Patient Care Navigation project (112677302.2.3) to have a positive impact on this domain by helping to navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care.

THFW will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 6: Children and Adult Core Measures**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Fort Worth/112677302  
**Unique RHP identification number:** 112677302.4.7

**Domain Descriptions:**  
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

**Domain Valuation:**  
THR will not report on RD-6 and, as such, no value has been assigned to this domain.
## Category 4: Population-Focused Measures

THR Southwest Fort Worth
120926804
Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: Texas Health Harris Methodist Southwest Fort Worth/120726804
Unique RHP identification number: 120726804.4.2

Domain Descriptions:
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Southwest Hospital (THSW) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values Category 3 outcomes.

The use of APRNs as intermediate care providers in the extensivist clinic (120726804.2.4) will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes. A comprehensive diabetes care management program (120726804.2.1P will empower the target population of Medicaid and uninsured patients better self-manage of their disease. As many of these patients do not have primary care physicians, self-management techniques are extremely important to proactively reduce hospital admissions for diabetes related complications. Implementing the sepsis bundle (120726804.2.2) will reduce admissions through rapid diagnosis and treatment in the ED. Highly skilled case managers in the ED (120726804.2.3) will pair patients without a primary care provider with a physician or clinic to manage their healthcare proactively thus reducing future admissions.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

THSW will begin to report on all required eight measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Fort Worth/120726804

**Unique RHP identification number:** 120726804.4.3

**Domain Descriptions:**
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THSW will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

A comprehensive diabetes care management program will empower the target population of Medicaid and uninsured patients with type 1 or type 2 diabetes, pre-diabetes or gestational diabetes better self-management of their disease. As many of these patients do not have primary care physicians, self-management techniques are extremely important to proactively reduce hospital readmissions for diabetes related complications. The use of APRNs as intermediate care providers in the extensivist clinic will decrease the readmission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. A comprehensive diabetes care management program will empower the target population of Medicaid and uninsured patients better self-manage of their disease. Implementing the sepsis bundle will reduce readmissions through rapid diagnosis and treatment.

THSW will begin to report on all required seven measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP
dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Fort Worth/120726804  
**Unique RHP identification number:** 120726804.4.4  

**Domain Descriptions:**  
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THSW will prepare its data systems for reporting this domain as well.

Diabetes self-management is the key to proactively managing the disease state and preventing complications. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes and preventing potential complications related to chronic disease processes (ED navigation and Extensivist clinic). Highly skilled case managers in the ED will pair patients without a primary care provider with a physician or clinic to manage their healthcare proactively thus reducing potential complications. Implementing the sepsis bundle will reduce complications through rapid diagnosis and treatment in the ED.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

THR will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**  
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Fort Worth/120726804  
**Unique RHP identification number:** 120726804.4.5

**Domain Descriptions:**
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. During DY2, THSW will ensure that its data systems are optimized to report this domain.

THSW has proposed quality-based projects with DSRIP that target the improvements of patient satisfaction and disease management.

The THSW project will utilize the Patient Advisory Council to provide additional patient satisfaction trainings to staff, facilitate shared lessons learned to represent voice of the patients. The identified target populations of patients are Medicaid and uninsured patients in need of primary care, disease management and sepsis treatment.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the THSW project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

THSW will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Texas Health Harris Methodist Southwest Fort Worth/120726804

Unique RHP identification number: 120726804.4.6

Domain Descriptions:
The use of APRNs as intermediate care providers will decrease inappropriate usage of the described population of patients in the ED and increase the usage of resources within the community for primary care is the focus of this unique project. ED navigation produces a similar reduction in ED usage by pairing patients with a primary care provider. Diabetic patients developing proactive disease management habits will decrease their utilization of the ED for exacerbation of their disease.

Improvement targets for both outcome measures chosen were selected based on populations of patients the project proposes to serve, and align with the goal of decreasing inappropriate utilization of the ED

THSW will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 6: Children and Adult Core Measures**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Southwest Fort Worth/120726804

**Unique RHP identification number:** 120726804.4.7

**Domain Descriptions:**
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

**Domain Valuation:**
THR will not report on RD-6 and, as such, no value has been assigned to this domain.
## Category 4: Population-Focused Measures

**Texas Health Harris Methodist Southwest Fort Worth / 120726804**

### Capability to Report Category 4 Milestone:
- Status report submitted to HHSC confirming system capability to report Domains 1, 2, 4, 5, and 6.
- Status report submitted to HHSC confirming system capability to report Domains 3.

THR Stephenville
121794503
Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: Texas Health Harris Methodist Stephenville/121794503
Unique RHP identification number: 121794503.4.2

Domain Descriptions:
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Stephenville Hospital (THS) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values Category 3 outcomes.

A comprehensive diabetes care management program will empower the target population of Medicaid and uninsured patients with type 1 or type 2 diabetes, pre-diabetes or gestational diabetes better self-management of their disease. As many of these patients do not have primary care physicians, self-management techniques are extremely important to proactively reduce hospital admissions for diabetes related complications.

Category 3 outcomes: By the end of the waiver, our goal is to have approximately 120 diabetic patients 18 years and older who are uninsured or Medicaid enrolled in the diabetic comprehensive care management program to proactively managed their disease, therefore, decreasing the rate of potential admissions.

This project’s Category 4 Reporting Domain includes RD-1 Potentially preventable admissions (PPAs) in low-income, Medicaid, and uninsured Erath County adult population with the reporting measure RD-1.2 Diabetes with short-term complications or uncontrolled diabetes. This project will support, reinforce, and enable other projects through its design and intervention for the above described patient population by adding to best practices and lessons learned.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

THS will begin to report on all required eight measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.
Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Texas Health Harris Methodist Stephenville/121794503
Unique RHP identification number: 121794503.4.3

Domain Descriptions:
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THS will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

A comprehensive diabetes care management program will empower the target population of Medicaid and uninsured patients with type 1 or type 2 diabetes, pre-diabetes or gestational diabetes better self-management of their disease. As many of these patients do not have primary care physicians, self-management techniques are extremely important to proactively reduce hospital readmissions for diabetes related complications.

THS will begin to report on all required seven measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Stephenville/121794503

**Unique RHP identification number:** 121794503.4.4

**Domain Descriptions:**
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THS will prepare its data systems for reporting this domain as well.

Diabetes self-management is the key to proactively managing the disease state and preventing complications. Severe diabetic complications can lead to blindness, amputations and kidney failure. Each of these severe complications leads to reduced quality of life and productivity for the patient. Less severe complications put increased demands on healthcare providers and loss of productivity for patients. The area served by THS does not currently have any diabetic education services other than those provided at the hospital which is not covered by Medicaid and cost prohibitive for the uninsured.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

THR will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Stephenville/121794503  
**Unique RHP identification number:** 121794503.4.5

**Domain Descriptions:**
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. During DY2, THS will ensure that its data systems are optimized to report this domain.

THS has proposed a quality-based project with DSRIP that targets the improvements of patient satisfaction and disease management.

The THS project will develop a patient experience focus team within the organization to provide additional patient satisfaction trainings to staff, facilitate shared lessons learned, and expand the Patient Advisory Council to represent voice of the patients. The identified target populations of patients the diabetes management program will service are Medicaid and uninsured patients with type 1 or type 2 diabetes, pre-diabetes or gestational diabetes that do not currently have access to disease management opportunities currently.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the THS project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

THS will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Stephenville/121794503  
**Unique RHP identification number:** 121794503.4.6

**Domain Descriptions:**
The use of APRNs as intermediate care providers will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care is the focus of this unique project.

Improvement targets for both outcome measures chosen were selected based on populations of patients the project proposes to serve, and align with the goal of decreasing inappropriate utilization of the ED by providing disease self-management education for the targeted population that frequently utilized the ED for services related to diabetes.

THS will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 6: Children and Adult Core Measures

Performing Provider Name/TPI: Texas Health Harris Methodist Stephenville/121794503
Unique RHP identification number: 121794503.4.7

Domain Descriptions:
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

Domain Valuation:
THR will not report on RD-6 and, as such, no value has been assigned to this domain.

| **Grand Total Payments Across Category 4** | $1,266 | $3,691 | $3,955 | $3,955 |
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** PHRC-Ennis LP dba Ennis Regional Medical Center/121822403

**Unique RHP identification number:** 121822403.4.2

**Domain Descriptions:**
Ennis Regional Medical Center (ERMC) will report all the measurements in 5 reporting domains starting on the designated reporting year. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, two of the eight measurements, Pneumococcal Immunization and Influenza Immunization are being tracked and reported in a form of public healthcare statistics. Measurements that have not yet been addressed are 1) Congestive Heart Failure Admission Rate, 2) Diabetes Admission Rates, 3) Behavioral Health and Substance Abuse Admission Rate, 4) Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rates, 5) Hypertension Admission Rate and 6) Pediatric Asthma. In addition, many DSRIP projects will provide interventions to ERMC patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, ERMC will establish new protocols for data collecting and reporting and are currently expanding and optimizing our existing data collecting system in order to fully participate. The PPA’s will all be impacted positively by the efforts of our Category 1 and 2 projects 121822403.1.1 Expand Primary Care Capacity. Many patients that are currently being seen at ERMC do not have a primary care physician. Efforts by Case Management and discharge planning have struggled to find physicians for patients to follow up after hospitalization, for the appointments to be made without long waits as well as to find primary healthcare for Medicaid patients. What physicians are available in the area have a limit of Medicaid patient volumes. Without regular primary care, a patient may have to be admitted to the hospital as a result of a worsening condition.

All of the additional measures are relevant to ERMC patient population. With improved and expanded data availability ERMC will be able to study these specific patient populations and their specific performance in order to implement focused improvements as identified.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined
that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** PHRC-Ennis LP dba Ennis Regional Medical Center/121822403

**Unique RHP identification number:** 121822403.4.3

**Domain Descriptions:**
Ennis Regional Medical Center (ERMC) will report all the measurements in 5 reporting domains starting on the designated reporting year. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 6 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, one of the seven measurements are being tracked and reported in a form of public healthcare statistics. Measurements that have not yet been addressed are 30 Day Readmissions for 1) Diabetes, 2) Behavioral Health & Substance Abuse, 3) Chronic Obstructive Pulmonary Disease, 4) Stroke, 5) Pediatric Asthma and 6) All-Cause. In addition, many DSRIP projects will provide interventions to ERMC patients in multiple areas, resulting in improvement of PPRs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, ERMC will establish new protocols for data collecting and reporting and are currently expanding and optimizing our existing data collecting system in order to fully participate. The PPR’s will all be impacted positively by the efforts or our Category 1 and 2 projects 121822403.1.1 Expand Primary Care Capacity. Many patients that are currently being seen at ERMC do not have a primary care physician. Efforts by Case Management and discharge planning have struggled to find physicians for patients to follow up after hospitalization, for the appointments to be made without long waits as well as to find primary healthcare for Medicaid patients. What physicians are available in the area have a limit of Medicaid patient volumes. Indigent care is also very limited. Without regular primary care, a patient may have to be re-admitted to the hospital as a result of a worsening condition, medications that need to be supervised and other methods of preventing re-admission to the hospital.

All of the additional measures are relevant to ERMC patient population. With improved and expanded data availability ERMC will be able to study these specific patient populations and their specific performance in order to implement focused improvements as identified.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined
that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** PHRC-Ennis LP dba Ennis Regional Medical Center/121822403  
**Unique RHP identification number:** 121822403.4.4

**Domain Descriptions:**
Ennis Regional Medical Center (ERMC) will report all the measurements in 5 reporting domains starting on the designated reporting year. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 6 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, none of the sixty four measurements are being tracked and reported in a form of public healthcare statistics. The PPC’s population will not be affected by the ERMC Category 1, 2 and Category 3 outcomes project. Many DSRIP projects will provide interventions to ERMC patients in multiple areas, resulting in improvement of PPCs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, ERMC will establish new protocols for data collecting and reporting and are currently expanding and optimizing our existing data collecting system in order to fully participate.

All of the additional measures are relevant to ERMC patient population. With improved and expanded data availability ERMC will be able to study these specific patient populations and their specific performance in order to implement focused improvements as identified.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Performing Provider Name/TPI:** PHRC-Ennis LP dba Ennis Regional Medical Center/121822403  
**Unique RHP identification number:** 121822403.4.5

**Domain Descriptions:**
Ennis Regional Medical Center (ERMC) will report all the measurements in 5 reporting domains starting on the designated reporting year. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 6 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3.

Currently, one of the two measurements are being tracked and reported internally to the Performance Improvement Leadership Organizational Team (PILOT). The Measurement that has not yet been addressed is Medication Management. One of the two patient populations that are considered in these areas would have some minor impact by the ERMC Category 1, 2 and Category 3 outcomes project. For Patient Satisfaction the patient is impacted by the arrangements that are made in their behalf for continuing physician care beyond the hospitalization for which our Category 1 and 2 projects 121822403.1.1 Expand Primary Care Capacity will improve. The Medication Management component would not be impacted by the ERMC Category 1, 2 and Category 3 outcomes project. In addition, ERMC proposed several quality-based projects that will provide improvement of care to all ERMC patients in multiple areas, resulting in improvement of patient satisfaction throughout all measurements in the Reporting Domain. ERMC will establish new protocols for data collecting and reporting and are currently expanding and optimizing our existing data collecting system in order to fully participate.

The additional measure is relevant to ERMC patient population. With improved and expanded data availability ERMC will be able to study these specific patient populations and their specific performance in this area in order to implement focused improvements as identified.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** PHRC-Ennis LP dba Ennis Regional Medical Center/121822403

**Unique RHP identification number:** 121822403.4.6

**Domain Descriptions:**
Ennis Regional Medical Center (ERMC) will report all the measurements in 5 reporting domains starting on the designated reporting year. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 6 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability for all Category 1, and 2 projects and Category 3 outcomes by the end of DY3. The Emergency Department Reporting Domain does not relate to and will not have an impact on the ERMC Category 1 and 2 projects and Category 3 outcomes.

A time tracking system is already in place and will be modified or improved to satisfy the requirement of new reporting domains.

With improved and expanded data availability ERMC will be able to study performance and implement focused improvements as identified.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: JPS Health Network/126675104
Unique RHP identification number: 126675104.4.2

Domain Descriptions:
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, JPS will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Successful Category 1 interventions will lead to health care improvements throughout the waiver period. Implementation of a 24-hour nurse call center (126675104.1.2) will facilitate patient navigation and positively impact all-cause admission rate for patients seeking medical care in JPS network. Expanding diabetes specialty care in primary care settings (126675104.2.1) will greatly reduce diabetes admission rate. Establishing a partial hospitalization program (PHP) (126675104.1.4) will provide additional care for behavioral health and substance abuse patients. Interventions mentioned above will significantly improve all-cause PPA starting in DY4.

Many Category 2 interventions will also reduce all-cause PPAs. Embedding a well-trained, specialized healthcare team in homeless shelters (126675104.2.3) will greatly reduce the all-cause admission rate and improve immunization rate among the homeless. Implementation of an advance care PCMH (126675104.2.2) and E-Consult Program will provide specialized care for patients in primary care settings. The Care Transition Program (126675104.2.5) will facilitate patient navigation and therefore reduce avoidable admission rate. Admission rates for chronic diseases such as CHF and diabetes will decrease with Palliative Care and additional support in outpatient setting (126675104.2.4). Continuous care for chronically ill patients can be established by connecting with non-JPS clinics (126675104.2.10). Additional patient education and chronic disease management will be established by first medical responders through the partnership with MedStar (126675104.2.8). Furthermore, integrating virtual psychiatric support (126675104.2.9) and other forms of behavioral health care into primary care settings (126675104.2.6) in conjunction with a behavioral health discharge management program (126675104.2.7) will greatly increase primary and mental health care access for behavioral health and substance abuse patients. Interventions mentioned above will significantly reduce all-cause PPAs starting in DY4.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline
measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

JPS will begin to report on all required eight measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** JPS Health Network/126675104  
**Unique RHP identification number:** 126675104.4.3

**Domain Descriptions:**
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, JPS will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Successful Category 1 interventions will result in various health care improvements during the waiver period. Expanding behavioral health clinic hours (126675104.1.1) will increase the access of care for behavioral health patients and lower the readmission rate for affected populations. Expanding specialty care to the PCMH (126675104.2.2) and establish a nurse staffed call center (126675104.1.2) will decrease the all-cause readmission rate by providing timely care to patients with chronic diseases.

A mental health discharge management program will provide further improvement to reduce behavioral health and substance abuse readmission rate. A partnership with MedStar (126675104.2.8) to establish a nurse triage 9-1-1 program and in-home CHF management program will facilitate patient navigation and encourage self disease management to reduce the CHF readmission rate. Improving patient navigation through the care transitions program (126675104.2.5) and development of an advanced PCMH (126675104.2.2) will facilitate utilization of primary and preventive care in the right setting and time, reducing the all-cause 30-day readmission rate. Connecting chronic patients in the JPS network to non-JPS clinics (126675104.2.10) to provide continuous care will have a significant impact on chronic disease readmission rates. Implementation of inpatient rehabilitation care, palliative care, and pain management program will help reduce all-cause 30 days readmission rate.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPR rate.
JPS will begin to report on all required seven measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 3: Potentially Preventable Complications

Performing Provider Name/TPI: JPS Health Network/126675104
Unique RHP identification number: 126675104.4.4

Domain Descriptions:
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, JPS will prepare its data systems for reporting this domain as well.

Some of the JPS DSRIP projects target specific JPS healthcare practices to reduce PPCs. The newly developed Innovation and Transformation Center will utilize various data-driven tools such as Lean, Six Sigma and Rapid Cycle Improvements to coordinate the implementation of major organizational performance improvement and transformational activities. The priority during the waiver period will be focusing on reducing the following PPCs: venous thrombosis, surgical site infections, in-hospital trauma and fractures from falls, catheter-associated urinary tract infections, and central line-associated bloodstream infections. Implementing and improving compliance with the sepsis resuscitation bundle (126675104.2.12) will directly impact the occurrence of hospital acquired septicemia and severe infections in the ED and ICU. A specialized wound center established as part of the Expanding Specialty Care project (126675104.1.3) will provide direct interventions to decrease the rate of decubitus ulcer occurrence. The Journey to Life project will reduce associated obstetric complications by promoting perinatal best practices among pregnant women.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

JPS will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** JPS Health Network/126675104  
**Unique RHP identification number:** 126675104.4.5

**Domain Descriptions:**  
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. During DY2, JPS will ensure that its data systems are optimized to report this domain.

JPS has proposed several quality-based projects with DSRIP that target the improvements of patient satisfaction and medication management.

The JPS Cares project (126675104.2.11) will develop a patient experience focus team within the organization to provide additional patient satisfaction trainings to staff, facilitate shared lessons learned, and expand the Patient and Family Advisory Council to represent voice of the patients. In addition, implementation of successful inpatient rehabilitation care, palliative care, and pain management program can indirectly influence patient satisfaction score. Redesigning financial incentive program and establish innovation and transformation center to improve care efficiency can also increase patient satisfaction score. Patient satisfaction scores based on HCAHPS will observe improvements throughout the waiver period.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of JPS Care project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

There is no DSRIP projects focuses on medication management at this time. Therefore no measureable impact is expected on medication management.

JPS will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**  
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** JPS Health Network/126675104  
**Unique RHP identification number:** 126675104.4.6

**Domain Descriptions:**
Initial analysis of the current JPS healthcare reporting system indicates a time tracking system is already in place and will be modified or improved to satisfy the requirement of this reporting domain. There is no DSRIP project associated with this reporting domain and therefore no measureable impact is expected for this domain related to the intervention.

JPS will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 6: Children and Adult Core Measures**

**Performing Provider Name/TPI:** JPS Health Network/126675104  
**Unique RHP identification number:** 126675104.4.7

**Domain Descriptions:**  
JPS will participate in the optional Reporting Domain with separated measurement sets for children and adults. Initial analysis of the current JPS healthcare reporting system indicates this data system is already in place and will be modified or improved to satisfy the requirement of this reporting domain. Many of JPS DSRIP projects will bring improvements to each measurement over the course of the waiver period.

The selected chronic diseases admission rates in RD 6 will be impacted by the same Category 1 and Category 2 projects listed in RD 1 narratives. Plan all-cause readmission rate will be improved by the same projects described in RD 2. Financial incentive redesign project will effect the elective delivery rate and antenatal steroids usage rate. The Journey to Life project aims to promote perinatal care and decrease elective deliveries for all JPS obstetric patients. With increasing perinatal care, the percentage of live births weighing less than 2,500 grams will be significantly reduced. The JPS Health Network-wide care transitions program (126675104.2.5) will produce positive impact on the care transitions measures.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures.

JPS will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**  
JPS has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
## Category 4: Population-Focused Measures

**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Azle/ 127304703  
**Unique RHP identification number:** 127304703.4.X

**Domain Descriptions:**  
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Harris Methodist Fort Worth (THAZ) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Successful Category 1 interventions will lead to health care improvements throughout the waiver period. Expanding primary care capacity (127304703.1.1) is critical to expand the medical home model and redesign primary care. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improve all-cause readmissions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementing our HELP CDSMP-based intervention (127304703.2.1) for uninsured and disadvantaged adults with a serious chronic condition will have a positive impact on all cause admissions.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate. Implementation of the sepsis bundle (112677302.2.4) will also have a positive impact on readmissions.

THAZ will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**  
THAZ has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Texas Health Harris Methodist Azle/ 127304703
Unique RHP identification number: 127304703

Domain Descriptions:
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAZ will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Successful Category 1 interventions will lead to health care improvements throughout the waiver period. Expanding primary care capacity (127304703.1.1) is critical to expand the medical home model and redesign primary care. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improve all-cause PPR.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementing our HELP CDSMP-based intervention (127304703.2.1) for uninsured and disadvantaged adults with a serious chronic condition will have a positive impact on all-cause PPR.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPR rate.

THAZ will begin to report on all required seven measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THAZ has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Azle/ 127304703  
**Unique RHP identification number:** 127304703

**Domain Descriptions:**
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAZ will prepare its data systems for reporting this domain as well.

Primary care capacity, access, and efficiency attained in primary care clinics (127304703.1.1) along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes and preventing potential complications related to chronic disease processes. Additional staff members and providers are necessary to increase capacity to deliver care. We expect that expanding primary care capacity will have a positive impact on PPC’s.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

THAZ will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THAZ has valued Category 4 at 9% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Azle/ 127304703  
**Unique RHP identification number:** 127304703

**Domain Descriptions:**  
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. During DY2, THAZ will ensure that its data systems are optimized to report this domain.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Expanding primary care access (127304703.1.1) and providing will develop a patient experience focus team within the organization to provide additional patient satisfaction trainings to staff, facilitate shared lessons learned, and expand the Patient and Family Advisory Council to represent voice of the patients. In addition, expanding the scope of the chronic disease self-management patient education can indirectly influence patient satisfaction scores. Patient satisfaction scores based on HCAHPS will observe improvements throughout the waiver period.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of THAZ Care project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

THAZ will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**  
THAZ has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Azle/ 127304703  
**Unique RHP identification number:** 127304703

**Domain Descriptions:**
Currently, all RD-5 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAZ will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

Since this particular measure reports on the decision time to transfer an emergency patient to another facility and *not* the actual transport time, (decision to make the first call form arrival in transferring ED until call initiated) it is advisable that THR work closely with our Care Connect reporting to determine if additional data fields need to be build and collected so a report can be created to meet this NQF 0497 measure. During our preliminary review, it appears that we may be able to utilize a MU report that does capture NQF 0497 for all THR entities participating in MU. In addition, a clear time frame in which the reporting period should encompass needs to be stated clearly.

We expect the walk-in care clinic (127304703.1.1) to have a positive impact on this domain by providing appropriate health care resources to assist those with urgent and emergent care needs thereby expanding primary care and urgent care access to patients and increasing capacity in the ED.

THAZ will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THAZ has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 6: Children and Adult Core Measures**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Azle/ 127304703  
**Unique RHP identification number:** 127304703

**Domain Descriptions:**
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

**Domain Valuation:**
THR will not report on RD-6 and, as such, no value has been assigned to this domain.
### Category 4: Population-Focused Measures

**Texas Health Harris Methodist Azle / 127304703**

| Grand Total Payments Across Category 4 | $21,728 | $76,048 | $81,480 | $81,480 |
Wise Regional
130606006
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Wise Regional Health System/130606006  
**Unique RHP identification number:** 130606006.4.2

**Domain Descriptions:**
Currently, two of the eight Potentially Preventable Admissions (PPA) measurements are being tracked and reported in a form of public healthcare statistics. Reporting Domain measures RD-1.7 Bacterial Pneumonia Immunization and RD-1.8 Influenza Immunization are being captured and reported as part of Wise Regional Health System’s (WRHS) Core Measure requirements. The remaining measurements pertaining to this Reporting Domain have yet to be addressed; these include RD-1.1 Congestive Heart Failure Admission Rate, RD-1.2 Diabetes Admission Rates, RD-1.3 Behavioral Health and Substance Abuse Admission Rate, RD-1.4 Chronic Obstructive Pulmonary Disease or Asthma in Adults Admission Rate, RD-1.5 Hypertension Admission Rate, and RD-1.6 Pediatric Asthma. Many DSRIP projects will provide interventions to WRHS patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data needed to report these measures.

All eight Reporting Domain measures will be positively impacted through the implementation of the DSRIP projects WRHS has selected. Specifically, project 2.1.1 Enhance/Expand Medical Homes will positively affect RD-1.2 Diabetes Admission Rates. The primary care physicians involved in the Patient Centered Medical Home (PCMH) project will create a registry in which patients diagnosed with either controlled or uncontrolled diabetes will be entered, monitored and maintained using a patient centered approach. The goal of the project is to improve over-all care for these patients, which in turn should reduce diabetes related hospital admissions.

Project 2.13.1 Design and Implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse utilizing a disease model with evidence-based therapies and services, should reduce RD-1.3 Behavioral Health and Substance Abuse Admission Rate. The goal of the IOP is to rehabilitate while promoting an over healthy lifestyle. It is anticipated that participation in this program will lead to good health practices and preventive measures that would reduce the need for hospital admission.

Project 1.1.1 Expand Pediatric Primary Care will positively affect measure RD-1.6 Pediatric Asthma with a measure of pediatric patients that return to the ED for asthma treatment within 15 days. The implementation of this project will reduce this measure by capturing the target population, pediatric patients currently the ED for low-level acute care management or chronic conditions, and redirecting them to pediatric primary care services. In turn pediatric primary care
providers will manage patients with chronic conditions, such as asthma, resulting in a reduction of ED pediatric asthma related visits.

Project 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model to improve care transitions will use measure RD-1.1 Congestive Heart Failure Admission Rate as a reporting metric. It is WRHS’ goal to reduce this measure by 10% over the demonstration period. Project 2.12.1 will focus on improving this measure through the implementation of a Care Coordination Program designed to expand and enhance patient education and follow-up care through the organization and expansion of post-discharge resources available through-out the community; while providing guidance and follow-up pertaining to these resources. Special attention will be paid to Congestive Heart Failure patients as the care coordination project is implemented and patients are selected participate.

It is anticipated that there will be an overall steady decline in all Potentially Preventable Admissions as DSRIP projects are implemented. Baseline rates for measure RD1-1, Congestive Heart Failure Admission Rate will be established in DY2. In DY3, baseline rates will be established for the additional 7 RD 1 measures. Also during this year, it is projected that measure RD1-1 will see a 3% reduction. Throughout DY4-5 it is anticipated that those measures directly correlated to our projects, RD1-3 and RD1-1 will see a yearly reduction of approximately 3%. In DY4 and 5, WRHS will measure and report all eight of these metrics to HHSC on an annual basis.

**Domain Valuation:**
The total combined dollars allocated to Category 4 based on the Funding and Mechanics Protocol (PFM) and based on the individual project values from our three projects were added together to get a Category 4 Total. This total was per year based on the PFM. The amount per demonstration year was divided equally for each eligible domain within the demonstration year.

WRHS has several DSRIP projects that will be implemented throughout the demonstration period. It is anticipated that as these projects are implemented there will be improvement across all Category 4 measures. In addition to the introduction of projects, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report all Category 4 measures. It is our assumption that this will be a gradual process that encompasses all 5 demonstration years. Therefore, WRHS has taken the value given to the project and divided it evenly and applied that amount to each demonstration year.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Wise Regional Health System/130606006
Unique RHP identification number: 130606006.4.3

Domain Descriptions:
Currently, one of the seven Potentially Preventable Readmissions measurements, RD-2.1 Congestive Heart Failure 30-Day Readmissions, is being tracked and reported in a form of public healthcare statistics. Measurements pertaining to this domain that are not currently being reported include, RD-2.2 Diabetes 30-Day Readmissions, RD-2.3 Behavioral Health and Substance Abuse 30-Day Readmissions, RD-2.4 Chronic Obstructive Pulmonary Disease (COPD) 30-Day Readmissions, RD-2.5 Stroke 30-Day Readmissions, RD-2.6 Pediatric Asthma 30-Day Readmissions and All-Cause 30-Day Readmissions. Many DSRIP projects will provide interventions to Wise Regional Health System patients in multiple areas, resulting in improvement of PPRs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report these measures.

All eight Reporting Domain measures will be positively impacted through the implementation of the DSRIP projects WRHS has selected. Specifically, project 2.1.1 Enhance/Expand Medical Homes will positively affect RD-2.2 Diabetes 30-Day Readmissions. The primary care physicians involved in the Patient Centered Medical Home (PCMH) project will create a registry in which patients diagnosed with either controlled or uncontrolled diabetes will be entered, monitored and maintained using a patient centered approach. The goal of the project is to improve over-all care for these patients, which in turn should reduce diabetes related hospital admissions and readmissions.

Project 2.13.1 Design and Implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse utilizing a disease model with evidence-based therapies and services, should reduce RD-2.3 Behavioral Health and Substance Abuse 30-Day Readmissions. The goal of the IOP is to rehabilitate while promoting an overall healthy lifestyle. It is anticipated that participation in this program will lead to good health practices and preventive measures that would reduce the need for hospital admission and readmissions.

Project 2.12.1 will focus on improving this measure through the implementation of a Care Coordination Program
designed to expand and enhance patient education and follow-up care through the organization and expansion of post-discharge resources available throughout the community; while providing guidance and follow-up pertaining to these resources.

It is anticipated that there will be an overall steady decline in all Potentially Preventable Readmissions as DSRIP projects are implemented. In DY2 baseline will be established for measure RD2-7 All-Cause 30-Day Readmissions, and subsequently in DY 3-5 a reduction in the baseline measure of 3% per year. Baseline measures for the six remaining metrics will be determined in DY3. In DY4 and 5, WRHS will measure and report all eight of these metrics to HHSC on an annual basis.

Based on the data from DY1, October 1, 2011 through September 30, 2012, WRHS is exempt from reporting measure RD-2.6 Pediatric Asthma 30-Day Readmissions, because less than five pediatric asthma readmissions occurred. This exemption qualification was set forth in the RHP Companion Document Section V: DSRIP Projects.

**Domain Valuation:**
The total combined dollars allocated to Category 4 based on the Funding and Mechanics Protocol (PFM) and based on the individual project values from our three projects were added together to get a Category 4 Total. This total was per year based on the PFM. The amount per demonstration year was divided equally for each eligible domain within the demonstration year.

WRHS has several DSRIP projects that will be implemented throughout the demonstration period. It is anticipated that as these projects are implemented there will be improvement across all Category 4 measures. In addition to the introduction of projects, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report all Category 4 measures. It is our assumption that this will be a gradual process that encompasses all 5 demonstration years. Therefore, WRHS has taken the value given to the project and divided it evenly and applied that amount to each demonstration year.
**Reporting Domain 3:** Potentially Preventable Complications

**Performing Provider Name/TPI:** Wise Regional Health System/130606006  
**Unique RHP identification number:** 130606006.4.4

**Domain Descriptions:**
Wise Regional Health System (WRHS) is not currently tracking or reporting Potentially Preventable Complications (PPCs) in a form of public healthcare statistics or internally maintaining this information. However, WRHS does have access and is aware of the data pertaining to these 64 metrics which is being collected and maintained by HHSC. Many DSRIP projects will provide interventions to WRHS patients in multiple areas, resulting in improvement of PPCs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data available to providers. In addition, WRHS will determine necessity and if needed establish new protocols for data collecting and reporting Potentially Preventable Complications.

These measures are not directly correlated to any of our Category 2 or 3 projects. However, these measures should see improvement indirectly through the implementation of all of our Category 2 and 3 projects. Project 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model is designed to further develop and enhance the capabilities of our care management program. In theory, this project indirectly reduces potentially preventable complications through increased communication and continued outreach to the participating patients, paired with improved data collection and tracking capabilities. Project 2.13.1 Design and Implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse utilizing a disease model with evidence-based therapies and services and project 2.1.1 Enhance/Expand Medical Homes promote overall health through patient centered concepts. These models are based on improved communication and documentation, so in theory the implementation of these projects should increase the likelihood of capturing patients susceptible to PPCs and indirectly decrease the number of occurrences.

It is anticipated that there will be an overall steady decline in all Potentially Preventable Complications as DSRIP projects are implemented. Over In DY’s 2-5, Wise Regional Health System has determined that efforts will be made to evaluate current processes, establish new protocols for data collecting and reporting, and optimize our existing data collecting system. It is anticipated that through this process improvements will be made and our ability to obtain and report this measure will increase. Baseline measurements will be established in DY3. In DY4 and 5, WRHS will measure and report all eight of these metrics to HHSC on an annual basis.

**Domain Valuation:**
The total combined dollars allocated to Category 4 based on the Funding and Mechanics Protocol (PFM) and based on the individual project values from our three projects were added.
together to get a Category 4 Total. This total was per year based on the PFM. The amount per demonstration year was divided equally for each eligible domain within the demonstration year.

WRHS has several DSRIP projects that will be implemented throughout the demonstration period. It is anticipated that as these projects are implemented there will be improvement across all Category 4 measures. In addition to the introduction of projects, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report all Category 4 measures. It is our assumption that this will be a gradual process that encompasses all 5 demonstration years. Therefore, WRHS has taken the value given to the project and divided it evenly and applied that amount to each demonstration year.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Wise Regional Health System/130606006  
**Unique RHP identification number:** 130606006.4.5

**Domain Descriptions:**
Currently, both measurements, RD-4.1 Patient Satisfaction and RD-4.2 Medication Management are being tracked and reported internally. Wise Regional Health System will take efforts to expand optimize our existing data collection system by evaluation of current data collection, investing in upgrades and additional software packages, in efforts to produce significant and accurate reporting.

These measures are not directly correlated to any of our Category 2 or 3 projects. However, these measures should see improvement indirectly through the implementation of all of our Category 2 and 3 projects. Improved communication will indirectly have a positive effect on RD-4.1 Patient Satisfaction. All of our projects, Project 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model, Project 2.13.1 Design and Implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse utilizing a disease model with evidence-based therapies and services, Project 2.1.1 Enhance/Expand Medical Homes, and Project 1.1.1 Expand Pediatric Primary Care, are designed to increase communication to appropriate patient populations while fulfilling their needs. While none of these projects are directly correlated with the measure, it is anticipated that improved communication and guidance through appropriate care will increase our patients’ overall satisfaction. RD-4.2 Medication Management, should indirectly be increased through the implementation of Project 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model, which includes the evaluation and improvement of current hospital processes in regard to patient management for predetermined patient populations, including medication management. While this measure is not directly tied to the project, the review and improvement of processes, namely documentation, should have a positive impact on the medication management measure.

**Over DYs 2-5:** In DY2, Wise Regional Health System has determined that efforts will be made to evaluate current processes, establish new protocols for data collecting and reporting, and optimize our existing data collecting system. It is anticipated that through this process improvements will be made and our ability to obtain and produce significant and accurate reporting in regard to this measure will increase. Baseline measurements will be established in DY3. In DY4 and 5, WRHS will measure and report all eight of these metrics to HHSC on an annual basis.
**Domain Valuation:**
The total combined dollars allocated to Category 4 based on the Funding and Mechanics Protocol (PFM) and based on the individual project values from our three projects were added together to get a Category 4 Total. This total was per year based on the PFM. The amount per demonstration year was divided equally for each eligible domain within the demonstration year.

WRHS has several DSRIP projects that will be implemented throughout the demonstration period. It is anticipated that as these projects are implemented there will be improvement across all Category 4 measures. In addition to the introduction of projects, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report all Category 4 measures. It is our assumption that this will be a gradual process that encompasses all 5 demonstration years. Therefore, WRHS has taken the value given to the project and divided it evenly and applied that amount to each demonstration year.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Wise Regional Health System/130606006
Unique RHP identification number: 130606006.4.6

Domain Descriptions:
A time tracking system is already in place and will be modified or improved to satisfy the requirement of the new Reporting Domain. Wise Regional Health System is currently utilizing a Medhost software package to capture, track and evaluate many Emergency Department related measures. In an effort to better capture the data required for reporting this measure, WRHS will take efforts to evaluate current processes, establish new protocols for data collecting and reporting, and optimize our existing data collecting system.

This measure is not directly correlated to any of our Category 2 or 3 projects. However, this measure should see improvement indirectly through the implementation of all of our Category 2 and 3 projects. RD-5 Emergency Department, should indirectly be improved through the implementation of Project 2.12.1 Develop, implement, and evaluate standardized clinical protocols and evidence-based care delivery model, which includes the evaluation and improvement of current hospital processes with regard to patient management, including Emergency Department admission decision protocol for the patient population targeted by the project. If during the review process, obstacles or more efficient means are determined there will be revisions or new protocols put into place. Any process improvements should positively affect this measure. The remaining three projects, Project 2.13.1 Design and Implement an Intensive Outpatient Program (IOP) for the target population of Behavioral Health/Substance Abuse utilizing a disease model with evidence-based therapies and services, Project 2.1.1 Enhance/Expand Medical Homes, and Project 1.1.1 Expand Pediatric Primary Care, are designed to provide patient care in the appropriate settings, thus decreasing the amount of patients improperly using ED services for non-emergent conditions. In theory, the implementation of these projects will result in increased efficiency through the reduction of demand on ED resources. This will enable our ED providers to increase overall efficiency, theoretically decreasing the measure.

Over DYs 2-5 In DY2, Wise Regional Health System has determined that efforts will be made to evaluate current processes, establish new protocols for data collecting and reporting, and optimize our existing data collecting system. It is anticipated that through this process improvements will be made and our ability to obtain and report this measure will increase. Baseline measurements will be established in DY3. In DY4 and 5, WRHS will measure and report all eight of these metrics to HHSC on an annual basis.

Domain Valuation:
The total combined dollars allocated to Category 4 based on the Funding and Mechanics Protocol (PFM) and based on the individual project values from our three projects were added.
together to get a Category 4 Total. This total was per year based on the PFM. The amount per demonstration year was divided equally for each eligible domain within the demonstration year.

WRHS has several DSRIP projects that will be implemented throughout the demonstration period. It is anticipated that as these projects are implemented there will be improvement across all Category 4 measures. In addition to the introduction of projects, WRHS will take efforts to establish new protocols for data collection and reporting, and optimize our existing data collection system by investing in upgrades and additional software packages designed to expand our ability to obtain the data need to report all Category 4 measures. It is our assumption that this will be a gradual process that encompasses all 5 demonstration years. Therefore, WRHS has taken the value given to the project and divided it evenly and applied that amount to each demonstration year.
### Category 4: Population-Focused Measures

THR Arlington Memorial
13614405
Reporting Domain 1: Potentially Preventable Admissions:

Performing Provider Name/TPI: Texas Health Arlington Memorial (THAM)/130614405
Unique RHP identification number: 130614405.4.2

Domain Descriptions:
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Arlington Memorial (THAM) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THAM is not participating in Category 1 interventions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (130614405.2.4) will facilitate patient navigation and positively impact all-cause admission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (130614405.2.1) will reduce diabetes admission rate. Establishing a heart failure clinic (130614405.2.2) will provide additional post-acute care for heart failure patients. Interventions mentioned above will significantly improve all-cause PPA starting in DY4.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

THAM will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Texas Health Arlington Memorial (THAM)/130614405  
**Unique RHP identification number:** 130614405.4.3

**Domain Descriptions:**
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAM will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THAM is not participating in Category 1 interventions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (130614405.2.4) will facilitate patient navigation and positively impact all-cause readmission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (130614405.2.1) specifically will reduce diabetes readmission rate. Additionally, we expect the heart failure clinic (130614405.2.2) to have a significant impact on CHF readmission rate by providing additional post-acute care for heart failure patients.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPR rate.

THAM will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Arlington Memorial (THAM)/130614405  
**Unique RHP identification number:** 130614405.4.4

**Domain Descriptions:**  
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAM will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THAM is not participating in Category 1 interventions.

Category 2 interventions that will target specific THAM healthcare practices to reduce PPC’s include implement innovative evidence-based strategies to reduce low birth weight and preterm birth (130614405.2.3). The Prenatal Clinic provides an avenue for those who might not otherwise obtain prenatal care to receive this care. Complications associated with obstetrics can be reduced through the provision of prenatal care and early identification of/intervention with patients at risk for obstetrical complications.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPC rate.

THAM will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**  
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Texas Health Arlington Memorial (THAM)/130614405
**Unique RHP identification number:** 130614405.4.5

**Domain Descriptions:**
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAM will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THAM is not participating in Category 1 interventions.

The only Category 2 intervention that will target this RD specifically is the heart failure clinic (130614405.2.2). A component of this project includes Medication Management as enhanced inpatient screening and discharge processes will verify completion of medication reconciliation and assist patient in understanding and/or obtaining necessary medications prior to discharge.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the heart failure clinic project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Texas Health Arlington Memorial (THAM)/130614405
Unique RHP identification number: 130614405.4.6

Domain Descriptions:
Currently, all RD-5 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THAM will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THAM is not participating in Category 1 interventions.

Since this particular measure reports on the decision time to transfer an emergency patient to another facility and not the actual transport time, (decision to make the first call form arrival in transferring ED until call initiated) it is advisable that THR work closely with our Care Connect reporting to determine if additional data fields need to be build and collected so a report can be created to meet this NQF 0497 measure. During our preliminary review, it appears that we may be able to utilize a MU report that does capture NQF 0497 for all THR entities participating in MU. In addition, a clear time frame in which the reporting period should encompass needs to be stated clearly.

We expect the Patient Care Navigation project (130614405.2.4) to have a positive impact on this domain by helping to navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care.

THAM will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 6:  Children and Adult Core Measures

Performing Provider Name/TPI: Texas Health Arlington Memorial (THAM)/130614405
Unique RHP identification number: 130614405.4.7

Domain Descriptions:
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

Domain Valuation:
THR will not report on RD-6 and, as such, no value has been assigned to this domain.

**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Cleburne / 131036903  
**Unique RHP identification number:** 131036903

**Domain Descriptions:**
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Cleburne Hospital (THC) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values Category 3 outcomes.

The use of APRNs (131036903.1.1) as intermediate care providers will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. Expanding primary care capacity is critical to expand the medical home model and redesign primary care. Primary care capacity, access, and efficiency attained in primary care clinics along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes.

Category 3 outcomes: By the end of the waiver, our goal is to have ≥10% of patients 18 years and older who are uninsured or underfunded seen in a primary care setting (either a THC based urgent care clinic or the JC HOPE Clinic), therefore decreasing the rate of potential admissions.

This project’s Category 4 Reporting Domain includes RD-1 Potentially preventable admissions (PPAs) in low-income, Medicaid, and uninsured Johnson County adult population with the reporting measures of RD-1.1 CHF, RD-1.2 Diabetes with short-term complications or uncontrolled diabetes, and RD-1.4 COPD or asthma. This project will support, reinforce, and enable other projects through its design and intervention for the above described patient population by adding to best practices and lessons learned.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.
THC will begin to report on all required eight measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**

THC and Texas Health Resources have valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Texas Health Harris Methodist Cleburne / 131036903
Unique RHP identification number: 131036903

Domain Descriptions:
Currently, all RD-2 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THC will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will be performed in compliance with HHSC and AHRQ guidelines. New implementations and any modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match the new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

The use of APRNs (131036903.1.1) as intermediate care providers will decrease the readmission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care. Expanding primary care capacity is critical to expand the medical home model and redesign primary care.

Target population: The identified target populations of patients the urgent care clinic will service are Non-Funded /self-pay without access to additional resources and high frequency of inpatient admissions and ER visits within the last 6 months. The identified target populations of patients the urgent care clinic will service are:
   a) Diagnoses to include COPD, heart failure, diabetes
   b) Non-funded/self-pay without access to additional resources
   c) High frequency of inpatient admissions and ED visits within the last six months

THC will begin to report on all required seven measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 3: Potentially Preventable Complications

Unique Project ID: 131036903.1.1
Performing Provider Name/TPI: Texas Health Harris Methodist Cleburne / 131036903

Domain Descriptions:
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THC will prepare its data systems for reporting this domain as well.

Primary care capacity, access, and efficiency attained in primary care clinics (131036903.1.1) along with restructuring primary care to be delivered in a proactive, organized, population-health focused manner are foundational to improving patient outcomes and preventing potential complications related to chronic disease processes. Additional staff members and providers are necessary to increase capacity to deliver care.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 will serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the corresponding PPC rate.

THR will begin to report on all required PPC measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 4: Patient-Centered Healthcare**

**Unique Project ID:** 131036903.1.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Cleburne / 131036903

**Domain Descriptions:**
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. During DY2, THC will ensure that its data systems are optimized to report this domain.

THC has proposed several quality-based projects with DSRIP that target the improvements of patient satisfaction and medication management.

The THC Unique Project ID 131036903.1.1 will develop a patient experience focus team within the organization to provide additional patient satisfaction trainings to staff, facilitate shared lessons learned, and expand the Patient Advisory Council to represent voice of the patients. The identified target populations of patients the urgent care clinic will service are Non-Funded /self-pay without access to additional resources and high frequency of inpatient admissions and ER visits within the last 6 months.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the THC project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

THC will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THC has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 5: Emergency Department**

**Unique Project ID:** 131036903.1.1  
**Performing Provider Name/TPI:** Texas Health Harris Methodist Cleburne / 131036903

**Domain Descriptions:**
The use of APRNs as intermediate care providers will decrease the admission rates of the described population of patients in the ED and increase the usage of resources within the community for primary care is the focus of this unique project.

Improvement targets for both outcome measures chosen were selected based on populations of patients the project proposes to serve, and align with the goal of decreasing inappropriate utilization of the ED by providing an alternative in an urgent care clinic (131036903.1.1) managed by APRNs, and partnering with the JC HOPE clinic to provide primary care resources for patients who currently do not have access to primary care.

THC will begin to report the required measures, during reporting period 1 annually to HHSC, starting in DY3 as required.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 6: Children and Adult Core Measures

Unique Project ID: 131036903.1.1
Performing Provider Name/TPI: Texas Health Harris Methodist Cleburne / 131036903

Domain Descriptions:
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

Domain Valuation:
THR will not report on RD-6 and, as such, no value has been assigned to this domain.
## Category 4: Population-Focused Measures

**Texas Health Harris Methodist Cleburne Hospital / 131036903**

**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth/135036506  
**Unique RHP identification number:** 135036506.4.2

**Domain Descriptions:**  
Baylor All Saints Medical Center at Fort Worth will report all the measurements starting on the designated reporting year. Initial analysis of the current Baylor All Saints Medical Center at Fort Worth healthcare reporting system indicates further refinement and definition will be required for some of the required metrics. The reporting system has the capability to track and report the required measurements but will require additional work to get the exact required specifications. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 8 of the eight measurements are being tracked and reported at Baylor All Saints Medical Center at Fort Worth. In addition, many regional DSRIP projects will provide interventions to Baylor All Saints Medical Center at Fort Worth patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Baylor All Saints Medical Center at Fort Worth will expand the existing data collecting system, and optimize the old system for new reporting processes.

The measurement period for this domain per HHSC will be the calendar year and the reporting period Baylor All Saints Medical Center has chosen will be 10/1 to 3/31.

The PPA domain in Category 4 has 8 components. Although the impact of the Baylor All Saints Medical Center at Fort Worth’s DSRIP projects on the PPA domain will not be known until the latter years of the waiver, the projects we have chosen will help to facilitate improvements in the PPA domain. The projects and outcomes listed below will help to reduce/prevent PPAs in patients who engage in these programs, are actively managed and have their conditions under control.

The table below summarizes the projects and outcomes that potentially relate to the PPA domain. Whether marked improvement will occur at a population level is uncertain.

<table>
<thead>
<tr>
<th>Category 4</th>
<th>RD1-PPA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cat 1, 2, &amp; 3</td>
<td>1.1 1.2 1.3 1.4 1.5 1.7 1.8</td>
</tr>
</tbody>
</table>
| **135036506.1.1: Expand Primary Care Capacity**  
**Baylor Clinic Capacity Expansion** | X X X X X X |
| IT 1.7 Controlling high blood pressure | X X |
| IT 12.5 Influenza Vaccination rate | X X |
We expect that once patients are under the care of a PCMH and have their clinical and social needs met, that PPAs should improve. Getting patients into a PCMH, managing their chronic diseases, behavioral health, specialty care and care coordination needs will help to reduce PPAs.

**Domain Valuation:**
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

All of the required reporting domains are pertinent in transforming the healthcare of RHP 10. Each domain focuses on outcomes that will positively impact the community and each of the performing providers. At Baylor All Saints Medical Center at Fort Worth, the rigor of data collection is the same for each domain. Thus, we valued each of the outcome domains at the same dollar amount.
Reporting Domain 2: Potentially Preventable Readmissions

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth/135036506
Unique RHP identification number: 135036506.4.3

Domain Descriptions:
Baylor All Saints Medical Center at Fort Worth will report all the measurements starting on the designated reporting year. Initial analysis of the current Baylor All Saints Medical Center at Fort Worth healthcare reporting system indicates further refinement and definition will be required for some of the required metrics. The reporting system has the capability to track and report the required measurements but will require additional work to get the exact required specifications. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 7 of the seven measurements are being tracked and reported at Baylor All Saints Medical Center at Fort Worth. In addition, many regional DSRIP projects will provide interventions to Baylor All Saints Medical Center at Fort Worth patients in multiple areas, resulting in improvement of PPRs throughout all measurements in the Reporting Domain. One note is that PPRs are reported within Baylor Health Care System only. Thus, if a patient presents at a Baylor facility and then is readmitted at another provider’s facility, we cannot capture that data.

Currently, HHSC will make potentially preventable event data to providers. In addition, Baylor All Saints Medical Center at Fort Worth will expand the existing data collecting system, and optimize the old system for new reporting processes.

The measurement period for this domain per HHSC will be the calendar year and the reporting period Baylor All Saints Medical Center has chosen will be 10/1 to 3/31.

The PPR domain in Category 4 has 7 components. Although the impact of the Baylor All Saints Medical Center at Fort Worth’s DSRIP projects on the PPR domain will not be known until the latter years of the waiver, the projects we have chosen will help to facilitate improvements in the PPR domain. The projects and outcomes listed below will help to reduce/prevent PPRs in patients who engage in these programs, are actively managed and have their conditions under control.

The table below summarizes the projects and outcomes that potentially relate to the PPR domain. Whether marked improvement will occur at a population level is uncertain.

We expect that once patients are under the care of a PCMH and have their clinical and social needs met, that PPRs should improve. Getting patients into a PCMH, managing their chronic diseases, behavioral health, specialty care and care coordination needs will help to reduce PPRs.

**Domain Valuation:**

All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

All of the required reporting domains are pertinent in transforming the healthcare of RHP 10. Each domain focuses on outcomes that will positively impact the community and each of the performing providers. At Baylor All Saints Medical Center at Fort Worth, the rigor of data collection is the same for each domain. Thus, we valued each of the outcome domains at the same dollar amount.
Reporting Domain 3: Potentially Preventable Complications

Performing Provider Name/TPI: Baylor All Saints Medical Center at Fort Worth/135036506
Unique RHP identification number: 135036506.4.4

Domain Descriptions:
Baylor All Saints Medical Center at Fort Worth will report all the measurements starting on the designated reporting year. Initial analysis of the current Baylor All Saints Medical Center at Fort Worth healthcare reporting system indicates further refinement and definition will be required for some of the required metrics. The reporting system has the capability to track and report the required measurements but will require additional work to get the exact required specifications. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, many of the sixty four measurements are being tracked and reported at Baylor All Saints Medical Center at Fort Worth. In addition, many regional DSRIP projects will provide interventions to Baylor All Saints Medical Center at Fort Worth patients in multiple areas, resulting in improvement of PPCs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Baylor All Saints Medical Center at Fort Worth will expand the existing data collecting system, and optimize the old system for new reporting processes.

The measurement period for this domain per HHSC will be the calendar year and the reporting period Baylor All Saints Medical Center has chosen will be 10/1 to 3/31.

The PPC domain in Category 4 has 1 component with 64 reportable measures. Although the impact of the Baylor All Saints Medical Center at Fort Worth’s DSRIP projects on the PPC domain will not be known until the latter years of the waiver, the projects we have chosen will help to facilitate improvements in the PPC domain. The projects and outcomes listed below will help to reduce/prevent PPCs in patients who engage in these programs, are actively managed and have their conditions under control. We expect that once patients are under the care of a PCMH and have their clinical and social needs met, that PPCs should improve. Getting patients into a PCMH, managing their chronic diseases, behavioral health, specialty care and care coordination needs will help to reduce PPCs in the inpatient setting. For example, helping a patient control their diabetes in the outpatient setting may help to reduce PPC # 26: Diabetic Ketoacidosis and Coma or PPC #38 Post Operative Infection and Deep Wound Disruption with Procedure (if a patient has well controlled diabetes, they may be less susceptible to post operative infections). The correlation between outpatient management and PPCs is weak and the overall impact of outpatient interventions on PPCs may be minimal.
The table below summarizes the projects and outcomes that potentially relate to the PPC domain. Whether marked improvement will occur at a population level is uncertain.

**Domain Valuation:**

All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

All of the required reporting domains are pertinent in transforming the healthcare of RHP 10. Each domain focuses on outcomes that will positively impact the community and each of the performing providers. At Baylor All Saints Medical Center at Fort Worth, the rigor of data collection is the same for each domain. Thus, we valued each of the outcome domains at the same dollar amount.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth/135036506  
**Unique RHP identification number:** 135036506.4.5

**Domain Descriptions:**

Baylor All Saints Medical Center at Fort Worth will report all the measurements starting on the designated reporting year. Initial analysis of the current Baylor All Saints Medical Center at Fort Worth healthcare reporting system indicates further refinement and definition will be required for some of the required metrics. The reporting system has the capability to track and report the required measurements but will require additional work to get the exact required specifications. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Currently, 2 of the two measurements are being tracked and reported internally within the Baylor Healthcare System’s Office of Patient Centeredness and Quality Reporting and Analytics departments. Although Baylor All Saints Medical Center at Fort Worth does not have any projects directly related to patient satisfaction in the inpatient realm, one of our care navigation projects will most likely positively impact inpatient patient satisfaction. Baylor All Saints Medical Center at Fort Worth will expand existing data collecting systems, and optimize the old system for new reporting processes.

Baylor All Saints Medical Center at Fort Worth does not have any projects that directly address patient satisfaction measures in the inpatient setting. We do have projects in the ambulatory realm which will measure the impact of patient satisfaction. We do believe that the Care Connect project mentioned in the table below will help improve patient satisfaction scores in the inpatient setting through providing care coordination and continuity of care services.

<table>
<thead>
<tr>
<th>Category 4</th>
<th>RD4- IP Pat Sat</th>

<td>X X</td>
</tr>
</tbody>
</table>

We expect to see improvements in patient satisfaction for those patients who have engaged in the Care Connect program. Historically, we have not measured this impact of the program and thus do not have any data on the direct impact on patient satisfaction.
Domain Valuation:
All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

All of the required reporting domains are pertinent in transforming the healthcare of RHP 10. Each domain focuses on outcomes that will positively impact the community and each of the performing providers. At Baylor All Saints Medical Center at Fort Worth, the rigor of data collection is the same for each domain. Thus, we valued each of the outcome domains at the same dollar amount.
**Reporting Domain 5: Emergency Department**

**Performing Provider Name/TPI:** Baylor All Saints Medical Center at Fort Worth/135036506  
**Unique RHP identification number:** 135036506.4.6

**Domain Descriptions:**  
Baylor All Saints Medical Center at Fort Worth will report all the measurements starting on the designated reporting year. Initial analysis of the current Baylor All Saints Medical Center at Fort Worth healthcare reporting system indicates further refinement and definition will be required for some of the required metrics. The reporting system has the capability to track and report the required measurements but will require additional work to get the exact required specifications. New system implementation and improvement of the current reporting infrastructure to fulfill reporting requirement for each of the 5 Category 4 domains will be carried out during DY2 and DY3. We anticipate having full Category 4 reporting capability by the end of DY3.

Baylor All Saints Medical Center at Fort Worth has the data infrastructure and processes to track admit decision time to discharge. Some modification may be required to satisfy the requirement of new reporting domain.

This domain only has 1 component which measures the time between admit decision to discharge in the ED. The majority of our projects are not physically located in the hospital other than our Care Connect program. We anticipate that if a patient is identified as a candidate for Care Connect in the ED, they can be triaged to community based or non-hospital based resource more quickly, leading to a shorter admit to discharge time duration.

<table>
<thead>
<tr>
<th>Category 4</th>
<th>RD5-ED</th>
</tr>
</thead>
<tbody>
<tr>
<td>135036506.2.3: Establish/Expand a Patient Care Navigation Program- Care Connect</td>
<td>X</td>
</tr>
<tr>
<td>IT 5.1 Improve cost savings</td>
<td></td>
</tr>
<tr>
<td>IT 9.2 ED appropriate utilization</td>
<td>X</td>
</tr>
</tbody>
</table>

We expect that as the Care Connect program develops and expands that the time patients spend in the ED will decrease. Care Connect entails a comprehensive care coordination and case management system which can help to move patients to appropriate care settings more quickly.
**Domain Valuation:**

All Region 10 providers required to participate in Category 4 reporting have taken no more than the 10% allocation and forgone the optional reporting domain. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

All of the required reporting domains are pertinent in transforming the healthcare of RHP 10. Each domain focuses on outcomes that will positively impact the community and each of the performing providers. At Baylor All Saints Medical Center at Fort Worth, the rigor of data collection is the same for each domain. Thus, we valued each of the outcome domains at the same dollar amount.

THR Hurst-Euless-Bedford
136326908
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hurst Euless Bedford/136326908  
**Unique RHP identification number:** 136326908.4.2

**Domain Descriptions:**
Currently, all RD-1 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, Texas Health Harris Methodist HEB (THHEB) will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THHEB is not participating in Category 1 interventions.

Successful Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (136326908.2.4) will facilitate patient navigation and positively impact all-cause admission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (136326908.2.1) will reduce diabetes admission rate. Expanding current capacity for the heart failure clinic (136326908.2.2) will provide additional post-acute care for heart failure patients. Furthermore, integrating behavioral health services into primary care settings (136326908.2.3) will greatly increase primary and mental health care access for behavioral health and substance abuse patients. Interventions mentioned above will significantly improve all-cause PPA starting in DY4.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPA rate.

THHEB will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP
dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hurst Euless Bedford/136326908  
**Unique RHP identification number:** 136326908.4.3

**Domain Descriptions:**
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THHEB will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THHEB is not participating in Category 1 interventions.

A mental health discharge management program will provide further improvement to reduce behavioral health and substance abuse readmission rate (136326908.2.3). Other Category 2 interventions will lead to health care improvements throughout the waiver period. Implementation of a patient care navigation program (136326908.2.4) will facilitate patient navigation and positively impact all-cause readmission rate for patients seeking medical care in the Texas Health network. Expanding diabetes specialty care and patient education in primary care settings (136326908.2.1) specifically will reduce diabetes readmission rate. Additionally, we expect the heart failure clinic (136326908.2.2) to have a significant impact on CHF readmission rate by providing additional post-acute care for heart failure patients.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPC rate.

THHEB will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP
dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.

**Reporting Domain 3: Potentially Preventable Complications**

**Performing Provider Name/TPI:** Texas Health Harris Methodist Hurst Euless Bedford/136326908  
**Unique RHP identification number:** 136326908.4.4

**Domain Descriptions:**
Currently, all RD-3 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THHEB will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THHEB is not participating in Category 1 interventions.

Category 2 interventions that will target specific THHEB healthcare practices to reduce PPC’s include implementation of a patient care navigation program (136326908.2.4) to navigate patients to appropriate health care resources and assist those with chronic health care needs in receiving ongoing care.

Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through Category 1 and 2 interventions will feed back into Category 4 reporting measures and reduce the overall all-cause PPC rate.

THHEB will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 4: Patient-Centered Healthcare

Performing Provider Name/TPI: Texas Health Harris Methodist Hurst Euless Bedford/136326908

Unique RHP identification number: 136326908.4.5

Domain Descriptions:
Currently, all RD-4 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THHEB will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THHEB is not participating in Category 1 interventions.

The only Category 2 intervention that will target this RD specifically is the heart failure clinic (136326908.2.2). A component of this project includes Medication Management as enhanced inpatient screening and discharge processes will verify completion of medication reconciliation and assist patient in understanding and/or obtaining necessary medications prior to discharge.

Patient satisfaction Category 3 outcomes and Category 4 reporting measures reinforce each other by sharing similar measurements. The initial reporting value in DY3 from Category 4 can serve as baseline measurements for Category 3 outcomes. In DY4 the improvements in Category 3 outcomes achieved through the successful administration of the heart failure clinic project will feed back into Category 4 reporting measures and improve overall patient satisfaction scores.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Texas Health Harris Methodist Hurst Euless Bedford/136326908
Unique RHP identification number: 136326908.4.6

Domain Descriptions:
Currently, all RD-5 measurements are being tracked and reported as public healthcare statistics. In conjunction with the HHSC-provided PPA/PPR/PPC numbers, THHEB will prepare its data systems for reporting this domain as well.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will take place during DY2 and DY 3 to optimize system compatibility to match new reporting demands. New protocols will be installed to ensure proper reporting functions. Initial reporting data can be used to establish baseline values for Category 1, and 2 projects, and Category 3 outcomes.

THHEB is not participating in Category 1 interventions.

Since this particular measure reports on the decision time to transfer an emergency patient to another facility and not the actual transport time, (decision to make the first call form arrival in transferring ED until call initiated) it is advisable that THR work closely with our Care Connect reporting to determine if additional data fields need to be build and collected so a report can be created to meet this NQF 0497 measure. During our preliminary review, it appears that we may be able to utilize a MU report that does capture NQF 0497 for all THR entities participating in MU. In addition, a clear time frame in which the reporting period should encompass needs to be stated clearly.

We expect the Patient Care Navigation project (136326908.2.3) to have a positive impact on this domain by helping to navigate patients to appropriate health care resources to assist those with chronic health care needs in receiving ongoing care.

THHEB will begin to report on all required measurements in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
THR has valued Category 4 at 15% of the total DSRIP allocation for this hospital. As a region, it was determined that each reporting domain was to be valued equally; thus, prescribed DSRIP dollars per DY were divided by the number of reporting domains to calculate the value for each domain and DY.
Reporting Domain 6: Children and Adult Core Measures

Performing Provider Name/TPI: Texas Health Harris Methodist Hurst Euless Bedford/136326908
Unique RHP identification number: 136326908.4.7

Domain Descriptions:
The child core measure is a domain that THR doesn’t have an enough volume to reliably report or for the measurement to be stable and a domain that would not be statistically significant. THR does not meet the minimum volume requirements for publication of these measures by CMS.

Domain Valuation:
THR will not report on RD-6 and, as such, no value has been assigned to this domain.
### Category 4: Population-Focused Measures

Children’s Medical Center at Dallas
138910807
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807  
**Unique RHP identification number:** 138910807.4.1

**Domain Descriptions:**

Children’s has been reporting and tracking these statistics through Child Health Corporation of America (CHCA), now called Children’s Hospital Association (CHA) for comparison with other stand-alone pediatric hospitals.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will occur during DY2 and DY3 to optimize system compatibility and to meet new reporting requirements. New processes will be implemented to ensure complete and accurate data collection. Category 1 and 2 projects and Category 3 outcomes will use available data to establish baseline and milestone metrics.

Children’s successful implementation of Category 1 interventions will lead to health care improvements during and after the waiver period. Expanding MyChildren’s hours at the Grapevine location (138910807.1.1) will improve access to care by making primary care office visits available outside of the regular office hours. Potentially Preventable Admissions can be avoided with regular primary care. Studies have shown that use of a pediatric nurse triage phone system (138910807.1.1) can reduce unnecessary trips to the emergency room by two thirds while increasing the use of the emergency department or urgent care in 15% of families who would have otherwise stayed at home. Appropriate escalation of care to the most effective setting will decrease the Potentially Preventable Admissions. By implementing disease management programs in the MyChildren’s practice and in school-based clinics in RHP 10 (138910807.1.2), chronic diseases such as asthma can be managed locally with exacerbations of symptoms reduced and thus Potentially Avoidable Admissions prevented. Access to behavioral health services in the MyChildren’s (138910807.1.3) will also decrease Potentially Preventable Admissions, particularly when coupled with disease management for chronic illness. Children with chronic illness are at much higher risk of increased incidence of mental illness which can result increased inpatient admissions.

The Category 2 project to transform the MyChildren’s primary care office into a patient-centered medical home certified by the NCQA (138910807.2.1) will provide timely, effective, culturally sensitive primary care services which will reduce Potentially Preventable Admissions by proactively identifying and treating health issues which could result in hospital admissions.
Improvements in Category 3 outcomes will influence the Category 4 reporting measures by demonstrating the effects of proactively treating health concerns to avoid escalation of care needs including emergency room use and hospital admissions.

All Category 1 and 2 projects and Category 3 outcome measures will support improvements in Category 4 reporting measures including Potentially Preventable Admissions.

Children’s will report on all pediatric-appropriate measures in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

**Domain Valuation:**
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document and influence pediatric healthcare outcomes.
Reporting Domain 2: Potentially Preventable Readmissions:

Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807
Unique RHP identification number: 138910807.4.2

Domain Descriptions:

Children’s has been reporting and tracking these statistics through Child Health Corporation of America (CHCA), now called Children’s Hospital Association (CHA) for comparison with other stand-alone pediatric hospitals.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will occur during DY2 and DY3 to optimize system compatibility and to meet new reporting requirements. New processes will be implemented to ensure complete and accurate data collection. Category 1 and 2 projects and Category 3 outcomes will use available data to establish baseline and milestone metrics.

Children’s successful implementation of Category 1 interventions will lead to health care improvements for pediatric patients during and after the waiver period including long-term health improvements into adulthood. It is important that children receive appropriate outpatient follow-up care after a hospitalization. Anecdotally, discharges at Children’s are often delayed due to the need to secure an outpatient follow-up post discharge, particularly for those patients on Medicaid, CHIP or uninsured. MyChildren’s offices are placed in locations where there are limited number or no pediatricians who accept Medicaid and CHIP. Expanding MyChildren’s hours at the Grapevine location (138910807.1.1) will make more appointments available at times convenient to parents thus increasing the ability to make a follow-up appointment post discharge and lessen the potential for a preventable readmission. Studies have shown that use of a pediatric nurse triage phone system (138910807.1.1) can increase the use of the emergency department for urgent care in 15% of families who would have otherwise stayed at home, unaware of the urgency of their child’s medical condition. Appropriate escalation of care to the most effective setting post inpatient discharge will decrease the Potentially Preventable Readmissions. Many children are hospitalized for chronic disease conditions. Children can be enrolled in the disease management program through the MyChildren’s practice and in school-based clinics in RHP 10 (138910807.1.2) during their inpatient stay. Post discharge, the chronic condition such as asthma can be managed locally with exacerbations of symptoms reduced and thus Potentially Avoidable Readmissions prevented. Access to behavioral health services in the MyChildren’s (138910807.1.3) will also decrease Potentially Preventable Readmissions, particularly when coupled with disease management for chronic illness. Children with chronic
illness are at much higher risk of increased incidence of mental illness which can result in increased inpatient admissions.

The Category 2 project to transform the MyChildren’s primary care office into a patient-centered medical home certified by the NCQA (138910807.2.1) will provide timely, effective, culturally sensitive primary care services. Since the medical home is designed to manage a child’s medical condition holistically, missed follow-up appointments post discharge will be flagged for further contact with the family. Also, the medical home practice will be proactively following patients who have had a recent inpatient stay, thereby reducing Potentially Preventable Readmissions.

Improvements in Category 3 outcomes will influence the Category 4 reporting measures by demonstrating the effects of proactively treating health concerns to avoid escalation of care needs including emergency room use and hospital admissions and readmissions.

All Category 1 and 2 projects and Category 3 outcome measures will support improvements in Category 4 reporting measures including Potentially Preventable Readmissions.

Children’s will report on all pediatric-appropriate measures in RD2 in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document, influence and improve pediatric healthcare outcomes.
Reporting Domain 3: Potentially Preventable Complications:

Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807
Unique RHP identification number: 138910807.4.3

Domain Descriptions:

Children’s has been reporting and tracking these statistics through Child Health Corporation of America (CHCA), now called Children’s Hospital Association (CHA), for comparison with other stand-alone pediatric hospitals.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will occur during DY2 and DY3 to optimize system compatibility and to meet new reporting requirements. New processes will be implemented to ensure complete and accurate data collection. Category 1 and 2 projects and Category 3 outcomes will use available data to establish baseline and milestone metrics.

There are no DSRIP projects proposed by Children’s that will directly influence outcomes for RD3. However, Children’s successful implementation of Category 1 and Category 2 interventions will lead to health care improvements for pediatric patients during and after the waiver period including long-term health improvements into adulthood. One of the outcomes of the Category 1 and Category 2 interventions will be a more health-literate patient and family. Teaching families to be the advocates for their children’s health will be part of a patient-centered medical home (138910807.2.1), disease management (138910807.1.2) and behavioral health services (138910807.1.3). Families who are an active member of their child’s health care team when that child is hospitalized can greatly influence and reduce Potentially Preventable Complications by questioning care providers and escalating concerns to receive appropriate intervention. By expanding MyChildren’s hours at the Grapevine location (138910807.1.1) and making more appointments available at times convenient to parents, the likelihood of a potentially avoidable admission is decreased thereby eliminating potentially preventable complications during an inpatient stay. Studies have shown that use of a pediatric nurse triage phone system (138910807.1.1) can increase the use of the emergency department or urgent care in 15% of families who would have otherwise stayed at home, unaware of the urgency of their child’s medical condition. Appropriate escalation of care to the most effective setting will decrease the potentially preventable admissions thereby eliminating the potential for complications during an inpatient stay.
All Category 1 and 2 projects and Category 3 outcome measures will support improvements in Category 4 reporting measures by improving health and patient/family health advocacy thereby reducing potentially preventable complications during an inpatient stay.

Children’s will report on all pediatric-appropriate measures in RD3 in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.

Domain Valuation:
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document, influence and improve pediatric healthcare outcomes.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807  
**Unique RHP identification number:** 138910807.4.4  

**Domain Descriptions:**

Children’s has been reporting and tracking these statistics through Child Health Corporation of America (CHCA), now called Children’s Hospital Association (CHA) for comparison with other stand-alone pediatric hospitals.

All data collection and reporting processes will comply with HHSC and AHRQ guidelines. New implementations and modification of the current reporting system will occur during DY2 and DY3 to optimize system compatibility and to meet new reporting requirements. New processes will be implemented to ensure complete and accurate data collection. Category 1 and 2 projects and Category 3 outcomes will use available data to establish baseline and milestone metrics.

There are no DSRIP projects proposed by Children’s that will directly influence outcomes in RD 4. However, Children’s successful implementation of Category 1 and Category 2 interventions will lead to improvements for pediatric patients during and after the waiver period including long-term health improvements into adulthood. One of the outcomes of the Category 1 and Category 2 interventions will be a more health-literate patient and family. Teaching families to be the advocates for their children’s health will be part of a patient-centered medical home (138910807.2.1), disease management (138910807.1.2) and behavioral health services (138910807.1.3). Families who are an active member of their child’s health care team when that child is hospitalized can be more satisfied with the care they received while hospitalized and can be proactive in requesting medication reconciliation at discharge.

Improvements in Category 3 outcomes will influence the Category 4 reporting measures by demonstrating the effects of proactively treating health concerns to avoid escalation of care needs including emergency room use and hospital admissions and readmissions.

All Category 1 and 2 projects and Category 3 outcome measures will support improvements in Category 4 reporting measures by improving health and patient/family health advocacy thereby patient and family satisfaction and medication management during an inpatient stay.

Children’s will report on all pediatric-appropriate measures in RD4 in compliance with the HHSC provided risk-adjusted 3M tool annually starting in DY3.
Domain Valuation:
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document, influence and improve pediatric healthcare outcomes.
Reporting Domain 5: Emergency Department:

Performing Provider Name/TPI: Children’s Medical Center of Dallas/138910807
Unique RHP identification number: 138910807.4.5

Domain Descriptions:

Children’s Medical Center of Dallas is a designated Pediatric Level 1 trauma center. There are transfers of patients from Children’s Emergency Department at its Legacy campus in Plano, TX (RHP 18) to the Dallas campus. It is extremely rare for a patient in Children’s emergency department in Dallas to be transferred to another facility. Transfers primarily occur when adult patients present to Children’s emergency department. All EMTALA guidelines are followed to triage and stabilize adult patients prior to transfer to an adult facility. There are no DSRIP projects associated with this reporting domain and therefore no measureable impact is expected for this domain related to the interventions.

Children’s will report on the required measures annually starting in DY3.

Domain Valuation:
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document and influence pediatric healthcare outcomes.
**Reporting Domain 6: Children and Adult Core Measures**

**Performing Provider Name/TPI:** Children’s Medical Center of Dallas/138910807  
**Unique RHP identification number:** 138910807.4.6

**Domain Descriptions:**  
Children’s will participate in the optional Reporting Domain with separated measurement sets for children and adults. Since Children’s is a pediatric facility, limited information will be available for the adult data set.

Children’s does not provide prenatal or birthing services, therefore Measure 1 through 4 of the Initial Core Set of Children’s Health Care Quality Measures will not be influenced by Children’s Category 1 and 2 projects. Category 1 intervention 138910807.1.1 and Category 2 intervention 138908072.1 are based in the primary care environment and will positively influence Measures 5 through 18. Category 1 intervention 1389108071.2 provides expansion of disease management services and will positively influence Measures 20 and 22. Category 1 intervention 138910807.1.3 will increase behavioral health services and will positively impact Measures 21 and 23. The DSRIP projects are all designed to improve patient and family satisfaction and therefore should positively influence Measure 24. The DSRIP projects will not directly address Measure 19.

Children’s will report on the required measures annually starting in DY3.

**Domain Valuation:**  
As per HHSC and CMS guidelines, Children’s has valued Category 4 at the maximum allowed values of 10% for DY2 and 15% for DY3, DY4 and DY5. This maximum valuation reflects Children’s commitment to providing data to document and influence pediatric healthcare outcomes.

### Grand Total Payments Across Category 4

|  | $93,750 | $281,250 | $281,250 | $281,250 |
Methodist Mansfield
186221101
**Reporting Domain 1: Potentially Preventable Admissions:**

**Performing Provider Name/TPI:** Methodist Mansfield Medical Center/186221101

**Unique RHP identification number:** 186221101.4.2

**Domain Descriptions:**
Currently, eight of the eight measurements are being tracked and reported in a form of public healthcare statistics. In addition, many DSRIP projects will provide interventions to Methodist Mansfield Medical Center patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Methodist Mansfield Medical Center will establish new protocols for data collecting and reporting, expand existing data collecting systems, and optimize old systems for new reporting processes.

The patient navigation program will reduce potentially preventable admissions for RD1.1 (CHF), RD1.2 (Diabetes), RD1.4 (COPD) and RD1.5 (Hypertension) by identifying frequent users of the ED who often use the ED as a care site for these chronic conditions. The navigator will present education and alternative care site solutions for these patients. The result should be better chronic care management and fewer admissions.

There will be improvements in DYs2-5 for the potentially preventable admissions category 4 measures.

**Domain Valuation:**
The value for each domain above is based on the combined efforts of Region 10 and Region 9 healthcare systems to perform research on empirical studies for potential value of each clinical condition on the cost of care, individual impact and community impact. The funding allocation for Category 4 compared to Categories 1-3 was weighted by 5% in DY2 and 10% in DY3-DY5 considering that Domain 6 will not be reported. The funding allocation is weighted more heavily in DY4 and DY5 to be consistent with the emphasis on outcome results.

The patient navigation program will provide services to all frequent users of the ED. Therefore the program will impact all of the clinical conditions identified in the domains above. The value of each domain was treated equally and the impact of the navigation program patients’ treated will be consistent during DY2 to DY5.
**Reporting Domain 2: Potentially Preventable Readmissions**

**Performing Provider Name/TPI:** Methodist Mansfield Medical Center/186221101  
**Unique RHP identification number:** 186221101.4.3

**Domain Descriptions:**
Currently, seven of the seven measurements are being tracked and reported in a form of public healthcare statistics. In addition, many DSRIP projects will provide interventions to Methodist Mansfield Medical Center patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Methodist Mansfield Medical Center will establish new protocols for data collecting and reporting, expand existing data collecting systems, and optimize old systems for new reporting processes.

The patient navigation program will reduce 30 day readmissions for RD1.1 (CHF), RD1.2 (Diabetes), RD1.4 (COPD) and RD1.5 (Hypertension) by identifying frequent users of the ED who often use the ED as a care site for these chronic conditions. The navigator will present education and alternative care site solutions for these patients. The result should be better chronic care management, fewer admissions and fewer readmissions.

There will be improvements in DYs2-5 for the potentially preventable 30 day readmissions category 4 measures.

**Domain Valuation:**
The value for each domain above is based on the combined efforts of Region 10 and Region 9 healthcare systems to perform research on empirical studies for potential value of each clinical condition on the cost of care, individual impact and community impact. The funding allocation for Category 4 compared to Categories 1-3 was weighted by 5% in DY2 and 10% in DY3-DY5 considering that Domain 6 will not be reported. The funding allocation is weighted more heavily in DY4 and DY5 to be consistent with the emphasis on outcome results.

The patient navigation program will provide services to all frequent users of the ED. Therefore the program will impact all of the clinical conditions identified in the domains above. The value of each domain was treated equally and the impact of the navigation program patients’ treated will be consistent during DY2 to DY5.
Reporting Domain 3: Potentially Preventable Complications

Performing Provider Name/TPI: Methodist Mansfield Medical Center/186221101
Unique RHP identification number: 186221101.4.4

Domain Descriptions:
Currently, sixty-four of the sixty-four measurements are being tracked and reported in a form of public healthcare statistics. In addition, many DSRIP projects will provide interventions to Methodist Mansfield Medical Center patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Methodist Mansfield Medical Center will establish new protocols for data collecting and reporting, expand existing data collecting systems, and optimize old systems for new reporting processes.

The patient navigator and chronic condition – diabetes projects provide better resources and patient care pathways that will allow clinical care givers to impact the potentially preventable complications.

There will be improvements in DYs2-5 for the potentially preventable complications category 4 measures.

Domain Valuation:
The value for each domain above is based on the combined efforts of Region 10 and Region 9 healthcare systems to perform research on empirical studies for potential value of each clinical condition on the cost of care, individual impact and community impact. The funding allocation for Category 4 compared to Categories 1-3 was weighted by 5% in DY2 and 10% in DY3-DY5 considering that Domain 6 will not be reported. The funding allocation is weighted more heavily in DY4 and DY5 to be consistent with the emphasis on outcome results.

The patient navigation program will provide services to all frequent users of the ED. Therefore the program will impact all of the clinical conditions identified in the domains above. The value of each domain was treated equally and the impact of the navigation program patients’ treated will be consistent during DY2 to DY5.
**Reporting Domain 4: Patient-Centered Healthcare**

**Performing Provider Name/TPI:** Methodist Mansfield Medical Center/186221101  
**Unique RHP identification number:** 186221101.4.5

**Domain Descriptions:**
Currently, two of the two measurements are being tracked and reported in a form of public healthcare statistics. In addition, many DSRIP projects will provide interventions to Methodist Mansfield Medical Center patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Methodist Mansfield Medical Center will establish new protocols for data collecting and reporting, expand existing data collecting systems, and optimize old systems for new reporting processes.

The patient navigator and chronic condition – diabetes projects provide better resources and patient care pathways that will allow clinical care givers to impact the patient centered healthcare measures.

There will be improvements in DYs2-5 for the Patient Centered Healthcare category 4 measures.

**Domain Valuation:**
The value for each domain above is based on the combined efforts of Region 10 and Region 9 healthcare systems to perform research on empirical studies for potential value of each clinical condition on the cost of care, individual impact and community impact. The funding allocation for Category 4 compared to Categories 1-3 was weighted by 5% in DY2 and 10% in DY3-DY5 considering that Domain 6 will not be reported. The funding allocation is weighted more heavily in DY4 and DY5 to be consistent with the emphasis on outcome results.

The patient navigation program will provide services to all frequent users of the ED. Therefore the program will impact all of the clinical conditions identified in the domains above. The value of each domain was treated equally and the impact of the navigation program patients’ treated will be consistent during DY2 to DY5.
Reporting Domain 5: Emergency Department

Performing Provider Name/TPI: Methodist Mansfield Medical Center/186221101
Unique RHP identification number: 186221101.4.6

Domain Descriptions:
Currently, the one measurement is being tracked and reported in a form of public healthcare statistics. In addition, many DSRIP projects will provide interventions to Methodist Mansfield Medical Center patients in multiple areas, resulting in improvement of PPAs throughout all measurements in the Reporting Domain. Currently, HHSC will make potentially preventable event data to providers. In addition, Methodist Mansfield Medical Center will establish new protocols for data collecting and reporting, expand existing data collecting systems, and optimize old systems for new reporting processes.

The patient navigator and chronic condition – diabetes projects provide better resources and patient care pathways that will allow clinical care givers to impact the decision time to admit in the emergency room.

There will be improvements in DYs2-5 for the Emergency Department category 4 measure.

Domain Valuation:
The value for each domain above is based on the combined efforts of Region 10 and Region 9 healthcare systems to perform research on empirical studies for potential value of each clinical condition on the cost of care, individual impact and community impact. The funding allocation for Category 4 compared to Categories 1-3 was weighted by 5% in DY2 and 10% in DY3-DY5 considering that Domain 6 will not be reported. The funding allocation is weighted more heavily in DY4 and DY5 to be consistent with the emphasis on outcome results.

The patient navigation program will provide services to all frequent users of the ED. Therefore the program will impact all of the clinical conditions identified in the domains above. The value of each domain was treated equally and the impact of the navigation program patients’ treated will be consistent during DY2 to DY5.

Appendix C: Affiliation Agreements

C-1: Signed agreements of small hospitals participating in a collaboration in Pass 1 as allowed in the PFM Protocol, paragraph 25.c.iii.

Please see the attached addendums for affiliation agreements from:
- Wise Regional Medical Center and North Texas Community Hospital
- Baylor All-Saints Medical Center Fort Worth, Baylor Regional Medical Center at Grapevine, and Baylor Medical Center at Waxahachie

C-2: Signed agreements of Tier 3 and 4 Performing Providers that combined their Pass 1 allocations as allowed in the PFM Protocol, paragraph 25.c.iv.

Not applicable for Region 10 RHP.

C-3: Signed agreements of Performing Providers that combined their Pass 2 allocations as allowed in the PFM Protocol, paragraph 25.d.iii.

- Wise Regional Health System and Wise CCA

Figure D-2.2: Regional Stakeholder Survey Summary Results

The Regional stakeholder survey was distributed to participants during the months of April and June to solicit feedback on access to care, care coordination and population health.
SUMMARY OF RESPONSES: ACCESS TO CARE

Question format

1) Respondents were asked to **rate** the difficulty low-income patients faced when trying to access care

2) Respondents were then asked to **rank** potential barriers to care from 1 – 8.

“Other” responses

- “Limited specialty services and limited indigent eligibility”
- “Because access for ‘routine hospital services’ is ‘difficult,’ EDs (the most expensive location to receive medical services) is overused."
- “Providers not well informed of various programs and how they work"
- “Without insurance, unable to get treatment until condition is emergent/life threatening”
Question a:
Difficulty low-income patients face when trying to access emergency care services:

Barriers to access to emergency care services for low-income patients

- Lack of coverage/financial hardship
- Difficulty navigating systems/lack awareness of available resources
- Lack of capacity (e.g., insufficient providers/extended wait times)
- Eligibility screening process for beneficiated services
- Delays in authorization/referral approval
- Lack of access due to provider distance
- Other (specify below)
- Scheduling (system inefficiency or standard process)

Least significant Most significant

n = 59

Question a:
Difficulty low-income patients face when trying to access prenatal care:

Barriers to access to prenatal care for low-income patients

- Lack of coverage/financial hardship
- Difficulty navigating systems/lack awareness of available resources
- Lack of capacity (e.g., insufficient providers/extended wait times)
- Lack of access due to provider distance
- Other (specify below)
- Eligibility screening process for beneficiated services
- Delays in authorization/referral approval
- Scheduling (system inefficiency or standard process)

Least significant Most significant

n = 60

“Other” responses

- “Using emergency medical is easy..., but is it NOT be BEST way for them to receive medical care.”

- “Lack of psychiatric availability for dual diagnosed (MH/MR individuals. Also lack of substance abuse treatment capacity.”

- “Limited number of area providers.”

“Other” responses

- “Local Hospital does not provide.”

- “No OB physicians or services at hospital.”

- “Lack of knowledge about resources available.”
“Other” responses

- “Some area physicians are not providing immunization services.”
- “Low reimbursement makes me unable to allow scheduling of Medicaid patients. It is easy for cash paying patients to get a visit and be seen in my office.”
- “Physician offices/Providers do not offer non traditional hours, for example: after work and on weekends.”
Question 26: Difficulty low-income patients face when trying to access urgent care services:

Question 27: Barriers to access to urgent care services for low-income patients

“Other” responses

- “Lack of providers of specialty care for Behavioral Health and Children and Adults with behavioral disorders.”
- “[Lack of] transportation to Specialty practices in another county”
- “Specialists will not accept patients with no resources.”

“Other” responses

- “Many individuals with intellectual disabilities are unaware of other urgent care facilities and most are dependent on assistive transportation resulting in a higher incident of costly ER usage for medical needs.”
- “Lack of knowledge regarding resources that are available at low or no cost”
Difficulty low-income patients face when trying to access mental/behavioral health care:

<tr>
<td>n = 58</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

“Other” responses

- “Lack of Bililingual and Culturally Sensitive Mental Health Professionals”

Access to Care: Key Takeaways

- The top three barriers for access to all types of care:
  - Lack of coverage/financial hardship (#1 for all types)
  - Difficulty navigating the system/lack of awareness of available resources
  - Lack of capacity (e.g. insufficient provider/extended wait times)

Access to Care: Key Takeaways

- For routine hospital care, routine primary/preventive care and routine specialty care the majority of respondents rated them as “difficult” to access
- For Mental/behavioral health care the majority of respondents rated it as “very difficult” to access
- Emergency care was rated by most respondents as “easy” to access

Question Format

1. Respondents were asked to state whether they agreed or disagreed that their county had certain types of care coordination

2. Respondents were then asked to rate the effectiveness of certain types of care coordination
“Other” responses

• “Clients cannot sit and wait for hours and miss more work when they have a limited income.”

• “General lack of primary care physicians, and FPs not paid well to see their own patients in the hospital (eliminates need to ‘coordinate’ care)”

• “Poor patient compliance with recommended follow-up, they are discharged from hospital or ER and just plan on returning to ER when their condition gets out-of-hand again”

• “Rate of reimbursement too low and government requirements too time consuming”

Comments (Continued)

• “Lack of communication. Patients are either seen/treated for a medical condition or a psychiatric condition. It does not seem that both are addressed. It is whichever is prevalent at the time in crisis.”

• “The mental health resources are limited at best. MHMR is flooded with people with substance abuse issues and cannot adequately respond. This creates a system where physicians are often put in a tough place of diagnosing mental health issues as well as other physical ailments without anyone local to refer patients to for counseling.”

Effectiveness of primary care physicians co-managing patients who have both mental health and medical conditions with mental health professionals

<table>
<thead>
<tr>
<th></th>
<th>Very effective</th>
<th>Somewhat effective</th>
<th>Somewhat ineffective</th>
<th>Very ineffective</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>20%</td>

n = 82

Barriers to effective co-management of a patient’s health between providers

<table>
<thead>
<tr>
<th>Barriers to Co-management</th>
<th>Least Significant</th>
<th>Most Significant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complexity of coordination for patients with high levels of need/complexity and chronic illness</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Fragmented, stand-alone services rather than an integrated delivery system</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Practice norms that encourage clinicians to act in silos rather than coordinate care</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Lack of staff and time for coordination of care</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Limited health IT infrastructure and interoperability</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Limited primary care provider involvement in inpatient care</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
<tr>
<td>Patient confidentiality and sharing information with other providers</td>
<td>[Bar graph]</td>
<td>[Bar graph]</td>
</tr>
</tbody>
</table>

“Other” responses

• “Not enough family physicians in community, who are not paid fairly to care for complex patients.”

• “Limited primary care involvement is not related to only inpatient care - PCPs and Mental Health Professionals each treat the patient in a silo...there is no ‘co-management’...each does their own part.”
Question 22
Effectiveness of co-management of chronically ill patients between primary care physicians and specialists

- Very effective
- Somewhat effective
- Somewhat ineffective
- Very ineffective

n = 87

Comments

- “Providers work in silos and do not have incentives to coordinate care; additionally, there may be language barriers for clients when utilizing the systems that are in place.”
- “Difficulty getting specialists to accept patients on programs that have low pay rates or are unfamiliar to the providers.”
- “No system appears to be in place to assure communication across providers.”

Care Coordination: Key Takeaways

- In general, respondents felt neutral or did not feel that there was effective care coordination among physicians, specialists, hospitals and other providers for mental health, etc.
- However, respondents did feel that care coordination for chronically-ill patients between primary and specialty care patients was somewhat effective.

SUMMARY RESPONSES: COMMUNITY HEALTH

Question format

1. Respondents were asked to choose the top five conditions prevalent in their county.

Top 5 most prevalent chronic diseases in the community:

- Diabetes
- Obesity
- Hypertension (high blood pressure)
- Heart Failure
- Chronic obstructive pulmonary disease (COPD)
- Cancer
- Asthma
- Hypercholesterolemia
- Stroke
- Arthritis
- End-stage renal disease/chronic kidney disease
- Other (please specify below)

n = 198

Chart showing the prevalence of chronic diseases with diabetes being the most prevalent.
"Other" responses

- Alzheimer's Disease
- "All of these diseases are prevalent in our community"
- Dental needs/infection

Question 34, cont.

Top 5 conditions associated with preventable hospitalizations in the county:

- Hypertension (high blood pressure)
- Uncontrolled Diabetes
- Chronic Obstructive Pulmonary
- Congestive Heart Failure
- Diabetes Short-Term Complications
- Urinary Tract Infection
- Cough
- Diabetes Long-Term Complications
- Gastrointestinal Pains
- Adult Asthma
- Angina (without procedures)
- Low Birth Weight
- Other (Please specify below)
- Lower Extremity Amputation Among
- Perforated Appendix

Least prevalent  Most prevalent

n = 130

Question 35, cont.

"Other" responses

- Community health clinics
- Health fairs
- University health center and counseling center
- Provider nurses
- Case managers
- Television
- Dr. Oz
- Agrilife Extension Office
- Home health agencies

Question 36

Issues having the most impact on the health of the population:

Behavioral health
Substance abuse
Insufficient access to primary care and prevention
Insufficient or ineffective patient education materials and information
Insufficient use of existing clinics
Socioeconomic factors (e.g., cultural, linguistic, financial)
Preventive chronic conditions (diabetes, heart disease, hypertension etc.)
Lifestyle choices (e.g., lack of physical activity, poor nutrition)
Other (Please specify below)

Least impact  Most impact

n = 130
“Other” responses
- "Environmental quality and the built environment"
- "Not treating the history of trauma and anxiety"
- "Poor nutrition due to the inability to purchase healthy foods because they cost so much more than the unhealthier options"
- "Lack of transportation to get to needed medical care"

Community Health: Key Takeaways
- The top health conditions affecting Region 10 patients were diabetes, obesity, hypertension, COPD and congestive heart failure.
- Patients mostly get their health education from friends, family, the internet and their doctor.
- Behavioral health and substance abuse were the top issues impacting the patient population.

Additional Comments
"County lacks physicians who will take Medicaid patients. Patients need more transportation to other counties with specialists."

"Our county has a wealth or resources for its residents. Many simply are unaware that these resources are available."

"There should be some discussion about population health, health equity and undocumented patients."

Additional Comments (cont’d)
"Most families have no where to go to get assessments completed or medication management for their children or adult children to get help with the behaviors they exhibit due to their dual diagnosis. Mental health practitioners in the community refuse to see them because of their mental retardation diagnosis and they have to end up going to Dallas and or staying here and paying out of pocket extremely high payments just to get medications or assessments."

Additional Comments (cont’d)
"[Both] insured and uninsured patients are not incentivized to pursue preventive care and maintain appropriate follow-up care."

"The clients must receive both mental and physical health care in one location. The piece meal system no longer works."
FINAL TAKEAWAYS

Respondents overwhelmingly listed a lack of coverage/financial hardship as a barrier to care for low-income patients.

Write-in comments in the survey indicated an overuse of the emergency department services and an inability for patients to access primary/preventive care (due to difficulty navigating the system and a lack of capacity, according to responses).

In general, respondents did not feel that there was strong care coordination between primary care providers, hospitals and specialists.

D-4: County-specific findings

As part of the outreach process for the RHP, county visioning sessions were held throughout the Region. The purpose of these sessions are to bring together local leadership, stakeholders and performing providers to discuss local health care needs, resources and gaps in the current delivery system, develop a local vision and goals for health care delivery and identify potential opportunities for county and Regional collaboration. The county visioning sessions were also a means to facilitate discussions between providers in the same county about the current health data presented and what their perceived experiences in their service area. These discussions provided a qualitative look at local health care needs and are intended to supplement the quantitative findings in this report. We also aggregated information from various assessments, reports and data that were submitted by Regional providers.

ELLIS COUNTY

Health care Needs

- Increased psychiatry patients
- Lack of Communicable Disease Management Programs
- Tremendous shortage to Dental care
- Lack of substance abuse services
- Lack of Transportation
- Lack of Care Management Programs
- High need for Behavioral Health Programs
- Lack of Urgent Care
- Increase need for Medicare Providers
- 85% patients have Diabetes
- Lack of geriatric beds

Workforce Needs

- Mobile Services staff
- Psychiatry Physicians
- Medicare/Medicaid providers

HOOD COUNTY

Health care Needs

- Lack of on site psychiatrist
  - Currently have telemedicine psychiatrists
- Fragmented care coordination between primary care and psychiatry
- Uninsured/underinsured do not have access to care
- Lack of patient education programs
- Language barriers between patients and providers
- Affordability of care
- Increased group of Latino population need care
- Asthma is highly prevalent in Hood county

Workforce Needs

- Psychiatric nurses
- OR nurses
- Fully trained nurses
JOHNSON COUNTY
Health care Needs
- Need for additional Mental Health Professionals (Only one in County)
- CMHC: over utilization → 600 patients
- Limited access to MHMR
- Lack of access to urgent care

SOMERVELL COUNTY
Health care Needs
- Increasing need for Mental Health Providers
- Lack Substance Abuse
  - No plans for residential treatment → MHMR looking at outpatient service
  - Not funded through State → Medicaid or private pay
  - No services for non paying patients
- Catastrophic injuries that are not funded → very expensive
- Medically complex patients are missing care at Somervell County → they are going somewhere else for care
- Need for ICU (5% transfer from ED → Baylor, THR)
- Need postdischarge support for target-based populations: No formal process in place
- Lack of substance abuse programs
- No OB services
- Need on-site psychiatrists
- Need physical therapists

ERATH COUNTY
Health care Needs
- Diabetes Management Program
- Lack of coverage/financial hardship
- Lack of access due to provider distance
- Difficulty navigating the system/lack of awareness of available resources
- Access to routine hospital care, routine primary/preventive care and routine specialty care rated as “difficult” to access in stakeholder survey
- For Mental/behavioral health care the majority of respondents rated it as “very difficult” to access
- Lack of care coordination
- Not enough emergency department beds to meet demand
- Not confident in ability to coordinate with MHMR for postdischarge support and care transitions

NAVARRO COUNTY
Health care Needs
- Lack of access due to provider distance
- Limited financial integration
- Fragmented, stand-alone services
- Lack of staff time
- Ineffective care coordination
PARKER COUNTY

Health care needs
- Difficult to access: (1) Emergency care, (2) Pediatric care, and (3) Specialty care
- Difficulty navigating the system/lack of awareness of available resources
- Lack of capacity (e.g., insufficient provider/extended wait times)
- Eligibility screening process
- Limited health care IT
- Lack of care coordination
- Large number of the patients have no insurance and no access to primary care
- Need to integrate primary care and behavioral health

WISE COUNTY

Health Care Needs
- Routine hospital care, primary care and specialty care are “difficult” to access
- Lack of coverage/financial hardship
- Eligibility screening process
- Limited primary care access
- Lack of some 24 hour specialty care
- Limited care coordination with all physicians
- Lack of population-focused programs
- Long delays in being able to get the patient an appointment for MHMR

TARRANT COUNTY

Health care Needs
- Lack of care coordination due to limited staff time
- Limited Primary care provider involvement in patient care
- Limited Health care IT infrastructure
- Mental/behavioral and substance abuse services are “very difficult” to access
- Lack of capacity (e.g., insufficient provider/extended wait times)

JPS/United Way Community Health Needs Assessments
As part of this community health needs assessment, a review of United Way’s CHNAs from Tarrant County was conducted. The United Way’s CHNA, findings are substantively similar to the findings reported in this Community Needs Assessment. In addition to United Way’s CHNA data for Tarrant County, a review of JPS Health System’s CHNA was also conducted as comparison. The data findings are similar to this Community Needs Assessment. JPS additionally included a section on appointment wait times for new appointments as well as the follow up appointments in different areas within the county. According to JPS’s analysis, it takes longer for a new patient to be scheduled at a primary care clinic than OB/GYN or pediatric facilities. On the contrary, follow up appointment times are longer for OB/GYN or pediatrics than primary care. Additionally, new patient appointment wait times differ in Tarrant County based on the geographical location of the provider or the clinic.

D-6: Survey of Provider Participation in Federal Initiatives

Region 10 RHP
Survey of Potential DSRIP Project Overlap with Federally Funded Initiatives

Region 10 RHP is required to submit an RHP plan to the Texas Health and Human Services Commission (HHSC) and to the Centers of Medicare and Medicaid (CMS) on behalf of the Region’s performing providers that details all proposed Delivery System Reform Incentive Payment (DSRIP) projects. CMS and HHSC guidance indicates that they want performing providers to report their participation in all of the federal initiatives listed below.

Please indicate whether your organization participates in any of the following federal initiatives by indicating “YES,” “NO,” or “UNKNOWN.” If you answer “YES” to an initiative, please also indicate which project(s) potentially overlap by its unique DSRIP Project Identifier number.

Thank you for your continued participation in Region 10 RHP!

E-2: Detailed Description of RHP Committees, Charters, Sample Agendas and List of Committee Members

Steering Committee
Region 10 RHP’s steering committee provides leadership and shapes the development of the RHP. Inclusion of leadership from participating Performing Provider was critical to ensure the commitment of the Region’s major providers. This committee’s responsibilities include educating and informing all stakeholders on the purpose, intent and consequences related to the development and implementation of the RHP plan. Committee members were charged with the following stakeholder engagement duties:

- Define required level of engagement for providers wishing to participate in the RHP;
- Ensure regular communication and updates to and from all RHP committees and stakeholders;
- Identify, recruit and encourage active engagement by all stakeholders in the Region in RHP plan development; and,
- Provide and support representation and communication for the RHP to HHSC.

Meeting dates:
- May 30, 2012
- June 20, 2012
- July 18, 2012
- August 15, 2012
- September 19, 2012
- October 31, 2012

Please see below (Appendix E-2.1) for the charter that was ratified by committee members. Please see below (Appendix E-2.2) for an example of an agenda used during the meetings.

Elected Officials Committee
Region 10’s Elected Officials Committee’s roles and responsibilities are to educate and inform constituencies and stakeholders on the purpose, intent and consequences related to the development and implementation of the Waiver, and facilitate coordination and collaboration among Region 10 stakeholders. Responsibilities of the Elected Officials Committee that pertain to stakeholder engagement include:

- Identify county liaison(s) to support and coordinate with Region 10 committees in development of RHP Plan, information gathering and stakeholder involvement and education;
- Discuss and assist with dissemination of new information and developments from HHSC;
- Provide support and guidance to Region 10 Steering committee to ensure performing provider engagement and alignment during the initial Region 10 RHP Plan development and the four year performance period;
- Assist in outreach to stakeholders and encouragement of ongoing stakeholder feedback during the initial RHP Plan development and the four year performance period;
• Provide insight into county needs and relations between various providers and stakeholders; and
• Assist with facilitation of coordination between performing providers, as well as between performing providers and other stakeholders.

Meeting dates:
• May 30, 2012
• June 20, 2012
• July 18, 2012
• August 15, 2012
• September 19, 2012
• October 31, 2012

Please see below (Appendix E-2.1) for the charter that was ratified by committee members. Please see below (Appendix E-2.2) for an example of an agenda used during the meetings.

Planning Committee
The RHP Planning Committee provides guidance, coordination, and oversight of the development, submission and implementation of the Region 10 RHP Plan. Secondarily, the Planning Committee works to educate RHP participants, particularly IGT entities and performing providers, on Waiver developments, communicate information, develop planning and implementation principles consensus, and to solicit feedback for development of position papers affecting Waiver planning matters. In particular, this committee is responsible for providing technical assistance and support to performing providers during project development. Members of this Committee take lead responsibility for coordination with all other Region 10 committees, and their responsibilities include:

• Identify and engage stakeholders from each county within Region 10;
• Collaborate on timelines, processes, communications and deliverables during the development of the RHP plan;
• Develop by consensus the Regional and local gaps for the Community Health Needs Assessment to be addressed by DSRIP projects in years 3-5;
• Coordinate with Clinical & Quality Committee to support coordinated development of DSRIP projects for participating providers at local and Regional level; and
• Participate in collaboration and implementation of general public engagement and communication process.

The Region 10 RHP planning team conducted a stakeholder survey, a county judge survey, and provided county-level assessment tools and Performing Provider Readiness assessment tools in order to develop an accurate and comprehensive picture of the Region. The team completed the RHP-level CHNA by synthesizing the County-level CHNA and Performing Provider Readiness surveys in mid-July. This information was provided to RHP participants to inform the development of DSRIP projects.

Meeting dates:
• May 24, 2012
• June 14, 2012
Please see below (Appendix E-2.1) for the charter that was ratified by committee members. Please see below (Appendix E-2.2) for an example of an agenda used during the meetings.

**Clinical Quality Committee**
The Clinical Quality Committee’s primary role and responsibility is to ensure that all DSRIP projects meet quality objective standards, are linked to patient-focused outcomes, and fully comply with Waiver quality requirements. Clinical Quality Committee activities are linked to stakeholder engagement efforts in the following ways:

- Synthesize and disseminate best practices;
- Define which feedback mechanisms to providers will be most helpful and determine the consequences for those providers who do not comply with requirements of a new delivery system;
- Provide leadership for improving care coordination across partners;
- Develop recommendations on how to best utilize and effectively structure specialty care, hospital-based, and ancillary service delivery;
- Identify and strengthen efforts to work with provider advocacy groups/organizations;
- Provide guidance on clinical information systems; and
- RHP Plan content – Provide guidance and content to committees regarding clinical quality matters required for completion of the RHP Plan for Region 10.

Clinical Quality Committee members utilized their individual strengths, expertise, and current roles and coordinated with Region 10 RHP providers on the following tasks:

- Quality improvement;
- Process improvement;
- Creation of clinical quality metrics for DSRIP projects; and
- Evaluations of potential DSRIP projects to ensure that clinical quality outcomes were patient-centered and returned an appropriate clinical value to the community.

Meeting dates:
- May 24, 2012
- June 14, 2012
- June 28, 2012
- July 12, 2012
- July 26, 2012
August 9, 2012
August 23, 2012
September 27, 2012
October 11, 2012
October 25, 2012
November 15, 2012
December 3, 2012

Please see below (Appendix E-2.1) for the charter that was ratified by committee members. Please see below (Appendix E-2.2) for an example of an agenda used during the meetings.

**Finance Committee**

The Finance Committee’s roles and responsibilities were to build a detailed, structurally sound and internally consistent budget (for fiscal years 2013 through 2016 of the initial term of the Waiver) that supports the Region 10 RHP Plan. Secondarily, the Committee works to educate members on financial aspects of Waiver development, communicate informational requirements, develop consensus on Regional financial principles, and solicit feedback for development of position papers on Waiver financing. Members of the Finance Committee were committed to the following responsibilities regarding stakeholders:

- Build relationships and enable collaboration among RHP members;
- Provide information as required to complete the RHP Plan; and
- Actively collaborate and provide meaningful participation in determination and completion of the RHP Plan.

Meeting dates:
- May 24, 2012
- June 14, 2012
- June 28, 2012
- July 12, 2012
- July 26, 2012
- August 9, 2012
- August 23, 2012
- September 27, 2012
- October 11, 2012
- October 25, 2012

Please see below (Appendix E-2.1) for the charter that was ratified by committee members. Please see below (Appendix E-2.2) for an example of an agenda used during the meetings.
Appendix E-2.1. RHP Committee Charters

RHP Steering Committee Charter
Adopted by RHP Steering Committee on June 20, 2012

I. Purpose

The primary goals of the RHP 10 Steering Committee are to (i) ensure all RHP 10 activities support the transformative intent of the Waiver to provide better health care for less money, (ii) educate and inform all stakeholders on the purpose, intent and consequences related to the development and implementation of the Waiver, and (iii) facilitate coordination and collaboration among the RHP 10 stakeholders.

II. Membership

A. All meetings will be open to the public.

B. List of committee members, titles and county affiliation (List of members to be finalized after HHSC makes its final determination of Region 10.)
   1. Robert Earley; CEO, JPS Health Network
   2. David Orcutt; CEO, Lake Granbury Medical Center
   3. Ray Reynolds; CEO, Glen Rose Medical Center
   4. Steve Newton; President, Baylor Health
   5. Scott B. Ransom, DO; President, UNTHSC
   6. Jim Scoggin; President, HCA North Texas Division, HCA
   7. Barclay Berdan; COO, THR
   8. Lou K. Brewer; Director, Tarrant County Public Health
   9. Randall Young; CEO, Parker County Hospital District
  10. Stephen Summers; CEO, Wise Regional
  11. Susan Garnett; Deputy CEO, MHMR Tarrant County
  12. Rick Merrill; President/CEO, Cook Childrens
  13. David Anderson; CEO, Ennis Regional
  14. John Delaney; Executive Director, Lakes Regional MHMR
  15. Xavier Villarreal; CEO, Navarro Regional Hospital
  16. Judge Thompson; County Judge – Erath
  17. Judge Whitley; County Judge – Tarrant

C. Committee Chair – Name, title and organizational affiliation
   1. Robert Earley, CEO, JPS Health Network (Anchor Facility)

D. Voting and decision-making process
   1. Each voting member will be given one vote for matters that require a vote for approval. Decision making will be by majority vote when required.
III. Roles and Responsibilities

The RHP Steering Committee is charged with the following responsibilities for the duration of the rights, interests and obligations contemplated in the Waiver:

- Ensure Performing Provider and IGT Entity engagement and alignment
- Provide oversight and review recommendations from the RHP committees (Planning, Quality/Clinical and Finance)
- Define required level of engagement for providers wishing to be participants in the RHP
- Ensure regular communication and updates to and from all RHP committees and stakeholders
- Identify, recruit and encourage active engagement in the RHP development by participants and other stakeholders
- Provide and support representation and communication for the RHP to HHSC
- Review interim and final deliverables, ensuring overall alignment with Waiver objectives, guidelines, Regional and local interests
- Support development of unified, coordinated Region 10 RHP proposal
- Act as the intermediary between the Elected Officials committee and the RHP committees
- Discuss and disseminate new developments and updates from HHSC

IV. Meetings

A. Meeting Schedule
   1. 3rd Wednesday of each month
   2. Time: 10:30am-12:00pm
   3. Location: The Riley Center – Southwestern Baptist Theological Seminary, Conference RC - 237

B. Meeting Agenda
   1. Outline of agenda template and content – The attached agenda format will be used.
   
   2. Process for developing, approving agenda with Chair and timeline for dissemination with committee members – Agenda items for each meeting will be developed in each preceding meeting. Requests for additional agenda items may be made and can be made by a participating member one week prior to a regularly scheduled meeting.
   
   3. Process for developing, approving and disseminating materials to committee members – Agenda’s and materials will be distributed by email on the Friday before each meeting
RHP Elected Officials Committee Charter
Adopted by Region 10 Elected Officials Committee on June 20, 2012

V. Purpose

The **primary goals** of the Region 10 Elected Officials Committee are to (i) ensure all Region 10 Steering Committee activities support the transformative intent of the Waiver to provide better health care for less money, (ii) educate and inform constituencies and stakeholders on the purpose, intent and consequences related to the development and implementation of the Waiver, and (iii) facilitate coordination and collaboration among the Region 10 stakeholders.

VI. Membership

E. **Membership Qualification** – Each county that participates in the Region 10 Regional Healthcare Partnership (RHP), as memorialized by a Memorandum of Understanding, may nominate its Judge, or a Commissioner in place of its Judge, to participate in the committee meetings. All meetings will be open to the public.

F. **List of committee members, titles and county affiliation** (List of members to be finalized after HHSC makes its final determination of Region 10)
- 1. Judge Glen Whitley, County Judge, Tarrant County
- 2. Judge Bill McElhaney, County Judge, Wise County
- 3. Judge Darrell Cockerham, County Judge, Hood County
- 4. Judge Mark Riley, County Judge, Parker County
- 5. Judge Roger Harmon, County Judge, Johnson County
- 6. Judge Mike Ford, County Judge, Somervell County
- 7. Judge Tab Thompson, County Judge, Erath County
- 8. Judge Carol Bush, County Judge, Ellis County
- 9. Judge HM Davenport Jr., County Judge, Navarro County

G. **Committee Chair:**
- 1. Judge Carol Bush, County Judge, Ellis County

H. **Voting and decision-making process**
- 1. Each participating county will be required to designate one voting member for matters that require a vote for approval. Decision making will be by majority vote when required.

VII. **Roles and Responsibilities**

A. The Region 10 Elected Officials Committee is charged with the following responsibilities during the initial Region 10 RHP plan development and the four year performance period:

- Identify county liaison(s) to support and coordinate with Region 10 committees in development of RHP plan, information gathering and stakeholder involvement and education
- Discuss and assist with dissemination of new information and developments from HHSC
• Ensure that their own county’s needs are represented within the Region 10, while supporting and informing coordination efforts across counties
• Provide support and guidance to Region 10 Steering committee to ensure performing provider engagement and alignment during the initial Region 10 RHP plan development and the four year performance period
• Assist in outreach to stakeholders and encouragement of ongoing stakeholder feedback during the initial RHP plan development and the four year performance period
• Provide insight into county needs and relations between various providers and stakeholders
• Assist with facilitation of coordination between performing providers, as well as between performing providers and other stakeholders

VIII. Meetings

C. Meeting Schedule
   1. 3rd Wednesday of each month
   2. Time: 9:00am-10:30am
   3. Location: The Riley Center – Southwestern Baptist Theological Seminary, Conference RC - 237

D. Meeting Agenda
   1. Outline of agenda template and content – The attached agenda format will be used.

   2. Process for developing, approving agenda with Chair and timeline for dissemination with committee members – Agenda items for each meeting will be developed in each preceding meeting, with additions recommended to the Chair by Region 10 support staff as new developments arise. Requests for additional agenda items may be made and can be made by a participating member one week prior to a regularly scheduled meeting.

   3. Process for developing, approving and disseminating materials to committee members – Agenda’s and materials will be distributed by email on the Friday before each meeting.
RHP Planning Committee Charter  
Adopted by RHP Planning Committee on June 14, 2012

IX. Overview

The primary goal of the RHP Planning Committee is to provide guidance, coordination, and oversight of the development, submission and implementation of the Region 10 Delivery System Reform Incentive Payment (DSRIP) plan; ensuring the DSRIP projects and plan, and related timelines, objectives, milestones, and metrics, meet all requirements of the Waiver Standard Terms and Conditions and applicable protocols.

The secondary purposes of the committee are to educate members on Waiver developments, communicate information, develop consensus on planning and implementation principles for Region 10 matters when necessary, and to solicit feedback for development of position papers affecting Waiver planning matters. Coordination with all Region 10 committees will be important.

X. Purpose

B. List of objectives and major activities of the committee – The Planning Committee’s core focus will be to develop the Region 10 plan as required by the terms of the Waiver. This will require focus in, but may not be limited to, the following areas:
   1. Development of Regional Community Health Needs Assessment
   2. Stakeholder Engagement
   3. DSRIP project evaluation – Develop methodologies, guiding principles and protocols for evaluating DSRIP projects to ensure (i) prompt acceptance by HHSC and CMS, (ii) enable reporting and measurement, and (iii) improve access, quality and outcomes to the betterment of the Region. This will require education and coordination with participating members, other Region 10 committees, HHSC and CMS.

C. Overview of deliverables, milestones and deadlines (timeline) – The deliverables for the Planning Committee for Region 10 include:
   1. Completion of Region 10 plan available for public comment: August 17, 2012
   2. Submission of Region 10 plan to HHSC: August 31, 2012
   3. Completion of position papers and other policies necessary for promoting Region 10 requirements and for guiding member participation (as needed)

XI. Membership

I. Membership Qualification – Each provider organization that participates in Region 10, as memorialized by an executed affiliation agreement, may participate in the committee’s meetings and agendas. Meetings will be open to the public.

J. List of committee members, titles and organizational affiliation – The committee shall consist of:
   1. List of members to be finalized after HHSC makes final determination of Region 10 counties and map.
K. Chair – Name, title and organizational affiliation – Scott Rule, Vice President – Planning and Analysis of the Anchor organization will chair meetings. The committee shall determine a back-up co-chair.

L. Voting and decision-making process – Each participating organization will be required to designate one voting member for matters that require a vote for approval. Decision-making will be by majority vote when required.

XII. Roles and Responsibilities

A. The RHP Planning Committee is charged with the following responsibilities for the duration of the rights, interests and obligations contemplated in the Waiver.
4. Identify and engage stakeholders from each county within Region 10
5. Collaborate on timelines, processes, communications and deliverables during the development of the RHP plan
6. Develop by consensus the Regional and local gaps for the Community Health Needs Assessment to be addressed by DSRIP projects in years 3-5
7. Coordinate with Clinical & Quality Committee to support:
   i. Coordinated development of DSRIP projects for participating providers at local and Regional level
   ii. Coordinated development of DSRIP goals, projected outcomes and milestones
8. Coordinate with Finance and Clinical & Quality Committees in the valuation of DSRIP projects, including development of methodologies and protocols for assigning values to DSRIP projects and education of and coordination with participating providers, HHSC and CMS
9. Participate in collaboration and implementation of general public engagement and communication process
10. Collaborate on the development of RHP processes, protocols and standards for data collection, reporting, performance management (post implementation)
11. Discuss and disseminate new developments and updates from HHSC

XIII. Meetings

A. Meeting Schedule
1. 2nd and 4th Thursday of each month
2. Time: 10:30am-12:00pm
3. Location: The Riley Center – Southwestern Baptist Theological Seminary, Conference RC – 237

B. Meeting Agenda
1. Outline of agenda template and content – The attached agenda format will be used.

2. Process for developing, approving agenda with Chair and timeline for dissemination with committee members – Agenda items for each meeting will be developed in each preceding meeting. Requests for additional agenda items may be made and can be made by a participating member one week prior to a regularly scheduled meeting.

3. Process for developing, approving and disseminating materials to committee members – Agenda’s and materials will be distributed by email on the Monday before each meeting.
RHP Clinical & Quality Committee Charter
Adopted by RHP Clinical & Quality Committee on June 14, 2012

XIV. Overview

The primary goal of the Clinical & Quality Committee is to ensure that appropriate clinical and quality metrics and outcomes are considered in (i) the selection of Delivery System Reform Incentive Payment (DSRIP) projects, and (ii) the measurement and reporting for the DSRIP projects consistent with the requirements of the 1115 Waiver Standard Terms and Conditions and the needs of the respective communities of Region 10.

XV. Purpose

D. List of objectives and major activities of the committee – The Clinical & Quality Committee’s core focus will be to select and apply appropriate clinical and quality outcomes and metrics related to the Region 10 plan as required by the terms of the Waiver. This will require focus in, but may not be limited to, the following areas:
   1. Input to HHSC on DSRIP project menu
   2. DSRIP project clinical and quality evaluation – Develop methodologies, guiding principles and protocols for evaluating DSRIP projects to (i) ensure prompt acceptance by HHSC and CMS, (ii) enable reporting and measurement, and (iii) improve access, quality and outcomes to the betterment of the Region. This will require education and coordination with participating members, other Region 10 committees, HHSC and CMS.
   3. Analysis of proposed outcomes and metrics associated with proposed DSRIP projects

E. Overview of deliverables, milestones and deadlines (timeline) – The deliverables for the Clinical & Quality Committee for Region 10 include:
   1. Comments to HHSC on DSRIP menu
   2. Coordinate with other RHP committees to complete the Region 10 plan
   3. Completion of position papers and other policies necessary for promoting Region 10 requirements and for guiding member participation (as needed)

XVI. Membership

M. Membership Qualification – Each provider organization that participates in Region 10, as memorialized by an executed affiliation agreement, may participate in the committee’s meetings and agendas. Meetings will be open to the public.

N. List of committee members, titles and organizational affiliation – The committee shall consist of:
   1. List of members to be finalized after HHSC makes final determination of Region 10 counties and map.

O. Chair – Name, title and organizational affiliation – Elizabeth Carter, MD, Senior Vice President – Population Health of the Anchor organization will chair meetings. The committee shall determine a back-up co-chair.
P. Voting and decision-making process – Each participating organization will be required to designate one voting member for matters that require a vote for approval. Decision-making will be by majority vote when required.

XVII. Roles and Responsibilities

A. The RHP Clinical & Quality Committee is charged with the following responsibilities during the initial RHP plan development and the four year performance period:

2. DSRIP projects: Support Planning committee in development and selection of appropriate DSRIP projects that reflect local and Regional provider vision and address health care delivery system gaps; including development of milestones, metrics and clinical outcome measures.
3. DSRIP project valuation – With Planning and Finance committees, develop methodologies and protocols for assigning values to DSRIP projects; including education and coordination with participating providers, HHSC and CMS.
5. Discuss and disseminate new developments and updates from HHSC.

XVIII. Meetings

E. Meeting Schedule
   1. 2nd and 4th Thursday of each month
   2. Time: 9:00am-10:30am
   3. Location: The Riley Center – Southwestern Baptist Theological Seminary, Conference RC - 237

F. Meeting Agenda
   1. Outline of agenda template and content – The attached agenda format will be used.

2. Process for developing, approving agenda with Chair and timeline for dissemination with committee members – Agenda items for each meeting will be developed in each preceding meeting. Requests for additional agenda items may be made and can be made by a participating member one week prior to a regularly scheduled meeting.

3. Process for developing, approving and disseminating materials to committee members – Agenda’s and materials will be distributed by email on the Monday before each meeting.

Appendix F:
Additional RHP DSRIP Project Development Information

The following timelines are examples of planning tools used during the RHP development process to communicate deadlines and process. The items in the timelines demonstrate the actions taken to help providers and the Region develop their DSRIP projects.
Appendix G:

Region 10 Learning Collaborative Plan
Learning Collaborative Proposal for RHP-10 Plan

Region 10’s DSRIP plan will transform the region’s health system so that low-income residents consistently experience coordinated, quality and timely care in the most appropriate health care setting. The region’s providers will achieve this through improvements at multiple levels: (1) at the provider level -- focusing on the provision of right care at the right time and place coordinated with other physical and behavioral health needs; (2) between providers -- integrating health care delivery and information; and (3) at the regional level -- collaborating to share best practices and lessons learned in order to achieve value-added, high-quality, patient-centered and outcomes-driven care.

Many projects in our plan test innovative models of care that move away from episodic treatment toward a more integrated and coordinated approach centered on the patient’s whole-person needs and health outcomes. As the region’s providers implement improvements, it is important that they learn from each other’s successes and challenges, as well as identify best practices that can be widely replicated. In this way, our collective learning can accelerate transformation.

For common areas of focus across multiple providers, the DSRIP program encourages bringing together the hands-on clinical implementation teams to learn from each other and improve more rapidly.

To this end, Region 10’s learning collaboratives will focus on:

- Sharing knowledge, experience and expertise;
- Improving patient and caregiver experience;
- Implementing evidence-based guidelines;
- Using data-driven analyses to drive performance improvement; and
- Testing, such as through Plan-Do-Study-Act (PDSA) cycles.

Based on community health needs, we have identified the following regional priority areas as opportunities for shared learning (more detailed information is provided on each below)

1. Access to and Capacity for Behavioral Health Care, including Integration with Primary Care; and,

2. Care Transitions and Patient Navigation.

These two collaboratives will accelerate the rate of improvement in care for many of our region’s most clinically vulnerable residents. Each collaborative will develop quantifiable goals to be reached by the end of the waiver. Goals will be consistent with DSRIP projects, and would utilize common metrics to measure progress toward goals. In order to measure progress, data
would be shared and aggregated. In addition to data, participants would share their qualitative experiences of the interventions being tested.

The Anchor entity may provide necessary assistance and facilitation of additional learning collaboratives to fulfill CQI requirements reflected in the RHP Plan.

Collaborative participants would be able to share information through:

1. A shared portal that includes shared data, learning and other resources;
2. A listserv for group questions, answers and check-ins;
3. Regular convenings and/or site visits.

At each meeting participants will scrutinize and discuss new data and its relevance and encourage discussion around progress toward goals, lessons learned, successes, challenges and identification of best practices.

Both newly formed collaboratives will have a designated project director or coordinator who will be responsible for convening the group, managing data collection and analytics, streamlining communications among group members (listserv, portal, etc.), and functioning as the regional “innovator agent” to observe and spread best practices from site to site, as well as serve as the liaison to the State and other regions and other relevant collaboratives.

Region 10 Learning Collaboratives

1. Expanding BH Access and Integrating Primary and Behavioral Health Care

- **Description:** The collaborative will focus on identifying best practices for primary care-behavioral health integration. Participants may decide to test one model as a group or to test various models and compare results. The collaborative will also provide an opportunity for providers working on behavioral health care access and capacity projects, to participate with those focusing specifically on primary care integration efforts for behavioral health care to reduce the fragmentation between behavioral health providers and those leading integration efforts, and to encourage full continuum thinking about individuals with behavioral health care needs.
- **New or Existing:** New
- **Number of providers with related projects:** 7
- **CHNA:**
  a. **CN.4:** Lack of access to mental health services. All but one county in Region 10 are recognized as health professions shortage areas for mental health providers.
  b. **CN.5:** Insufficient integration of mental health care in the primary care medical care system. Community stakeholders cite a need to achieve better integration of primary care and mental health care services in the primary care setting through heightened awareness of medical models for mental health integration.
- **Collaborative goal:** Increase patient access to care that is closely coordinated by a team of health care professionals that includes both primary and behavioral health providers. The collaborative may measure progress toward this goal through these or similar metrics:
  a. Implement integration in XX clinics
  b. Provide X% of Individuals with both physical and behavioral health care
  c. Increase the percentage of Individuals with a treatment plan developed and implemented with primary care and behavioral health expertise to XX%
  d. Decrease the “no shows” for behavioral and physical health appointments by XX%
  e. Screen at least X% of patients with one or more chronic diseases for depression
  f. Time from idea to full implementation
- **Meetings:** Teams would participate in bi-weekly check-in calls, quarterly data calls, and semi-annual in-person meetings, which may take place at a medical home that is further along in implementing the model, if appropriate.
- **Structure:** TBD

2. Care Transitions and Patient Navigation

- **Description:** Many of the region’s Performing Providers are undertaking DSRIP projects that will expand access to primary care, transform existing care approaches into a patient centered medical home model, and implement care transitions/patient navigations programs that provide more proactive and tailored prevention-oriented care to patients in the region struggling with chronic diseases, including asthma, diabetes. While specific chronic disease populations vary across the region’s DSRIP projects, they are all focused on providing better care coordination across health care settings and ensuring improved chronic care management for specific disease populations. This collaborative will build upon an existing, effective collaborative that focuses on reducing preventable
readmissions using the evidence-based Project RED (Re-Engineered Discharge) framework. In addition, participants from Region 10 will meet separately to share best practices regarding care coordination and transitions improvements that contribute to reduced readmission rates.

- **New or Existing:** Region 10 providers that have proposed care transitions and patient navigation projects in Pass 1 have already initiated the development of a Learning Collaborative focused on the topic.

- **Number of providers with related projects:** 21

- **CHNA:**
  - CN.8. Lack of access to healthcare due to financial barriers (i.e. lack of affordable care). Providers in our stakeholder survey overwhelmingly listed lack of coverage/financial hardship as a major barrier for low income patients.
  - CN.10. Overuse of emergency department (ED) services. Demand for ED visits is on the rise and EDs are becoming overcrowded due to reduced inpatient capacity and impaired patient flow. As a region, there were 1.1 million visits to hospital EDs in 2010, with a rate of 447.5 visits per 1000 persons. The 2007 national ED visit rate was 390.5 per 1000 persons, increasing 23% since 1997, but lower than the ED visit rate of Region 10.
  - CN.11: Need for more care coordination. All counties identified it as a system cap and need. Barriers include complexity of coordination, lack of staff, lack of financial integration, fragmented system service, and practicing in silos. Providers did not feel there was strong care coordination between primary care providers, hospitals, and specialists.

- **Collaborative goals:** Improve care coordination for patients across care settings and reduce hospital readmissions occurring within 30 days of discharge. Reduce ED visits due to impaired care coordination for patients. Improve timely and appropriate patient navigation with special emphasis on those with chronic diseases. The collaborative may measure progress toward this goal through these or similar metrics:
  a. Establish targets for care coordination and reduced hospital readmissions.
  b. Provide X% of Individuals with appropriate discharge and post-discharge followup.
  c. Increase the percentage of Individuals with a treatment plan developed and implemented with primary care, specialty care and behavioral health expertise to XX%.
  d. Increase navigation assistance to patients by XX%.

- **Meetings:** Teams would participate in bi-weekly check-in calls, quarterly data calls, and semi-annual in-person meetings, which may take place at a medical home that is further along in implementing the model, if appropriate.

- **Structure:** TBD

Appendix H:
Tarrant County Medical Society Letter of Support
November 29, 2012

Lisa Kirsch
Texas Health and Human Services Commission
Healthcare Transformation Waiver Operations
11209 Metric Blvd.
Austin, Texas 78758

Re: Letter of Support for the Region 10 RHP Plan for the Section 1115 Medicaid Waiver

Dear Ms. Kirsch:

I am writing on behalf of the Tarrant County Medical Society to express our organization’s strong support of the Region 10 RHP Plan for Texas’ Section 1115 Medicaid Waiver and the Delivery System Reform Incentive Payment (DSRIP) projects the plan proposes to implement.

JPS Health Network, the county’s public hospital and a critical part of the region’s safety net, has acted as Region 10’s anchor entity and worked to submit a plan that will truly reform health care delivery in the region’s nine counties. The waiver offers significant new opportunities for providers to address the serious access and capacity issues that impede population health and fragment care delivery in Region 10. The projects outlined in the Region 10 RHP plan will have a positive impact on the Medicaid and uninsured patient populations by providing timely and appropriate care with a focus on prevention.

The Tarrant County Medical Society (TCMS) is a professional organization representing more than 3,400 physicians, residents, medical students and Alliance members in Tarrant County. As the local arm of the Texas Medical Association, TCMS serves as the local physician’s advocate by linking medicine to the community. The society recognizes outstanding community contributors, coordinates physician access for community events and, most recently, began a “Project Access Tarrant County” project to allow physicians to expand health care access to the area’s uninsured and underserved.

The Tarrant County Medical Society welcomes the opportunity to work with Region 10 plan-providers in a coordinated effort to improve care for all residents of Tarrant County.

The society fully supports the efforts being undertaken in the outlined DSRIP projects and the Region 10 RHP vision to transform health care.
Please feel free to contact me at 817-296-4605 or g.sealy.massingill@unthsc.edu if you have additional questions.

Sincerely,

G. Sealy Massingill, MD  
President  
Tarrant County Medical Society  
555 Hemphill Street  
Fort Worth, TX 76104  
817-732-2825
This document defines primary care as family medicine, internal medicine, and pediatric medicine.

The federal poverty level is $10,890 for an individual, or $22,350 for a family of four, in 2011.
